The field of school administration draws primarily on Soviet law, the administration and management of schools in the USSR and abroad, the pedagogical legacy of the past, and the conclusions and recommendations of pedagogical science. In addition to the basic principles of school administration and management, school administration scholars study the work of public-education agencies with respect to the operational, pedagogical, and economic management of schools; specifically, they examine the implementation of universal education, the various types of general-education schools, the building of an efficient network of general-education schools, the pedagogical needs that must be met when designing and constructing schools and school buildings, the financing of schools, and the various ways of providing schools with teaching equipment.

School administration specialists also deal with the activities of public-education agencies involving the educational work of schools; these activities include the organization of methodological assistance for teachers and the inspection of schools. Other subjects of research by school administration scholars include the Soviet schoolteacher, the organization of records and accounts of educational institutions, and school statistics.

The field of school administration is based on the progressive tradition in the administration and management of Soviet schools expressed in Leninist decrees on public education; this tradition has been enriched by the practical activity and theoretical pronouncements of education workers and public-education agencies. Decrees of the Central Committee of the CPSU and the Council of Ministers of the USSR have indicated that the man-

agement of schools must be carried out in a more scientific manner. Proceeding from these instructions, Soviet school administration specialists deal with organizational and pedagogical problems involving the implementation of universal secondary education, the organization of educational work in various types of schools, the management of schools, and the administration of education at all levels.

SCHOOL OF MATHEMATICAL AND NAVIGATIONAL SCIENCES, an educational institution founded by Peter I the Great in Moscow in 1701 to train navy specialists, shipbuilders, geodesists, and engineers. Graduates of the school were also appointed as teachers in the newly created *tsifirnye shkoly* ("mathematical" schools) and in artillery, engineering, admiralty, and other special schools. In addition, they worked as civil servants in government institutions. The school was located in the building of the Sretenskaia, or Sukharev, Tower, at the top of which an astronomical observatory with a telescope was established. Youths between the ages of 12 and 20 from all social classes except the serf class were admitted to the school. Full financial support was provided by the state for those in need.

The curriculum at the school was divided into three levels (classes, or schools). In the elementary school, known as the Russian school, students were taught reading, writing, and the fundamentals of grammar and arithmetic. In the *tsifirnaia shkola*, they were instructed in arithmetic, geometry, and plane and spherical trigonometry. In the higher classes, the navigational classes, they received instruction in mathematical geography, astronomy, drafting, geodesy, navigation, and other subjects. Most students, primarily those of nongentry origin, were restricted to the first two levels and were appointed to subordinate positions in the navy, such as clerks. Students in the higher classes were required to receive practical training on seagoing vessels, at shipyards, and in roadbuilding. The principal organizers at the school were L. F. Magnitskii and A. Farvarson, who was invited to Russia from Scotland. In 1703 the school had 300 students, and in 1711, 500.

In 1715 the navigational classes of the school were transferred to St. Petersburg, where the Naval Academy (Naval Guards Academy) was established on their basis. The Russian and arithmetic classes continued to operate in Moscow to prepare students for the new academy. They were discontinued in 1752, after the founding of the Naval Cadet Corps.

Among the graduates of the School of Mathematical and Navigational Sciences were the admirals N. F. Golovin and V. Ia. Chichagov, the geodesists I. K. Kirilov, M. S. Gvozdev, I. M. Evreinov, and F. F. Luzhin, and the well-known educator N. G. Kurganov.

SCHOOLS, INDUSTRIAL TRAINING, beginning-level vocational-technical schools that existed from 1940 to 1963 at industrial enterprises and construction sites within the system of the State Labor Reserves of the USSR.

The industrial training schools prepared workers to occupy the most common jobs in various branches of the economy, including the construction, coal, mining, metallurgical, and petroleum industries; the course of study lasted six months. The schools admitted young people 16–18 years old with any general education whatsoever until 1955, when the admission requirement was changed; thereafter, at least an elementary education was required. Only young men 18 or over were admitted for training in occupations involving work underground, in shops where workers were exposed to high temperatures, and on construction sites. Students were fully maintained by the state.

In 1949 the industrial training schools for the coal and mining industries were reorganized as mining schools, with a six-month and a ten-month course of study. The industrial training schools for construction were reorganized as ten-month construction schools in 1955 and extended to two-year construction schools in 1957. Between 1959 and 1963, all industrial training, mining, and construction schools were reorganized as vocational-technical schools (*see* VOCATIONAL-TECHNICAL EDUCATION and VOCATIONAL-TECHNICAL EDUCATIONAL INSTITUTIONS). The industrial training schools provided instruction for approximately 6 million workers.

SCHOOLS, LITERACY (1) In prerevolutionary Russia, one- and two-year primary schools, operated under the auspices of various government departments or private individuals until 1891, when they were turned over to the Synod. Education at the literacy schools was limited to memorizing prayers and to mastering the rudiments of reading, writing, and arithmetic. The schools were abolished after the Great October Revolution of 1917.

(2) In the 1920's in Russia, one- and two-year training centers and schools for the elimination of illiteracy (*see* LITERACY and SCHOOLS FOR ADULTS).
[29–1268–2]

SCHOOLS FOR ADULTS, general-education institutions at which workers may receive instruction without leaving their jobs.

The first schools for adults—mainly primary schools—were created by private initiative in Russia in the late 1850's (*see* EVENING SCHOOLS and SUNDAY SCHOOLS). After the October Revolution of 1917, a state system of adult education was established, and in 1918 one- and two-year training centers and schools for the elimination of illiteracy were opened. After publication of the decree of the Council of People's Commissars On Eliminating Illiteracy in the RSFSR (1919), such schools and centers were set up throughout the country. Designed primarily for working people between the ages of 16 and 50, they existed until the late 1930's.

In the 1920's and 1930's instruction for persons who had mastered the rudiments of reading and writing was given in schools for the semiliterate and in advanced schools for adults; the former offered a primary education, and the latter a seven-year education. Workers' universities, peasants' universities, and one- and two-year general-education schools for adults also helped to raise the general cultural level of workers and peasants and provided advanced production training.

In 1936 two types of schools for adults were created: incomplete secondary general-education schools, formed from elementary schools, and secondary general-education schools, formed from seven-year schools. In 1937, the first incomplete secondary and secondary general-education correspondence schools were opened. In 1943 the schools for young workers and schools for rural youth became schools for adults, which in 1958 were renamed evening (shift) secondary general-education schools (*see* EVENING EDUCATION). Foremen's schools (classes) were first established in the USSR in 1962.

SCHOOLS FOR APPRENTICESHIP IN INDUSTRY, the basic Soviet vocational-technical schools from 1920 to 1940.

The schools for apprenticeship in industry were opened at large enterprises to train as skilled workers young people who were 14–18 years old and had a primary education. The schools had a three- or four-year course of study and offered both vocational training and a general education. From 1930 to 1939 the schools offered instruction primarily to young people who had completed the seven-year primary school; the course of study was reduced to 1.5–2 years by decreasing the number of hours devoted to general-education subjects. The schools turned out 2.5 million skilled workers for the country.

After 1940 the schools for apprenticeship in industry were found chiefly in light industry and in the food-processing industry. Between 1959 and 1963 the schools, together with all vocational-technical educational institutions in the USSR's State Labor Reserves system, were reorganized as vocational-technical schools, with courses of study of varying lengths (*see* VOCATIONAL-TECHNICAL EDUCATION).

SCHOOLS FOR KOLKHOZ YOUTH, rural general-education schools in the USSR that provided a seven-year education for students having a primary level education. The schools first appeared in 1923 and were called schools for peasant youth; in 1930 they were renamed schools for kolkhoz youth and the course of instruction was shortened to three years. In addition to providing a general education, the schools taught the fundamentals of agronomy and the basic principles for organizing agricultural production as applied to conditions in specific regions or zones.

The first evening schools for kolkhoz youth were established in 1928, and the first accelerated schools in 1930. Production training, which was subordinated to the task of socialist transformation of the countryside, was conducted at training farms, sovkhozes, cooperatives, kolkhozes, and machine-tractor stations. The schools for kolkhoz youth helped create an activist contingent of kolkhoz workers in the countryside, raise the cultural level of the peasants, increase the peasants' knowledge of agronomy, and bring new agricultural machinery into use on the kolkhozes. In 1934 the schools for kolkhoz youth were converted into incomplete secondary schools (seven-year schools).

SCHOOLS FOR PEASANT YOUTH, rural general-education schools in the USSR from 1923 to 1930 that covered the fifth through seventh grades and offered both day and evening instruction. In addition to general subjects, students were taught the fundamentals of agronomy and were trained for agricultural work. In 1930 the schools for peasant youth were renamed schools for kolkhoz youth. [29–1264–2]

SCHOOLS FOR RURAL YOUTH, general-education institutions in the USSR at which students received instruction without interrupting their agricultural work. The first schools for rural youth were opened in 1944 and offered instruction at the level of the primary and seven-year schools. The schools, which were established in large settlements, and at kolkhozes, sovkhozes, and machine-tractor stations, covered the first through fourth grades or the first through seventh grades. In 1956, the first secondary schools for rural youth, covering the fifth through tenth grades and the eighth through tenth grades, were opened. In 1958 the schools for rural youth were renamed evening (shift) secondary general-education schools.

SCHOOLS FOR WORKING YOUTH, general-education schools in the USSR at which students may receive instruction without leaving their jobs.

Since 1958, evening (shift) secondary general-education schools and secondary general-education correspondence schools at the oblast, krai, republic (in the autonomous republics), and city (in such major cities as Moscow and Leningrad) levels have been classified as schools for working youth; in 1962, foremen's schools and classes were also placed in this category. In the 1976–77 academic year, 4,917,000 students were enrolled in 14,020 evening (shift) and general-education correspondence schools, 92.7 percent of whom were in grades nine through 11. At various times evening schools for adults, Sunday schools, schools for adults, schools for young workers, and schools for rural youth have been schools for working youth. [29–1269–1]

SCHOOLS FOR YOUNG WORKERS, general-education schools in the USSR at which students received instruction without leaving their jobs. The first schools for young workers were established in 1943 and were called schools for adolescents working at enterprises; in 1944 they were renamed schools for young workers. The schools, which offered general educational training comparable with seven-year and secondary schools, covered the fifth through seventh grades and fifth through tenth grades. In 1958 the schools for young workers were renamed evening (shift) secondary general-education schools (*see* EVENING EDUCATION).

SCHOOL THEATER, a form of theater that originated in the educational establishments of Western Europe in the Middle Ages as a means of general upbringing and of studying Latin. The school theater was subsequently used to strengthen Catholicism and Protestantism. The plays were eventually performed in the vernacular. School dramas resembled mystery, miracle, or morality plays or plays on historical and mythological themes.

The school theater existed in many countries in Western Europe from the 15th to 18th centuries and in Russia in the 17th and 18th centuries. It had its own basic theoretical principles and rules carefully developed by such humanist writers as G. Pontano in Italy, J. C. Scaliger in France, and the scholar and poet Feofan Prokopovich in Russia.

Because Polish Jesuits encouraged school drama in the 16th and 17th centuries, the art became highly developed in Poland and from there spread to the Ukraine. Many school dramas were written at the Kiev Mogila Academy. The founder of school theater in Rus' was Simeon Polotskii. While outlining a project for establishing a religious academy in Moscow, Polotskii wrote of the need to organize a theater at the academy. He also wrote for the theater the plays *A Comedy Parable About the Prodigal Son* and *King Nebuchadnezzar*. Under Peter I, the school theater stressed political themes, glorifying the new undertakings of the government; a typical example is Feofan Prokopovich's *Vladimir* . . . (staged 1705).

Presentations of school theater were given in educational establishments and in squares during festivals; between the acts interludes were performed, mainly comic scenes from everyday life.

SCHOONER, a fore-and-aft rigged vessel with at least two masts. With displacements of 100 to 5,000 tons, schooners are used as cargo, fishing, sport, and training vessels. Most modern schooners are equipped with internal-combustion engines, which enable them to travel during calm weather and in narrow fairways. The barkentine and the brigantine are special types of schooners. [29–1560–6]

SCHOPENHAUER, ARTHUR. Born Feb. 22, 1788, in Danzig (now Gdansk); died Sept. 21, 1860, in Frankfurt am Main. German idealist philosopher.

In 1820, Schopenhauer became a privatdocent at the University of Berlin, and from 1831 he lived in Frankfurt am Main. His principal work is *The World as Will and Idea* (vols. 1–2, 1819–44). The Kantian a priori forms—time, space, and the categories of reason—were reduced by Schopenhauer to a single fundamental law of sufficient foundation. Subject and object are considered as corelative factors that make up the world as the "idea" (*Vorstellung*) of the subject. On the other hand, the world taken as a "thing in itself" is represented in Schopenhauer as a blind, irreducible "will to life," which is fractionated into an infinite multiplicity of "objectifications." Peculiar to each objectification is a striving toward absolute domination, which is expressed in an unceasing "war of all against all." At the same time the multiplicity of the objectifications of the will also exists as a hierarchical entity, reflecting the hierarchy of ideas (understood in the Platonic sense), that is, of adequate objectifications of the will. The highest degree in the series of objectifications of the will is man—a creature endowed with a rational awareness. Each cognizant individual is aware of his own will to life, and all other individuals exist in his idea as something dependent on his being; this serves as the source of man's limitless egoism.

The social organization (the state) does not abolish egoism, according to Schopenhauer, since it is merely a system of balanced private wills. The overcoming of egoistic impulses is carried out in the sphere of art and morals. Art is the creation of genius, based on the capacity of "disinterested contemplation," in which the subject acts as a "pure, will-less" subject and the object functions as the idea. The highest of the arts is music, which has as its goal not the reproduction of ideas but rather the direct reflection of the will itself.

In emphasizing the illusory nature of happiness and the inevitability of suffering, rooted in the very "will to life," with its senselessness and eternal dissatisfaction, Schopenhauer—in contrast to Leibniz—called the existing world the "worst of all possible worlds," and he designated his own doctrine as "pessimism." Schopenhauer considered the true foundation of morality to be the sense of compassion, owing to which the deceptive appearance of individuality is dissolved in the awareness of the unity of all being.

Schopenhauer's irrationalistic and pessimistic philosophy, which was not popular during his lifetime, found wide acceptance during the second half of the 19th century; it became one of the sources for the philosophy of life and was a predecessor of a number of the concepts of depth psychology (the doctrine of the unconscious). Schopenhauer's influence was felt by R. Wagner, E. von Hartmann, F. Nietzsche, and T. Mann, among others. In 1911 the Schopenhauer Society was founded in Frankfurt am Main.

SCHORL, a mineral, a black ferruginous variety of tourmaline with isomorphic admixtures of magnesium, manganese, and trivalent iron (*see* TOURMALINE). Schorl is found in granites, pegmatites, greisens, skarns, gneisses, hydrothermal veins, and various metamorphic shales. [29–1141–1]

SCHORLEMMER, KARL. Born Sept. 30, 1834, in Darmstadt; died June 27, 1892, in Manchester. German organic chemist. Fellow of the Royal Society of London (from 1871).

Schorlemmer was educated at the Justus Liebig University in Giessen. In 1859 he began working at Owens College in Manchester, where he became a professor in 1874. Schorlemmer's main works dealt with saturated hydrocarbons. Schorlemmer proved the equivalence of the four valences of carbon (1868). He proposed a system of classifying organic compounds and used it as a basis for his textbook *Lehrbuch der Kohlenstoffverbindungen* (1872; 3rd ed., 1885–97). He was also the author of works on the history of organic chemistry.

A progressive public figure, Schorlemmer was a member of the German Social Democratic party and a friend of K. Marx and F. Engels.

SCHÖRNER, FERDINAND. Born June 12, 1892, in Munich; died July 2, 1973. Fascist German field marshal (1945).

A veteran of World War I, Schörner also fought in World War II, commanding the XIX Mountain Corps above the arctic circle in 1942 and 1943 and the 40th Tank Corps in the Ukraine in 1943 and early 1944. In February 1944 he was appointed chief of staff of the Nazi command of the army. Schörner commanded Army Group South Ukraine from April to July 1944 and Army Group North from July 1944 to January 1945, when he assumed command of Army Group Center. Appointed commander in chief of the army on Apr. 30, 1945, he attempted to continue resistance against Soviet forces in Czechoslovakia after fascist Germany capitulated. After surrendering to the American forces, he was turned over to Soviet authorities and convicted as a war criminal by a military tribunal. Schörner was released from prison in 1955. [29–1142–3]

SCHOTT, FRIEDRICH OTTO. Born Dec. 17, 1851, in Witten (Ruhr); died Aug. 27, 1935, in Jena. German chemist. Founder (1884) and head of the Jena Glassworks (Jenaer Glaswerk Schott und Genossen).

Schott studied at the Technische Hochschule in Aachen, as well as at the universities of Würzburg and Leipzig. His research was primarily devoted to the chemistry and technology of glass. By adding various oxides in different proportions—oxides of bar-

ium, zinc, lead, boron, and phosphorus—to the glass composition, Schott developed new types of glass, with highly valuable optical, chemical, thermal, and electrical properties. His research served as the basis for the development of the German optical glassmaking industry. Schott also organized the manufacture of high-quality glass chemical, medical, and electrical-engineering equipment.

SCHOTT, PAUL GERHARD. Born Aug. 15, 1866, in Tschirma, Thuringia; died Jan. 15, 1961, in Hamburg. German oceanographer (Federal Republic of Germany).

Schott graduated from the University of Berlin in 1891. Beginning in 1921, he was a professor at the University of Hamburg. In 1891–92, Schott took part in scientific expeditions in India and East Asia. In 1898–99 he was a member of the German oceanographic expedition in the Atlantic and Pacific oceans on the ship *Valdivia*. In 1902 he conducted research in the West Indies. Schott was a member of the expedition that circumnavigated the globe on the ship *Meteor* in 1929. He wrote the first monographs on the geography of the Atlantic, Indian, and Pacific oceans, which served as a foundation for the further study of the oceans.

SCHOTTKY BARRIER, a potential barrier that is formed in the contact region of a semiconductor, that is, in the region that adjoins a metal. The barrier is named after W. Schottky, the German scientist who investigated it in 1939. To obtain a Schottky barrier, the work functions of the metal and the semiconductor must differ, as was first pointed out in 1939 by the Soviet scientist B. I. Davydov.

If an *n*-type semiconductor is brought into contact with a metal whose work function Φ is higher than that of the semiconductor, the metal becomes negatively charged and the semiconductor becomes positively charged, because electrons pass from the semiconductor to the metal more easily than in the opposite direction. If a *p*-type semiconductor is brought into contact with a metal whose work function Φ is lower than that of the semiconductor, the metal becomes positively charged and the semiconductor becomes negatively charged. When equilibrium between the metal and the semiconductor is established, a contact potential U_c appears; $U_c = (\Phi_m - \Phi_s)/e$, where e is the charge of the electron. Owing to the high conductivity of the metal, the electric field does not penetrate the metal, and the potential difference U_c is produced in the surface layer of the semiconductor. The direction of the electric field in the semiconductor's surface layer is such that the energy of majority carriers in the surface layer is higher than that in the bulk of the semiconductor. This means that the energy bands of the contact region are bent upward in an *n*-type semiconductor and are bent downward in a *p*-type semiconductor (see Figure 1). As a result, if $\Phi_m > \Phi_s$ for an *n*-type semiconductor or if $\Phi_m < \Phi_s$ for a *p*-type semiconductor, a potential barrier is produced in the semiconductor near the contact with the metal.

The height of a Schottky barrier $\Phi_0 = \Phi_m - \Phi_s$. In real metal-semiconductor structures, this relationship does not obtain because local electronic states are usually present at the surface of the semiconductor or in the thin dielectric layer that is often formed between the metal and the semiconductor. The electrons in the local surface states shield the effect of the metal, so that the intrinsic field in the semiconductor is determined by the surface states and the height of the Schottky barrier does not depend on Φ_m. As a rule, Schottky barriers obtained by depositing an Au film on an *n*-type semiconductor have the greatest heights. The intensity of an electric image (*see* SCHOTTKY EFFECT) also affects the height of a Shottky barrier.

A Schottky barrier has rectifying properties. When an external electric field is applied, the current through such a barrier is produced almost entirely by majority carriers. The magnitude of the current is determined by the rate at which carriers from the bulk of the semiconductor arrive at the surface or—in the case of a semiconductor with a higher carrier mobility—on the thermionic current in the metal.

Schottky-barrier metal-semiconductor contacts are widely used in microwave detectors and mixers (*see* SCHOTTKY BARRIER DIODE), as well as in, for example, transistors and photodiodes.

SCHOTTKY BARRIER DIODE (also Schottky diode), a semiconductor diode that is based on a metal-semiconductor contact. The Schottky barrier diode is named after W. Schottky, the German scientist who developed the principles of the theory of such diodes in 1938 and 1939.

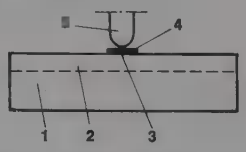

Figure 1. The structure of a Schottky-barrier detector diode: (1) semiconductor substrate, (2) epitaxial film, (3) metal-semiconductor contact, (4) metal film, (5) terminal

Schottky barrier diodes are fabricated by depositing a thin film of metal—for example, Au, Al, Ag, or Pt—on the clean surface of a semiconductor crystal—such as Si, GaAs, or, less often, Ge—by means of vacuum evaporation, cathode sputtering, chemical deposition, or electrodeposition. In the contact region of the semiconductor, as in the junction region of a diode with a *p-n* junction, a potential barrier is formed (*see also* SCHOTTKY BARRIER). The variation of the height of the potential barrier when an external voltage, or bias, is applied results in a change in the current through the device (*see*, for example, Figure 2 in SEMICONDUCTOR DIODE). In contrast to the current through a *p-n* junction, the current through the metal-semiconductor contact is due only to majority carriers.

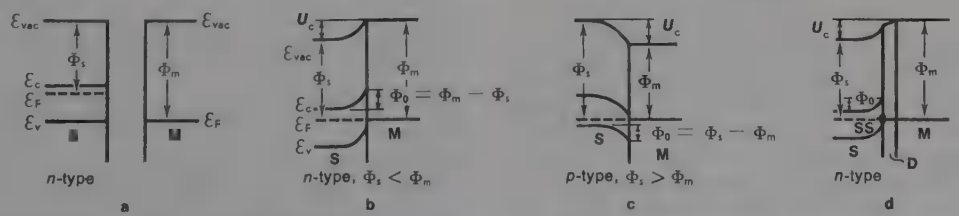

Figure 1. Energy diagrams for metal-semiconductor contacts: (a) semiconductor and a metal before being brought into contact, (b) an ideal metal–*n*-type semiconductor contact, (c) an ideal metal–*p*-type semiconductor contact, (d) a real contact; (M) metal, (S) semiconductor, (D) dielectric layer, (SS) surface electronic states, ($\mathcal{E}_{vac}$) electron energy level in vacuum, ($\mathcal{E}_v$) electron energy level at the top of the valence band, ($\mathcal{E}_c$) electron energy level at the bottom of the conduction band, ($\mathcal{E}_F$) Fermi energy

Several features distinguish Schottky barrier diodes from other types of semiconductor diodes. A desired barrier height may be obtained by choosing an appropriate metal. The volt-ampere characteristic is substantially nonlinear at low forward biases. The time lag is very low, ranging down to 10^{-11} sec, and the high-frequency noise level is low. Schottky barrier diodes are technologically compatible with integrated circuits and are easy to fabricate.

Schottky barrier diodes are used mainly as microwave diodes for various applications, for example, as detector diodes (see Figure 1), mixer diodes, avalanche transit-time diodes, varactors, and multiplier diodes. In addition, they are employed as radiation detectors, nuclear radiation detectors, strain gages, and light modulators. They are also used in, for example, high-frequency current rectifiers and solar batteries.

SCHOTTKY EFFECT, a reduction in the work function of electrons emitted from solids that occurs under the influence of an applied electric field that accelerates the electrons. The Schottky effect is exhibited as an increase in saturation thermionic current, a decrease in surface ionization energy (*see* ION EMISSION), and a shift of the photoelectric threshold toward longer wavelengths λ. The effect occurs in electric fields E that are strong enough to neutralize the space charge at the surface of the emitter—that is, $E \sim 10$–100 volts per cm (V/cm)—and is substantial in fields up to $E \sim 10^6$ V/cm. At $E > 10^7$ V/cm, the tunneling of electrons through the potential barrier at the boundary of the solid begins to dominate; such tunneling results in field emission.

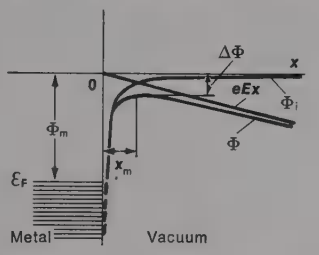

Figure 1. The Schottky effect: (Φ_i) electron potential energy in the field of the image force, (eEx) electron potential energy in the applied electric field, (Φ) electron potential energy near the surface of the metal in the presence of the applied field, (Φ_m) work function of the metal, ($\Delta\Phi$) reduction in the work function under the influence of the applied field, (ε_F) Fermi level in the metal, (x_m) distance from the height of the potential barrier to the surface of the metal; the shaded area indicates the filled electronic states in the metal

The classical theory of the Schottky effect for metals was developed by the German scientist W. Schottky in 1914. Owing to the high conductivity of metals, electric lines of force are perpendicular to the surface of a metal. Therefore, an electron, with a charge of $-e$, that is located at a distance of $x > a$, where a is the interatomic distance, from the surface interacts with the surface as if it induces its electric image—that is, a charge of $+e$—in the metal at a depth of x. The attractive force between the electron and its image is

$$F = e^2/16\pi\epsilon_0 x^2 \quad (1)$$

where ϵ_0 is the permittivity of empty space. The potential of the force, or the image potential, $\phi_i = -e/16\pi\epsilon_0 x$. The applied electric field reduces ϕ_i by the quantity $E \times x$ (see Figure 1); a potential barrier with a maximum value at $x = x_m = (e/16\pi\epsilon_0 E)^{1/2}$ appears at the metal-vacuum interface. At $E \leq 5 \times 10^6$ V/cm, $x_m \geq 8$ angstroms (Å). The reduction in the work function Φ caused by the applied field is $\Delta\Phi = e(eE/4\pi\epsilon_0)^{1/2}$. For example, at $E = 10^5$ V/cm, $\Delta\Phi = 0.12$ electron volt and $x_m = 60$ Å. As a result of the Schottky effect, the current j increases exponentially from j_0 to

$$j = j_0 \exp\left[\frac{e}{kT}(eE/4\pi\epsilon_0)^{1/2}\right]$$

where k is the Boltzmann constant, and the photoelectric threshold frequency $\hbar\omega_0$ is shifted by the quantity

$$\Delta(\hbar\omega_0) = e(eE/4\pi\epsilon_0)^{1/2}$$

In the case where the emitting surface is nonuniform and covered with "spots" having different work functions, a "spot" electric field is produced on the surface. The "spot" field decelerates electrons emitted from cathode regions whose work functions are lower than those of adjacent regions. The applied electric field combines with the "spot" field and increases, suppressing the decelerating effect of the "spot" field. As a result, the emission current from a nonuniform emitter increases with increasing E more rapidly than in the case of a uniform emitter.

The effect of an applied electric field on the emission of electrons from semiconductors is more complicated. In semiconductors, the electric field penetrates to greater depths, ranging from hundreds to tens of thousands of atomic layers. Therefore, the charge induced by an emitted electron is located in a layer with a thickness of the order of the screening radius r_s rather than at the surface. For $x > r_s$, equation (1) is valid, but for fields E that are many times weaker than in the case of metals, that is, for $E \sim 10^2$–10^4 V/cm. In addition, an applied electric field that penetrates a semiconductor causes a redistribution of charges in the semiconductor, leading to an additional reduction in the work function. However, surface electronic states are usually present at the surface of a semiconductor. For a sufficiently high surface-state density ($\sim 10^{13}$ cm^{-2}), the electrons in the surface states screen the applied field. In this case, the Schottky effect is the same as in the case of metals, provided the surface states are filled and emptied rapidly enough under the influence of an emitted electron's field.

The Schottky effect is also observed when a current flows through a metal-semiconductor contact (*see* SCHOTTKY BARRIER and SCHOTTKY BARRIER DIODE).

SCHRADER, OTTO. Born Mar. 28, 1855, in Weimar; died Mar. 21, 1919, in Breslau (now Wrocław, Poland). German linguist and historian.

Schrader studied in Jena and Leipzig. He became a professor at the University of Jena in 1890 and the University of Breslau in 1909. He helped develop the theories of the cultural history school of linguistics by correlating the findings of comparative-historical linguistics with those of history and such other disciplines as archaeology, ethnography, botany, and zoology. Schrader used his multidisciplinary cultural-historical approach to study the ancient ethnic history of the Indo-European peoples and to reconstruct the social and cultural structure of primitive society. Schrader compiled the *Dictionary of Indo-European Antiquities* (1901).

SCHRAMM, KONRAD. Born Aug. 21, 1822, in Krefeld; died Jan. 15, 1858, in St. Helier, Jersey, Great Britain. Figure in the German and international working-class movement.

During the Revolution of 1848–49 in Germany, Schramm helped with the publication of democratic newspapers. Arrested

in May 1849, he escaped from prison in September and emigrated to Great Britain. In London he became friends with K. Marx and F. Engels. Schramm joined the Communist League and became a member of its Central Committee; he was one of the editors of the league's journal, *Neue Rheinische Zeitung: Politische-oekonomische Revue*. After the split of the Communist League in the autumn of 1850, he supported the line of Marx and Engels. From 1852 to 1857, Schramm lived in the USA.

SCHREINER, ALBERT. Born Aug. 7, 1892, in Aglasterhausen. German historian (German Democratic Republic). Professor (1947).

Schreiner was a metalworker in his youth. In 1910 he joined the Social Democratic Party of Germany and became affiliated with its left wing; in 1919 he joined the Communist Party of Germany. He helped publish works on the history of the German working-class movement. Schreiner went abroad after the establishment of the fascist dictatorship in 1933 and did not return to Germany until 1946. From 1936 to 1938 he served in the international brigades in Spain; he was chief of staff of the 13th International Brigade.

In 1950, Schreiner became associated with the Museum of German History in Berlin, the Institute of History of the German Academy of Sciences, and the Institute of Social Sciences of the Central Committee of the Socialist Unity Party of Germany. His principal works deal with the history of German foreign policy and the influence of the October Revolution of 1917 on Germany. Schreiner received the National Prize of the German Democratic Republic in 1952.

SCHREINER, OLIVE (pen name, Ralph Iron). Born Mar. 24, 1855, in Wittebergen Reserve, Cape Colony (now in Lesotho); died Dec. 11, 1920, in Cape Town. South African writer.

Schreiner was one of the first proponents of Marxism in South Africa. She spoke out against women's lack of rights and against racial discrimination. Her collection of short stories entitled *Dreams* (1890) reflected her faith in the future of humanity. Protest against the colonial war in South Africa and social injustice is strongly expressed in her short story "Trooper Peter Halkett of Mashonaland" (1897; Russian translation, "Trooper Peter Halkett," 1900). Schreiner published the autobiographical novels *The Story of an African Farm* (1883), *From Man to Man* (published 1926), and *Undine* (published 1928). Schreiner warmly greeted the October Revolution of 1917 in Russia.

SCHREKER, FRANZ. Born Mar. 23, 1878, in Monaco; died Mar. 21, 1934, in Berlin. Austrian composer, conductor, and teacher.

Schreker received his musical education at the Vienna Conservatory, where he studied violin with A. Rosé and theory with R. Fuchs and H. Grädener. In 1908 he organized and led the Vienna Philharmonic Chorus, which under his direction premiered many works by modern composers. He achieved his greatest popularity as a composer of works for the stage, written, as a rule, to his own librettos.

Schreker's works show certain symbolist features and are distinguished by an erotic sensuousness and by subjectivism; at the same time they are notable for their brilliant color and dramatic tension. This combination of qualities explains the widespread, though short-lived, popularity of Schreker's music in the 1920's, when his operas *Der ferne Klang* (A Distant Bell; 1912), *Der Schatzgräber* (The Treasure-seeker; 1920), and *Irrelohe* (Errant Flame; 1924) were widely performed.

Schreker taught composition at the Akademie der Tonkunst in Vienna from 1912 to 1920, when he was appointed director of the Hochschule für Musik in Berlin; in 1932 and 1933 he was a professor at the Prussian Academy of Arts, where he held a master class for composition.

SCHRÖDER, ERNST. Born Nov. 25, 1841, in Mannheim; died June 16, 1902, in Karlsruhe. German mathematician and logician.

In 1876, Schröder became a professor at the Technische Hochschule of Karlsruhe. Schröder gave a systematic exposition of mathematical logic, or more accurately, of the algebra of logic. In addition to the term "propositional calculus," he introduced the duality principle and a number of other mathematical laws of logic. Schröder also made contributions to the theory of algorithms.

SCHRÖDER, FRIEDRICH LUDWIG. Born Nov. 3, 1744, in Schwerin; died Sept. 3, 1816, in Rellingen. German actor, stage director, teacher, and theater figure.

Schröder, son of the famous tragedienne S. S. Schröder, is considered, along with G. E. Lessing, to have been the greatest representative of the German Enlightenment theater. Making his stage debut as a child, he performed in the company of his stepfather, K. Ackermann, until 1756 and again in 1759 and 1760. From 1756 to 1759 he performed in the circus troupe of M. Stuart as a dancer, juggler, and acrobat and appeared in farces with J. F. von Kurz' company. Schröder helped found the Hamburg National Theater, and during the years 1771–80, 1785–98, and 1811–12 he headed the company. From 1781 to 1785 he worked in the Vienna Burgtheater. In Ackermann's company, Schröder played comic roles, becoming known as a master of improvisation. He also staged and composed approximately 70 ballets.

Schröder was the first German actor to play the role of Truffal-

dino in Goldoni's *A Servant of Two Masters*. He was the first to present Shakespeare's tragedies, notably *Hamlet, King Lear, Macbeth*, and *Othello*, on the German stage. These productions were in his own translations, and Schröder played the leading roles. Schröder also performed in the dramas of F. Schiller and in D. Diderot's bourgeois drama *The Father of the Family*.

Schröder established a national German repertoire, affirmed realist principles in stage design, and taught a natural, psychologically truthful and inspired method of acting. His acting harmoniously combined inner emotion with carefully conceived outward means of expression.

SCHRÖDER-DEVRIENT, WILHELMINE. Born Dec. 6, 1804, in Hamburg; died Jan. 26, 1860, in Coburg. German soprano.

Schröder-Devrient studied under J. Mazatti in Vienna. In 1821 she made her debut as Pamina in Mozart's *The Magic Flute*. She toured in various cities of Italy, as well as in Paris, London, and Prague. Her performance as Leonore in Beethoven's *Fidelio* (1822, Vienna) brought her fame as the leading female singer of Europe. From 1823 to 1847 she was a soloist with the court opera in Dresden. For her part in the Dresden uprising of 1849 she was exiled from Saxony, and she did not perform again until 1856. Schröder-Devrient performed as a guest artist in Russia.

Schröder-Devrient, a singer of superb vocal technique and a gifted actress, excelled as Senta in Wagner's *Der fliegende Holländer* and Agathe in Weber's *Der Freischütz*.

SCHRÖDINGER, ERWIN. Born Aug. 12, 1887, in Vienna; died there Jan. 4, 1961; buried in Alpbach, Tírol. Austrian physicist. One of the founders of quantum mechanics.

Schrödinger received the Ph.D. degree from the University of Vienna in 1910. In 1911 he began working at the Physics Institute of the University of Vienna. In 1920 he was a professor at the Technische Hochschule in Stuttgart, and in 1921, a professor at the Technische Hochschule in Breslau (Wrocław). From 1921 to 1927 he was a professor at the Technische Hochschule in Zürich, and from 1927, a professor at the University of Berlin. From 1933 to 1935 he was a professor at Oxford University, and from 1936 to 1938 at the university in Graz. In 1938–39 he was a professor in Ghent. Beginning in 1940, he was first a professor at the Royal Academy in Dublin, and then director of the Institute for Advanced Studies, which he founded in Dublin. From 1956, he was a professor at the University of Vienna.

Schrödinger's main works dealt with mathematical physics, the theory of relativity, atomic physics, and biophysics. His early studies were devoted to the theory of the crystal lattice and the creation (1920) of the mathematical theory of color, which became the basis for modern colorimetry. His most important contribution was the creation of wave mechanics (late 1925 and early 1926): proceeding from L. de Broglie's hypothesis regarding the wave properties of matter, Schrödinger showed that the stationary states of atomic systems may be considered as the self-oscillations of the wave field that corresponds to the given system. Schrödinger discovered the fundamental equation of nonrelativistic quantum mechanics (the Schrödinger equation) and gave its solution for a number of particular problems; he provided a general method of applying the equation in perturbation theory. Schrödinger established the relationship between wave mechanics and the "matrix mechanics" of W. Heisenberg, M. Born, and P. Jordan and proved that they were physically identical. The mathematical formalism developed by Schrödinger and the wave function ψ introduced by him proved to be the most adequate mathematical apparatus of quantum mechanics and its applications.

Schrödinger received a Nobel Prize in 1933. He was a foreign member of the Academy of Sciences of the USSR (1934).

L. S. POLAK [29–1413–2]

SCHRÖDINGER EQUATION, the fundamental dynamic equation of nonrelativistic quantum mechanics (*see* QUANTUM MECHANICS); named in honor of the Austrian physicist E. Schrödinger, who proposed it in 1926. In quantum mechanics the Schrödinger equation plays the same fundamental role as Newton's equation of motion plays in classical mechanics and the Maxwell equations play in the classical theory of electromagnetism. The Schrödinger equation describes the time variation of the state of quantum objects, which is characterized by the wave function. If the wave function ψ at the initial moment of time is known, then by solving the Schrödinger equation it is possible to find ψ at any subsequent time t.

For a particle of mass m moving under the action of a force generated by the potential $V(x, y, z, t)$, the Schrödinger equation has the form

$$i\hbar\frac{\partial\psi}{\partial t} = -\frac{\hbar^2}{2m}\Delta\psi + V(x, y, z, t)\psi \tag{1}$$

where $i = \sqrt{-1}$, $\hbar \cong 1.05 \times 10^{-27}$ erg·sec is Planck's constant, and $\Delta = \partial^2/\partial x^2 + \partial^2/\partial y^2 + \partial^2/\partial z^2$ is the Laplace operator (x, y, and z are the coordinates). This equation is called the Schrödinger time-dependent equation.

If the potential V is independent of time, the solutions of the Schrödinger equation may be represented in the form

$$\psi(x, y, z, t) = e^{-(i/\hbar)Et}\psi(x, y, z) \tag{2}$$

where E is the total energy of the quantum system and $\psi(x, y, z)$ satisfies the stationary Schrödinger equation:

$$-\frac{\hbar^2}{2m}\Delta\psi + V(x, y, z)\psi = E\psi \tag{3}$$

For quantum systems whose motion occurs in a bounded region of space, solutions of the Schrödinger equation exist only for certain discrete energy values: $E_1, E_2, \ldots, E_n, \ldots$; the members of this series, which is virtually infinite, are numbered by the set of integral quantum numbers n. A wave function $\psi_n(x, y, z)$ corresponds to every value of E_n, and a knowledge of the complete set of these functions makes it possible to calculate all measurable characteristics of the quantum system.

In the important particular case of the Coulomb potential

$$V(x, y, z) = -\frac{e^2}{\sqrt{x^2 + y^2 + z^2}} \tag{4}$$

(where e is the elementary electric charge), the Schrödinger equation describes the hydrogen atom, and the E_n are the energies of the stationary states of the atom.

The Schrödinger equation is a mathematical expression of a fundamental property of microparticles—the wave-particle duality—according to which all particles of matter that exist in nature are also endowed with wave properties (this hypothesis was first advanced by L. de Broglie in 1924).

The Schrödinger equation satisfies the correspondence principle and, in the limiting case where the de Broglie wavelengths are much smaller than the dimensions characteristic of the motion under examination, describes particle motion according to the laws of classical mechanics. The transition from the Schrödinger equation to classical trajectories is similar to the transition from wave optics to geometrical optics. The analogy between classical mechanics and geometrical optics, which is the limiting case of wave optics, played an important role in establishing the Schrödinger equation.

From the mathematical standpoint, the Schrödinger equation is a wave equation and is similar in structure to the equation that describes the vibrations of a weighted string. In contrast, however, to the solutions of the equation of the vibration of a string, which give the geometrical shape of the string at a given time, the solutions $\psi(x, y, z, t)$ of the Schrödinger equation do not have direct physical meaning. What has meaning is the square of the wave function, namely, the quantity $\rho_n(x, y, z, t) = |\psi_n(x, y z, t)|^2$, which is equal to the probability of finding a particle (or system) at a time t in the quantum state n at a point of space having the coordinates x, y, z. This probabilistic interpretation of the wave function is one of the principal postulates of quantum mechanics.

The mathematical formulation of the postulates of quantum mechanics that is based on the Schrödinger equation is called wave mechanics. It is fully equivalent to the matrix mechanics of W. Heisenberg, formulated in 1925.

The Schrödinger equation makes it possible to explain and predict a large number of phenomena of atomic physics and to calculate the experimentally observable fundamental characteristics of atomic systems, such as the energy levels of atoms and the change in atomic spectra under the influence of electric and magnetic fields. By using the Schrödinger equation, it has also been possible to understand and describe quantitatively a broad range of phenomena in nuclear physics, such as the regularities underlying alpha decay, the gamma radiation of nuclei, and the scattering of neutrons by nuclei.

SCHUBART, CHRISTIAN FRIEDRICH DANIEL. Born Mar. 24, 1739, in Obersontheim; died Oct. 10, 1791, in Stuttgart. German journalist and poet.

Schubart was the son of the village choir leader and organist. He traveled widely and held a variety of jobs. His newspaper *Deutsche Chronik* (1774–77) won enormous popularity; taking democratic positions, it exposed feudal customs in Germany and helped spread the ideals of the Enlightenment. At the order of the duke of Württemberg, Schubart was confined to a fortress for 10 years. Freed in response to public protest, he continued his militant journalistic activity by publishing the journals *Schubarts vaterländische Chronik* (1787), *Vaterlandschronik* (1788–89), and *Die Chronik* (1790–91).

Schubart's poetry developed in the *Sturm und Drang* tradition. His mature verses, such as "The Masters' Grave" (1780), "The Poor Soldier" (1783), and "Song of the Cape of Good Hope" (1787), contain elements of social criticism; they constitute one of the earliest examples of the political German lyric poem. Schubart enthusiastically welcomed the French Revolution.

A. A. GUGNIN [29–1511–3]

SCHUBERT, FRANZ PETER. Born Jan. 31, 1797, in Lichtenthal, near Vienna; died Nov. 19, 1828, in Vienna. Austrian composer.

The son of a schoolmaster, Schubert began his musical education by studying violin with his father, piano with his elder brother Ignaz, and voice with M. Holzer, the choirmaster of the parish church. In 1808 he was awarded a place in the court chapel as a choirboy; he studied figured bass under W. Ruzicka and, until 1816, counterpoint and composition under A. Salieri. Schubert attended a training school for elementary teachers in 1813 and 1814, then worked as an assistant teacher at his father's school until 1818, when he struck out on his own. For several years he gave music lessons and repeatedly, but unsuccessfully, tried to obtain a permanent position as a musician.

Schubert was surrounded by friends and supporters who rendered him as much financial assistance as they were able; they included the civil servant J. von Spaun, the amateur poet F. von Schober, the poet J. Mayrhofer, the painter M. von Schwind, the poet and comic dramatist E. von Bauernfeld, and the composer A. Hüttenbrenner. The singer M. Vogl popularized Schubert's songs. Schubert's friends and acquaintances often gathered to perform his works at evenings that became known as *Schubertiaden*. Schubert's works were first published in 1821.

Schubert left Vienna only rarely, usually in the summer. In 1818 and 1824 he was a music teacher to the daughters of Count J. Esterházy in Hungary, where he became acquainted with Hungarian folk music and Gypsy music. He visited Upper Austria with Vogl in 1819, 1823, and 1825 and Graz in 1827. Schubert's songs achieved wide renown, and in 1823 he was elected an honorary member of the Styrian and Linz musical societies. On Mar. 26, 1828, a concert of his works was given in Vienna, with great success. In the fall of that year Schubert contracted typhoid fever and died.

Schubert, who lived in the harshly reactionary Austria of Metternich, was the first great representative of romantic music. In his works he sought to re-create the shining ideal absent from life; his music reflects a longing for that ideal and the sufferings of a man in an alien and hostile social milieu. The warm, heartfelt quality of Schubert's music, its immediacy and open expressiveness, flow from the composer himself. Schubert's music is closely connected with the folk art of Austria (although actual folk themes rarely appear in his work) and with Viennese music evocative of everyday life; it also reflects the folklore of the Hungarians and the Slavic peoples, some of which were at that time part of the Austrian Empire. Although first and foremost a melodist, Schubert is noted for his inventive use of tonality, his original and richly colored harmonies, and his brilliant orchestration. Innovative as his music was, it remained firmly rooted in the traditions of the Viennese classical school.

An important place in Schubert's oeuvre is occupied by the lied, which Schubert, by more closely uniting words and music and by enhancing the meaning and distinctiveness of the musical images, transformed into a genre capable of expressing a profound content. In the Schubertian lied the vocal melody, which often includes recitative elements, generally can stand alone as a coherent musical creation. The piano accompaniment, profoundly expressive, at times takes on a pictorial quality. Schubert, by developing and enriching previous types of songs, created a new genre in which a musical idea is developed throughout the song and the varying themes in the piano are woven into a whole; he also created the first mature song cycles.

Schubert set his more than 600 lieder to the poems of approximately 100 poets. For each major poet he found an appropriate musical style. The poets who figure most prominently in his songs are Goethe (approximately 70 songs, including "Erlkönig" and "Gretchen am Spinnrade"), F. Schiller (more than 40 songs, including "Des Mädchens Klage" and "Gruppe aus dem Tartarus"), W. Müller (the song cycles *Die schöne Müllerin* and *Die Winterreise*), H. Heine (six songs, including "Der Doppelgänger"), and Mayrhofer (47 songs). He also wrote notable songs to the texts of C. F. D. Schubart ("Die Forelle"), F. O. Stolberg ("Auf dem Wasser zu singen"), M. Claudius ("Der Tod und das Mädchen"), G. P. Schmidt ("Der Wanderer"), L. Rellstab ("Ständchen" and "Aufenthalt"), F. Rückert ("Sei mir gegrüsst" and "Du bist die Ruh'"), M. von Collin, J. N. von Craigher, F. Schober ("An die Musik"), W. Scott ("Ave Maria"), and Shakespeare ("Hark! hark! the lark!").

Schubert's choruses, cantatas, oratorios, and quartets for male and females voices are related to his songs. In his church music, notably the last two masses (1819 and 1828), he expressed, as did J. S. Bach, simple human emotions. Although Schubert composed three operas and six Singspiels, they were never performed in his lifetime and have not found a place in the repertoire, primarily because their librettos are inferior. The three plays for

which he composed music did not long remain on the stage, but the overture and dances from the music for H. von Chézy's play *Rosamunde von Cypern* (1823) are often performed.

In his instrumental works, Schubert used the melodic and graceful themes typical of his songs, generally developing them into finished wholes and heightening their effect in various ways. Of the seven completed symphonies the last, in C major (final version, 1828), achieves a heroic, epic quality. This majestic composition is, in the words of V. V. Stasov, truly a work of genius "in its power, its passion, its beauty, its expression of close ties with the people, and its evocation of the broad masses." The lyric and dramatic Symphony No. 8 in B minor (*Unfinished Symphony*; 1822), of which two movements were completed, is imbued with psychological profundity. The most popular of Schubert's concert overtures are the two *Overtures in the Italian Style*.

Many of Schubert's chamber works reflect the domestic music-making popular in Austria at that time, notably the joyous Piano Quintet in A major (*The Trout*; 1819), the penultimate movement of which contains variations on the song "Die Forelle" (The Trout). Several of the chamber works are often orchestral in nature, such as the String Quartet in C major (1828) and the three final string quartets: the quartets in A minor (1824), G major (1826), and D minor (*Death and the Maiden*; 1824–26), which includes variations on the song "Der Tod und das Mädchen."

Works for the piano occupy an important place in Schubert's oeuvre. In his piano sonatas he was influenced by L. von Beethoven but made his own distinctive contributions to the genre. His finest sonatas are those in A major (1819), A minor (1823), A minor (1825), D major (1825), G major (1826), and B flat major (1828). The Fantasy in C major (1822), which uses the melody from the song "Der Wanderer," foreshadows the structure of F. Liszt's symphonic poems. The 11 *Impromptus* (1827–28) and six *Moments musicaux* (1818–28) are romantic miniatures for piano that anticipate the characteristic features of the piano music of F. Chopin and Liszt. The dances for piano, including waltzes, *Ländler* (Austrian slow waltzes), *deutsche Tänze* (German waltzes), *écossaises*, and galops, mark an important stage in the poeticization of the dance. Schubert composed numerous piano duets, including the Fantasy in F minor (1828), the *Divertissement à la hongroise*, variations, marches, and polonaises.

Some of Schubert's late works, such as *Die Winterreise* and the lieder set to Heine's poems, show an intensification of dramatic, even tragic, feeling. Even in his final years, however, he composed works, including songs, imbued with energy, strength, fortitude, and joy. During his lifetime Schubert was known primarily as a composer of lieder, and many of his large-scale instrumental works were not performed until decades after his death; the Symphony in C major (*The Great Symphony*), for example, was first performed in 1839, with F. Mendelssohn conducting, and the *Unfinished Symphony* received its first performance in 1865. Not until the early 20th century was Schubert's greatness as a composer of instrumental works recognized.

SCHUCHARDT, HUGO. Born Feb. 4, 1842, in Gotha; died Apr. 21, 1927, in Graz. German and Austrian linguist.

Schuchardt studied at the universities of Jena and Berlin; he was a student of F. Diez' and A. Schleicher's. He became a professor in Halle in 1873 and was a professor in Graz from 1876 to 1900.

Schuchardt's principal works deal with Romance philology and general linguistics. He studied Vulgar Latin, the Romance languages, and other Indo-European languages, as well as Basque, the Caucasian languages, the Hamito-Semitic languages, and Hungarian. Schuchardt propounded ideas on the mixing of languages, on ergative sentence constructions in several languages, and on the interaction of lexicon and grammar. He criticized the neogrammarians' interpretation of the laws of sound changes and Schleicher's genealogical classification of the Indo-European languages. A representative of the *Wörter und Sachen* trend, he believed that words should be studied in relation to the history of extralinguistic *realia*. Schuchardt's views influenced several foreign schools of philology.

SCHUCHERT, CHARLES. Born July 3, 1858, in Cincinnati, Ohio; died Nov. 20, 1942, in New Haven, Conn. American paleontologist and geologist.

Schuchert worked at Yale University in New Haven in 1892–93 and for the US Geolgoical Survey in 1893–94. Beginning in 1904, he was a professor at Yale University and the Sheffield Scientific School. At the same time, he was curator of the geological collection of the Peabody Museum of Natural History at Yale University. Schuchert's principal works dealt with the taxonomy of brachiopods, paleogeography, historical geology, the stratigraphy of North America, and the classification of geosynclines.

SCHULHOFF, JULIUS. Born Aug. 2, 1825, in Prague; died Mar. 13, 1898, in Berlin. Bohemian pianist and composer.

Schulhoff studied piano with I. Tedesco and theory with V. J. Tomášek (Tomaschek) in Prague. He made his debut in Dresden in 1842, and in 1845 he took up residence in Paris, where his playing and his compositions for piano attracted the attention of F. Chopin. Schulhoff gave concerts in many European countries and in 1853 toured Russia. He taught in Paris from 1853 to 1870 and Dresden from 1870 to 1897. He eventually took up residence in Berlin, where he became a professor in 1897.

Schulhoff composed approximately 60 works of salon music for piano, including two sonatas, 12 études, and *Prague Allegro brillant*. His dances include two collections of mazurkas: *Poland* and *Memories of Warsaw and Kiev*. Among Schulhoff's other works are transcriptions of Czech folk songs. [29–1526–1]

SCHULTZE, MAX JOHANN SIGISMUND. Born Mar. 25, 1825, in Freiburg; died Jan. 16, 1874, in Bonn. German zoologist and histologist.

Schultze graduated from the University of Griefswald and attended lectures at the University of Berlin. He was a professor at the universities of Halle (from 1854) and Bonn (1859–74). His main works dealt with protozoans. Schultze came to the conclusion that the "sarcode" of protozoans and the protoplasm of plant cells were one and the same. In the article *Ueber Muskelkörperchen und das was man eine Zelle zu nennen habe* (On Muscle Corpuscles and on What May Properly be Called a Cell; 1861), he stated the necessity for reexamining the notion of the cell advanced by T. Schwann and defined the cell as a "globule of protoplasm surrounding a nucleus." He was the author of a number of zoological and histological studies, in particular, studies on the histology of the eye in animals and on the electric organs of fishes.

SCHULZ, MAX WALTER. Born Oct. 31, 1921, in Scheibenberg. German writer of the German Democratic Republic (GDR). Member of the Socialist Unity Party of Germany.

Schulz served in World War II (1939–45). He attended the J. R. Becher Literary Institute in Leipzig, becoming director in 1964. He became a professor in 1969. He is vice-president of the Writers' Union of the GDR.

Schulz' novel about the non-lost generation, *We Are Not Dust in the Wind* (1962; Russian translation, 1964), received wide renown. Depicting Germany during and after the war, it shows how Nazi ideology was overcome and how the hero goes over to the side of socialism. The novel *Triptych With Seven Bridges* (1974) traces the lives of the first novel's heroes to 1968. Schulz is also a publicist and a literary critic.

Schulz was awarded the National Prize of the GDR in 1964.

SCHULZE, FRANZ EILHARD. Born Mar. 22, 1840, in Elsen, near Greifswald; died 1921. German zoologist.

Schulze was a professor at the universities of Rostock, Graz, and Berlin. His main works dealt with the anatomy and embryology of sponges and other invertebrates. Schulze was the author of monographs on a number of genera and orders of sponges. He also investigated the sense organs in lower vertebrates and described the most primitive multicellular animal—*Trichoplax*.

SCHULZE-BOYSEN–HARNACK ORGANIZATION (also Rote Kapelle, or Red Orchestra), an underground antifascist organization that operated in Berlin; one of the largest organizations of the German resistance.

The Schulze-Boysen–Harnack Organization was created in 1938 and 1939 by the merger of the underground groups of H. Schulze-Boysen and A. Harnack. The members of the organization included Communists, Social Democrats, former members of the Nazi Party, and persons who belonged to no party at all, including Schulze-Boysen and Harnack; by occupation they were blue- and white-collar workers, servicemen in the Wehrmacht, and students. The Communist Party of Germany's policy of creating a united democratic, antifascist front was embodied most fully in the activities of the Schulze-Boysen–Harnack Organization. Members of the organization carried out sabotage at military plants of the Reich, helped escaped prisoners who had fled from concentration camps, and conducted antifascist propaganda among soldiers in Hitler's army. The organization maintained ties with other groups of the resistance.

In August and September 1942, the Gestapo learned of the organization's activities and arrested many of its members; 49 persons were executed, and several others, unable to endure torture, committed suicide. On Oct. 7, 1969, Schulze-Boysen, Harnack, A. Kuckhof, and I. Stöbe were posthumously awarded Orders of the Red Banner, and a number of other members of the organization were awarded Orders of the Patriotic War First and Second Class.

SCHULZE-DELITZSCH, FRANZ HERMANN. Born Aug. 29, 1808, in Delitzsch; died Apr. 29, 1883, in Potsdam. German economist and political figure.

During the Revolution of 1848–49, Schulze-Delitzsch was a member of the Prussian National Assembly, where he aligned himself with the liberal "left center." He became a leader of the Progressive Party (Deutsche Fortschrittspartei) after its founding in 1861. Schulze-Delitzsch, who belonged to the vulgar economists, reiterated J. B. Say's theory of productive services and the propositions of F. Bastiat's *Economic Harmonies*. In 1849 he launched a campaign among German workers and artisans to establish cooperative societies and savings and loan institutions. Regarding these measures as the only way to eliminate poverty, he and his followers distracted the workers from the class struggle and helped bring about the preponderant influence of the liberal bourgeoisie over the working-class movement.

In his cooperative plans, Schulze-Delitzsch supported the "harmony of interests" between labor and capital, just as he did in his theoretical works on economics. Cooperation, in his view, was to transcend class and unite the members of all classes; its goal was to bring about social peace within the framework of a capitalist society. Schulze-Delitzsch's plans of cooperation collapsed as the societies founded by him went bankrupt and an independent German working-class movement developed.

Schriften und Reden, vols. 1–5. Berlin, 1909–13. [29–1528–2]

SCHULZE-GÄVERNITZ, GERHART VON. Born July 25, 1864, in Breslau; died July 10, 1943, in Crainsdorf, near Neurode. German economist.

In 1891 and 1892, Schulze-Gävernitz studied the textile industry and agrarian relations in Russia and taught at Moscow University. From 1893 to 1926 he was a professor of political econ-

omy at the University of Freiburg. An adherent of the historical school in bourgeois political economy, he sought to prove that it is possible to establish social peace in a capitalist society. He considered monopoly capital and the hegemony of the large banks an expression of organized capitalism, in which the industrial state consciously regulates the economy, thereby supplanting the action of automatically functioning economic laws.

The bourgeois apologetic views of Schulze-Gävernitz were subjected to a profound critique by V. I. Lenin. In his *Imperialism, the Highest Stage of Capitalism*, Lenin cited several passages from Schulze-Gävernitz's *The German Credit Bank* (1915), a work on German banks, and pointed out that "the task of a bourgeois professor is not to lay bare the entire mechanism, or to expose all the machinations of the bank monopolists, but rather to present them in a favorable light" (*Poln. sobr. soch.*, 5th ed., vol. 27, p. 335).

SCHUMACHER, KURT. Born Oct. 13, 1895, in Kulm (now Chełmno); died Aug. 20, 1952, in Bonn. Figure in the Social Democratic Party of Germany (SPD).

Schumacher joined the SPD in 1918. From 1920 to 1924 he edited the Social Democratic newspaper *Schwäbische Tagwacht* in Stuttgart. He was a member of the Reichstag from 1930 to 1933. During the fascist dictatorship, Schumacher was a prisoner in a concentration camp from 1933 to 1943 and again in 1944 and 1945.

After the defeat of fascism, Schumacher helped reestablish the Social Democratic Party in West Germany; he opposed the merger of the Social Democrats and Communists into one party. At the founding congress, held in Hanover in May 1946, he was elected chairman of the new SPD. He became a deputy to the Bundestag of the Federal Republic of Germany in 1949. Schumacher was a vigorous champion of reformism, class cooperation, and anticommunism. [29–1537–2]

SCHUMAN, ROBERT. Born June 29, 1886, in Luxembourg; died Sept. 4, 1963, at Chazelles, near the city of Metz. French political figure. Member of the Mouvement Républicain Populaire.

Schuman was a deputy to the French National Assembly from 1919 to 1940 and from 1946 to 1962 and a deputy to the constituent assemblies elected in 1945 and 1946. He served as minister of finance in 1946 and 1947, premier in 1947 and 1948, minister of foreign affairs from 1948 to January 1953, and minister of justice in 1955 and January 1956. He was closely associated with the de Wendel financial group. Schuman contributed to the establishment of the European Coal and Steel Community (1951), which marked the beginning of the process of Western European integration (*see* SCHUMAN PLAN). [29–1534–1]

SCHUMANN, GEORG. Born Nov. 28, 1886, in Leipzig; died Jan. 11, 1945, in Dresden. Figure in the German working-class movement.

Schumann joined the Social Democratic Party of Germany in 1905 and became associated with its left wing. During World War I he was tried several times for spreading antiwar propaganda. He joined the Communist Party of Germany (CPG) in 1919 and served on the party's Central Committee in the 1920's. From 1921 to 1924 he was a deputy to the Prussian *Landtag*, and from 1928 to 1933 he was a deputy to the Reichstag.

After the establishment of the fascist dictatorship in 1933, Schumann was sent to a hard labor prison and later to the Sachsenhausen concentration camp. After his release in 1939, he established an underground organization of the CPG in Leipzig; the organization was to become the center of the antifascist struggle in Saxony. In 1943, Schumann became a member of the underground operational leadership of the CPG. Together with a number of other leaders of the antifascist underground, he was arrested by the Gestapo in July 1944. Schumann was subsequently executed. [29–1533–3]

SCHUMANN, ROBERT ALEXANDER. Born June 8, 1810, in Zwickau; died July 29, 1856, in Endenich, near Bonn; buried in Bonn. German composer and musicologist.

The son of a book publisher, Schumann showed a talent for the arts, including music, while still a child. He studied under the teacher and organist J. G. Kuntzsch and made his debut as a pianist at the age of 13. He entered the University of Leipzig to study law in 1828 and continued his studies at the University of Heidelberg the following year; during this period he studied piano with the celebrated teacher F. Wieck. In 1831 and 1832 he studied music theory with the composer and conductor H. Dorn. While experimenting with a mechanical device to strengthen the muscles of the fingers, Schumann injured his right hand and destroyed all hope of becoming a piano virtuoso.

Schumann founded the *Neue Zeitschrift für Musik* in Leipzig in 1834 and was its editor and a contributor until 1844. The journal served as a rallying point for progressive German music; Schumann called the circle of friends and musical allies who gathered around the journal the Davidsbund, after the Biblical king and bard who defeated the Philistines. In 1840 he married the pianist Clara Wieck, a daughter and student of Wieck. In 1843 he accepted a post at the Leipzig Conservatory, where for a time he taught piano, composition, and playing from score. He and his wife made several concert tours, including one to Russia in 1844. Schumann moved to Dresden in 1844, and in 1850 he took up residence in Düsseldorf, where, in addition to composing, he directed choruses and conducted a symphony orchestra. From the late 1840's the mental illness that had plagued him gradually worsened, and he spent the final two years of his life in a hospital in Endenich, where he died.

Schumann is one of the most brilliant representatives of 19th-century romantic art. His music, which in many respects shows an affinity with the poetry of H. Heine, challenged the spiritual poverty of philistine Germany of the 1820's to 1840's and offered in its stead a lofty humanism. Following the tradition of F. Schubert and C. M. von Weber, Schumann further developed the democratic and realistic tendencies in German and Austrian romantic music; his work is closely tied to folk art and the traditions of German classical music.

At the same time, Schumann stands out in the history of music as a daring innovator who expanded and enriched the musical language. He sought to convey fully and precisely the processes of spiritual life, on the one hand, and exterior life—the relations and contrasts between phenomena that constitute the drama of life—on the other. This impulse partially accounts for his attempt to bring music closer to literature, especially poetry.

Most of Schumann's piano works are cycles whose small pieces in the lyric, dramatic, mimetic, and "portrait" genres are interrelated and form a thematic and psychological sequence. One of the most characteristic examples is the cycle *Carnaval* (1835), which presents a variegated series of miniature scenes, dances, masques, depictions of women (among them Chiarina, who represents Clara Wieck), and musical portraits of Paganini and Chopin. Similar to *Carnaval* are the cycles *Papillons* (1831), which was inspired by the works of Jean Paul, and the *Davidsbündlertänze* (1837).

Among Schumann's greatest achievements is the piano cycle *Kreisleriana* (1838), named after E. T. A. Hoffmann's work, whose hero is the musician and dreamer Johannes Kreisler. Passionate longings, heroic ardor, and the world of romantic images are reflected in such piano works as the *Etudes symphoniques* (1834), various sonatas (1835, 1835–38, and 1836), *Fantasy* (1836–38), and the Concerto in A for Piano and Orchestra (1841–45). In addition to variations and sonatas, Schumann composed piano cycles that resemble suites or albums of piano pieces, such as *Fantasiestücke* (1837), *Kinderszenen* (1838), and *Album für die Jugend* (1848).

In his vocal works, Schumann further developed the lyric song created by Schubert. His songs subtly render details of mood, the poetry of the text, and the intonations of living speech. The role of the piano accompaniment is considerably enhanced, richly filling in the poetic image and sometimes completing the content of the song. Schumann's most popular song cycle is *Dichterliebe* (1840), to poems by Heine. The cycle of 16 songs includes "Und wüssten's die Blumen," "Hör ich, das Liedchen klingen," "Am

leuchtenden Sommermorgen," "Ich grolle nicht," "Ich hab' im Traum geweinet," and "Die alten, bösen Lieder." Another cycle of thematically united songs is *Frauenliebe und Leben* (1840), to poems by A. Chammisso.

Songs on a variety of subjects are included in the cycle *Myrthen* (1840), set to poems by F. Rückert, Goethe, R. Burns, Heine, and Lord Byron, and the *Leiderkreis* (1840), set to poems by J. Eichendorff. Schumann's songs and ballads touch on a wide variety of subjects. The ballad "Die beiden Grenadiere," to the poem by Heine, is a brilliant example of Schumann's civic lyricism. Many of his songs create miniature scenes or portraits of everyday people, and their music recalls the German folk song; an example is "Volksliedchen," to the poem by Rückert.

In the oratorio *Das Paradis und die Peri* (1843), which is based on a theme from T. Moore's series of oriental tales *Lalla Rookh*, and in *Szenen aus Goethes "Faust"* (1844–53), Schumann came close to realizing his old dream of writing an opera. His only completed opera, *Genoveva* (1848), which is based on a medieval legend, did not gain recognition in the theatrical world. Schumann's music to Byron's dramatic poem *Manfred* (1849), which consists of an overture and 15 numbers, was a great success. His four symphonies—the *Spring Symphony* (1841), the Symphony No. 2 (1845–46), the *Rhenish Symphony* (1850), and the Symphony No. 4 (1841–51)—are marked by a bright and joyous mood, and they are dominated by episodes that suggest songs and dances and by passages of a lyric and descriptive character.

Schumann composed three string quartets (1842), three piano trios (1847, 1847, and 1851), a piano quartet (1842), and a piano quintet (1842) that has achieved wide renown. He is the author of choral works and of chamber music for solo strings and winds.

Schumann made a major contribution to music criticism. His journal disseminated the works of classical composers, fought against conservatism and philistinism, and championed the new romantic school in European music. Schumann castigated virtuosic posturing and an indifference to art that hid behind a mask of approved notions and fake erudition. His ideas were expressed through fictional personae, notably the impulsive, insolent, and mordantly ironic Florestan and the sensitive dreamer Eusebius, both of whom embodied aspects of the composer's own personality.

Schumann's ideals were close to those of the progressive 19th-century composers. He was regarded highly by F. Mendelssohn, H. Berlioz, and F. Liszt. In Russia, Schumann's work was popularized by A. G. Rubinstein, P. I. Tchaikovsky, and G. A. Larosh, as well as by the Russian Five.

SCHUMAN PLAN, a plan for integrating the coal, iron, and metallurgical industries of several Western European states proposed in 1950 by the French foreign minister R. Schuman.

The Schuman Plan served as the basis for the European Coal and Steel Community (ECSC), which was established by a treaty signed by the governments of the Federal Republic of Germany, France, Italy, Belgium, the Netherlands, and Luxembourg at a meeting in Paris on Apr. 18, 1951. The ECSC is one of the largest international state monopoly organizations in the capitalist world. In 1975 it controlled about 90 percent of the steel, almost 100 percent of the coal, and 50 percent of the iron ore produced in Western Europe. Great Britain, Ireland, and Denmark joined the ECSC on Jan. 1, 1973. The implementation of the Schuman Plan was one the first steps toward the capitalist economic integration of Western Europe.

SCHUMPETER, JOSEPH. Born Feb. 8, 1883, in Triesch (now Třešť), Moravia; died Jan. 8, 1950, in Taconic, Conn. Economist and sociologist.

Educated at the University of Vienna, Schumpeter served as finance minister of Austria in 1919 and 1920. He was a professor at the University of Bonn from 1925 to 1932 and at Harvard University from 1932 until his death. He regarded the history of the discipline of political ecorlomy as the development of an analytical framework and of research methods for studying economic phenomena.

Schumpeter is known primarily for his concept of economic dynamics, which assigned a central place to the entrepreneurial function. He advanced the theory of efficient competition, which depicts the market mechanism in the era of big business as the fruitful interaction of the forces of monopoly and competition. These forces are fueled by innovations and impart a particular dynamism to economic development.

Schumpeter worked out the dynamic concept of the business cycle, in which recurrent business cycles are seen as a law of economic growth. According to this concept, the driving force behind prosperity is mass investment, embodying certain innovations, in fixed capital. In Schumpeter's view, crises are not inevitable but occur when the natural cessation of an economic boom is met by panic. The theory of cycles assigns a major role to credit, which brings additional economic resources into play and thereby helps to implement innovations. Schumpeter attempted to refute the Marxist theory of socialist revolution by arguing that capitalist free enterprise would inevitaby be transformed, gradually, into an economic system whose development would be regulated and directed by the state.

SCHUNGITE (after the village of Shun'ga, Karelian ASSR), a Precambrian rock saturated with carbonaceous (schungite) matter in a noncrystalline state. During metamorphosis, schungites alter to graphitoids and cryptocrystalline graphites.

Unstratified (migrational) schungites, which contain up to 99 percent carbon, occur in the form of blanket veins, crossveins, pockets, and amygdules. They are black and have a strong semimetallic luster. They exhibit a conchoidal fracture. They have a hardness of 3–3.5 on Mohs' scale and a density of 1,840–1,980 kg/m^3. In ash they contain vanadium, nickel, molybdenum, copper, cerium, arsenic, tungsten, and other elements.

Stratified schungites form sheets of different thickness within the volcanogenic and sedimentary strata of Middle Proterozoic age. They are classified according to the mineral base (aluminosilicate, siliceous, and carbonate) or the amount of schungite matter. Schungite rocks with a silicate mineral base are further subdivided into low-carbon schungite rocks (up to 5 percent carbon), medium-carbon schungite rocks (5–25 percent carbon), and high-carbon schungite rocks (25–80 percent carbon).

Schungites are a valuable raw material in construction and industry. Owing to the ability of some schungites to swell during heat treatment, they are used as lightweight aggregate for concrete (schungisite). Their excellent reaction properties (schungites are powerful reducing agents) may be used in the production of yellow phosphorus, iron alloys, and other products. Release agents are manufactured using schungite. Some varieties of schungites are used as decorative building materials.

Industrial deposits of schungites occur in the Lake Onega region of the Karelian ASSR.

SCHUPPE, WILHELM. Born May 5, 1836, in Brieg (now Brzeg), Silesia; died Mar. 29, 1913, in Breslau. German idealist philosopher, representative of immanent philosophy. Professor at the University of Greifswald from 1873 to 1910.

Schuppe considered the ultimate irreducible element (the basis of philosophy) to be the experimentally established "I," the content of the consciousness of which is, according to Schuppe, "reality" (cognizable reality). To avoid solipsism, Schuppe supplemented his theory by postulating a theory of consciousness in general, which lends to reality an objective character. Thus, a subjectivist idealist theory became in Schuppe's philosophy an objectivist idealist theory. V. I. Lenin sharply criticized Schuppe as "a reactionary in philosophy" in *Materialism and Empiriocriticism*.

SCHURTZ, HEINRICH. Born Dec. 11, 1863, in Zwickau; died May 2, 1903, in Bremen. German ethnographer.

Schurtz headed the ethnography division of the Bremen Museum from 1893. He studied the ethnography of North Africa, Spain, and Asia Minor. He investigated problems of general ethnography, such as the origin of money, clothing, food taboos, and ornaments. He introduced the study of men's societies in clan-tribal societies. He combined the anthropogeographic method of his teacher F. Ratzel with an idealist interpretation of evolution.

SCHUSCHNIGG, KURT VON. Born Dec. 14, 1897, in Riva, Italy; died Nov. 18, 1977, in Innsbruck, Austria. Austrian political and state figure; a leader of the Christian Socialist Party.

Schuschnigg was minister of justice from 1932 to 1934 and minister of education in 1933 and 1934. He became chancellor in 1934 after the assassination of E. Dollfuss. In 1936 the Schuschnigg government and the government of fascist Germany concluded an agreement by which Austria virtually subordinated itself to Germany; Austria officially adopted the reactionary thesis of Pan-Germanism, which viewed Austria as a second German state. In February 1938, Schuschnigg signed an agreement with Hitler that resulted in the appointment of National Socialists to important positions in the Schuschnigg government; the agreement hastened the annexation of Austria by Germany.

After the *Anschluss* (annexation), which took place in March 1938, Schuschnigg was placed in a concentration camp. Schuschnigg was released in 1945 and emigrated to the USA, where he lived until 1967. [29–1559–1]

SCHÜTZ, HEINRICH (latinized name, Henricus Sagittarius). Born Oct. 14, 1585, in Köstritz, Thuringia; died Nov. 6, 1672, in Dresden. German composer, *Kapellmeister*, and teacher.

In 1599, Schütz became a chorister in the chapel of the landgrave of Hesse-Cassel. From 1609 to 1612 he studied composition in Venice under G. Gabrieli. Schütz was the founder of many genres of German music and played an important role in stimulating musical life in Germany. He wrote numerous religious works—including passions, oratorios, cantatas, and the *German Magnificat*—that paved the way for many of the innovations of J. S. Bach and G. F. Handel. Schütz drew on the achievements of Italian choral, instrumental, and stage music, as well as the traditions of German religious and folk music.

Schütz was the composer of the first German opera, *Daphne* (1627), and the first German ballet, *Orpheus and Eurydice* (1638); neither of these works has been preserved.

SCHUTZBUND (Defense League), a paramilitary organization of the Social Democratic Party of Austria in the 1920's and 1930's. The Schutzbund was founded in 1923 in response to the demand of the popular masses for defense against reactionary armed organizations. The Social Democratic leaders pursued a policy of capitulation with respect to the reactionaries; they restrained the actions of the Schutzbund and barred Communists from membership in it.

In February 1934, Schutzbund members in Linz, followed by their comrades in Vienna and many other Austrian cities, took up arms against the reactionaries and fascists (*see* FEBRUARY ARMED DEMONSTRATION OF 1934). Communists and unaffiliated workers fought alongside the members of the Schutzbund. Through the fault of the Social Democratic leaders, however, the demonstrators lacked leadership, and they were not supported by the main forces of the working class. The uprising was brutally suppressed after several days of bitter fighting.

After the events of 1934, many members of the Schutzbund left the Social Democratic Party and joined the Communist Party of Austria. [29–1556–2]

SCHWALBE, GUSTAV. Born Aug. 1, 1844, in Quedlinburg; died Apr. 23, 1916, in Strasbourg. German anatomist, histologist, and anthropologist.

Schwalbe studied medicine in Berlin, Zürich, and Bonn. He was a professor of histology at the Institute of Physiology in Leipzig from 1871, a professor of anatomy at Jena from 1873, and a professor of anatomy at Königsberg from 1881. Beginning in 1883 he was a professor of anatomy and director of the Institute of Anatomy in Strasbourg.

Schwalbe's principal works dealt with the anatomy and histology of bones, the sense organs, and the nervous and vascular systems of animals and man. Beginning in 1886, Schwalbe worked mainly in the field of anthropology. He proposed craniometric and cranioscopic methods of investigating the bones of fossil man. He was the author of classical descriptions of *Pithecanthropus* and Neanderthal man. He viewed the latter as a particular species of fossil man, the precursor of modern man. The journal *Zeitschrift für Morphologie und Anthropologie* began publication in 1899 upon Schwalbe's initiative.

V. M. KHARITONOV [29–925–4]

SCHWANK, in German literature, a short satirical story written at first in verse and later in prose. The *Schwank* was widely popular from the 13th to 17th centuries. It was similar to the French *fabliau* and the Italian novella of the Early Renaissance, and from time to time it was directly influenced by these genres. Reflecting the views of the townspeople, the *Schwank* was devoid of the idealization typical of courtly literature. It depicted the life of the various social estates, mainly the comic side. Its favorite heroes were cunning, clever commoners.

The masters of the *Schwank* were Der Stricker (mid-13th century) and the Austrian poet P. Frankfurter (late 14th or early 15th century). The genre was widely exploited in the popular book about Til Eulenspiegel (1515). Hans Sachs wrote *Schwänke* in verse form.

SCHWANN, THEODOR. Born Dec. 7, 1810, in Neuss; died Jan. 14, 1882, in Cologne. German physiologist and histologist; creator of the cell theory (*see* CELL THEORY).

After graduating from the medical faculty of the University of Berlin in 1834, Schwann worked under Johannes Müller in the anatomical museum of the University of Berlin from 1834 to 1839. He was a professor at the universities of Louvain (1839–47) and Liège (1848–80) in Belgium.

Schwann conducted research in various fields of biology. He investigated the effects of oxygen on the development of avian eggs and the process of putrefaction and established the involvement of yeast fungi in fermentation. In 1836 he discovered the digestive enzyme pepsin. He also studied the microscopic structure of chorda and cartilage in amphibian larvae. Schwann was acquainted with the work of the German botanist M. Schleiden on the function of the nucleus in the plant cell (already fairly well studied by that time) and concluded after comparing Schleiden's findings with his own that the structure and development of plants and animals from cells is based on the same principle. In 1838 he published three preliminary reports, and in 1839, his classic work, whose very title reflects the essence of the cell theory: *Mikroskopische Untersuchungen über die Uebereinstimmung in der Struktur und dem Wachstum der Tiere und Pflanzen* (Microscopic Researches on the Similarity in Structure and Growth in Animals and Plants). According to F. Engels, the creation of the cell theory, along with the law of the transformation of energy and the theory of evolution, was one of the three greatest discoveries in natural science in the 19th century.

Schwann was a fellow of the Royal Society of London (1879), the Paris Academy of Sciences (1879), and the Academy of Sciences in Brussels (1841).

Z. S. KATSNEL'SON [29–926–2]

SCHWANN'S CELL, a cell of nerve tissue forming the membranes of the long processes of the nerve cells (axons) in the peripheral nerves and ganglia; first described by T. Schwann in 1838.

The nucleus of a Schwann's cell is oval and contains one or two nucleoli. Masses of chromatin are found on the inner surface of the nuclear membrane. Mitochondria, lysosomes, the Golgi complex, microtubules, microfibrils, free ribosomes, and ribosomes attached to the membranes are concentrated around the nucleus in the cytoplasm. Schwann's cells may have cilia. They act as supporting cells in the processes of nerve cells and help form (and in unusual cases destroy) myelin in the medullated fibers. Metabolites penetrate the process of a nerve cell through the substance of Schwann's cells or at the point where the cells meet. It is possible that some substances are formed in Schwann's cells and then proceed to the processes. The capacity of Schwann's cells for wavelike movements may be related to the transport of various substances along the processes of nerve cells. [29–927–1]

SCHWARZ, HERMANN AMANDUS. Born Jan. 25, 1843, in Hermsdorf; died Nov. 30, 1921, in Berlin. German mathematician. Member of the Berlin Academy of Sciences (1893).

Schwarz' early works were devoted to the study of minimal surfaces. He obtained important results in the theory of conformal mappings. Schwarz proposed a solution of the Dirichlet problem for arbitrary bounding curves.

SCHWARZENBERG, FELIX VON. Born Oct. 2, 1800, in Krummau (now Český Krumlov, Czechoslovakia); died Apr. 5, 1852, in Vienna. Austrian statesman; field marshal; prince.

Between 1838 and 1848, Schwarzenberg served as a minister first in Turin and Parma and then in Naples. In 1848, commanding a division of Radetzky's army, he helped suppress the revolution in Italy. He became prime minister and foreign minister of Austria in November of the same year. His government crushed the revolution in Austria and, with the aid of troops from tsarist Russia, the revolution in Hungary.

Schwarzenberg's politics were aimed at establishing Austrian hegemony in Central Europe. In November 1850, at Olomouc (Olmütz), he concluded an agreement with Prussia that contributed to an increase in Austrian influence within the German Confederation. [29–931–3]

SCHWARZKOPF, ELISABETH. Born Dec. 9, 1915, in Jarotschin, near Poznań. German singer (soprano).

Schwarzkopf received her musical education at the Higher Music School in Berlin and studied voice under M. Ivagün. She made her debut in 1938 at the Berlin Municipal Opera, and from 1942 to 1951 she was a leading soloist at the Vienna State Opera.

In 1948 she began to perform on the major operatic stages of Europe and America and regularly took part in the Salzburg and Bayreuth festivals. She moved to London in 1951, and for a number of years she was a soloist at Covent Garden. She left the stage in the mid-1970's, continuing to perform in concert and to make records.

Schwarzkopf has an exceptionally versatile and pure voice of great beauty. She is also known for her sense of style and uncommon dramatic skills. She is an outstanding performer of the works of Mozart and R. Strauss.

SCHWARZSCHILD, KARL. Born Oct. 9, 1873, in Frankfurt am Main; died May 11, 1916, in Potsdam. German astronomer. Member of the Berlin Academy of Sciences (1912).

From 1901, Schwarzschild was a professor at the University of Göttingen and director of the university's observatory. Beginning in 1909, he was director of the astrophysical observatory in Potsdam. In 1912 he became a professor at the University of Berlin.

Schwarzschild worked out the methodology of photographic stellar photometry and compiled a catalog that contained the photographic determinations of the brightnesses of 3,500 stars. A number of his studies were devoted to the theoretical investigation of various problems of stellar astronomy and astrophysics. Schwarzschild established the ellipsoidal distribution of stellar velocities and gave a general solution of the integral equations of stellar statistics. He created the theory of the radiative equilibrium of stellar atmospheres and studied binary and variable stars, comets, and problems of quantum mechanics and relativity theory as applied to astronomy. Schwarzschild is also known for his studies in optics.

SCHWASSMANN-WACHMANN I COMET, a periodic comet discovered in 1927 by the German astronomers A. Schwassmann and A. Wachmann at the observatory in Bergedorf. The Schwassmann-Wachmann I comet is distinguished by its near-circular, planet-like orbit, located between the orbits of Jupiter and Saturn, by virtue of which it can be observed at any point in its orbit. It is characterized by irregular bursts, during which its brightness increases by a factor of 100 or more, and a uniformly expanding shell—a halo—forms around its head. A connection between these bursts and manifestations of solar activity is hypothesized. The comet can be seen only through strong telescopes. [29–932–4]

SCHWEDT, a city in the German Democratic Republic, near Frankfurt. Located on the Hohensaaten-Friedrichsthal Canal, on the left bank of the Oder. Population, 47,300 (1975). Fuel and nitrogen fertilizers are produced at a petroleum-refining and petrochemical combine, which was built at the international Druzhba (Friendship) Petroleum Pipeline. Schwedt has oil pipelines to the city of Rostock and to the Leuna-2 Petrochemical Combine. The city serves as a produce distributor to the Berlin area. A newsprint factory is located in Schwedt. [29–935–3]

SCHWEICKART, RUSSELL. Born Oct. 10, 1935, in Neptune, N.J. American astronaut; air force pilot (1956–63).

Schweickart received a bachelor of science degree in aeronautical engineering from the Massachusetts Institute of Technology in 1956 and a master of science degree in aeronautics and astronautics in 1963. He conducted research on the atmosphere at the Experimental Astronomy Laboratory of the Massachusetts Institute of Technology. In 1963 he became a member of the group of astronauts of the National Aeronautics and Space Administration.

Between Mar. 3 and Mar. 13, 1969, Schweickart, as the lunar module pilot, completed a spaceflight in the Apollo 9 spacecraft, together with J. A. McDivitt and D. R. Scott. During the test flight in earth orbit, which lasted 241 hr 01 min, the docking with the lunar module and its independent flight were performed and other systems of the spacecraft were tested; various studies were also carried out. During the flight, Schweickart undertook a space walk, which lasted 47 min. [29–936–2]

SCHWEINFURT, a city in the Federal Republic of Germany, in the *Land* (state) of Bayern (Bavaria). Population, 55,600 (1976). Schweinfurt, a railroad junction and a port on the Main River, produces bearings, internal-combustion engines, and dyes.
[29–942–1]

SCHWEINFURTH, GEORG AUGUST. Born Dec. 29, 1836, in Riga; died Sept. 19, 1925, in Berlin. German botanist and African explorer.

Schweinfurth studied at the universities of Heidelberg, Munich, and Berlin between 1856 and 1862. From 1863 to 1866 he conducted botanical research in Egypt, eastern Sudan, and on the coast of the Red Sea. Between 1869 and 1871 he was commissioned by the Prussian Academy of Sciences to explore the Bahr al-Gazal River basin. After arriving at Khartoum, Schweinfurth traveled to the Tonj and Jur rivers and discovered the Wau River and the sources of the Jur. In 1870 he discovered the Uélé River in the Congo basin. In 1873–1874 he participated in the Rolfs expedition into the Libyan Desert.

SCHWEITZER, ALBERT. Born Jan. 14, 1875, in Kayserberg, Alsace; died Sept. 4, 1965, in Lambaréné, Gabon. German-French thinker influenced by the "philosophy of life" movement; theologian, physician, musicologist, and organist. World-famous for his antiwar statements.

Schweitzer was educated at the universities of Strassburg, Berlin, and Paris. He earned the degree of doctor of philosophy in 1899 with a dissertation entitled *Kant's Philosophy of Religion*. He received a doctorate in theology in 1900 and a doctorate in medicine in 1913.

In the early 20th century Schweitzer gained prominence as a concert organist. As a musicologist, his main importance is his work on J. S. Bach. Schweitzer influenced contemporary styles of performance of Bach's music and promoted a rebirth of interest in the composer's works.

In 1913, Schweitzer and his wife, the nurse Hélène Bresslau, established a hospital in Lambaréné with their own resources. The hospital became Schweitzer's main preoccupation and the platform from which he propounded his ideas. In 1928, Schweitzer was awarded the Goethe Prize of the city of Frankfurt am Main. Awarded the Nobel Peace Prize in 1952, he used the prize money to build a leprosarium in Lambaréné.

Schweitzer's world view is founded on the concept of "life," which he opposed to the concept of "thought"; he regarded thought as derivative. In contrast to Descartes's "I think, therefore I am," Schweitzer offered the formula "I am life, which wants to live among life." From this formula he developed his basic ethical principle of reverence for life, which demands that life be preserved and improved. Morality, according to Schweitzer, is not just a law but a fundamental condition for the existence and development of life. Schweitzer believed that reverence for life should be the foundation of an ethical renewal of the human race and the development of precepts of a universal, cosmic ethical system.

Schweitzer defended the idea of the free and moral individual and opposed domination of the "concretely personal" by the "general." In an existential spirit he contrasted two vital principles: (1) the will as an expression of the free and moral essence of the human being and (2) knowledge (or understanding) as an attitude toward life based on a desire to submit to external necessi-

ty. In Schweitzer's thought, an "understanding" attitude toward the world leads to skepticism, which is an expression of the spiritual bankruptcy of civilization. Schweitzer opposed culture to civilization and criticized the age of technology and "external progress." According to Schweitzer, ethics must merge with culture organically to ensure human progress and the spiritual improvement of the individual. He considered the level of humanism reached by a particular society to be the criterion of its cultural development.

Schweitzer set as his goal the formulation of a philosophically sound optimistic world view that would have practical application; such a world view would strengthen the human personality in difficult times and restore its creative energy. From this humanist standpoint he criticized the moral state of modern bourgeois society, which is undergoing a profound spiritual crisis.

Monuments to Schweitzer were built in 1969 in Weimar and Günsbach; there is a memorial museum in Kaysersberg.

V. A. PETRITSKII and I. V. VENGROVA [29–995–4]

SCHWEITZER, JOHANN BAPTIST. Born July 12, 1833, in Frankfurt am Main; died July 28, 1875, in Giessbach, near Bern, Switzerland. Figure in the German working-class movement.

Schweitzer was a lawyer by profession. Influenced by F. Lassalle's ideas, he joined the Lassallean General German Workers' Association and became one of its leaders. He actively supported O. von Bismarck on the question of unifying Germany under Prussian hegemony. Schweitzer's political line led to the growth of an oppositional wing in the association; some of the members of the opposition broke with Lassalleanism and joined the Social Democratic Workers' Party (the Eisenachers). [29–997–2]

SCHWEIZERISCHE KREDITANSTALT (also Crédit Suisse), a Swiss commercial bank established in 1856.

The Schweizerische Kreditanstalt engages in a variety of banking operations and, through specialized subsidiaries, carries out financial transactions involving mortgages and the buying and selling of securities; the bank also acts as a middleman for the leasing of equipment. The bank's headquarters are in Zürich. In 1977 the Schweizerische Kreditanstalt had 118 branches and 13 subsidiaries in Switzerland and six branches, 20 offices, and six subsidiaries in foreign countries. It had an interest in several financial concerns and banks in Switzerland and abroad.

As of June 1977 the bank had total assets of 43.0 billion Swiss francs; current accounts and deposits of other banks totaled 12.3 billion francs, and those of other clients, 15.4 billion francs. The bank had capital and reserves of 2.7 billion francs, loans and discounted bills of 19.9 billion francs, mortgages of 3.0 billion francs, and accounts in other banks totaling 12.3 billion francs. [29–990–4]

SCHWEIZERISCHER BANKVEREIN (also Swiss Bank Corporation), a major Swiss commercial bank. Established in 1872 as the Basler Bankverein, the bank took its present name in 1897 after absorbing several other banks.

The Schweizerischer Bankverein has gained a reputation in international financial circles for its efficient organization and the wide range of transactions it carries out in secrecy, in accordance with the Swiss Banking Law of 1934. Because of their secret operations and their interest in precious metals, the Schweizerischer Bankverein and other Swiss banks have been called the gnomes of Zürich.

The Schweizerischer Bankverein, whose headquarters are in Basel and Zürich, has 156 branches and nine subsidiaries in Switzerland and seven branches, 13 companies, and 21 offices in foreign countries; the London branch was opened in 1898, and the New York branch in 1939. The bank works closely with multinational banks. As of June 1977 it had total assets of 53.8 billion Swiss francs; current accounts and deposits of other banks totaled 16.8 billion francs, and those of other clients, 25.5 billion francs, loans and discounted bills of 21.1 billion francs, and accounts in other banks totaling 24.1 billion francs. [29–990–3]

SCHWERIN, a district in the northwestern part of the German Democratic Republic (GDR). Situated in the Elbe River basin, mainly on the Mecklenburg Upland. Area, 8,700 sq km. Population, 590,300 (1975). The administrative center is the city of Schwerin. Schwerin is an industrial and agricultural region. Industry, including construction and handicrafts, employs 33.5 percent of the total labor force, and agriculture and forestry employ 22.6 percent.

The district accounts for 2.4 percent of the country's industrial output, including 6.9 percent of the food production. The main branches of industry are food processing (about one-half of the district's gross output), machine building (23 percent), light industry (excluding textiles, 10.2 percent), and the chemical industry (7.3 percent). The main industrial centers are Schwerin, Wittenberge (sewing machines, synthetic fiber), Güstrow (sugar, machinery), Boizenburg (river vessels) Neustadt-Glewe (machine building), and Ludwigslust (machinery, printing, food products).

Schwerin is an important agricultural region, specializing in the raising of dairy cattle and swine and the cultivation of grains, potatoes, and sugar beets. There are large agrarian-industrial complexes. Fish are caught and raised in the lakes. The Elbe is used for navigation. [29–998–2]

SCHWERIN, a city in the German Democratic Republic. Capital of Schwerin District. Population, 107,400 (1975). Schwerin is picturesquely located on the shore of Lake Schwerin. It is a railroad junction and a lake port. The district's main industrial center, it manufactures floating cranes, cable, hydraulic equipment, and building materials. Industry also includes clothing, leather haberdashery, furniture, and food processing. The Mecklenburg State Theater is located in the city. [29–998–3]

SCHWIND, MORITZ VON. Born Jan. 21, 1804, in Vienna; died Feb. 8, 1871, in Munich. Painter and graphic artist; representative of late romanticism in 19th-century German and Austrian art.

Schwind studied at the Vienna Academy of Arts from 1821 and at the Munich Academy of Arts under P. von Cornelius from 1828. He worked mainly in Munich after 1847. His works include genre pictures, for example, *The Wedding Trip* (1862); cycles of pictures and large watercolors, including *Beautiful Melusine* (1868–70, Gallery of the Nineteenth and Twentieth Centuries, Vienna); and numerous paintings and illustrations. Motifs from folktales and legends abound in these works, which are idyllic in mood but suffer from a certain measure of academism.

SCHWINGER, JULIAN. Born Feb. 12, 1918, in New York. American physicist.

After receiving the Ph.D. degree from Columbia University in 1939, Schwinger worked at the University of California (Berkeley), Cambridge University, the University of Chicago, and Boston University. From 1943 to 1946 he worked at the Radiation Laboratory of the Massachusetts Institute of Technology. From 1947 to 1972 he was a professor at Harvard University. In 1972 he became a professor at the University of California (Los Angeles).

Schwinger's main works deal with quantum field theory, the theory of nuclear forces, the theory of scattering and radiation, and the quantum theory of many-particle systems based on Green functions. Schwinger was the first to set down the foundations of quantum electrodynamics in covariant form and to calculate a number of radiation corrections. Schwinger worked out the variational method in the theory of scattering.

In 1965, Schwinger, R. P. Feynman, and S. Tomonaga were awarded a Nobel Prize. Schwinger is a member of the US National Academy of Sciences and the American Academy of Arts and Sciences.

SCHWYZ, a canton in Switzerland. Area, 908 sq km. Population, 92,000 (1970). The capital is the city of Schwyz.

Schwyz is first mentioned in written sources as a community of free peasants in 972. It later became dependent on the Hapsburgs. In its struggle against the Austrian dynasty, Schwyz concluded in 1291 a treaty of perpetual alliance with the other forest cantons of Uri and Unterwalden, thus forming the nucleus of the Swiss state. One of the economically backward cantons, Schwyz opposed the Protestant cantons and remained Catholic during the Reformation in the 16th century. As part of the Helvetian Republic from 1798 to 1803, it resisted centralization. During the 1830's and 1840's, Schwyz was a member of the League of Sarnen and the Sonderbund. [29–1062–1]

SCIACCA, MICHELE FEDERICO. Born July 12, 1908, in Giarre, Catania. Italian idealist philosopher; representative of Christian spiritualism.

Sciacca became a professor in Pavia in 1938 and in Genoa in 1947. He was one of the founders and leaders of the Gallarate movement, a group of Italian Catholic philosophers. Sciacca's views combine the Platonic and Augustinian tradition with the ideas of A. Rosmini-Serbati and, especially, G. Gentile. At the center of Sciacca's "philosophy of integralism" is the doctrine that the individual intuitively perceives in his "objective" inner experience the idea of absolute being (god); the idea of god transcends and at the same time is immanent in the individual consciousness. The author of works on the history of philosophy, Sciacca founded in 1946 the journals *Giornale di metafisica* and *Humanitas*.

SCOTLAND, an administrative and political division of the United Kingdom of Great Britain and Northern Ireland, comprising the northern part of the island of Great Britain and adjacent islands: the Hebrides, Shetland, and the Orkneys. Scotland, which maintains a degree of autonomy, has an area of 78,800 sq km; the population of 5.2 million (1971) is made up primarily of Scots, who speak a dialect of English. The literary language is English. The Gaels form a distinct ethnic group. Religious believers profess Protestantism.

For purposes of local administration, Scotland is divided into nine regions—Dumfries and Galloway, Borders, Strathclyde, Lothian, Fife, Central, Tayside, Grampian, and Highland—and the three island areas of Shetland, Orkney, and Western Isles. The regions and island areas are divided into administrative districts. The capital is the city of Edinburgh.

The terrain of Scotland is dominated by hills and mountains: the Highlands, which reach an elevation of 1,343 m at Ben Nevis (the highest point in Great Britain), and the Southern Uplands. Between these areas lie the Central Lowlands. Narrow, low-lying plains run along the coasts. Scotland has a temperate oceanic climate, with a mean temperature in Edinburgh of 3.4°C in January and 14.4°C in July. Annual precipitation is approximately 2,000 mm in the west and 700 mm in the east. The country has a dense network of rivers, the most famous of which is the Clyde. The numerous lakes include Loch Lomond and Loch Ness. Tracts of moorland are found throughout Scotland.

Economically, Scotland is divided into the Central Lowlands, a densely populated, primarily industrial region in which three-fourths of the population lives, and the Southern Uplands and the Highlands, which are sparsely populated and primarily agricultural. More than one-third of the economically active population works in industry, and less than one-tenth in agriculture. The main industrial centers are Edinburgh and the conurbation of Clydeside, whose center is Glasgow; other important industrial cities are those along the eastern coast, such as Aberdeen, Dundee, and Grangemouth.

Major industries include the coal, steel, petrochemical and chemical, printing, aluminum, electrical engineering, and food industries. The shipbuilding industry produces about one-third of all British ships. Scotland also produces electronic goods, office equipment, clocks, textiles, and paper. Petroleum is extracted off the eastern coast, on the North Sea shelf.

Agriculture is dominated by livestock raising. Large numbers of sheep are grazed in the hill country; in the plains of western Scotland chiefly beef and dairy cattle are raised. Along the coasts and the Central Lowlands, livestock raising is combined with the cultivation of barley, wheat, and potatoes. N. M. POL'SKAIA

Historical survey. The earliest archaeological remains discovered on Scottish soil date from the third millennium B.C. In the centuries immediately preceding the Common Era, Celtic tribes settled in Scotland; in the first centuries of the Common Era, the Picts were the principal inhabitants of the country. Among some tribes a class society began developing early in the Common Era. Beginning in the first century A.D. the Romans made repeated, but unsuccessful, attempts to conquer Scotland, which they called Caledonia. Between 360 and 367 the Picts invaded Roman Britain, reaching as far as the southern coast.

In the late fifth and early sixth centuries, tribes of Scots evidently began migrating from Ireland to Scotland. The name "Scotland," derived from the Scots, became established in the 11th century. During the Anglo-Saxon conquest of Britain in the fifth and sixth centuries, large numbers of Britons were driven into Scotland. In the seventh century Scotland was invaded by the Angles, who settled in the south. Norsemen raided the country from the ninth to 13th centuries.

The emergence of feudalism was accompanied by the preservation of the clan system, which had developed as the primitive communal system disintegrated (*see* CLAN). The process of feudalization was eased by the spread of Christianity in the sixth century. During the early feudal period the first state formations appeared. The Scottish kingdom was formed in the 11th century. In the second half of the 11th century Scotland was attacked by the Normans who had conquered England, and the Scottish king, Malcolm III (ruled 1058–93), acknowledged himself a vassal of the English king, William I (William the Conqueror). Beginning

in the 12th century feudal relations gradually emerged in the southern plains of Scotland, where land cultivation was developed. In the north, where stock raising formed the basis of the economy, feudalism spread only in the 14th and 15th centuries. The majority of Scottish peasants were serfs, or velleins. Handicrafts and trade developed in southern Scotland.

In the late 13th century, English feudal lords increased their efforts to subjugate Scotland. The English king Edward I proclaimed himself suzerain of Scotland, which was invaded by English troops in 1296; this incursion touched off a revolt against the English that lasted from 1296 to 1314. In 1305 the rebel troops, under W. Wallace, were defeated, but the following year a new revolt was led by Robert Bruce, who was proclaimed King Robert I of Scotland (1306–29). In 1314, Scottish troops defeated the English army of Edward II at Bannockburn. An invasion of Scotland in 1322 by English troops was unsuccessful.

In 1328, England recognized Scotland's independence, but English lords retained the holdings in Scotland that they had received earlier. The Scottish Parliament was formed in the late 13th and early 14th centuries. Gradually, the Scottish nationality took form, although centralization was hampered by feudalism and tribal separatism. Royal authority was weakened considerably in the late 14th century under the first Stuart kings. Internecine feudal wars undermined Scotland's position in wars with England, which flared up anew in the late 14th century and in which Scotland was often allied with the French.

In the 16th century elements of capitalist production emerged in the south, although Scotland remained, on the whole, a country whose productive forces were little developed. The cities of the south carried on a brisk trade with English cities. In the mid-16th century the Calvinist Reformation, headed by J. Knox, spread throughout the country. It embodied the interests of the nobility and the rising bourgeoisie. The former had concentrated five-sixths of the church property, which had gradually become secularized, in its hands, and the latter stood to gain an "inexpensive" church. In 1560, Parliament adopted Presbyterianism as the national religion.

As a result of an uprising by the Calvinist aristocracy in 1567, Mary Stuart, who had tried to restore Catholicism in Scotland, was overthrown. With the accession of the Stuarts to the English, in addition to the Scottish, throne in 1603, Scotland was bound by a personal union to England. The absolutist government used every means to strengthen its authority over Scotland. The rights of the Scottish Parliament were restricted, and measures were taken to Anglicanize the Scottish Church (*see* CHURCH OF ENGLAND). Attempts by Charles I to introduce a liturgy on the Anglican model triggered an uprising, and, in 1638, Scottish Presbyterians signed the National Covenant, in which they swore to defend the true faith against all encroachments (*see* COVENANT). Charles tried to suppress the uprising using armed force but was defeated in the ensuing Bishops' Wars of 1639–40, which served as an immediate cause of the English Bourgeois Revolution (English Civil War).

During the first stage of the revolution, Scottish Presbyterians who had signed the Covenant—the Whigs—entered into an alliance with the English Long Parliament against the king. In late 1647, however, the leaders of the Presbyterian elite, fearing that the conflict might deepen, concluded a secret agreement with the king in which they promised to help him in his struggle against the rebel army; in return, Charles would preserve Presbyterianism in Scotland. The Scottish army that invaded England was defeated in August 1648 near Preston by O. Cromwell.

Charles' execution in January 1649 and the declaration of the Independent republic in England were met with hostility by the Presbyterian leadership of Scotland. In February 1649 the Scottish Parliament recognized Charles II, the son of the executed king, as its sovereign; for his part, Charles accepted the National Covenant and other conditions limiting his power. In early 1650 the Marquess of Montrose staged an unsuccessful coup that would have allowed Charles to occupy the throne without submitting to any conditions; Montrose was executed.

England's ruling classes took advantage of the royalist danger threatening the English republic from the north in order to completely subjugate Scotland. In July 1650, Cromwell's army entered Scotland, and on September 3 it was victorious at Dunbar. Exactly one year later, Scottish troops under Charles invaded England and suffered a shattering defeat at the battle of Worcester. By May 1652 all Scotland had been taken by English troops. In April 1654 Cromwell issued an ordinance that made official the union of Scotland with England.

The lands of the Scottish aristocracy and royalist nobility were confiscated and given to new owners, mainly members of the English bourgeoisie and new nobility; this policy led to the destruction of the old agrarian relations in Scotland. Peasant holdings were partially expropriated, and many peasant landowners became tenant farmers. Increasing numbers of landless poor left to seek work in the cities.

The Restoration (1660–88) was a period of political reaction in both Scotland and England. The reestablished Scottish Parliament abolished the Covenant. The peasant movement became stronger, as evidenced by the march on Edinburgh of 1666 and the uprising of 1678–80. Anti-English uprisings in 1679 and 1685 were put down. The bourgeoisie and part of the nobility of southern Scotland supported the Glorious Revolution of 1688–89. Several Highland clans that rose in defense of the deposed Stuarts were crushed.

By the Act of Union of 1707, Scotland was fully united with England to form Great Britain. Under the act, the Scottish Parliament was dissolved, but Scotland was given the right to elect representatives to the Parliament in London; in addition, the Presbyterian Church remained independent. The Scottish commercial bourgeoisie entered into trade with the English colonies and helped exploit them. At the beginning of the 18th century, Scotland, which lagged behind England to a marked degree in economic development, principally exported food and raw materials. Workers in the coal and salt mines remained virtual serfs until the late 18th century. Peasants in southern Scotland held their farms under one-year leases. The main occupation of the Highlanders remained stock raising.

In the first half of the 18th century, much of the hereditary aristocracy of northern Scotland supported the claims of Stuarts to the throne. Various armed uprisings on behalf of the Stuarts by some of the Highland clans, notably those of 1715–16 and 1745–46 were, however, unsuccessful. The abortive uprising of 1745–46, which also reflected the protest of the Highlanders against their landlessness and oppression by the exploiting classes of England and Scotland, was followed by the final destruction of the outmoded clan system. In the second half of the 18th century tenants of small farms were driven off the land in increasing numbers; these land clearances continued until the 1880's and served as a source for the primitive accumulation of capital in Great Britain.

As a result of the industrial revolution, which began in the last third of the 18th century, a highly developed industrial capitalist system was established in Scotland and England. The textile industry, and later mining, metallurgy, and shipbuilding, underwent extensive development. Southern Scotland became one of Great Britain's chief industrial regions. During the industrial revolution the popular masses of Scotland suffered on a greater scale than did those of England. Emigration became commonplace; it has been estimated that more than 2 million persons left Scotland in the 19th and first half of the 20th century.

Under the influence of the French Revolution, organizations were formed that favored radical democratic change; such groups were crushed by the British government. The working-class movement developed in earnest in the early 19th century. A mass strike that took place in 1820, although essentially spontaneous, was the first general political strike in Great Britain; it received unusually strong support in Glasgow. Scottish workers took an active part in the Chartist movement (*see* CHARTISM).

In 1858 the Trades Union Council was formed in Glasgow. Progressive Scottish workers took part in the First International. In 1884 the Scottish Land and Labour League, founded in Edinburgh, merged with the British Social Democratic Federation. In 1888 the Scottish Labour Party was founded by J. Hardie, who became its leader; in 1893 the party merged with the Independent Labour Party. In 1897 the Scottish Trades Union Congress was founded.

With the transition to imperialism, the exploitation of Scotland by British monopoly capitalism accelerated, becoming particu-

larly marked as Great Britain lost its world industrial monopoly. In Scotland, as in the rest of Great Britain, the labor movement revived and experienced an upsurge between 1907 and 1912. During World War I the shop steward movement in the industrial region of Clydeside took on a wide scope and eventually spread throughout Great Britain (*see* SHOP STEWARD). V. I. Lenin described the shop steward movement as a profoundly proletarian, mass movement (*Poln. sobr. soch.*, 5th ed., vol. 41, p. 266). In 1915 and 1916 shop stewards led several strikes in Clydeside. In 1916 J. MacLean, W. Gallacher, and other leaders of the shop stewards were arrested and imprisoned, and A. MacManus was expelled from Clydeside.

The October Revolution fostered a new upswing in the struggle of the Scottish workers. A mass movement, under the slogan "Hands off Russia," developed in Scotland in the course of a revolutionary upsurge that enveloped the entire country. A strike in Clydeside in January and February 1919 involved over 100,000 workers (*see* CLYDE STRIKE OF 1919). Many participants in the Scottish working-class movement joined the Communist Party of Great Britain, formed in 1920. Scottish workers took part in the miners' strike of May to November 1926, the General Strike of 1926 in Great Britain, and other strikes in the 1920's and 1930's.

Britain's weakened position in the world market after World War I led to a substantial deterioration of British export industries, including the textile, coal, and shipbuilding industries, which had undergone extensive development in Scotland. In the period from 1931 to 1935 there were mass demonstrations of the unemployed. From Sept. 15 to 17, 1931, sailors mutinied at the port of Invergordon, on Scotland's northern coast (*see* INVERGORDON REVOLT OF 1931).

After World War II, Scotland was greatly affected by the widespread changes that took place in British industry and by the general weakening of the economic and political position of British imperialism. As new and advanced industries grew rapidly—notably the automobile, electrical engineering, electronics, chemical, and nuclear industries—the old, traditional Scottish industries, including the textile, mining, and shipbuilding industries, suffered a further decline. The modern industries that were being developed in Scotland, such as the chemical, electronics, and petroleum-refining industries, were to a considerable extent controlled by foreign, chiefly American, capital. In the 1960's and 1970's, American companies controlled the exploration and development of rich petroleum and gas deposits on the continental shelf of the North Sea off the northern coast of Scotland.

For many years, unemployment in Scotland has been much higher than in the rest of Great Britain; the mining industry has been particularly hard hit. As a result, emigration has doubled since the war. In the 1960's and 1970's the Scottish National Party, founded in 1928, became more active, and its leaders capitalized on the heightened national consciousness of the Scottish people.

Scotland has remained a major center of the working-class movement in Great Britain. For several months in 1971 and 1972, workers along the upper Clyde managed the shipyards when the owners tried to close them down. Supported by trade unions throughout Great Britain, the workers of the upper Clyde forced the government to keep the shipyards open. A characteristic feature of the working-class movement in Scotland, as in Great Britain as a whole, from the 1950's to the 1970's was its close association with the peace movement. A drive to remove American military bases found widespread response. Cultural and other ties with the USSR have been strengthened; this trend has been facilitated by the Scottish USSR Society, founded in 1945.

Communists have played an active role in the struggle of Scottish working people for their rights. A special resolution of the Thirty-first Congress of the Communist Party of Great Britain (November 1969) emphasized that the Scottish people have the right to determine their own fate. The Communist Party has supported autonomous parliaments for Scotland and Wales. At the same time, the party opposes bourgeois separatist slogans calling for the complete separation of Scotland from Great Britain and does not support attempts by the leaders of the Scottish National Party to divert the nationalist movement from the resolution of the class and social problems facing Scottish working people. The Communists have repeatedly stressed that the primary goal remains the common struggle of all British working people against monopolies and for democracy and socialism.

L. A. ZAK

Literature. Scottish literature has developed in the English and Scots languages. The earliest extant poetic texts date from the 14th century, but Scottish literature emerged before that time. Popular ballads first appeared no later than the 13th century, flourished in the 15th century, and were set down in printed leaflets beginning in the 16th century. The poet and chronicler Andrew of Wyntoun (15th century) attributed to Huchown, among the first to use alliterative verse, the narrative poems *The Awntyrs of Arthure, Sir Gawain and the Grene Knight*, and *The Pistil of Susan*. The victories of the Scottish people in its struggle for independence from England in the late 13th and early 14th centuries inspired such patriotic poetry as the epic *Bruce* (published 1571) by J. Barbour (c. 1316–95) and the narrative poem *Schir William Wallace* (modernized text published 1722) by Harry the Minstrel, or Blind Harry (fl. 1470–92).

Scottish poetry of the 15th and 16th centuries reflects a set of ideas common to European literature in the period when humanism emerged and became established. Notable works of this period are *The Kingis Quair* (1423) by the lyric poet and king James I (1394–1437), the fables and the narrative poem *Testament of Cresseid* (published 1593) by R. Henryson (c. 1430–1506), and the narrative poems and satires of W. Dunbar (1460–c. 1517). A precursor of the Renaissance was the poet G. Douglas (c. 1474–1522), who translated Vergil's *Aeneid* and wrote the narrative poem *King Hart* (1516). Brilliant examples of the humanist lyric were created by A. Scott (1525?–85?) and A. Montgomerie (1556?–1610?).

The union of Scotland and England influenced the development of Scottish literature. Although the literature of the 17th century reflects the political and religious struggle of the time, it is markedly inferior to that of the preceding period. In the 18th century many Scottish writers wrote in English but made use of local color; writers of this period include J. Home (1722–1808) and W. Wilkie (1721–72).

The contradictions of bourgeois development in Scotland and the loss of national independence aroused in literature a nostalgia for a vanished past, a yearning that awakened an interest in folklore and medieval literature. A. Ramsay (1686–1758) and R. Fergusson (1750–74) reproduced in Scots verse the features of folk poetry, its joyousness and love of freedom. The Ossianic fragments (1765) of J. Macpherson, which were written in a style suggestive of ancient Erse poetry, were influential throughout Europe; imbued with melancholy, they became one of the most important examples of preromantic poetry.

The profoundly democratic and original poems of R. Burns (1759–96), the best known of which appear in the collection *Poems, Chiefly in the Scottish Dialect* (1786), embodied the freedom-loving spirit of the people and its dreams of justice and equality. Walter Scott (1771–1832), who wrote in English, created the genre of the historical novel in modern literature. He began his artistic career as a collector of Scottish folk poetry, which he published in *Minstrelsy of the Scottish Border* (1802), and he wrote several romantic narrative poems on medieval subjects. Scott's historical novels, beginning with *Waverly* (1814), depict Scottish life in the 16th to 18th centuries.

The Edinburgh Review (1802–1929) and *Blackwood's Magazine* played an important role in the development of British literature in the romantic period. Scottish romantic poets of note included John Wilson (1785–1854), whose *City of the Plague* (1816) was used by A. S. Pushkin in *The Feast During the Plague*. R. L. Stevenson (1850–94), a representative of late romanticism, achieved world renown with his novels of adventure and his historical novels. The naturalistic prose of the Kailyard school, represented by such writers as G. Macdonald (1824–1905) and J. Watson (1850–1907), showed that literature had turned to modern subjects. In the novel *The House With the Green Shutters* (1901), G. Brown (1869–1902) exposed avarice and self-interest.

The social novel appeared in the first half of the 20th century. D. Allan (*Hunger March*, 1934), A. McArthur (1901–47; *No Mean City*, 1935), and G. Blake (1893–1961; *The Shipbuilders*, 1935), turning to industrial subject matter, depicted Scotland during the world economic crisis and described the class struggle in their country. L. Grassic Gibbon (1901–35) wrote the epic tril-

ogy *A Scots Quair* (1932–34), which traces the stories of Scottish farmers against the background of the events of the early 20th century.

The 1920's witnessed the beginning of the Scottish renaissance, a period in which poetry in the Scots language flourished. The central figure in this renaissance was the brilliant poet Hugh MacDiarmid (real name, C. M. Grieve; born 1892), the author of two "Hymns to Lenin" (1931 and 1935) and the founder of a new school of modern Scottish poetry. Many poets, although influenced by W. H. Auden and other English poets of the 1930's, kept alive the Scottish literary tradition in their work; these include E. Muir (1887–1959; *Collected Poems*, 1960), G. Bruce (born 1909; the collection *Sea Talk*, 1944), R. Todd (born 1914; *Garland for the Winter Solstice*, 1962), W. Soutar (1898–1943; *Collected Poems*, 1948), A. Young (1885–1971), S. G. Smith (born 1915), and A. Mackie (born 1925; *Clytach*, 1972).

The most important contemporary prose writers include R. Jenkins (born 1912; the novels *Guest of War*, 1956, and *The Changeling*, 1958), G. M. Brown (born 1921; *Calendar of Love*, 1967), I. C. Smith (born 1928; *Consider the Lilies*, 1968, and *The Lost Summer*, 1969), and Muriel Spark (born 1918; *The Prime of Miss Jean Brodie*, 1961).

The drama has been relatively little developed. Among playwrights writing in English were James M. Barrie 1860–1937), whose works include *The Admirable Crichton* (staged 1902), *Peter Pan* (1904), and *What Every Woman Knows* (1918), and James Bridie (real name, O. H. Mavor; 1881–1951), whose works include *Sunlight Sonata* (1930), *Tobias and the Angel* (1931), and *Dr. Angelus* (1950). Social themes are particularly evident in the plays of Joe Corrie (1894–1968; *In Time of Strife*, 1929), W. D. Home (born 1912), and Ewan MacColl.

A. A. ANIKST

Architecture and art. Dating from the period of the clan system are stone ramparts, cylindrical towers (brochs), and the remains of shepherds' settlements with stone huts. Early Christian churches are closely related to the art of Ireland, as are stone crosses decorated with pagan and Christian images that are combined with complex geometric and plant designs.

Romanesque architecture appeared in Scotland in the 12th century, and Gothic in the 13th. The Romanesque and Gothic structures of Scotland, which include many castles, are notable for their severe formal simplicity; in addition to lierne vaults, tunnel vaults were used extensively in Gothic structures. A distinct type of Scottish castle is the peel tower, which has four sides and rises vertically from the ground. In the 15th and 16th centuries the castles were transformed into palaces with towers, in a style known as Scottish Baronial; this style gradually absorbed features of French Renaissance architecture.

The finest Scottish architects of the 17th and 18th centuries—J. Vanbrugh, J. Gibbs, W. Chambers, and the Adam brothers—built little in their own country, preferring the rapidly growing industrial centers of England. Scottish classicism, however, engendered not only many interesting structures but many noteworthy examples of city planning, such as Edinburgh's New Town, built according to the plan of J. Craig in the second half of the 18th century. The romantic period, in which the Gothic revival dominated Scottish architecture, is the golden age of Scottish visual art. Notable painters of this period are the portraitists A. Geddes and H. Raeburn, the landscape painters A. Nasmyth, P. Nasmyth, and J. Thomson, and the genre painter D. Wilkie.

National and romantic trends were continued in the work of such masters as B. Scott, who developed in the late 19th and early 20th centuries new types of cottages and established a school of interior design. A prominent figure in *art nouveau* was the Scottish architect C. R. Mackintosh. In the 20th century Scottish architecture has developed along the same lines as that of England, as evidenced in the construction of satellite cities in the 1950's and 1960's. Large-scale residential housing is dominated by low-rise, multi-unit buildings, that, although somewhat severe in outline, are nevertheless united in attractive complexes.

Scottish visual art of the 20th century has produced the works of W. Macgregor (and other members of the Glasgow school) and W. McTaggart and the expressionist canvases of the Scottish colorists S. Peploe, L. Hunter, and J. Maxwell. From the 1950's to 1970's such Scottish artists as J. Eardley and R. Philipson have turned away from France as the sole source of artistic ideas.

In addition to wood carvings and woven articles, Scottish folk art is represented by such textiles as the woolen fabrics tweed, cheviot, and tartan.

Hardie, W. *Scottish Painting, 1837–1939*. London, 1976.

Music. The sources of Scottish music lie in the folk songs and dances of the tribes that inhabited the country, notably the Celts, Scots, and Norsemen. Music has long been an important part of the everyday life of fishermen, shepherds, and farmers, as well as fullers and other artisans; such working people composed a variety of songs, including work songs, love songs, and humorous songs. The distinctive national narratives were disseminated and preserved by wandering Celtic popular singers and tellers of tales, who were known as bards and who flourished from the earliest times to the 19th century, and later by minstrels and harpers. The bards, minstrels, and harpers composed and performed epics, heroic songs, sagas, ballads, and love songs.

Scottish folk songs typically are written in the pentatonic scale or are modal. Melodies often contain leaps of great intervals. The rhythm of the folk song, such as the Lombardic rhythm and the Scotch snap, are associated with the specific features of such folk dances as the reel, the strathspey, and the Highland fling (*see* ÉCOSSAISE). Singing and dancing were accompanied by the clarsach (a kind of harp that appeared in the 12th century), the bagpipe, and the fiddle and later by the violin and viola. The bagpipe has been the principal national instrument of Scotland since the 15th century; there are military orchestras made up of bagpipes.

Church and secular court music developed on a formal basis in the 12th century. In the 13th century singing schools (*sang scuils*) were established, in which instruction was provided in the Gregorian chant and in instrumental, primarily organ, performance. The first organs were installed in churches in the 1440's. Notable organists and composers of the 15th century were J. Malison, J. Fethy, J. Black, P. Davidson, A. Melville, and L. de France.

After Edinburgh became the capital of Scotland, in the mid-15th century, a royal chapel was built there and many foreign musicians were attracted to the court. Extant 16th-century manuscript collections contain religious and secular vocal and instrumental works; religious compositions include masses, motets, anthems, and psalms, and secular music is represented by dances and potpourris. Scottish composers of the first half of the 16th century include R. Carver, R. Johnson, D. Peebles, R. Douglas, and A. Blackhall.

The spread of the Reformation and the establishment of Presbyterianism retarded Scotland's musical development, but music flourished anew in the 17th century. Scottish music reached a high level of development under the Stuarts, beginning in 1603, as attested by numerous manuscripts, including the Skene Manuscript (1615–35), which contains the melodies to songs, dances, arias, and instrumental music, all notated in lute tablature. Scottish national melodies were used by such English composers as H. Purcell and G. Playford (works for the virginal) and later appeared in the works of F. Mendelssohn (*Scottish Symphony*) and M. Bruch (*Scottish Fantasy for Violin and Orchestra*).

In the 18th century, musical societies and choral, orchestral, and opera societies and associations were founded. Interest in Scottish folk music increased in Scotland and England. Many collections of folk music were published, notably *Orpheus Caledonius* (1726) and *The Scots Musical Museum* (1787–1803). Scottish folk songs provided a basis for the first Scottish ballad opera: A. Ramsay's *The Gentle Shepherd* (1725), which served as a model for other Scottish and English works in this genre and influenced the German Singspiel.

The performing arts attained a high level of professionalism in the 18th and 19th centuries. Musical education underwent development: in 1838 a chair of music was endowed at the University of Edinburgh, and in 1890 the Glasgow Athenaeum School of Music (now the Royal Scottish Academy of Music and Drama) was founded. Prominent composers of the second half of the 18th and 19th centuries were T. Erskine, J. Fergus, W. McGibbon, D. Dow, and N. Howe. A. Mackenzie, who flourished in the late

19th and the first third of the 20th century, founded the modern school of Scottish composition; his works include five operas, oratorios, cantatas, fantasias, and piano concerti. Mackenzie's followers include H. MacCunn, C. Macpherson, W. Wallace, F. G. Scott, and L. Drysdale.

Contemporary composers include C. Davie, R. Crawford, and T. Musgrave. Outstanding German and English conductors, notably C. von Bülow, C. Hallé, and J. Barbirolli spent part of their careers in Scotland, as did the musicologists J. Thomson, H. R. Bishop, F. Niecks, and D. Tovey. An international festival of music, drama, and ballet has been held annually in Edinburgh since 1947. The country's chief musical centers are Glasgow and Edinburgh, the latter of which has a symphony orchestra and choruses.

I. V. ROZANOV

Theater. The dramatic theater in Scotland dates from the mid-18th century. In 1767 a patent was granted to the Concert Hall in Edinburgh, which thereupon became the Theatre Royal. By the mid-18th century three theaters had been built in Glasgow, all of which were burned down by religious fanatics. In 1769 the actor and entrepreneur D. Ross built a new Theatre Royal in Edinburgh, at which the plays of English authors were staged, primarily with English actors. In 1883 the Lyceum Theatre opened. Initially, the finest English companies, such as that of H. Irving's, appeared at the theater, and their performances were an important influence on the formation of a national school of drama. In 1964 the Lyceum was acquired by a company in Edinburgh, and since 1965 it has been a repertory theater; its artistic director is C. Perry.

In Glasgow, the Dunlop Street Theatre existed from 1782 to 1863, the Queen Street Theatre from 1805 to 1829, and the Adelphi from 1842 to 1848; the City Theatre opened in 1845, followed by the Queen's Theatre and the Prince's Theatre. In 1909 the Glasgow Repertory Theatre was founded, with A. Wareing as its director. Although the theater survived for only five seasons, it played an important part in the establishment of a national theatrical art. In addition to the plays of English and foreign writers, several works by Scottish playwrights were staged, including J. Ferguson's highly successful *Campbell of Kilmohr*. The theater closed down during World War I, and its funds were used to launch the movement that in 1921 produced the Scottish National Players, a company that performed the works of Scottish dramatists. When the company ceased its activities in the early 1930's because of financial difficulties, its work was carried on by the Curtain Theatre in Glasgow (1933–40).

The first Scottish Theatre Festival was held in 1939. Since that time the Scottish Community Drama Association has organized annual festivals in which all professional and amateur groups in Scotland take part. In 1943 the Glasgow Citizen's Theatre was founded. In the 1970's interesting productions have been staged by the Traverse Theatre Club in Edinburgh and the Close Theatre Club in Glasgow. There are repertory theaters in Perth, Dundee, Pitlochry, and St. Andrews. Theaters are subsidized by the Scottish Committee of the Arts Council and by municipal arts councils. The Edinburgh Festival of Music and Drama has been held annually since 1947.

SCOTS, a nation (*natsiia*, nation in the historical sense) inhabiting the northern half of the island of Great Britain and adjacent islands. According to a 1975 estimate, the Scots number more than 5.2 million. Often the Scots are counted together with the Gaels, the remaining descendants of the Celtic-speaking population of the Highlands. Scottish immigrants and their descendants also live in the USA (250,000), Canada (more than 200,000), Australia (more than 150,000), and New Zealand (more than 50,000). The Scots speak a dialect of English; their literary language is English. The majority are Presbyterians, although approximately 15 percent are Catholics.

The Scots are descended from local tribes of Picts and from Celtic tribes called Scots, who came from Ireland in the fifth and sixth centuries. In the seventh century these tribes partly intermingled with Germanic tribes of Angles and Saxons that had arrived in Scotland and whose language they adopted. The Scottish nationality formed during the consolidation of the Scottish state (11th century) and the struggle against the English conquerors. The political union of Scotland with England in the early 18th century and the British government's policy of assimilating the Scots did not succeed in fusing the Scots with the English.

In certain features of their traditional culture and daily life, the Scots resemble the Irish. In the Highlands, the clan system was preserved into the 18th century. Elements of the traditional male costume, such as the kilt, the plaid, and knitted knee socks, have been retained, as have special foods and holidays. The Scots have a singing tradition that goes back to the historical ballad and the heroic Celtic tale.

V. I. KOZLOV [29–1378–2]

SCOTTISH SCHOOL (also philosophy of common sense), a school of philosophy that developed and flourished from the 1760's to 1780's in the universities of Scotland. The Scottish school was founded by T. Reid, and its leading representatives were J. Oswald, J. Beattie, and D. Stewart. It was formed in response to the skepticism of D. Hume, and it rejected the philosophy of G. Berkeley.

According to the Scottish school, truths incontrovertible by common sense are founded on direct intuitive certainty, which is inherent in the very nature of human beings and is of divine origin. In essence, the philosophy of common sense reinforced generally accepted convictions and prejudices, making them the foundation of science, ethics, and religion. Asserting that faith constituted the foundation of philosophy, the Scottish school advanced arguments, based on direct knowledge, in favor of the existence of god, the soul, and the purposefulness of all that existed.

Using similar arguments, the school defended the material world from attack by subjective idealism, skepticism, and agnosticism and refuted the phenomenalistic theory of perceptions (ideas). According to the Scottish school, a fundamental law of cognition is the certainty that the material world exists independently of consciousness. Of basic importance for the members of the school, however, was the recognition that religious truths are

self-evident and the acceptance of irrefutable moral laws rooted in "moral feeling." Proceeding from these beliefs, the members of the school fought against the sensualism of J. Locke and the materialism of D. Hartley, J. Priestley, and, subsequently, D. Diderot. For their part the materialists, especially Priestley, sharply criticized the Scottish school. The most active proponent of the philosophy of common sense in the USA was J. McCosh; in France the Scottish school influenced the thought of P. Royer-Collard.

B. E. BYKHOVSKII [29–1377–2]

SCOW (in Russian, *shalanda*), a small, shallow-draft vessel used in loading and unloading large ships lying in roads and for transporting earth or small cargoes. Large scows are usually self-propelled. Scows that are used to remove earth excavated by dredges are usually equipped with doors in the bottom for dumping. The Russian word *shalanda* is also used for flat-bottomed, sail-rigged fishing boats that have a centerboard and that operate on the Black Sea. [29–813–5]

SCRAPER, a metal-cutting tool in the form of a metal rod with cutting edges on the end, used for scraping. Flat, three-sided, and shaped scrapers differ in the shape of the cutter; scrapers may be designed as one-piece tools, or they may have removable cutting plates. In addition to hand scrapers, pneumatic and electromechanical power scrapers are also used.

In the graphic arts, scrapers are used to remove the burr formed in engraving on metal and to smooth the grainy surface of the metal plate used in mezzotint engraving. They are also sometimes used by lithographers and sculptors. [29–791–4]

SCRAPING, the cutting or shaving of thin metal particles from the surface of a workpiece with a scraper. Usually performed after finishing the workpiece on a metal-cutting machine tool, scraping makes it possible to fit contacting surfaces to each other or join them with a hermetic seal. [29–793–2]

SCREEN ADAPTATION, a cinematographic interpretation of a work from another art form—prose, drama, poetry, song, or opera or ballet libretto.

Immediately after its inception, the art of the cinematographer turned to literature for its plots and themes. The first Russian feature film, *Sten'ka Razin and the Princess* (1908, also known as *The Freemen of the Lower Reaches*), was a screen adaptation of the song "From the Island to the Channel" ("The Song of Sten'ka Razin"). By 1917 approximately 100 motion pictures had been made in Russia based on novels and novellas by A. S. Pushkin, F. M. Dostoevsky, A. P. Chekhov, L. N. Tolstoy, and other writers. Works of foreign literature were also widely adapted for the screen, including Shakespeare's *Hamlet*. After the October Revolution of 1917, the mastery and further development of the realistic traditions of classic and modern literature made a significant contribution to the art of the Soviet motion picture. With the appearance of sound motion pictures, the expressive possibilities and selection of genres available to cinematography were greatly increased, and the motion-picture novel and novella were created.

Outstanding Soviet screen adaptations have included *The Mother*, based on the novel by M. Gorky (1926, directed by V. I. Pudovkin); *The Poor Bride*, based on the play by A. N. Ostrovskii (1936, directed by Ia. A. Protazanov); *Peter the First*, based on the historical novel by A. N. Tolstoy (1937–38, directed by V. M. Petrov); *The Childhood of Gorky, In the World*, and *My Universities*, based on works by Gorky (1938–40, directed by M. S. Donskoi); *The Young Guard*, based on the novel by A. A. Fadeev (1948, directed by S. A. Gerasimov); *Othello*, based on the play by Shakespeare (1956, directed by S. I. Iutkevich); *The Quiet Don* (1957–58, directed by Gerasimov) and *A Man's Fate* (1959, directed by S. F. Bondarchuk), based on works by M. A. Sholokhov; *Hamlet*, based on the play by Shakespeare (1964, directed by G. M. Kozintsev); *War and Peace*, based on the novel by L. N. Tolstoy (1966–67, directed by Bondarchuk); *The Brothers Karamazov*, based on the novel by Dostoevsky (1969, directed by I. A. Pyr'ev); and *The Dawns Here Are Quiet*, based on a work by B. L. Vasil'ev (1972, directed by S. I. Rostotskii).

A popular device in foreign screen adaptations is the transfer of the action of a classic work into another time, usually modern. Screen adaptations are also frequently used in television programming, for example, the Soviet serial *How the Steel Was Tempered*, based on the novel by N. A. Ostrovskii, and the British serial *The Forsyte Saga*, based on the series of novels by J. Galsworthy.

SCREENED DEPOSIT. (1) In petroleum geology, a deposit of oil or gas bounded along the strike by strata of petroleum-impermeable rocks.

Three types of screened deposits are distinguished: tectonic screened deposits, where the stratum containing the oil or gas deposit is bounded by a disjunctive tectonic displacement (normal fault, slip-strike fault); lithological screened deposits, which are characterized by an abrupt alteration in the lithological composition of the collector rocks by impermeable rocks; and stratigraphic screened deposits, in which the collector strata are cut off by the surface of a stratigraphic unconformity above which are petroleum-impermeable rocks.

Tectonic screened deposits are widespread in petroleum and gas provinces that are associated with regions of subsidence of mountain ranges, intermontane depressions, and foredeeps characterized by various types of large-scale faulting. In platform conditions such deposits are usually found in areas of tectonic salt structures. Accumulations of oil in lithological screened deposits occur widely in both platform regions and folded areas.

Stratigraphic screened deposits are rare in the USSR; they contain small quantities of petroleum. They are widespread on the North American Platform in the United States.

The term "screened deposit" of oil or gas was first proposed in 1937 by the Soviet geologist I. O. Brod.

(2) In mining geology, screened deposits of mineral products are ore bodies occurring beneath water-impermeable rock strata from ascending ore-bearing hydrothermal solutions. They are common in layered strata, especially among carbonate rocks alternating with clay shales, which form the screen that blocks the movement of the ore-bearing solutions.

L. M. BOGDANOVA [29–1887–2]

SCREW CONVEYOR, a mechanism whose working member is a shaft with a continuous helical blade (the screw) or individual, pitched vanes. The rotating shaft, housed in a horizontal or inclined trough, moves loose or small piece cargoes or liquids along

the trough. Screw conveyors are used in extruders, feeders, and other machines. They offer design simplicity and even feeding, but they have low productivity and efficiency because of the friction of the material against the walls. Feeding is regulated by the frequency of rotation of the screw. A screw conveyor was used in Archimedes' screw, a device designed to raise water. Screw conveyors in which the screws of two adjacent machines rotate in opposite directions are used to mix materials. [29–1327–2]

SCREW TIE-DOWN (Russian, *shtopor*), a coiled rod made of a thick, usually steel wire, 10–20 mm in diameter, with a ring attached to the end. When screwed into the ground, a tree, or ice, it serves for tying down airplanes, gliders, and helicopters, for mooring small ships, and for anchoring tents. [29–1484–4]

SCUTAGE, a monetary levy collected from the holders of knightly fiefs in medieval England beginning in the mid-12th century; collected for the king in lieu of military service or as partial compensation for service. Although the levy was prohibited by the Magna Carta of 1215, it was collected arbitrarily ("at the will of the king") until the beginning of the 14th century. A considerable portion of the total was actually paid not by fief holders but by serfs and free peasants. [29–1612–4]

SCUTELLARIA (skullcap), a genus of plants of the family Labiatae. The plants are perennial herbs or subshrubs; annual herbs occur infrequently. The leaves vary from entire to pinnatisect. The flowers are arranged in twos in the axils of the upper leaves; they are frequently clustered together in a dense racemose inflorescence. The calyx is two-lipped, with a shield-like formation on the upper lip. The corolla has a helmet-shaped upper lip. There are four stamens; the fruit consists of four nutlets.

There are about 300 species, distributed in temperate, subtropical, and tropical regions. The USSR has about 120 species (with subspecies), growing mainly in the mountains of the Caucasus and Middle Asia. The most common species is *S. galericulata*, which grows in the European USSR, Siberia, and Middle Asia on floodplain meadows, in swamps, along the shores of reservoirs and canals, and in flooded forests. The plant is used in folk medicine to arrest bleeding. *S. baicalensis*, which is found in Transbaikalia and the Far East on rocky slopes, in sandy steppes, and along river banks, is a medicinal plant. A tincture of its rootstock and roots is used as a mild hypotensive agent and sedative. Several species, including *S. alpina, S. baikalensis*, and *S. orientalis*, are cultivated as ornamentals.

SCUTELLUM, one of the principal organs in the embryo of grasses of the family Gramineae. During seed sprouting, the scutellum secretes enzymes that make soluble the reserve substances of the endosperm that nourish the developing embryo. Some botanists regard the scutellum as a cotyledon, and others as a modified axis of the embryo. [29–1613–1]

SCUTUM (Shield), an equatorial constellation that contains no stars brighter than the fourth visual stellar magnitude. The best conditions for observation of the constellation are in June and July. Scutum can be seen everywhere in the USSR except the Far North. [29–1606–1]

SEAM, in garment manufacturing, the point where sections are joined in clothing, footwear, and the like. There are three types of seams: stitched, glued, and welded. Stitched seams are the most common. Welded seams are used for garments made of thermoplastic fabric or films; they are ordinarily produced by the heat, ultrasound, or high-frequency method. Welded seams may be segmented to reduce rigidity if the seal does not have to be airtight. [29–1330–1]

SEAM WELDING, a type of resistance welding for joining overlapped metal sheets of steel, aluminum, and other metals 0.2–5 mm thick. [29–1332–2]

SECHIUM, a genus of herbaceous plants of the family Cucurbitaceae. The genus has only one species—chayote (*S. edule*)—a large perennial with a climbing tendriled stem that reaches several meters in length. The leaves have five lobes and reach 20 cm in length. The yellowish white flowers are unisexual (the plant is monoecious). The staminate flowers are in racemes, and the pistillate ones are solitary. The fruits are large, weighing 100 g to 1 kg (most often 250 to 500 g); they contain one very large seed.

Chayote is cultivated in Mexico, Central America, the southern USA, and several other countries as a valuable high-yielding food plant. It is unknown in the wild. The unripe fruits are eaten raw, or they are stewed, roasted, boiled, salted, or pickled. The roots form starchy tubers that taste something like yams. Chayote is often used in the same way as spinach or asparagus. The stems yield a material used for making hats and other woven articles.

SECTION, in geology, a thin, flat piece of rock, mineral, or fossil coal used in microscopic studies. The most commonly used sections are thin sections—flat pieces 0.02–0.03 mm in thickness prepared mainly from silicate rocks. At such a thickness, most minerals are translucent, which makes it possible to study them with a polarizing microscope to determine the optical properties of the minerals, the crystal structure, the nature of interrelationships, and other aspects of minerals. The study of thin sections is one of the primary techniques of petrography. Sections 0.005–0.035 mm in thickness are used to study fossil coals. Sections are made by grinding one side of a fragment of rock or mineral of any thickness on a special grinding machine, cementing the polished side to a glass slide with Canadian balsam or some other organic resin, and then grinding the other surface until the section reaches the proper thickness.

Polished translucent sections, in which the upper surface of the section is polished with special care, are made to study the composition of minerals by spectral X-ray analysis. For opaque minerals, mostly ores, polished sections are used, which are usually 0.5–1.0 cm in thickness, polished on one side, and mounted on a glass slide with mastic or modeling clay. The study of polished sections of ore minerals is the task of mineragraphy, or mineralography, an important branch of mineralogy.

ŠEDUVA, a city in Radviliškis Raion, Lithuanian SSR. Šeduva is situated on the Šiauliai-Panevėžys highway, 42 km southeast of Šiauliai, near the Šeduva railroad station on the Šiauliai-Panevėžys line. The city produces building materials and has a garment factory of the Lelija Production Association, whose main facility is in Vilnius. Šeduva has a branch of the Aušra Museum of History and Ethnography, which is located in Šiauliai. [29–1078–5]

SEEDLESS SPIKE, the incomplete setting of seeds in cereal crops, for example, winter rye and corn, as a result of incomplete pollination. Seedless spikes result from unfavorable weather conditions during flowering, for example, high temperatures, rain, or high winds. To prevent the formation of seedless spikes, artificial supplementary pollination is performed on hybridization and experimental plots two or three days after the onset of flowering. [29–193–1]

ŞEHDİ OSMAN. Dates of birth and death unknown. Turkish state figure of the mid-18th century.

In 1758, Şehdi Osman headed a Turkish embassy to St. Petersburg. His account of the journey included information on such Russian cities as St. Petersburg, Moscow, Kiev, Kronstadt, and Tula.

ŞEMSETTİN SAMİ (also Şemseddin Sami Fraşeri). Born June 1, 1850, in Frăsheri, Albania; died July 1, 1904, in Istanbul. Turkish writer and lexicographer.

Şemsettin Sami moved to Istanbul in 1872. He published the newspaper *Sabah* and the journal *Aile*. After serving at the court from 1880 to 1890, he was exiled to his villa in Erenköy, where he spent the rest of his life. He was the author of the novel *The Love of Talât and Fitnet* (1872) and of the first Turkish play, *Besa, or Loyalty to the Oath* (1875), the heroes of which are peasant shepherds. Şemsettin Sami is known primarily as a lexicographer and as the author of a two-volume Turkish-French and French-Turkish dictionary (1880), an encyclopedia of historical geography (vols. 1–6, 1889–98), and *Dictionary of Turkish* (vols. 1–2, 1900).

SENCHUS MOR, a collection of ancient Irish laws. Compiled in the fifth century, the *Senchus Mor* is a record of the customary law of the ancient Irish. The oldest extant copy dates from the 14th century. Embracing all branches of law, including procedural, property, and family law, the collection reflects the process whereby clan relations in ancient Irish society were broken down and feudalization began. The *Senchus Mor* is the main source for information on the early history of Ireland.

ŠENOA, AUGUST. Born Nov. 14, 1838, in Zagreb; died there Dec. 13, 1881. Croatian writer.

Šenoa studied law in Zagreb and Prague between 1857 and 1865. He was first published in 1861. In his short stories and novellas he denounced bourgeois-landowner society, exposed the arbitrariness of the bureaucracy, and depicted the peasantry's lack of rights. Such historical novels as *The Goldsmith's Treasure* (1871; Russian translation, 1963), *Beware of the Hands of Senj* (1875), and *Damnation* (1881) are distinguished by their documentary nature. The periods dealt with are portrayed in a thorough and objective manner, and the author displays a fine understanding of progressive trends. The novel *Peasant Uprising* (1877; Russian translation, 1955) deals with the Matija Gubec Revolt of 1573 and portrays the people as a progressive historical force.

Despite the presence of some elements of romantic didacticism, Šenoa's works on the whole affirm the principles of realism, national content, and national uniqueness in literature and art. Šenoa also wrote publicist articles and works of literary criticism.

SENSE ORGANS, highly specialized organs that arose in the course of evolution to enable the organism to obtain information about changes in the environment. Sensitivity to light, temperature, chemical agents, and other stimuli is evident even in protozoans. However, the reaction to external influences by lower organisms is usually caused not by special organs but by a general property of living matter—irritability (or excitability). In higher animals, adaptation to the environment, the search for food, reproduction, and escape from enemies are complex activities, effective only if information about the environment is fairly complete and timely. Such information is transmitted by sense organs adapted to perceive signals of a certain kind.

The traditional idea of five specialized sense organs—eye, ear, nose, tongue, and skin—that make possible vision, hearing, smell, taste, and touch was considerablely expanded and deepened with the development of physiology. The vestibular apparatus, the receptor systems of the motor apparatus, and the numerous visceral receptors were investigated in both animals and man, as were the electroreceptors in fish. It was found that the perception of touch, pain, pressure, heat, and cold, combined in the sense of touch, is effected by various receptor structures of the skin. However, light can be perceived by, for example, such different organs as the human eye and the compound eye of insects. The variety of receptor elements of the sense organs led to the idea of the main types of reception, or sensibility—mechanoreception (for example, touch, phonoreception, or perception of sound, and vestibular reception, or perception of the spatial position of the body), chemoreception (taste, smell), and photoreception (light)—and the corresponding perceiving apparatus—the receptors (*see* RECEPTOR). In various groups of animals, differing in evolutionary development and ecology, the perception and analysis of environmental signals can be accomplished by structures of different degrees of complexity, while the development and principal use of a particular type of sensibility also depend on the animals' mode of life and habitat. In man, more than 80 percent of the information about the external world is received through the eyes.

In modern physiology, the sense organs, in the broad meaning of the term, are taken to mean the complex sensory systems (analyzers in I. P. Pavlov's terminology), including perceiving elements (receptors), conducting nerve pathways, and the corresponding regions in the brain where a signal is converted into sensation (*see* SENSATION and ANALYZERS). In the narrow meaning, sense organs are only receptor elements and auxiliary structures, such as the eye and ear, that perceive signals and convert them into nerve impulses.

The development of ideas about the activity of the sense organs and their function of obtaining information about the external world has a long history. The ancient Greek and Roman philosophers did not doubt the reality of external objects and phenomena and the adequacy of its perception by the sense organs. Empedocles was one of the first ancient thinkers to attempt to understand the nature of light and color perception. The scientific study of the sense organs was stimulated by the work of Galileo and R. Descartes, who insisted that the study of natural phenomena be strictly limited and confined to the formulation of questions to which concrete answers could be obtained by experimentation or mathematical calculation. Following these principles, J. Kepler regarded the eye as an optical instrument, and on the basis of the laws of geometrical optics, showed that external objects produce a reverse and reduced image on the retina. In doing so, he deliberately avoided the question of why the world is not perceived upside down. Kepler's work laid the foundation of physiological optics and paved the way for the development of physiological acoustics and the physiology of other sense organs.

The foundations of modern experimental physiology of the sense organs were laid in the 19th century by the classical studies of H. von Helmholtz, G. T. Fechner, I. M. Sechenov, and other scientists. Pavlov's conditioned reflex method was of enormous importance for objective research on sensory activity. The sense organs have been successfully studied since the 1920's by the electrophysiological method, which makes it possible to record electrical phenomena arising in different parts of the sensory systems under the influence of external stimuli. Research on the physicochemical and biochemical bases of visual reception was begun in the late 1930's, and research on the physicochemical and biochemical bases of olfactory and gustatory reception, in the late 1960's. However, despite the advances in 20th-century physiology, which have made use of the results of biophysics, biochemistry, cytology, psychology, and other sciences, many problems related to the activity of the sense organs remain unresolved. For example, such major processes as the transformation of the energy of external stimuli into receptor signals in the receptor cells,

the coding and decoding in various sensory systems of information contained in the spatial and temporal code of nerve impulses, and the neurophysiological mechanisms of external image recognition have still not been conclusively studied. Lenin's words are still timely: "there still remains to be investigated and reinvestigated how matter, apparently entirely devoid of sensation, is related to matter which, though composed of the same atoms (or electrons), is yet endowed with a well-defined faculty of sensation" (*Poln. sobr. soch.*, 5th ed., vol. 18, p. 40).

The human sense organs were studied in great detail in the late 1930's and early 1940's. Thresholds of stimulation—both the absolute threshold (limits of sensibility) and the differential threshold (the capacity of sense organs to recognize the minimal difference between two stimuli)—were established for all the sense organs. Research of the 1970's was directed at elucidating the mechanisms controlling the sense organs, thereby making it possible to study the molecular, membranal, and cellular mechanisms of visual reception, the delicate mechanisms of smell and taste, mechanoreception, and electroreception.

Changes in the environment are perceived by the sense organs in the form of light, mechanical (including acoustic), or chemical stimuli. The "signal" interacts with the cellular membrane of a receptor or specialized receptor protein molecule, triggering a chain of ionic, enzymic, and electrical processes. This gives rise to an electrochemical signal or nerve impulse, identical for all types of receptors, that is transmitted to the brain by way of the conducting pathways. A series of such impulses constitutes a sort of code that is decoded in the corresponding nuclei (visual, auditory, and so on) of the cerebral cortex and transformed therein into an image of the external world. Some of the principles and mechanisms of information processing by the sensory systems have been largely elucidated. Sensory analysis at all levels—from the receptors to the cerebral cortex—is a comparative process directed at identifying the characteristics of the signal. The principal neurophysiological mechanism of such comparison is the correlation of the excitatory and inhibitory processes in the nerve networks or at the entry of individual neurons. Specifically, what is involved is the mechanism of lateral inhibition, when the physiological condition of every nerve cell depends on the activity of the adjacent cells. Such inhibition helps strengthen contrasts or contours and localize the site of contact, that is, eliminate redundant information and distinguish the most important information.

The mechanisms of object recognition are, for the most part, still not completely known. However, some neurophysiological data can probably be regarded as providing the first steps toward such knowledge, namely, the discovery of the specific neurons—detectors—capable of reacting selectively to certain biologically important characteristics of objects, for example, only a moving dark spot or only a sound of a certain pitch. Such neurons were first discovered in the visual and then in the other sensory systems. The properties of the detectors become increasingly complex as sensory information is analyzed and transmitted from the receptors to the cortical centers. Specialization of the detectors increases even more from layer to layer in the cortex itself. Thus, visual images, sound patterns, or blends of odors are broken down in the sensory systems into simple constituents and are analyzed separately. The final stage in the analysis of sensory information is its synthesis—the formation of a subjective integral image of the objective external world. Further research in this direction will elucidate the complex mechanisms governing the functioning of the sense organs in the cognitive process.

The elucidation of the mechanisms of activity of the sense organs is not only of great scientific and philosophical interest but is of importance for various practical purposes in medicine, technology, and psychology.

SENSIBILITY (physiology), the capacity of a living organism to perceive stimuli from the external or internal environment.

An organism's sensitivity to corresponding stimuli varies with the sensitivity of its sensory systems (analyzers). Sensibility is characterized by the threshold of stimulation: the lower the threshold, the higher the sensibility. A distinction is made between absolute and differential sensibility, that is, discriminative sensibility, and, accordingly, absolute and differential thresholds of stimulation. The absolute threshold is the minimum force of stimulation capable of producing a reaction. The differential threshold is the minimum amount of stimulation that has to be changed in order to change the response. Somatosensory sensibility (cutaneous sensibility and proprioceptive, that is, muscle-joint, sensibility), visceral sensibility, and sensibility based on the activity of the sense organs are distinguished according to the sensory systems responsible for the perception of stimulation. Cutaneous sensibility is sometimes divided into coarse, protopathic, sensibility and fine, epicritic, sensibility. With respect to the type of stimulus, one can speak of sensitivity to mechanical, chemical, light, temperature, and other stimuli.

The sensibility of an organism may be judged from sensations and from objective criteria, for example, autonomic reactions and bioelectrical reactions. The thresholds, which are determined by various methods, may differ. For example, photosensitivity, determined from the bioelectrical activity of the brain, is higher than sensibility determined from the verbal responses of a subject regarding his sensations. Sensitivity to a stimulus is not a constant quantity and may change under the influence of a variety of factors, for example, during physiological adaptation, under the influence of efferent regulation, and as a result of the action of other stimuli. Pathological processes may cause a variety of disturbances of sensibility, depending on the place where a sensory system is affected: the peripheral portion (receptor), the conducting portion, or the central (including the cortical) portion.

O. B. IL'INSKII [29–725–2]

SENSING ELEMENT, in measuring systems or automatic control systems, a component of a sensor that directly senses the physical quantity acting on the sensor. Devices that may be used as sensing elements include diaphragms, gyroscopes, thermal resistors, strain gages, induction coils, and piezoelectric quartz plates. [29–728–2]

SENSITIVITY, of an automatic control system, the dependence of the dynamic properties of an automatic control system on a variation of the system's parameters or characteristics. A variation of a system's parameters is taken to mean any deviations of the system's parameters from the values adopted as the initial values. Such deviations may be completely known and described by certain functions of time or may be known only to the extent of belonging to a specified class, for example, limited in magnitude. The variations of a system's parameters may be finite or infinitesimal. Hence, the order of the differential equations that describe the variations may remain unchanged or may vary.

Sensitivity functions are used for the direct evaluation of sensitivity. Such functions play a major role in the quantitative evaluation of the extent to which variations of a system's parameters affect the dynamic properties of the system.

Sensitivity functions contain extremely valuable information, for example, for solving problems of the synthesis of automatic control systems. A very important problem is the synthesis of systems that have a minimum sensitivity to variations of their parameters. The problem of sensitivity may be considered a problem of the theory of games for automatic control, if we assume that a disturbance caused by a variation of a system's parameters is in conflict with both the dynamic properties of an object and a control action. Such an application of the methods of the theory of games in sensitivity theory is promising, especially for the synthesis of optimal control systems, which are insensitive to varia-

tions of the parameters of a controlled object and have minimax properties.

Of great practical importance is the inverse problem, which consists in the estimation of a variation of a system's parameters by observing the disturbance of an output signal that is caused by the variation. Parameter variations computed on the basis of a deviation of an output signal may be used to modify the parameters of a control system in order to improve the quality of the operation of the system as a whole.

Metody teorii chuvstvitel'nosti v avtomaticheskom upravlenii. Leningrad, 1971.

Tomović, R., and M. Vukobratović. *Obshchaia teoriia chuvstvitel'nosti*. Moscow, 1972. (Translated from Serbian and English.) [29–726–1]

SENSITIVITY, a property of a measuring instrument that is expressed by the ratio of the linear displacement (Δl) or the angular displacement ($\Delta\alpha$) of the pointer on the scale of the instrument—that is, the signal at the output of the instrument—and the change in a measured quantity that causes the displacement. A distinction is made between absolute sensitivity and relative sensitivity. Absolute sensitivity $S = \Delta l/\Delta x$ or $\Delta\alpha/\Delta x$, where Δx is the change in a measured quantity x and is expressed in the same units as the quantity. Relative sensitivity $S_0 = \Delta l/(\Delta x/x)$ or $\Delta\alpha/(\Delta x/x)$. [29–726–2]

SENSITIVITY, RECEIVER, a radio receiver's capability of receiving weak signals or a quantitative criterion of that capability. In many cases, the criterion is defined as the minimum level, at a receiving antenna, of a radio signal at which the useful information contained in the signal may be reproduced with the required quality, for example, with sufficient loudness or adequate picture contrast. The signal level may be either the electromotive force (usually expressed in millivolts or in microvolts) induced by the signal in the antenna or the field strength (expressed in millivolts per m) near the antenna.

In the simplest radio receivers, sensitivity depends mainly on the extent to which signals are amplified. As the gain is increased, normal reproduction of information may be achieved for weaker radio signals; that is, the receiver sensitivity is raised. However, in complicated radio receivers, such as communications receivers, the method of raising the receiver sensitivity by increasing the gain is of no value, since the strength of the useful radio signals may turn out to be comparable to the intensity of external radio interference. Such interference acts on the antenna at the same time as the useful signals and distorts the information received. In this case, the ultimate sensitivity of a receiver is said to be interference-limited; such sensitivity not only is a receiver parameter but also depends on external factors.

Under the most favorable conditions—mainly in the reception of metric waves or waves of shorter wavelength and especially in space communications—external interference is weak and the intrinsic random noise (*see* FLUCTUATIONS, ELECTRICAL) of a receiver itself becomes the main factor that limits receiver sensitivity. Under normal operating conditions, the intrinsic random noise of a receiver has a constant level. Therefore, noise-limited sensitivity is a completely specified parameter. In this case, the random-noise level, which is characterized by a noise factor and a noise temperature, is often used directly as a measure of receiver sensitivity. (*See also* THRESHOLD SIGNAL.)

SENSORY NERVE FIBER, a process of a nerve cell (axon), along with its membrane, that conducts excitation from the exteroreceptors and interoreceptors to the central nervous system. Sensory nerve fibers are divided into several groups according to their diameter. For example, among different afferent fibers of muscles, groups 1 to 4 are distinguished. The thickest fibers in the organism (about 20 micrometers with a rate of conduction of about 120 m/sec) belong to group 1a and terminate in muscle receptors called primary muscle spindle endings. In the specialized literature, sensory nerve fibers are also called afferent nerve fibers (*see* AFFERENT NERVE FIBER). [29–728–1]

SENTENCE PARTS, words or word groups that perform a specific semantic-syntactic function in a sentence. A dual classification of words—according to morphological features (parts of speech) and syntactic function (sentence parts)—is most often used for languages with a developed morphology. The need for such a classification is determined by the lack of unambiguous correspondence between the morphological class of a word and the syntactic function performed by the word. Some grammatical theories do not use the concept of sentence parts. Some such theories are based on the combinatory capacities of parts of speech, which provide for the transition from word to sentence (the syntax of parts of speech, dependency grammar, and chain syntactic analysis); others make use of distribution classes, which unite all words and word groups that can replace each other in a particular syntactic position.

The theory of sentence parts arose within the framework of logical and semantic approaches to syntax; the former approach associated sentence categories with categories of thought, and the latter associated sentence categories with extralinguistic reality. The origin of the theory determined the diversity of the functions of the sentence parts selected or their universality. The following sentence parts are generally recognized: subject, predicate, complement (direct and indirect, such as agent, instrument, and addressee), adverbial modifiers (of place, time, manner, cause, purpose, concession, condition, and extent), and attributes. The sentence parts correspond to types of information that can be communicated concerning some event or situation. Each sentence part is therefore associated with a specific type of question and is often determined on the basis of this correspondence (*Chto ty dal mal'chiku?*, "What did you give the boy?" [the question for direct objects]; *Ia dal mal'chiku* **miach**, "I gave the boy the **ball**").

The functions performed by sentence parts are not consistent. Some sentence parts are more closely associated with the logical-communicative organization of the sentence (subject and predicate); others complete the informational insufficiencies of the governing word (complements); still others have a relatively independent semantic function (attributes).

Two groups are distinguished by the logical-communicative division of a sentence: the subject group and the predicate group, which are joined by the predicative relationship (*Malen'kii mal'chik/otnial u devochki igrushku*, 'the small boy/ took from the girl the toy"). The nuclear elements of each group—the subject (*mal'chik*, "boy") and predicate (*otnial*, "took")—are principal parts of the sentence and determine the sentence's syntactic organization. They mainly perform logical-communicative functions. The sentence subject (*podlezhashchee*) corresponds to the formal subject (*sub''ekt*) of a proposition as well as to the theme of communication (the given). The semantic function of agent or bearer of a quality, property, or state is not obligatory for the sentence subject (as is demonstrated in passive sentences). The sentence predicate corresponds to the predicate of a proposition as well as to the rheme (new information). In an expanded sentence the greatest communicative value is possessed not by the nuclear element of the predicate group but by one of the elements subordinate to it, which usually appears in final position. In this case the central position does not carry communicative significance.

Since the truncation of a sentence to a lone predicate (*Deti stuchat*, "The children are knocking" → *Stuchat*, "They are knocking") does not affect the function of the whole unit, the predicate constitutes a minimum sentence and is considered a constituent. The many instances in which the formal-syntactic and logical-communicative structures of a sentence do not coincide (encountered in various languages, such as Russian) often deprive the principal parts of the sentence of a content function, changing them into elements of the structural arrangement of the sentence. For example, the sentences *Mal'chik prishel* ("The boy has come") and *Prishel mal'chik* (literally, "Came the boy") have the same structure but different logical-communicative meanings. In the second sentence the subject is the rheme, not the theme.

Secondary sentence parts are distinguished within the subject and the predicate. They are on the level of the word group. Attributes, both in agreement and not in agreement, can combine with any of the nouns in the sentence to form attributive word groups. Complements and adverbial modifiers are distinguished within the predicate. Direct and indirect complements are associated with the verb (less often, with an adjective) in a complementary relationship; that is, they complete the semantic insufficiency of a word, completing its structure of government. If the predicate is expressed by a transitive verb, a direct object, the most strongly governed element of the structure, is semantically necessary, although it is not a primary part of the sentence. It makes concrete that component of the semantics of the verb that can be called the orientation of the action. In describing the same real situation, a verb can be oriented toward different "participants" in the action (*vygruzhat'* ***ugol'*** *iz vagona*, "to unload **the coal** from the car"; *razgruzhat'* ***vagon***, "to unload **the car**"). The weaker the government, the more defined the semantics of the complement. For this reason, indirect complements characteristically have clearer semantic functions (for example, the instrumental complement in *zabivat' gvozd'* ***molotkom***, "to drive the nail in **with a hammer**").

Adverbial modifiers are sentence parts that govern weakly or not at all. The boundary between adverbial modifiers and complements is not clearly defined. For example, the verb *priezzhat'* ("to arrive [by vehicle]") requires an indication of the destination; that is, it is in complementary relation with the noun following (*priekhat'* ***v gorod***, "to arrive in **town**"). By this characteristic the noun can be considered a complement. At the same time, it has the meaning of location and can be replaced by an adverb of place (*priekhat'* ***tuda***, "to arive **there**"), which makes it similar to an adverbial modifier. The essential difference between an adverbial modifier and a complement is that each type of complement has one corresponding syntactic position, which is opened by verbal government and which permits completion by a number of nominals only if the nominals can be joined by a coordinating conjunction (*Ia prochital* ***eti knigi i zhurnaly***, "I read **those books and magazines**"). Each type of adverbial modifier can occupy several syntactic positions (***Letom s kontsa iulia do kontsa avgusta ia otdykhal na beregu Chernogo moria v Krymu v dome otdykha***, **"In summer from the end of July to the end of August** I vacationed **on the Black Sea Coast in the Crimea at a house of rest**").

The independence of adverbial modifiers from the meaning and the category features of the predicate provides some grounds for considering certain of their forms as expansions of a sentence structure deriving from a word group (***V Krymu*** *nastupili kholoda*, "**In the Crimea** it turned cold"; ***Na dvore*** *liven'*, "**Outside** it's pouring"). Adverbial modifiers expressing a logical relation between events or situations (adverbial modifiers of cause, purpose, condition, or concession) correspond to a truncated subordinate clause (*On ne priekhal* ***iz-za snezhnykh zanosov na dorogakh***, "He didn't come **because of the snowdrifts on the roads**," = *On ne priekhal,* ***potomu chto na dorogakh byli snezhnye zanosy***, "He didn't come **because there were snowdrifts on the roads**"). In expressing a feature, or characteristic, adverbial modifiers of manner are functionally similar to attributes (*bezhat' bystro*, "to run **fast**"; *bystryi beg*, "a **fast** run").

Sentence parts are distinguished on the basis of their form and content, as well as by the syntactic relation that inserts them into a sentence. Ambiguity in the interrelations between morphological, syntactic, and semantic features makes it difficult to separate sentence parts. In distinguishing a sentence part, different criteria are given preference in different cases. Thus, in distinguishing the sentence subject, whose semantic and communicative functions are not fixed, only a nominative case form is accepted. The forms of complements, which are established by verbal government, very often do not coincide with their function. For example, in the sentence *Direktor rukovodit bol'shim kollektivom* ("The director manages a large collective"), the noun complement *kollektivom* ("collective") is strongly governed by a verb that requires a complement in the instrumental case, rather than the accusative case, which is characteristic of the direct object. Each type of complement has several forms of expression, one of which is primary; for example, in Russian the accusative case form is the primary form for expressing the direct object. Adverbial modifiers and, to some extent, indirect complements are divided into types mainly on the basis of content features. Thus, a morphological criterion is crucial in determining the sentence subject. The syntactic relation realized by complements and attributes, which is attributive for attributes and complementary for complements, is used in distinguishing complements and attributes. Adverbial modifiers are determined on the basis of their semantic content.

SENTRY, an armed guard with the combat mission of protecting and defending an assigned post. According to the Regulations on Garrison and Guard Duty of the Armed Forces of the USSR, a sentry is inviolable, his rights and person specially protected by law. He is responsible only to the guard commander, the commander's assistant, or the sergeant of the relief and must be obeyed unquestioningly. He has the right to use arms in circumstances defined in the regulations.

A sentry must guard his post vigilantly and defend it staunchly and is authorized to use weapons without warning in the event of a clear attack on him or his post. While on duty, a sentry is prohibited from leaving his post, from sleeping, sitting, talking, eating, drinking, or smoking, or from engaging in activities that would prevent him from carrying out his mission. [29–75–2]

SERE, the totality of plant communities (phytocoenoses) that are present in response to changes of the principal environmental factor or factors. The main ecological factors may include moistening or salinization of the soil, the content of humus or mineral nutrients in the soil, and differing grassland and bottomland regimes. The sere is most often associated with changes in the moisture content or salinity of the soil or with simultaneous changes in both these factors.

The sere that best reflects changes in the soil moisture content is best observed on slopes in the floodplains of rivers. The soil at the bottom of the slopes usually has a higher moisture content than the soil at the top, with the result that the phytocoenoses of the lower portions contain plants that are more hygrophilous. Moreover, changes in the moisture content are usually accompanied by changes in a number of other factors (temperature, humus content in the soil), although the moisture content remains the principal ecological factor. Seres that are associated with simultaneous changes in both the salinity and moisture content of the soil may be observed along the shores of salt lakes and when the bottoms of such lakes become overgrown with vegetation as they dry out. Seres are also clearly manifested on the gently sloping shores of freshwater lakes that are in the process of bog formation.

A. M. BYLOVA [29–1774–2]

SERICULTURE, a branch of agriculture, the raising of silkworms for their cocoons, which are the raw materials used in the manufacture of silk. In the USSR the domesticated Asiatic silk-

worm moth *Bombyx mori* is cultivated; other countries also use the cocoons of some wild silkworms (*Antheraea pernyi, Philosamia cynthia*, and *Philosamia ricini*). The raising of Asiatic silkworm moths to obtain silk began about 5,000 years ago in China. In the territory of what is now the USSR, sericulture developed in Middle Asia and Transcaucasia between the fifth and seventh centuries. In Russia silkworm raising was mainly concentrated in the households of peasants; the facilities were usually not large, producing 10–15 g of silkworm eggs.

The first large-scale specialized sericultural sovkhozes were established in the USSR. State silkworm egg farms, centers for the primary processing of cocoons, and silk-reeling factories have also been built, and state and kolkhoz silkworm farms have been organized. A unified state system has been created for breeding and pedigree work and for the procurement and primary processing of cocoons. Soviet scientists have developed highly productive white-cocoon breeds and hybrids of silkworms and highly productive varieties of mulberry trees; more effective methods for cultivating the trees have also been developed. Such efforts have resulted in an average yield of 56–57 kg of cocoons per box of silkworm eggs containing 29 g of eggs. Cocoon production was 34,800 tons in 1965 and 45,000 tons in 1976. The production of raw silk totaled 2,600 tons in 1965 and 3,400 tons in 1976.

Production processes in sericulture include cultivation of mulberries, the leaves of which are the only food for the larvae of the silkworm moth (*see* MULBERRY CULTIVATION); production of silkworm eggs (*see* SILKWORM EGG FARMING); incubation and hatching of the eggs; rearing of the silkworms; and primary processing of cocoons, including killing and drying.

Incubation takes place in incubators having a capacity of 150–200 boxes of silkworm eggs. It is timed to coincide with the appearance of the first five–six leaves on the mulberry trees. The hardiest larvae obtained in the course of the first three days of hatching are kept for rearing. The silkworms are reared in special breeding houses, where a constant temperature and humidity are maintained according to the age of the silkworms. Larvae in the first three stages of growth are fed chopped leaves and young shoots. An average of 17–18 kg of leaves is needed to produce a 1 kg cocoon; 11–12 kg of leaves suffices on the best-run farms. Feeding is halted during the periods of sleep and molting, and the temperature is raised somewhat. Rearing is completed in approximately 35 days; the best-run farms complete rearing in 22–25 days. The majority of the cocoons are obtained from the spring generation. On some farms in the Ukraine, Moldavia, and the Northern Caucasus, several generations are reared by using the silkworm eggs of the hardiest varieties and hybrids and by planting the mulberries so that they produce young leaves during the period from summer to fall.

The aim of selective breeding in sericulture is the development of new, highly productive varieties. A notable achievement in the selective breeding of silkworms has been the genetic development of varieties that, when crossed, lay viable eggs of only the male sex. The males produce cocoons with more silk, and such an advance eliminates the labor-intensive operation of sorting out female eggs. Of crucial importance in the development of sericultural selective breeding were the works of B. L. Astaurov on the regulation of sex and the development of polyploid strains of silkworms, the introduction of commercial hybridization, and the use of the biological effects of thermal shock to disinfect live silkworm eggs infected with the pathogenic organism of pébrine (*Nosema bombycis*). Research in selective breeding is conducted at the Middle Asia Scientific Research Institute of Sericulture in Tashkent, the Azerbaijan Scientific Research Institute of Sericulture in Kirovabad, the Georgian Agricultural Institute, various institutes of the academies of sciences of the USSR and of the Union republics, and test stations. Sericultural stations or the corresponding shops on silkworm egg farms are responsible for increasing the number of silkworm varieties and improving their economic characteristics.

World production of silkworm cocoons totaled 438,700 tons in 1938 and 270,000 tons in 1974. Other major producers include Japan (106,000 tons in 1974), China (90,000 tons), and India (30,000 tons). Sericulture is also developed in Korea, Indochina, southern Europe, and Brazil.

SERRATIA MARCESCENS, a species of bacteria among the pigmented microorganisms. The gram-negative, motile, peritrichous, nonspore-forming bacilli are 0.6–1.0 micrometer long and 0.5 micrometer wide. According to metabolism, the bacteria are facultatively anaerobic. On an agar surface they form smooth or grainy dark and bright red columns with a metallic shine. *Serratia marcescens* live in the soil, in water, and in foodstuffs. The bacteria develop in milk and on bread when there is increased moisture. The milk and bread turn reddish and may not be sold. The bacteria are a potential pathogen for animals and man and can cause suppuration. [29–735–3]

SERVICE BALLOON, a free balloon that, with a volume of up to 150 cu m, is designed to lift a person to an altitude of 100–150 m. The lifting force of the service balloon at the earth's surface is equal to the weight of a person or, sometimes, slightly less. During the 1930's service balloons were used to examine the envelopes of stratosphere balloons at their launch sites. [29–870–5]

ŠEŠUPĖ (Russian, Shiashupe; Polish, Szeszupa), a river that flows in the Lithuanian SSR and Kaliningrad Oblast, RSFSR, and has its source in Poland. A left tributary of the Neman, the Šešupė is 298 km long and drains an area of 6,100 sq km. The river, which rises in the Baltic Ridge, is fed primarily by rain. The mean flow rate 43 km from the mouth is 33.2 cu m per sec. The river freezes over between mid-November and January, and the ice breaks up between late February and early April. Cities on the Šešupė include Kalvarija, Kapsukas, Kudirkos Naumiestis, and Krasnoznamensk. [29–1569–1]

SETARIA, a genus of plants of the family Gramineae. The plants are perennial or annual herbs with flat leaf blades. The inflorescence is a cylindrical or, less commonly, somewhat lobular spicate panicle with very short branchlets. The spikelets are two-flowered and surrounded by rough bristles, or setae.

There are more than 120 species, distributed in tropical, subtropical, warm-temperate, and—to a lesser extent—temperate regions. The USSR has nine species. Particularly widely distributed are *S. glauca* and *S. viridis*, both of which are weeds that contaminate mainly spring crops, for example, millet. The plants occur along garden paths, in sands along rivers, in gravelly areas, and in pine forests. Young plants serve as pasturage for all domestic animals; the grain is readily eaten by domestic fowl. The genus includes a number of important cultivated crops, for example, several varieties of foxtail millet (*S. italica*).

T. V. EGOROVA [29–1600–2]

SEWING MACHINE, a machine for joining or finishing sections of garments. It is used in the clothing, knitwear, footwear, and other branches of light industry as well as in the home.

The sewing machine was invented in the second half of the 18th century. The first designs typically imitated the method of hand stitching. After J. Madersperger invented the needle with the eye at the point in 1814, a number of investigators (Fisher, Gibbons, W. Hunt, E. Howe, and others) began working to devise stitching that would make use of such a needle. In 1845, Howe obtained a US patent for a lockstitch sewing machine that operated at a rate of 300 stitches per min. The needle in Howe's machine moved horizontally, and the fabrics being sewn were positioned in a vertical plane and could only be moved along a straight line. In the machines designed by Gibbs, I. M. Singer (1851), and A. B. Wilson (1850), the needle was arranged in a vertical position, and the fabric, which was held by a presser foot, was posi-

tioned on a horizontal platform and advanced intermittently by a gear wheel (later, by a rack). With development the sewing machine became more complex and was improved; it has become faster and more specialized.

Depending on the application, sewing machines may be classified as conventional stitching (single-needle and multineedle), serging, blind-stitching, button-sewing, and other types. A distinction is also made between universal machines that can sew various kinds of seams, stitches of different lengths, and stitches in different directions and specialized machines designed to perform specific operations; the latter are usually semiautomatic. Sewing machines are also subdivided into two groups according to the interlacing of the thread in a stitch: machines with a lockstitch and those with a chain stitch. All machines in each subgroup have many features in common, such as the principle of operation and the design of the operating members.

The most common universal machines are single-needle, lockstitch types, in which the needle, thread tensioner, shuttle, and cloth-moving mechanisms are the major elements. The needle mechanism imparts a reciprocating or oscillating motion to the needle, which has the thread passing through its eye. The material is punctured by the needle, the needle thread is drawn through the material from above, and a loop is formed by the eye of the needle. The shuttle mechanism captures the loop and passes it around a bobbin case. The thread tensioner unwinds thread from a spool, pulls it from the shuttle, and tightens the stitch. The cloth-moving mechanism shifts the material a distance equal to the length of the stitch. All mechanisms are driven from a main shaft that is rotated by an electric or mechanical drive.

The design, dimensions, shape, speeds, and other characteristics of the sewing machines used industrially (as in the clothing industry) are dictated by the assigned tasks, the size of the articles, the properties and thickness of the material, and other considerations. Many machines are equipped with mechanisms for trimming the fabric, pinking, and other functions. Machines used in the home are also of the universal lockstitch type. In addition to straight sewing, they can sew zigzag stitches, which are used to serge cloth parts, attach lace and appliqué, and finish articles. The use of additional, interchangeable attachments on such machines makes it possible to serge buttonholes and sew on hooks and buttons.

The largest group of universal stitching machines is composed of single-needle machines for single-thread and especially two-thread chain stitching, which provides more flexible and stretchable seams compared with those of lockstitch machines. The most common multineedle machines are two-needle types, but machines having three and four needles are also in use. Models with up to 12 or 14 needles are used to fasten materials in parallel stitches.

Serging machines may be used to stitch a material and simultaneously serge parts or only to serge the edge of the material to provide bar tacks. They usually produce a chain stitch and are used especially in the manufacture of knitwear and fur articles. Zigzag machines are used to join materials edge to edge, to serge a section of fabric, to make seams for certain linings, to sew on lace, and to finish articles. Machines in this group produce both simple and complicated stitches with a lockstitch or chainstitch type of thread interlacing. Machines capable of blind stitching are intended for making running stitches on collars and side interlinings and for various other operations in which topstitches and running stitches are used. In such machines a curved needle oscillates along an arc, penetrates the first fabric completely, but only partially penetrates the second (face) fabric, so that the stitches are not visible from the front. The threads may be interlaced as in a lockstitch or a chain stitch.

Button sewers are used to attach flat buttons having two or four holes and shank buttons, as well as to wind thread around the button shank. Buttonholers fashion the edges of buttonholes, cut the apertures to the required size and shape, provide bar tacks on slit ends, and cut off the ends of the thread when the sewing is completed. They use carcass thread to sew straight buttonholes without bars or with two bars at each end and fancy buttonholes with an eyelet. In embroidery machines, several needles, shuttles, and fabric-moving mechanisms operate in synchronism and produce the same pattern simultaneously on several pieces of cloth held in embroidery frames. The frames are moved simultaneously in a specific direction over the necessary distance corresponding to the pattern being embroidered. Button sewers, buttonholers, embroidery machines, bar-tack machines, and various other types of sewing machines are semiautomatic. Similar machines are used to join fabrics with welded or glued seams.

ŞEYHİ, SİNAN. Born 1370's in Kütahya; died 1422 or 1431 in Dumlupınar. Turkish poet. One of the founders of the secular *mathnawi* (long narrative poem consisting of rhymed distichs) in medieval Turkish literature.

Şeyhi was educated in medicine in Iran. He was the court physician of Sultan Mahmud I and the pupil and friend of the poet Ahmedi. He was the author of a divan of lyric poems that included ghazals, qasidas, and *rubais*. He became famous for his narrative poem *Khusrau and Shirin*, a "reply" to Nizami's poem of the same name, and for his *Book of an Ass*, one of the earliest works of medieval Turkish satire. Şeyhi was the first Turkish writer to use *aruz*, a complex system of versification borrowed from classical Persian poetry.

SHAAMIRIAN, SHAAMIR SULTANUM. Born 1723 in Iran; died 1798. Armenian public figure and Enlightenment thinker.

A wealthy merchant, Shaamirian conducted trade in India. From 1770 to 1790 he headed a printing house and an Armenian patriotic circle in Madras; M. Bagramian was a member of the circle. Shaamirian helped develop the idea that Armenia should be liberated from Iranian and Turkish supremacy through a people's revolution, and he affirmed that only in alliance with Russia could Armenia attain and preserve its national independence. In the publicist work *The Pitfall of Ambition* (most recent edition: Tiflis, 1913, in Armenian), Shaamirian criticized feudal monarchical state systems and set forth the republican principles that he believed should be the foundation of the state system of a free Armenia.

SHAARTUZ, an urban-type settlement and the administrative center of Shaartuz Raion, Kurgan-Tiube Oblast, Tadzhik SSR. Shaartuz is located in the Kafirnigan River valley. It has a railroad station and a cotton-ginning plant. [29–787–3]

SHABA (until 1972, Katanga), a province in southeastern Zaïre; the chief mining region of the country and one of the most important mining regions in Africa. Area, 497,000 sq km. Population, 3.1 million (1974). The city of Lubumbashi is the capital of the province.

In the southern part of Shaba, along the border with Zambia, stretches a belt of rich copper deposits; the copper is found together with cobalt, zinc, uranium, and other metals. There are three main groups of deposits: the central group is centered at Likasi, the southeastern group at Lubumbashi, and the western group at Kolwezi. The western group yields more than two-thirds of Shaba's total output of copper and complex ores.

Metallurgical works are located in Lubumbashi (copper), Li-

kasi (copper and cobalt), Kolwezi (zinc, cadmium, and germanium), and Luilu (copper and cobalt). Electricity for the mining and metallurgical industries in the copper belt is supplied by the hydroelectric power plants of Le Marinel (258 megawatts) and Delcommune (108 megawatts) on the Lualaba River. In 1975 the companies of the copper belt produced a total of 495,000 tons of copper in the form of concentrates (452,000 tons of smelted copper), 12,100 tons of cobalt in the form of semifinished material (the highest amount in the capitalist world), and 79,000 tons of zinc (66,000 tons of smelted zinc).

Manganese ore is mined in Kisenge, in the southwestern part of the province (308,500 tons in 1975). Manono, which is located in the north, is the center for the mining of tin. Coal is mined in the Luena coalfield (0.1 million tons in 1975).

The cities of Shaba have chemical, cement, metalworking, textile, and food-processing plants. Mining and metallurgical products are exported through the ports of Matadi, Lobito (Angola), Beira (Mozambique), and Dar es Salaam (Tanzania); these ports all have rail or combined water-and-rail links with Shaba.

[29–787–4]

SHABAD, LEON MANUSOVICH. Born Jan. 6 (19), 1902, in Minsk. Soviet oncologist. Academician of the Academy of Medical Sciences of the USSR (1962). One of the founders of experimental oncology in the USSR. Member of the CPSU since 1953.

Shabad graduated from the First Leningrad Medical Institute in 1924. From 1938 to 1941 he was head of the subdepartment of pathological anatomy of the Second Leningrad Medical Institute. Beginning in 1935 he was head of the laboratories of experimental oncology of the All-Union Institute of Experimental Medicine and various institutes of morphology and oncology of the Academy of Medical Sciences of the USSR. In 1958 he became head of the department of carcinogenic agents of the All-Union Institute of Experimental Medicine.

Shabad has worked mainly on chemical carcinogenesis, precancers, the prevention of malignant tumors, and the history of oncology. He discovered (1937) endogenous chemical carcinogens in the human body. He was awarded the International Prize of the World Health Organization in 1962 for the best work on cancer and methods of combating cancer.

Shabad is a foreign member of the Polish Academy of Sciences and of many scientific oncological societies. He is an honorary doctor of Charles University in Prague and an honorary member of The New York Academy of Sciences. He was awarded the Order of Lenin, the Order of the Badge of Honor, and several medals.

SHABALIN, ALEKSANDR OSIPOVICH. Born Oct. 22 (Nov. 4), 1914, in the village of Iudmozero, in what is now Onega Raion, Arkhangel'sk Oblast. Twice Hero of the Soviet Union (Feb. 22, 1944, and Nov. 5, 1944). Rear admiral (1969). Member of the CPSU since 1943.

Shabalin, the son of a peasant, joined the navy in 1936. In 1939 he passed an examination to qualify for the rank of officer. He graduated from the Caspian Higher Naval School in 1951 and the academic courses of the Naval Academy in 1955. He fought in the Soviet-Finnish War of 1939–40 as commander of a motor torpedo boat.

During the Great Patriotic War (1941–45), Shabalin commanded a motor torpedo boat and a unit and detachment of motor torpedo boats in the Northern and Baltic fleets. He personally sank seven enemy ships, four supply ships, and one motor boat. After he assumed command of the detachment in February 1944, 25 enemy ships were sunk. Since 1957, Shabalin has held leadership posts in higher naval educational institutions.

Shabalin, the recipient of two Orders of Lenin, has been awarded three Orders of the Red Banner, the Order of the Patriotic War Second Class, the Order of the Red Star, and the Order for Serving the Homeland in the Armed Forces of the USSR Third Class. He has also received numerous medals. A bust of Shabalin was placed in the city of Onega, Arkhangel'sk Oblast.

[29–789–2]

SHABBI, ABU AL-QASIM AL-. Born 1909 in the village of al-Shabbiya, near Tozeur; died 1934 in Tunis. Tunisian poet. One of the first romanticists in Arabic poetry; a classic author of modern Tunisian literature.

Al-Shabbi was the son of a Muslim judge who instilled in him the beliefs of M. Abdo and other Islamic reformers. In the early 1920's he studied at the Zaytunah higher Muslim religious school in Tunis. He graduated from the Tunis School of Law in 1930. He first published his works in 1926.

Al-Shabbi had a perfect command of the classical traditions of Arabic poetry but contrasted it with the poetry of sentiment in the spirit of French romanticism, familiar to him from Arabic adaptations of the works of A. de Musset, A. de Lamartine, and T. Gautier. The romanticist rift between the ideal and the real was manifested in al-Shabbi's works as the tragic contradiction between contemporary Tunisian society ("a dead world . . . of ancient tombs") and the yearning for a spiritual rebirth and personal freedom (the collection *Songs of Life*, published 1955).

In 1929, in a public lecture entitled "Poetic Imagination Among the Arabs" (published 1929), Shabbi criticized the Arabic classical heritage and spoke out harshly against the prevailing traditionalism, to which he ascribed the self-isolation of Arabic literature from life and from other literatures of the world.

SHABEL'KOVKA, an urban-type settlement in Donetsk Oblast, Ukrainian SSR, under the jurisdiction of the Kramatorsk city soviet. Shabel'kovka is 4 km from Kramatorsk. The settlement has a vegetable and dairy sovkhoz and a sovkhoz where fruit plants are raised for transplantation. Most of the inhabitants of Shabel'kovka work in enterprises in Kramatorsk. [29–791–2]

SHABENDE (pen name of Abdulla, son of Miami). Born circa 1720; died 1800. Turkmen poet improviser. Born and lived in the region of Kunia-Urgench and Vas, in what is now Tashauz Oblast, Turkmen SSR.

Shabende studied in a madrasa in Khiva. He wrote lyric poetry and the *dastans Shabekhram, Gul' and Bul'bul* (1800), and *Khodzhamberdikhan*. The poetic style of his *dastans* is similar to that of Turkmen folklore. Many of his song poems entered the repertoire of the *bakhshi*.

Shabende's works are mainly written in Turkic meter, with lines of eight, 11, and 14 syllables. They also include quantitative verses, for example, *ghazals, rubaiyat*, and *mukhammas*.

SHABESTARI, MAHMUD. Born circa 1287 in the village of Shabestar, near Tabriz; died there circa 1320. Azerbaijani poet and philosopher who wrote in Farsi.

Shabestari, a follower and teacher of Sufism, exerted an appreciable influence on the development of social thought in Azerbaijan and in the countries of the Middle East. He wrote *The Book of Happiness, Treasury of Truths, The Truth-seekers' Looking Glass, Book of an Eyewitness*, and other literary and philosophical works in verse.

Shabestari achieved fame for his narrative poem *Golshan-e raz* (*The Mystic Rose Garden*), one of the oldest sources setting forth the principles of Sufi symbolism. In 1835, J. von Hammer-Purgstall made a complete translation of the poem into German. The poem has been published in many countries.

SHABLIOVSKII, EVGENII STEPANOVICH. Born Apr. 14 (27), 1906, in Kamen'-Kashirskii, in what is now Volyn' Oblast. Soviet literary scholar. Corresponding member of the Academy of Sciences of the Ukrainian SSR (1934). Member of the CPSU since 1928.

Shabliovskii graduated from the department of history and philology of the Kiev Institute of Public Education in 1930. He has written studies on the history and theory of Ukrainian literature, monographs on the work of T. G. Shevchenko, and studies of such writers as L. Ukrainka, I. Ia. Franko, V. S. Stefanik, and N. I. Kostomarov. He received the Lenin Prize in 1964 for his book *T. G. Shevchenko and the Russian Revolutionary Democrats, 1858–1861* (1962). Shabliovskii's works have been translated into foreign languages and languages of the USSR.

SHABLYKINO, an urban-type settlement and the administrative center of Shablykino Raion, Orel Oblast, RSFSR. Shablykino is 68 km from Orel and 40 km from the Karachev railroad station on the Orel-Briansk line. The settlement has a hemp-processing plant, a starch factory, a creamery, and a brickyard. [29–792–2]

SHABROVSKII, an urban-type settlement in Sverdlovsk Oblast, RSFSR, under the jurisdiction of the Chkalovskii raion soviet of the city of Sverdlovsk. Shabrovskii is 25 km south of Sverdlovsk. A talc combine is located in the settlement, and marble is quarried nearby. [29–793–3]

SHABULIN, MIKHAIL NIKOLAEVICH. Born Nov. 6, 1887, in the village of Mikhalkovo, in what is now Novoderevenskii Raion, Riazan' Oblast; died Sept. 6, 1925, in Yalta. Participant in the revolutionary movement in Russia. Member of the Communist Party from 1904.

Shabulin was the son of a peasant. He graduated from the Riazan' Teachers' Seminary in 1906 and taught in Riazan' Province. He conducted party work among the peasants and was arrested several times. In 1913 he began teaching at the Moscow Teachers' Institute. In 1916, Shabulin was called into the army; after graduating from the Aleksei Military School, he was sent to the front. After the February Revolution of 1917 he served on a regimental committee and the executive committees of the Lutsk soviet and of the soviet of the Special Army of the Southwestern Front. In May 1917, Shabulin became a member of the united army committee of the RSDLP, and from June to September he was deputy chairman of the committee. In December he served on the revolutionary military committee of the Special Army.

In 1918, Shabulin returned to Riazan', where he became deputy provincial commissar of education. He served as deputy chairman of the provincial executive committee and, in 1919 and 1920, as chairman of the committee. From August to November 1919 he was a member of the revolutionary military committee of Riazan' Province. In 1920 he undertook party work on the Sovetskii Kavkaz and Oktiabr'skaia Revoliutsiia, two agitational trains of the All-Russian Central Executive Committee; the trains operated in the Northern Caucasus and Siberia. In 1921, Shabulin began conducting party and Soviet work in Yalta.

Shabulin was a member of the All-Russian Central Executive Committee, and he served as a delegate to the Ninth Congress of the RCP(B) in 1920. [29–793–5]

SHACKLETON, ERNEST HENRY. Born Feb. 15, 1874, in Kilkee; died Jan. 5, 1922, on South Georgia Island. British antarctic explorer.

From 1901 to 1903, Shackleton was a member of R. F. Scott's expedition. In 1908–09 he headed an expedition aboard the *Nimrod*. The expedition split up into three groups, one of which, led by Shackleton, set off for the south pole. The group never reached the pole, traveling as far as 88°23′ S lat.; en route it discovered the Beardmore Glacier. In the period 1914–17, Shackleton organized and led a transantarctic expedition. The expedition succeeded in exploring only part of the coast of Coats Land (called Caird Coast by Shackleton) because its ship, the *Endurance*, was trapped in the ice and crushed. In 1921, Shackleton once again set off for antarctic shores, aboard the *Quest*, but he died en route.

A coast, an ice shelf, and a strait in Antarctica and three mountains (Antarctica, Canada, and eastern Greenland) have been named after Shackleton.

WORKS

In Russian translation:

V Serdtse Antarktiki. Moscow, 1957. [29–1089–3]

SHACKLETON COAST, the northeastern slope of the Transantarctic Mountains in Antarctica, bordering on the Ross Ice Shelf between 80°30′ and 83°31′ S lat. Shackleton coast, which measures about 350 km in length, is an almost continuous chain of mountain ranges separated by outlet glaciers. The summits rise to more than 3,000 m. The slopes of the mountains are separated from the Ross Ice Shelf by steep ice precipices and broad crevasses. Discovered in 1902 by R. F. Scott's expedition, the coast is named in honor of E. Shackleton. [29–1090–1]

SHACKLETON ICE SHELF, an ice shelf in Eastern Antarctica, on the coast of Queen Mary Land (or Queen Mary Coast) and Wilkes Land, between 95° and 105° E long. The Shackleton Ice Shelf measures 440 km from west to east and 170 km from south to north. It has an area of 37,400 sq km and is 180–200 m thick. The thick Scott and Denman outlet glaciers feed into the middle parts of the shelf. Individual ice domes rise 250–300 m above the ice surface. The Shackleton Ice Shelf separates the Bunger Oasis from the Mawson Sea; the oasis' lagoons are connected with the ocean beneath the ice. The shelf was discovered in 1840 by the American expedition of C. Wilkes and was named in honor of E. Shackleton by D. Mawson's Australian antarctic expedition (1911–14). The first detailed study of the ice shelf was made by the Soviet antarctic expedition of 1956–58. [29–1090–2]

SHAD (*Alosa sapidissima*), a fish of the family Clupeidae (herrings). The largest of the anadromous herrings, the shad is up to 75 cm long and weighs up to 6.4 kg. It is found along the Atlantic coast of North America, from the Gulf of St. Lawrence to Florida. It has been acclimatized in the Pacific Ocean, where it is found from Alaska to San Diego and near Kamchatka. The fish ascend rivers to spawn in the spring. The eggs are deposited in batches. Fecundity is up to 150,000 eggs. The diet consists of plankton (usually the larger forms) and, sometimes, fry. The shad is a valuable commercial fish. In recent years, the catch has decreased considerably because of pollution and the regulation of rivers.

SHADAEV, APOLLON INNOKENT'EVICH. Born Dec. 2 (15), 1902, in the *ulus* of Khurdut, in what is now the Ust'-Orda Buriat Autonomous Okrug, Irkutsk Oblast; died June 15, 1969, in Ulan-Ude. Soviet Buriat writer. Member of the CPSU from 1941.

Shadaev is best known for his comedy *Mergen* (1938), which is about the establishment of kolkhozes in Buriatia. He is the author of the plays *Limbe* (1935), *Bair* (in collaboration with G. Tsydynzhapov; staged 1938), *Two Untruths* (1945), *Spring Joy* (1947), *The Winged Fish* (1956), and *The Mistake of Erkhete the Blacksmith* (1965). A scholar and collector of Buriat folk tales, he published the collections *Budamshu* (1949), *The Magic Stone* (1958), and *The Little Golden Egg* (1967). Shadaev's works have been translated into the languages of the peoples of the USSR. He was awarded the order of the Badge of Honor.

SHADDADID, a feudal dynasty of Kurdish descent in Aran and Armenia from approximately 951 to 1199. The founder of the dynasty was Muhammad ibn-Shaddad, who established his rule in the city of Dvin. In Gandzha (now Kirovabad) the main branch of the Shaddadids ruled from the 970's until the Seljuk conquest of 1075. Manuchihr ibn-Shavur II founded the Ani branch of the Shaddadids in about 1072. After the incorporation of the city of Ani into Georgia in 1199, the Shaddadid dynasty came to an end.

SHADED-POLE MOTOR, a squirrel-cage induction motor in which a rotating magnetic field is created by the field winding (FW) and a short-circuited winding (SW) that encircles a part of each stator pole (Figure 1). The pulsating magnetic flux produced by FW induces currents in SW that, according to Lentz's law, cause the pulsating magnetic flux through SW to be delayed compared with the other portion. This is the shading effect of SW. The rotor turns under the influence of the magnetic field that is created by the magnetic fluxes from the shaded and unshaded parts of the stator poles as a result of the displacement of the flux axes by angle θ and of the pulsation of the fluxes with the time lag.

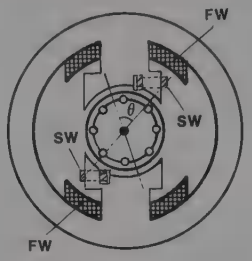

Figure 1. Cross section of a shaded-pole motor: (FW) field winding, (SW) short-circuited winding, (θ) angle between the axes of the magnetic fluxes from the shaded and unshaded parts of the stator poles

Shaded-pole motors are used to drive tape recorders, record players, table fans, and other equipment for which a power of 20–300 watts is sufficient.

SHADR, IVAN DMITRIEVICH (real surname, Ivanov). Born Jan. 30 (Feb. 11), 1887, in Shadrinsk, in what is now Kurgan Oblast, RSFSR; died Apr. 3, 1941, in Moscow. Soviet sculptor.

Shadr studied under T. Zal'kaln at a commercial art school in Ekaterinburg from 1903 to 1907 and at the drawing school of the Society for the Promotion of the Arts in St. Petersburg in the years 1907 and 1908. In 1910 and 1911 he studied in Paris, where he profited from the advice of E. A. Bourdelle and A. Rodin, and in 1911 and 1912 he was in Rome. In 1926 he became a member of the Society of Russian Sculptors.

Shadr's early works, for example, his design for the unrealized *Monument to World Suffering* (1915), reveal the influence of *art nouveau*. Shadr helped carry out Lenin's plan of monument propaganda. The revolution had a considerable impact on his work; his romantic, generalized depictions took on a more concrete meaning, expressing zeal for social transformation. Shadr's mastery of plastic form aided him in his expressive and true-to-life series *The Red Army Soldier, The Worker, The Sower*, and *The Peasant*, which was intended for reproduction on postage stamps, bank notes, and bonds (all in plaster, 1922, Museum of the Revolution of the USSR, Moscow; cast in bronze, 1951, Tret'iakov Gallery).

Shadr's sculpture *The Cobblestone—Weapon of the Proletariat* dynamically portrays a young worker ripping a cobblestone from the pavement. The work has become symbolic of the rising revolutionary force of the popular masses.

Beginning in 1924, Shadr devoted a good deal of time to depicting V. I. Lenin. His monument to Lenin on the dam of the Zemo-Avchaly Hydroelectric Power Plant in the Georgian SSR is one of the best of Soviet monuments. The sculpture renders the leader's great historical importance with lifelike veracity. It fits organically into the surrounding mountainous landscape, with the power plant and dam. The culmination of Shadr's accomplishments in monumental sculpture was his design for the monument to M. Gorky in Moscow (bronze, 1939, Tret'iakov Gallery), which was executed by V. I. Mukhina together with N. G. Zelenskaia and Z. G. Ivanova (bronze and granite, 1951).

Shadr tended toward symbolic generalization in his portraits, for example, *The Mother* (plaster, 1922, collection of T. V. Shadr-Ivanova, Moscow; bronze, Tret'iakov Gallery) and *Maksim Gorky: The Stormy Petrel* (bronze, 1939, Tret'iakov Gallery). This tendency is also evident in his gravestones, for exam-

ple, that of E. N. Nemirovich-Danchenko (marble and labradorite, 1939, Novodevich'e Cemetery, Moscow).

Shadr's works are pervaded with revolutionary romanticism. They were important in establishing socialist realism in Soviet sculpture.

SHADRINSK, a city under oblast jurisdiction and administrative center of Shadrinsk Raion, Kurgan Oblast, RSFSR. Situated on the left bank of the Iset' River (Ob' River basin). Railroad station on the Sverdlovsk-Kurgan line, 146 km northwest of Kurgan. Population, 82,000 (1977).

Shadrinsk produces units for motor vehicles, printing machinery, metal structural units, and reinforced-concrete and keramzit products. The city also has a plant for the repair of metallurgical equipment, a brickyard, a tannery, a brewery, a distillery, and factories for the production of clothing, felt footwear, and leather clothing accessories and footwear. Other enterprises include a meat- and poultry-packing plant, a food-processing combine, and shops servicing the railroad industry.

Shadrinsk has a pedagogical institute and technicums of auto repair, financial studies, industrial pedagogical training, cooperative agriculture, and physical culture. It also has a medical school. The city has a drama theater and a museum of local lore. [29–807–1]

SHADRINSK GOOSE (also Ural goose), a breed developed in the 17th century in the southern Urals through the selection and breeding of the best specimens of tamed wild greylag geese. The body is short, deep, and broad. The plumage is white, gray, or of motley colors. The male weighs 5–7 kg, and the female, 4–5 kg. The egg-laying capacity is 30–40 eggs, each egg weighing 160 g. The Shadrinsk goose is bred in Kurgan, Sverdlovsk, Tiumen', and other oblasts. [29–807–2]

SHAFAREVICH, IGOR' ROSTISLAVOVICH. Born June 3, 1923, in Zhitomir. Soviet mathematician. Corresponding member of the Academy of Sciences of the USSR (1958).

Shafarevich graduated from Moscow University in 1940; he joined the university's teaching staff in 1944 and was appointed a professor in 1953. In 1943 he became associated with the Institute of Mathematics of the Academy of Sciences of the USSR. Shafarevich's principal works deal with algebra and the theory of algebraic numbers. Shafarevich received the Lenin Prize in 1959.

Osnovy algebraicheskoi geometrii. Moscow, 1972. [29–886–4]

SHAFFER, GORDON. Born Oct. 1, 1905. Public and political figure of Great Britain. A journalist by profession.

From 1937 to 1953, Shaffer contributed to the newspaper *Reynold's News*. He then became an editor of the *Journalist*, a magazine published by the National League of Journalists. Until 1972 he was president of the British Committee for the Defense of Peace, and in 1971 he became president of the British Committee for European Security and Cooperation. In 1972, Shaffer became the vice-president of the National Peace Council. He is a member of the World Peace Council.

In 1964, Shaffer received the International Lenin Prize for Strengthening Peace Among Nations. [29–890–1]

SHAFI AHMED AL-SHEIK, AL-. Born May 2, 1924; died July 26, 1971. Figure in the Sudanese and international working-class movement.

After graduating from a technical school in the city of Atbarah, al-Sheik worked in railroad workshops and took part in the communist and working-class movement. He was a member of the Politburo of the Sudanese Communist Party, and in 1950 he became general secretary of the Sudan Workers Trade Union Federation. He was subjected to repression by the reactionary authorities several times. In 1957, al-Sheik became vice-president of the World Federation of Trade Unions. In 1965 he became a member of the World Peace Council. In 1971 the Sudanese authorities accused al-Sheik of taking part in an attempted coup d'etat, and he was executed by order of a military tribunal.

In 1970, al-Sheik received the Lenin Prize for Strengthening Peace Among Nations. [29–887–3]

SHAFIROV, PETR PAVLOVICH. Born 1669; died Mar. 1 (12), 1739, in St. Petersburg. Russian state figure and diplomat; baron (from 1710).

Shafirov came from a Jewish family. In 1691 he took up his father's profession and began serving as an interpreter and translator in the Posol'skii Prikaz (Foreign Office). In 1697 and 1698 he took part in the Great Embassy in Western Europe; during this time, Peter I brought Shafirov into his own service. In 1703, Shafirov became a privy secretary to Chancellor F. A. Golovin, and in 1709 he became vice-chancellor and director of the postal service. Shafirov concluded the Prut Peace Treaty of 1711 with Turkey, and he signed the alliance agreements with Poland and Denmark in 1715 and with Prussia and France in 1717. In 1717 he became vice-president of the Collegium of Foreign Affairs. He helped with preparations for the conclusion of the Treaty of Nystadt with Sweden, which was signed in 1721.

In 1723, as a result of a struggle among groups at the court, Shafirov was accused of embezzlement of public funds and was sentenced to death; the sentence was commuted to exile for life. Shafirov was sent to Nizhny Novgorod to serve his sentence, but in 1725 he was pardoned by Catherine I and was made president of the Commerce Collegium. During the reign of Emperor Peter II (1727–30), Shafirov was in retirement. From 1730 to 1732 he served as Russian ambassador in Tehran, and in 1732 he concluded the Treaty of Resht with Iran. In 1733, Shafirov again became president of the Commerce Collegium.

WORKS

Rassuzhdenie, kakie zakonnye prichiny e. v. Petr Velikii . . . k nachatiiu voiny protiv korolia Karla XII Shvedskogo v 1700 godu imel, 3rd ed. St. Petersburg, 1722. [29–888–1]

SHAFONSKII, AFANASII FILIMONOVICH. Born Dec. 13 (24), 1740, in the village of Sosnitsy, in what is now Chernigov Oblast; died Mar. 27 (Apr. 8), 1811, in the village of Iaklichi (Gapovka), in what is now Chernigov Oblast. Ukrainian economist, ethnographer, and physician.

Shafonskii was the son of a *sotnik* (cossack lieutenant). From 1756 to 1763 he studied at the universities of Halle, Leiden, and Strasbourg. In 1769 he became a senior physician at Moscow General Hospital, where he took part in the struggle against a plague epidemic. His book *A Description of the Plague in the Capital City of Moscow From 1770 to 1772* (parts 1–2, 1775) was translated into many foreign languages. In 1782, Shafonskii served in the criminal court of Chernigov Vicegerency; between 1784 and 1786 he compiled *A Topographical Description of Chernigov Vicegerency* (parts 1–2, 1851), which contains valuable material on the history, ethnography, and economy of the Left-bank Ukraine. [29–888–2]

SHAFRAN, DANIIL BORISOVICH. Born Feb. 13, 1923, in Leningrad. Soviet cellist. People's Artist of the USSR (1977).

In 1950, Shafran graduated from the Leningrad Conservatory, where he had studied cello with A. Ia. Shtrimer. He maintains a busy performance schedule in the USSR and abroad. Shafran won recognition for his profound interpretations of the classical cello repertoire and the works of Soviet composers. His playing is distinguished by a subtle poetic quality, a high level of artistry, and brilliant virtuosity. He took first prize in the All-Union Competition of Violinists and Cellists in Moscow in 1937 and the H. Wihan International Cello Competition in Prague in 1950. Shafran received the State Prize of the USSR in 1952.

SHAFRANOVO, an urban-type settlement in Al'sheevskii Raion, Bashkir ASSR. Shafranovo is situated on the right bank of the Kursak River (a left tributary of the Dema River), 137 km southwest of Ufa. It has a railroad station on the Ufa-Kuibyshev line. The settlement has a factory that makes tapestries and carpets. Limestone is mined in the area.

Shafranovo is a climatic health resort that provides koumiss treatment. Summers are warm (average July temperature, 19°C), and winters are moderately cold (average January temperature, −15°C). Annual precipitation is 415 mm. Shafranovo has a tuberculosis sanatorium. [29–889–1]

SHAFRANOVSKII, ILARION ILARIONOVICH. Born Mar. 11 (24), 1907, in St. Petersburg. Soviet crystallographer. Doctor of geological and mineralogical sciences (1943); professor (1945). Honored Scientist of the RSFSR (1973).

Shafranovskii graduated from Leningrad University in 1930. In 1931 he began working at the Leningrad Institute of Mines, where he became head of the subdepartment of crystallography in 1946. He also taught at Leningrad University from 1934 to 1948.

Shafranovskii's main works deal with crystal morphology, mineralogical crystallography, and the history of mineralogy and crystallography. Shafranovskii linked the morphology of crystals with the conditions of crystal formation and the effects of environmental symmetry. He worked out the theory of distorted crystal forms and devised the goniometric technique of describing rough diamonds.

Shafranovskii has been awarded the Order of the Red Banner of Labor and various medals.

SHAFTESBURY, THIRD EARL OF (Anthony Ashley Cooper). Born Feb. 26, 1671, in London; died Feb. 15, 1713, in Naples. English moral philosopher, aesthetician; deist.

A student of J. Locke, Shaftesbury expressed ideas characteristic of the early Enlightenment. A supporter of freethinking and an opponent of church religiosity and fanaticism, he saw reason as the single criterion of truth. Shaftesbury's philosophy was the expression of an extremely optimistic view of the world and history. Using Neoplatonic images borrowed particularly from the Cambridge Platonists, he drew a sweeping picture of a universe at the same time eternally created and in the process of being created, with a single origin of the true, the good, and the beautiful. Shaftesbury's image of the universe was the expression of man's striving for the ideal of harmonious naturalness as the reasonable order of human existence. Morality, according to him, is rooted in an innate human "moral sense"; its essence lies in the harmonious combination of individual and social inclinations. Shaftesbury's characteristic aesthetization of the world was linked with an assertion of the aesthetic nature of moral perfection, the indissoluble unity of beauty and morality (the dialogue *The Moralists: A Philosophical Rhapsody*, 1709). He analyzed the principles of classicist realism, elaborated the problem of character, which was crucial to Enlightenment art, and developed the doctrine of intrinsic form.

Shaftesbury's aesthetic ideas were systematized by British philosophy of the 18th century (F. Hutcheson and D. Hume) and were developed in English poetry and moralistic prose, beginning with A. Pope, J. Addison, and R. Steele. Shaftesbury strongly influenced aesthetic ideas in France (D. Diderot) and especially Germany (C. M. Wieland, J. G. Hamann, J. G. Herder, J. W. von Goethe, F. von Schiller, and the Jena romantics).

SHAFT FURNACE, a furnace that has an upright working chamber of circular, elliptical, or rectangular cross section and is used to smelt or roast lumped materials. The heat required for the smelting or roasting process is produced by the combustion of a fuel either directly in the furnace or in an external firebox from which hot combustion products are supplied to the furnace.

Moderate velocities of the gaseous combustion products are characteristic of shaft furnaces. At such velocities, the bulk of the lumped materials (the charge) is not entrained by the ascending gas stream and, in contrast to the case of a fluidized-bed furnace, maintains aerodynamic stability. The countercurrent motion of the charge (from the top to the bottom) and of the gases forced through the charge (from the bottom to the top) and the direct contact between the charge and the hot gases result in good heat exchange and the generation of low-temperature exhaust gases. Consequently, shaft furnaces are characterized by a high thermal efficiency and a relatively high output. Such furnaces are widely used to smelt iron ores (*see* BLAST-FURNACE PRODUCTION), pig iron (*see* FURNACE, CUPOLA), and the raw materials employed in nonferrous metallurgy, as well as to roast, for example, iron ore (in the direct reduction of iron ore) and limestone.

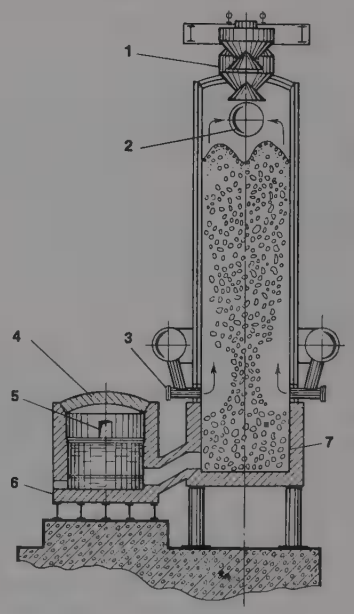

Figure 1. A shaft furnace: (1) charging device, (2) gas outlet, (3) tuyere, (4) outside crucible, (5) slag notch, (6) matte hole, (7) inside crucible

The shaft furnaces used in nonferrous metallurgy (Figure 1) are designed for continuous operation. They are low (<8 m high) because of the need to carry out smelting without the reduction of substantial amounts of iron oxides and are narrow (<2 m wide in the plane of the tuyeres); the length of the furnaces is 8–15 m. The main components of such a furnace are as follows: a top, through which the charge is loaded and the gaseous combustion products are discharged; a shaft equipped with tuyeres, through which either a blast for fuel combustion or hot gases are supplied; and an inside crucible with a refractory lining, where the molten products collect. The smelts are tapped through an outside crucible or directly from the inside crucible to a forehearth for the

stripping of the slags. The forehearth is often equipped for electric heating.

Formerly, shaft furnaces were constructed from metal jackets, through which water for cooling circulated (hence the obsolete name for shaft furnaces used in nonferrous metallurgy: the water-jacket furnace). Later, evaporative cooling came to be used instead of water cooling. The shaft is constructed of thick-walled tubing welded into units. Shaft furnaces are usually not lined since iron slags in nonferrous metallurgy readily dissolve refractory materials.

I. D. REZNIK [29–909–1]

SHAFT FURNACE, a firebox for the laminar combustion of moist solid fuel, such as lump peat or firewood. A shaft furnace has a tall loading shaft in which the fuel is dried and heated and volatile substances are partially released owing to the heat of the burning fuel bed below. As combustion progresses, the prepared beds in the upper part of the shaft move down to the combustion zone on the furnace grate. Shaft furnaces are used mainly to fire small boilers, that is, boilers with a steam output of up to 6.5 tons/hr. [29–911–1]

SHAGAN (also Chagan), a river in Semipalatinsk Oblast, Kazakh SSR; a left tributary of the Irtysh. The Shagan is 295 km long and drains an area of 25,400 sq km. It flows within the Kazakh Melkosopochnik. Fed primarily by snow, the river has a mean flow rate of approximately 1.02 cu m per sec. The upper course of the Shagan is dried up most of the year; it flows only during May and June. The lower course flows intermittently and sometimes divides into separate reaches. The Shagan freezes over in November, and the ice breaks up in early April. The Ashchisu is a right tributary of the Shagan. [29–800–1]

SHAGINIAN, GRANT AMAZASPOVICH. Born July 30, 1923, in the village of Giulasarak, Stepanavan Raion, Armenian SSR. Soviet gymnast. Honored Master of Sport (1951). Member of the CPSU since 1951.

Shaginian was Olympic champion in 1952, world champion in 1954, and Soviet champion six times between 1948 and 1955, taking part in individual competitions of combined events. He was all-around champion of the USSR in 1952.

Shaginian has been awarded two orders. [29–802–2]

SHAGINIAN, MARIETTA SERGEEVNA. Born Mar. 21 (Apr. 2), 1888, in Moscow. Soviet Russian writer. Hero of Socialist Labor (1976); doctor of philological sciences (1946); corresponding member of the Academy of Sciences of the Armenian SSR (1950). Member of the CPSU from 1942.

Shaginian, the daughter of an Armenian scholar and physician, graduated from the history and philosophy department of the Ger'e Advanced Courses for Women in 1912. From 1906 to 1912 she contributed to the Moscow press and later to the newspapers *Priazovskii krai* (The Azov Region), *Kavkazskoe slovo* (The Caucasian Word), and *Baku* (Baku). She published the books of poetry *First Encounters* (1909) and *Orientalia* (1913) and the short-story collections *Narrow Gates* (1914) and *Seven Conversations* (1915). In her novel *One's Destiny* (published in full in 1923), she appealed to the intelligentsia to reconsider their own destiny from the point of view of the people's destiny.

The October Revolution of 1917, which Shaginian enthusiastically welcomed, provided new themes for her writing, for example, the novella *The Change* (1923). Under the pen name Jim Dollar she published the series of agitation-adventure novellas *Mess-Mend* (1924–25), consisting of *A Yankee in Petrograd, Lori Len, Metalworker*, and *The Road to Baghdad*, which were published throughout the world by the working-class press and enjoyed enormous success; the series was adapted for the screen in 1926.

Shaginian's novel *Hydrocentral* (1930–31) deals with socialist construction and new human relationships. The novel reflects the years the author spent at the construction site of hydroelectric power plants in Armenia. It reveals her gift for exploring a literary theme, developing a plot, and providing an abundance of technical information. These qualities make *Hydrocentral* one of the best examples of the Soviet industrial novel.

In her numerous essays, including "Journey Through Soviet Armenia" (1950; State Prize of the USSR, 1951), Shaginian examines important phenomena of modern life against the scrupulously depicted panorama of Armenian culture and history. The book of sketches *Letters From Abroad* (1964) depicts postwar Europe's complex ideological struggle in the face of the growing forces of the socialist camp. Shaginian, a master of the literary portrait, wrote sketches of G. B. Iakulov, V. F. Khodasevich, S. V. Rachmaninoff, and W. Blake, as well as full-length biographical works, including *T. Shevchenko* (1941), *I. A. Krylov* (1944), *Studies on Nizami* (1955) and *Resurrection*, which is devoted to the Czech composer J. Mysliveček. Shaginian was also the author of various studies, essays, and articles, including several about Goethe, for example, *Journey to Weimar* (1914, published 1923) and *Goethe* (1950).

Themes drawn from Lenin's life occupy a special place in Shaginian's works. The historical and philosophical interpretation of various problems determined her success as a writer. Her chronicle novels *The Ul'ianov Family* (1938, rev. ed. 1957) and *The First All-Russian Exhibition* (1965) were awarded the Lenin Prize in 1972, along with several of her sketches. In the two novels, Shaginian details the history of Russia in the 1870's, shows the profound validity of Leninism as a historical phenomenon, and creates a vital image of Lenin as a man and thinker.

Shaginian's works have been translated into many languages of the peoples of the USSR, as well as foreign languages. She has been awarded two Orders of Lenin, the Order of the October Revolution, seven other orders, and several medals.

SHAGLYTENIZ, a closed freshwater lake on the boundary of Kokchetav and Severnyi Kazakhstan oblasts in the Kazakh SSR. The lake has a variable surface area, ordinarily 240 sq km but sometimes as much as 380. It is no more than 2 m deep. The lake is situated at an elevation of 135 m. It is fed primarily by melted snow and dries up periodically. The Chaglinka River flows into Lake Shaglyteniz. [29–803–1]

SHAGONAR, a city and administrative center of Ulug-Khem Raion, Tuva ASSR. Located on the left bank of the Enisei (Ulug-Khem) River, 124 km west of Kyzyl on the Kyzyl-Chadan highway. As a result of the construction of the Saian-Shushenskaia Hydroelectric Power Plant, Shagonar was situated in the flooding zone. Construction of a new Shagonar was undertaken in 1978, 7 km from the old town in the direction of Kyzyl.

[29–805–3]

SHAGOV, NIKOLAI ROMANOVICH. Born Mar. 4 (16), 1882, in the village of Klintsovo, Nerekhta District, Kostroma Province; died June 9, 1918, in Kostroma. Participant in the revolutionary movement in Russia. Member of the Communist Party from 1905.

The son of a weaver, Shagov was a worker. He took part in the Revolution of 1905–07 in Ivanovo-Voznesensk. From 1912 to

1914 he served as a deputy to the Fourth State Duma as a representative of the workers' curia of Kostroma Province. In 1913 he became a member of the Bolshevik fraction of the Fourth State Duma. Shagov contributed to *Pravda*, and in 1913 he took part in the Kraków and Poronin meetings of the Central Committee of the RSDLP with party workers.

Shagov was arrested in 1914 and exiled to Turukhansk Krai in 1915; after the February Revolution of 1917, seriously ill, he returned to Petrograd.

SHAGZHIN, TSYREN (also Tsyrenzhap Shagzhin). Born 1918 in the *ulus* of Kharashibir', in what is now Zaigraevo Raion, Buriat ASSR. Soviet Buriat playwright, actor, and stage director. People's Artist of the Buriat ASSR (1953). Member of the CPSU from 1943.

Shagzhin graduated from the School of Music and Theater in Ulan-Ude in 1938. His plays include *Cunning Budamshu* (1956), which is based on Buriat folklore; *The First Year* (1956) and *Conscience* (1961), which deal with life in a Buriat kolkhoz; *Song of Spring* (1957); *Flaming Hearts* (Russian translation, 1967); *The Oath* (1969); and the comedy *Devil in a Trunk* (1963). He also wrote short stories. Some of Shagzhin's works have been translated into languages of the peoples of the USSR.

Shagzhin has been awarded the Order of the Badge of Honor and several medals.

SHAH, the title of the monarch in several countries of the Middle East and in the Sultanate of Delhi in India. It was first used in the Sassanid state. [29–890–3]

SHAHBANDAR, ABDUL RAHMAN. Born 1886; died July 7, 1940. Syrian political figure; a physician by education and profession.

Shahbandar took part in the national liberation movement of the Arabs in the Ottoman Empire from 1908 to 1914. In 1925 and 1926 he was head of the People's Party (Hizb as-Shaab; founded 1925), and he took an active part in the Syrian National Uprising of 1925–27; in 1926 he commanded a partisan detachment in the Ghuta region. From December 1926 until 1937, he was in exile in Egypt. Shahbandar was killed by Muslim fanatics. [29–890–6]

SHAH-FAZYL (also Safid-Bulend), a monument of Asian architecture. Shah-Fazyl is a domed brick mausoleum with a concentric plan, located in the settlement of Safid-Bulend, Osh Oblast, Kirghiz SSR. It was probably built in the 11th or 12th century. The interior is richly ornamented with carved *ganch* (a mixture of burned gypsum and clay), some of which is tinted. [29–917–1]

SHAHI, a city in northern Iran, in the *ostan* (province) of Mazanderan; situated in the northern foothills of the Elburz Mountains. Population, 42,000 (1975). Shahi is a highway junction, and it has a station on the Bandar-e Shah–Tehran railroad line. The city is a center of the textile industry; the production of cotton fabric and sacking is of particular importance. Other industrial activity includes food processing. [29–892–2]

SHAHIN TANIYUS. Born 1815; died 1895. Leader of a peasant uprising in Kisrawan, northern Lebanon, in 1859 and 1860.

Shahin Taniyus was a blacksmith by trade. In January 1859 he instigated an uprising, during which the feudal lords of Kisrawan were driven out and the peasants assumed power. Shahin Taniyus remained in power until mid-1860, when the uprising was suppressed.

SHAH-I-ZINDAH, a unique monument of medieval Middle Asian architecture in Samarkand. Shah-i-Zindah is an ensemble of mausoleums of the Samarkand nobility. The first structures were built in the 11th and 12th centuries on the eastern slope of the fortified settlement of Afrasiab; excavations have revealed remains of mausoleums, a wooden portico, and a minaret. Most of the remains, however, date from the 14th and 15th centuries.

The ensemble consists of a narrow lane with groups of religious and memorial structures featuring bright polychromatic ornamentation of carved glazed terra-cotta, painted ceramic tiles, and compositions of mosaics. They include the mausoleum of Kusama ibn Abbasa (1334), with ornamental wall paintings and tiles, and several mausoleums of the Samarkand nobility with domes and portals, including Shadi-Mulk (1372, Bukhara architects Shamseddin, Bareddin Bukhari, and Zainuddin Bukhari) and Shirin-bek-aka (1385). The Tuman-aka complex, begun in the 15th century, consists of a chartak, a memorial mosque, and a mausoleum with a carved wooden door. Also of interest are the mausoleum of Kazi Zadeh al-Rumi (first third of the 15th century) and memorial mosques dating from the mid-15th century.

SHAH JAHAN. Born Jan. 5, 1592, in Lahore; died Jan. 22, 1666, in Agra. Ruler of the Mogul Empire (1627–58).

Shah Jahan's given name was Khurram; he received the titular name of Shah Jahan (literally, "ruler of the world") in 1616 for his victories in the Deccan. Between 1622 and 1625 he led a rebellion against his father, Jahangir, but he was defeated and forgiven. After becoming the Great Mogul in 1627, he killed his brothers and other relatives in order to be rid of pretenders to the throne. During Shah Jahan's reign magnificent structures were erected, including the Taj Mahal in Agra and the Red Fort and Jumma Masjid in Delhi; these structures are among the finest examples of Mogul architecture.

Despite its outward splendor, however, the Mogul Empire declined under Shah Jahan. Evidence of the decline may be seen in the terrible famine that struck the southern part of the country in 1630 and in the failure of numerous attempts to recover Kandahar, which had been captured by Iran. The spread of European trading companies in India intensified during Shah Jahan's reign.

A rumor of the emperor's death in 1658 led to internecine warfare among his sons, as a result of which the eldest, Aurangzeb, seized the throne. Thereafter, Shah Jahan was imprisoned in his chambers until he died in 1666. [29–891–6]

SHAHJAHANPUR, a city in northern India, in the state of Uttar Pradesh. Population, 144,000 (1971). Shahjahanpur is a trading and transportation center. The city's industries include the production of chemicals. Various branches of the food-processing industry are also represented in Shahjahanpur, including the refining of sugar. Carpet weaving is among the city's cottage industries. [29–892–1]

SHAHN, BEN. Born Sept. 12, 1898, in Kaunas, Lithuania; died Mar. 14, 1969, in New York City. American painter and graphic artist.

In 1906, Shahn was brought by his family to the USA. He studied at New York University, the College of the City of New York, and the National Academy of Design. Shahn's work dealt

with acute social problems, such as the injustice of the bourgeois world, the loneliness of urban man, and the strivings of simple people for peace. He expressed these themes in subjective, dramatic images closely related to the style of expressionism (*The Passion of Sacco and Vanzetti*, 1931–32, Whitney Museum of American Art, New York). Shahn was a master of fresco work (mural in the Bronx County Post Office, New York, 1938–39) and poster art.

SHAH-NAMEH (Book of Kings), the title of prose and verse collections of myths, epic legends, and historical chronicles of the Persian peoples. The most significant was the epic by Ferdowsi. Other collections have survived only in excerpts recounted by various authors. Originally the collections were entitled *Khvatay-namak*, and the title *Shah-nameh* appeared later.

The collections were first compiled during the rule of the Sassanids (third to sixth centuries) in Middle Persian, and in the eighth and ninth centuries they were translated into Arabic. None of these collections survives today in the original or in Arabic. In the tenth century, works entitled *Shah-nameh* were compiled in Farsi, based on the *Khvatay-namak* and other Middle Persian works, as well as on their Arabic translations.

The poet Masudi Marwazi wrote a verse *Shah-nameh*, which evidently incorporated the mythology, epos, and court chronicle of the Sassanids. The poet Abul Muayyad Balkhi wrote a prose *Shah-nameh*, which included *dastans* and episodes not found in Ferdowsi's work. In 957 the Abu Mansur prose collection was completed; the work was named for a Samanid military commander who financed its writing. Ferdowsi's version was begun by the poet Daqiqi, who managed to write no more than 1,000 *beyts* (couplets). The first version dates to 994, but it was not a complete version of the poem. The definitive version was written in 1010–11.

SHA HO, a river in the northeastern part of China, in the basin of the Liao Ho. From Sept. 22 (Oct. 5), to Oct. 4 (17), 1904, the Sha Ho was the scene of a major battle of the Russo-Japanese War of 1904–05.

After the Russian defeat in the battle of Liaoyang of 1904, the Russian Manchurian Army, under the command of General A. N. Kuropatkin, retreated to the vicinity of Mukden (Shenyang) and to the south. The Japanese First, Second, and Fourth armies (up to 150,000 men, 648 field guns, and 18 machine guns), under the command of Field Marshal I. Oyama, came to a halt north of the T'aitzu Ho. Kuropatkin, after receiving reinforcements, which increased the fighting capacity of the Russian Army to 195,000 infantry (in reality 150,000, since the Sixth Siberian Corps arrived only at the end of the battle), more than 19,000 cavalry, 758 field guns, and 32 machine guns, passed to the offensive in accordance with the tsar's orders to aid besieged Port Arthur and effect a turning point in the war. The operation was poorly organized: preparations were not kept secret and the choice of the area of the main thrust (in mountainous terrain) and the distribution of forces were unfortunate; moreover, the Russians had no maps of the terrain. The Japanese command, learning of the Russian plan, decided to meet the Russian forces in a prepared position, sap their strength, and then pass to the counteroffensive.

On September 22 (October 5), the Russian Army launched its offensive with the immediate objective of occupying the north bank of the T'aitzu Ho. The left wing, General A. Shtakel'berg's Eastern Detachment, which constituted one-third of all the forces, delivered the main thrust over mountainous terrain against Penhsihu with the goal of enveloping the enemy's right flank. The right wing, General A. A. Bil'derling's Western Detachment, which constituted one-fourth of all the forces, delivered an auxiliary strike at Liaoyang. Significant forces were held in reserve (one-fourth) and to protect the areas in the rear (one-sixth). The Russian troops advanced slowly, and it was only on the morning of September 23 (October 6) that the right wing reached the Sha Ho and the left wing approached the enemy forward position. Stubborn attacks by the Eastern Detachment against the Japanese First Army in the passes resulted in significant losses and failure. On September 27 (October 10), the Japanese Second and Fourth armies passed to the counteroffensive and on September 29 (October 12) succeeded in pushing the Western Detachment beyond the Sha Ho. On September 30 (October 13), the Eastern Detachment also began to withdraw. In early October, the Japanese forces attempted to develop the offensive on their left wing, but they were repulsed by Russian troops. Weakened by extensive losses (up to 40,000 Russians and, according to Japanese figures, 20,000 Japanese), both sides passed to the defensive. A stationary front 60 km long formed south of Mukden. [29–917–2]

SHAHR-ASHUB (also *shahrangiz*; literally, [verses] troubling a city), the general term for poems of the classical period of Persian-Tadzhik literature that aroused a stormy reaction among the residents of a medieval city. Some works written in the *shahr-ashub* genre exposed the misdeeds of city officials and noblemen, while others were associated with "artisan" poetry, which glorified handsome youths who worked in the town's shops, with specific references to their love affairs. The *shahr-ashub* consisted of distichs or quatrains written in the meter of *rubaiyat*, *ghazals*, or *qitahs*.

The first *shahr-ashub* were written as early as the tenth and 11th centuries by Rudaki, Kassai, Labibi, and Maghsadi. However, the genre became most popular in late-medieval cities. Safai Bukhari (died c. 1504) wrote a series of 48 "artisan" *ghazals*, Darvish Dikhaki (died 1531 or 1532) and Sayido Nasafi (died c. 1710) wrote 212 "dedications" to young artisans, and the Turkish poet Isa Masihi (1470–1512) wrote a cycle of *shahrangiz* consisting of 47 "portraits" of youths in Adrianople.

SHAHRASTANI, MUHAMMAD IBN ABD AL-KARIM AL-. Born 1086 in Shahrestan, in eastern Iran; died 1153. Muslim theologian and philosopher who wrote in Arabic.

Al-Shahrastani was the author of a collection of biographies of philosophers and scholars. His most significant work, *Religious Communities and Sects*, provides information about Islam and other religious and philosophical doctrines and about sects of antiquity and the Middle Ages, including schools of Greek philosophy, the Gnostics, the pagan beliefs of Iran and Central Asia, Judaic and Christian sects, and Indian religious and philosophical systems. [29–904–1]

SHAHREZA, a city in central Iran, in the *ostan* (province) of Isfahan, on the Bushehr-Tehran highway. Population, 36,000 (1975). Shahreza has a textile industry. [29–1169–1]

SHAHR-I SOKHTA, a multilevel Neolithic and Bronze Age settlement, located 40 km from the city of Zabol, in Iran. Shahr-i Sokhta was excavated by British (1916) and Italian (1967–71) ex-

peditions. Its development has been traced from a settlement of early farmers of the late fourth and early third millennia B.C., characterized by hand-modeled painted pottery, to an urban center of the second half of the third millennium B.C., with developed industry and monumental architecture. By the beginning of the second millennium B.C., Shahr-i Sokhta was no longer inhabited.

SHAHRISTAN, the territory of an early feudal city in Middle Asia. A *shahristan* usually had a rectangular layout with a more or less regular network of streets and was protected by a fortress wall with towers and gates. Sometimes a citadel was built inside the *shahristan*, for example, at the site of the ancient fortified city of Kafyr-Kala near Kolkhozabad in the Tadzhik SSR. The compactly built residential districts included meeting places, workshops, and small markets. Temples occupied a prominent place in the urban layout. Caravansaries were located outside the walls of the *shahristan*, as were suburban estates, a cemetery, and sometimes a citadel, as in Pendzhikent. With the development of feudalism, the *shahristan* developed an artisans' suburb, called a *rabad*.

SHAHRUD, a city in northern Iran, in the chief governorate of Semnan; situated in the southeastern foothills of the Elburz Mountains, on the highway and railroad linking Meshed and Tehran. Population, 32,000 (1975). Sugar is refined in Shahrud, which is the center of a viticultural and fruit-growing region. Chromite and coal are mined in the area. [29–905–5]

SHAH RUKH. Born 1377; died 1447. Ruler of Herat (Khorasan). Successor and youngest son of Tamerlane (Timur); father of Ulug Beg.

After several years of internecine warfare, Shah Rukh nominally attained supreme authority over all the areas conquered by Tamerlane. Under the rule of Shah Rukh, feudal relations underwent further development, and the system of landed estates was expanded by the granting of military feudal estates (*see* SOYURGHAL). Herat replaced Samarkand as the capital of the state.

The death of Shah Rukh was followed by a fierce power struggle among his successors, and the state of the Timurids disintegrated.

SHAIGINO, an urban-type settlement in Tonshaevo Raion, Gorky Oblast, RSFSR. Shaigino has a railroad station (Tonshaevo) on the Gorky-Kotel'nich line. A wood-products plant is located in the settlement. [29–809–1]

SHAIK, ABDULLA MUSTAFA OGLY (real surname, Talybzade). Born Feb. 12 (24), 1881, in Tiflis; died July 24, 1959, in Baku. Soviet Azerbaijani writer and teacher. Honored Art Worker of the Azerbaijan SSR (1941).

From 1898 to 1900, Shaik studied in Mashhad, Iran. In 1901 he took up residence in Baku and became a teacher. After the establishment of Soviet power in Azerbaijan he worked to build a socialist culture. In his prerevolutionary works, Shaik combined elements of realism and romanticism. He wrote powerful prose filled with criticism of social injustice and oppression. Outstanding examples include the novel *Heroes of Our Age* (1909), the novella *The Unhappy Family* (1912), and the story "The Letter Did Not Arrive" (1908), which describes the life of petroleum workers.

Shaik's poetry of the Soviet period is pervaded with patriotism and revolutionary optimism, for example, "It's All Ours" and "Rise Up!" His stories are devoted to the new life and expose vestiges of the past. Shaik's most significant prose work is the historical revolutionary novel *Araz* (1938), which is about the Baku proletariat and its struggle for freedom.

Shaik is the author of folktales in verse and the first Azerbaijani plays for children; he also produced a series of textbooks, teaching aids, and essays on literary criticism. He translated the works of Nizami, Ferdowsi, Shakespeare, A. S. Pushkin, I. A. Krylov, J. Swift, D. Defoe, and other authors into Azerbaijani. Shaik's works have been translated into numerous languages of the peoples of the USSR.

Shaik was a deputy to the second and fourth convocations of the Supreme Soviet of the USSR. He was awarded the Order of Lenin, the Order of the Red Banner of Labor, and several medals.

A. MIRAKHMEDOV [29–807–4]

SHAIKH AL-ISLAM. (1) In Islamic countries since the 11th century, a title of respect for ulama, or prominent theologians.

(2) In the Ottoman Empire from the mid-16th century to 1924, the mufti of Istanbul—that is, the head of the Muslim clergy, appointed by the sultan.

(3) In Iran during the reign of the Safavids, one of the chief judges among the ecclesiastical judges appointed by the shah. [29–1088–2]

SHAIKHET, ARKADII SAMOILOVICH. Born Aug. 28 (Sept. 9), 1898, in Nikolaev; died Nov. 18, 1959, in Moscow. Soviet photographer; one of the founders of Soviet photojournalism.

From 1922 to 1924, Shaikhet worked as a retoucher in a private photographer's studio in Moscow. Beginning in 1924 he contributed to the magazines *Ogonek*, *SSSR na stroike*, and *Nashi dostizheniia*. An important series of his photographs constitutes a chronicle of the first five-year plans. During the Great Patriotic War of 1941–45, Shaikhet took many pictures at the front.

Shaikhet was awarded two orders and various medals.

SHAIN, GRIGORII ABRAMOVICH. Born Apr. 7 (19), 1892, in Odessa; died Aug. 4, 1956, in Moscow; buried in the village of Goluboi Zaliv, in the Crimea. Soviet astrophysicist. Academician of the Academy of Sciences of the USSR (1939).

Shain graduated from the University of Iur'ev (Dorpat) in 1919. From 1921 to 1925 he worked at the Pulkovo Observatory, where he conducted research in celestial mechanics, the motion of meteors, and the application of relativity theory to variable and binary stars and carried out statistical studies of binary stars in relation to the problem of the evolution of their components. Beginning in 1925, he worked at the Simeiz branch of the Pulkovo Observatory, where he supervised the mounting of what was then the largest reflector in the country, with a mirror diameter of 102 cm. From 1945 to 1952 he was director of the Crimean Astrophysical Observatory. Shain initiated the creation of the Soviet 2.6-m reflector that now bears his name.

Shain's main works dealt with stellar spectroscopy and the physics of gaseous nebulas. With V. A. Al'bitskii (Albitzky), Shain determined the radial velocities of about 800 stars and discovered and calculated the orbits of new spectral binaries. In 1928, Shain, simultaneously and in part jointly with O. Struve, discovered the rapid rotation of a number of stars of the early spectral classes on the basis of the study of the form of the spectral lines. Shain conducted spectrophotometric studies of stars, especially cold stars and in particular long-period variables, such as Mira Ceti, in which he ascertained the coexistence of the high-

temperature emission and absorption lines of cold stars; these studies enabled him to notice the similarity to phenomena of solar activity—chromospheric flares, which cause the ejection of hot matter from the interior and the appearance of emission lines in the spectra of these stars. In the spectra of carbon stars, Shain discovered a high content of the isotope C^{13}. A number of Shain's studies dealt with planetary nebulas, the integral spectrum of various parts of the Milky Way, and the spectrum of the rings of Saturn. His series of studies on the nature of gaseous nebulas and of their relation to the problem of the existence of interstellar magnetic fields is widely known. Shain discovered systematic deviations of the average direction of the interstellar polarization of the light of stars from the galactic equator, which indicated that the plane of the magnetic field was inclined 18°–20° to the plane of the galactic equator. With V. F. Gaze, Shain discovered more than 150 diffuse nebulas.

Shain was a member of the London Royal Astronomical Society, an honorary doctor of the University of Copenhagen, and an honorary member of the American Academy of Arts and Sciences. Shain received the State Prize of the USSR in 1950. He was awarded two Orders of Lenin and various medals.

SHAIN'S COMET, a comet of the 11th stellar magnitude, discovered in 1925 by G. A. Shain at the Simeiz Observatory. Shain's comet is distinguished by its extremely large perihelion—4.18 astronomical units. Its orbit is near-parabolic. [29–810–1]

SHA'IR (also *shair, shakhir*; in Turkmen, *shakhir*; in Tatar and Kazakh, *shagïyr*), a poet-scribe among many peoples of the Near East. Among the peoples of Middle Asia, *sha'irs* continue to perform folktales, improvised poetry, and national heroic and romantic *dastans*. Unlike the *bakhshi*, who performs a memorized text, the *sha'ir* often changes or adds to the story, creating his own versions and sometimes even composing new *dastans*, for example, *Khasan-kol* by the Uzbek poet Pulkan-Shair (1874–1941). The *sha'ir* usually accompanies himself on a musical instrument, such as the *dutar* or *saz*.

Celebrated Uzbek *sha'irs* have included Ergash Dzhumanbulbul-ogly (1868–1937) and Fazyl Iuldash-ogly (1872–1955). Kermolla (1872–1934) and Durdy Klych (1886–1950) are among the renowned Turkmen *sha'irs*. [29–808–1]

SHAIRI, one of the basic meters of Georgian poetry, the classic examples of which are found in Sh. Rustaveli's narrative poem *The Man in the Panther's Skin*. In Old Georgian literature the term *shairi* had the broader meaning of "verse" or "poetry." Early examples of *shairi* were preserved in mythological and ritual folk poetry.

SHAKA (also Chaka). Born circa 1787; died September 1828. Zulu inkosi, or ruler.

Shaka united a number of related tribes in what is now Natal Province, Republic of South Africa. He later extended his authority to parts of what are now the Transvaal, Cape of Good Hope Province, and the Orange Free State. Shaka created a disciplined army and laid the groundwork for a Zulu state. In the last years of his life his power was unlimited, and he became a despot. Shaka was murdered by a group of conspirators.

SHAKESPEARE, WILLIAM. Born Apr. 23, 1564, in Stratford-on-Avon; died there Apr. 23, 1616. English playwright and poet.

Shakespeare's father was John Shakespeare, an artisan and merchant. As a grammar school student, Shakespeare learned Latin and the fundamentals of ancient Greek. Beginning in the late 1580's, he worked in London as an actor (until approximately 1603) and as a playwright. In 1594 he became a shareholder in the theatrical troupe called the Lord Chamberlain's Company, which in 1603 was renamed The King's Men. In approximately 1612, Shakespeare returned to Stratford.

Because of the scarcity of biographical information, Shakespeare's works have been attributed to others, including F. Bacon, the earls of Rutland and Oxford, and the playwright C. Marlowe. But careful study of the cultural life of the period and of Shakespeare's work shows these hypotheses to be scientifically unfounded.

As a poet, Shakespeare gained renown with his narrative poems *Venus and Adonis* (1593) and *Lucrece* (1594), which were in the tradition of the philosophical poetry of the Renaissance. Between 1592 and 1600 he wrote 154 sonnets, which were published in 1609. They are apparently autobiographical in content, expressing the poet's feelings toward a friend (sonnets 1–126) and toward his beloved (sonnets 127–152). The sonnets' themes and motifs are typical of Renaissance poetry, but their more complex perception of life and man foreshadows Shakespeare's dramatic work.

The Shakespearean canon includes 37 plays, 18 of which were published in Shakespeare's lifetime; 36 of the plays were in the first edition of his collected works, published in 1623 (only *Pericles* being excluded). Attempts to establish the chronology of Shakespeare's works began in the second half of the 18th century. The following list of his plays indicates the year in which they were written and classifies them by period and genre according to the accepted practice in Shakespearean scholarship.

First period (1590–94). Early chronicle plays: *Henry VI*, Part 2 (1590), *Henry VI*, Part 3 (1591), *Henry VI*, Part 1 (1592), and *Richard III* (1593). Early comedies: *The Comedy of Errors* (1592) and *The Taming of the Shrew* (1593). Early tragedy: *Titus Andronicus* (1594).

Second period (1595–1600). Chronicle plays in the tragic vein: *Richard II* (1595) and *King John* (1596). Romantic comedies: *The Two Gentlemen of Verona* (1594), *Love's Labour's Lost* (1594), *A Midsummer Night's Dream* (1596), and *The Merchant of Venice* (1596). First mature tragedy: *Romeo and Juliet* (1595). Chronicle plays in the comic vein: *Henry IV*, Part 1 (1597), *Henry IV*, Part 2 (1598), and *Henry V* (1598). Comedies (representing Shakespeare's mastery of the comic genre): *Much Ado About Nothing* (1598), *The Merry Wives of Windsor* (1598), *As You Like It* (1599), and *Twelfth Night* (1600).

Third period (1600–08). Tragedies (representing a turning point in Shakespeare's work): *Julius Caesar* (1599) and *Hamlet* (1601). "Bitter comedies," or "problem plays": *Troilus and Cressida* (1602), *All's Well That Ends Well* (1603), and *Measure for Measure* (1604). Shakespeare's tragic masterpieces: *Othello* (1604), *King Lear* (1605), and *Macbeth* (1606). Tragedies based on ancient history: *Antony and Cleopatra* (1607), *Coriolanus* (1607), and *Timon of Athens* (1608).

Fourth period (1609–13). Romantic tragicomedies: *Pericles* (1609), *Cymbeline* (1610), *The Winter's Tale* (1611), and *The Tempest* (1612). Late chronicle play: *Henry VIII* (1613), possibly written in collaboration with J. Fletcher.

The following plays are not considered part of the Shakespearean canon: *Edward III* (1594–95), whose authorship is uncertain; *Thomas More* (1594–95; one scene); and *The Two Noble Kinsmen* (1613), written with J. Fletcher. Some Shakespearean scholars, including A. A. Smirnov of the Soviet Union, divide Shakespeare's work into three periods, combining the first and second periods (1590–1600).

Shakespeare's work incorporated all the major influences in the age of the Renaissance—both aesthetically, by synthesizing the traditions and motifs of popular romantic genres, Renaissance poetry and prose, folklore, and humanist and popular theater, and ideologically, by reflecting the entire edifice of contemporary thought, including traditional notions about the world order, defense of the patriarchal feudal system and of political centralization, Christian ethics, Renaissance Neoplatonism and Stoicism, sensualism, and Machiavellianism. This eclecticism, ranging over the full spectrum of life and human nature, was responsible for the all-encompassing vitality of Shakespeare's work. His reality, however, was presented under different facets and in different lights at various stages of his creative development.

The ideology of humanism, combined with popular ideals and aspirations, always remained the basis of Shakespeare's plays. It is no coincidence that Shakespeare's genius found its fullest expression in the theater, which by its very essence can convey life's drama more successfully than other forms of art. The socioeconomic processes that brought about the cultural upheaval known as the Renaissance began later and developed more rapidly in England than they did on the Continent. The contradictions and contrasts that marked this period were sharper and more pressing in England; the signposts marking the development of humanist thought—the belief, followed by disbelief, in the imminent triumph of humanist ideals; the hope, followed by disillusion—were separated by centuries in Italy, for example, whereas in England they were part of the experience of a single generation. Shakespeare, better than anyone else, was able to grasp and expose the contradictions of his time; hence the dynamic and dramatic character of his works, filled with struggle and conflict. His profound understanding of contemporary trends was also a factor in his dynamic view of reality; this, together with his growing craftsmanship, defines the evolution of his work.

The works of his first period show that even at this early stage Shakespeare was acutely sensitive to the comic and tragic absurdities of life, although he depicted them in a largely traditional manner, presenting the tragic as dreadful and the comic as farcical—the one being isolated from the other. Shakespeare was still learning, attempting to master both the national tradition of Marlowe's "bloody tragedy" and the European tradition in general; his work was based on ancient models—on Plautus in the case of *The Comedy of Errors*, on Seneca in *Titus Andronicus*, and on Italian humanist comedy in *The Taming of the Shrew*. Shakespeare's humanist position, too, was still to assume definite form. The positive heroes of the chronicle plays gravitate toward antiquity, and the comedies are clearly influenced by patriarchal morality.

The dramatic nature of life remains the basis of Shakespeare's work during his second creative period. The general tone and the endings of his plays testify to his faith in the harmonious resolution of life's contradictions. The ambience of these works is defined by characters who uphold harmony in government and in social and personal relationships, such as Romeo and Juliet, Viola, and Henry V. The bearers of evil, such as Tybalt, Shylock, and Malvolio, are solitary figures. The plays of this period are characterized by the organic merging of comedy and tragedy, the unconditional triumph of the principles of humanism, the ability to present ideas by means of situations and complex images, and the effort to create full-fledged characters as embodiments of ideals. All these qualities attest to Shakespeare's mature and independent mastery of his craft.

Shakespeare's writings in the 1590's consisted primarily of the chronicle plays and comedies. Eight of the chronicle plays, forming two cycles, cover the history of England from 1397 to 1485. The earlier cycle (made up of the three parts of *Henry VI* and *Richard III*) depicts the Wars of the Roses and the fall of the House of Lancaster and shows the breakup of the state owing to feudal rapaciousness. The second cycle (consisting of *Richard II*, the two parts of *Henry IV*, and *Henry V*) is devoted to the preceding period; it includes the rise of the Lancasters and England's victories in the Hundred Years' War, representing the progression from anarchy to the unified state. *King John* and *Henry VIII*, which stand apart, portray the country's internal conflicts engendered by the struggle between the English monarchy and the Roman Catholic Church.

The state, considered from the point of view of its historical destiny, constitutes the main subject of the chronicle plays. The principal conflict is the clash between the interests of the state and of the individual; this theme is developed in the struggle of entire social groups as represented by individual characters—the latter appearing as relatively sketchy figures in the early chronicle plays, while coming to life as individuals (such as Hotspur and Falstaff) in the later ones. Reflecting humanist ideology, the chronicle plays focus on the rightful victory of centralized authority (that is, absolutism) over willful anarchy. In conjunction with popular notions about good and bad rulers, such humanist views are also reflected in the portrayal of the ideal king, Henry V, and of his opposite, Richard III. In fact, the personalities of most of the monarchs in the chronicle plays show that Shakespeare recognized how far actual rulers were from the ideal and how illusory was the ideal of absolute monarchy as a general concept.

If the chronicle plays deal with man and the state, the comedies that Shakespeare wrote in the 1590's are concerned with man and nature—nature being considered in the universal and optimistic sense ascribed to it by the humanists, who saw it as an all-beneficent and omnipotent force encompassing man and society. In Shakespeare's comedies the ideal, which is identified with the natural, is dominant; hence the kinship between the comedies and romantic literature. As in the latter, the subjects are steeped in folklore, adventure, and pastoral motifs; the major themes are love and friendship, and the heroes and heroines are basically poetic and romantic figures.

The unique source of the comic in Shakespeare is life in motion, interpreted as the movement of unfettered nature in all its fullness and abundance; this explains why his comedy, in contrast to all subsequent European comedy, is not noticeably satirical in nature. The duels of wits, the jesters' pranks, the drollness of the simpletons (who make up the comedies' secondary group of characters), and the elements of festiveness, recalling ancient rites and carnivals—all this freewheeling natural playfulness contributes to the cheerful and optimistic atmosphere of Shakespeare's comedies. The world appears as a harmonious whole, life is seen as a joyous holiday, and people are represented as essentially noble and good.

Shakespeare's comedies contain dramatic complications as well—for example, Proteus' treachery in *The Two Gentlemen of Verona* and Shylock's intrigues in *The Merchant of Venice*—but whatever is inimical to genuine humanity is easily overcome and, as a rule, is not attributed to social factors. In the comedies of the 1590's, Shakespeare has no interest in actual social relationships; the comedies of the 1600's, on the other hand, present a different picture. Here Shakespeare raises important social and moral questions, such as the problem of social inequality in *All's Well That Ends Well* and questions of law and morality in *Measure for Measure*. The elements of satire and the grotesque are more noticeable; the action approaches tragedy, the happy endings are purely formal, and the tone no longer expresses the joy of living.

The gloominess of the "problem comedies" reflects Shakespeare's frame of mind during his third period, when tragedy became his predominant genre. The contradictions of bourgeois progress and of the entire transitional stage of social development between feudalism and capitalism are now interpreted as the tragically unresolvable conflicts of life in general; they are seen to represent the divergence of humanist ideals from mankind's entire past, present, and immediate future. Shakespeare's social base is nowhere so evident as it is in *Timon of Athens* (which deals with the essential nature of money) or in *Coriolanus* (which shows the people in opposition to the ruling clique). So-

cial conflict is usually presented as moral or family conflict (as in *Hamlet* and *King Lear*), as personal conflict (*Othello*), or as the struggle of conflicting ambitions (*Macbeth* and *Antony and Cleopatra*).

The basic theme of Shakespeare's tragedies—man and society—is developed primarily in the clash of individual personalities. Nevertheless, the conflict encompasses the entire chain of being; it assumes a universal or even cosmic character, and at the same time it is projected into the hero's consciousness. In *King Lear, Coriolanus*, and *Timon of Athens*, the emphasis is on the former; in *Othello, Macbeth*, and *Antony and Cleopatra*, on the latter; and in *Hamlet* the two aspects of the conflict are given equal weight.

Independently of the theme of conflict, the essence of Shakespeare's tragic humanism is revealed most fully in the figure of the main hero. The heroes of the tragedies are titanic heroes, both in strength of character and in the ability to perceive the social and universal aspect of personal misfortune. In giving his heroes the capacity for spiritual growth, Shakespeare was the first in world literature to offer a profoundly perceptive portrayal of character *development*; such development takes place in the course of the hero's gradual understanding of the nature of society—and of his own nature. Some heroes (such as Richard III, Romeo, Juliet, and Coriolanus) retain the integrity of their own nature during this process. Others (such as Brutus, Hamlet, Macbeth, and Antony) realize their own duality and the dual nature of man in general. For all of them, however, comprehension of reality and self-knowledge give rise to tragic suffering (often intensified by the realization of their own fateful mistakes, as in the case of Antony, Macbeth, and especially Othello and Lear) and lead to spiritual change, or at times to complete transformation of the personality (as in Lear). The very greatness of their merits—the qualities of mind in Brutus and Hamlet, the intensity of feeling in Romeo and Othello, the strength of character in Macbeth—is what leads the heroes to their downfall.

In spite of the significant role played by chance in leading to a tragic denouement (thus adding a hint of the mysterious to the tragic), the hero's downfall follows inevitably from the incompatibility of the hero and his world; it confirms—as does the play's entire action—the greatness of the individual, leaving no aftertaste of hopelessness. The denouement of Shakespeare's tragedies always entails a return to some sort of originally existing equilibrium. In thus uniquely structuring his tragedies, Shakespeare the humanist reveals his belief in a certain standard without which life would be impossible.

Shakespeare's fourth period reflects a new and more complex view of the world, associated with the deepening crisis of humanism and expressed in the genre of romantic tragicomedy, which is the characteristic genre of mannerism and of the baroque. The plays' tragic conflicts and happenings reflect the same clear perception of the tragic aspect of life, while faith in the humanist ideals is now primarily expressed in the happy endings—which, incidentally, are clearly utopian in character. The abundance of folklore and fantasy, the improbable and intricate plots, the simplification of character, and the markedly conventional mode of representation (especially in the denouements) all contribute to the romantically unreal atmosphere of Shakespeare's last plays.

Despite the differences between the various periods in Shakespeare's creative development, one senses the unity of artistic method in all his plays. Goethe noted that "truth and life itself are the great foundation of [Shakespeare's] works" (*Sobr. soch.*, vol. 10, Moscow, 1937, p. 585). Shakespeare's fidelity to life, however, differs from that of late realism; it is based on the playwright's poetic view of the world, which is evident even in his choice of subjects. With the exception of *Love's Labour's Lost, A Midsummer Night's Dream*, and *The Merry Wives of Windsor*—the only three plays by Shakespeare whose plots are based on unknown sources—the subjects of all his plays were taken directly from history (for example, from R. Holinshed's chronicles) or drawn from legends, tales, and narrative poems. Because the subjects are traditional, the plots acquired an epic quality by presenting some important turning points in the development of the state and in the political history of mankind and by capturing the most essential aspects of life. Furthermore, the traditional character of the subjects added authenticity to the fictional situations and made it unnecessary to adhere to verisimilitude of detail or to justify certain events or actions—for example, to explain Lear's renunciation of power. Finally, Shakespeare's use of traditional subjects allowed him to introduce fairy-tale motifs, accompanied by the characteristic mode of reasoning of folk poetry.

Shakespeare's approach to reality, which he represents by means of poetic imagery, is manifested in his abundant use of anachronisms (such as the presence of a duke in ancient Athens or of billiards in ancient Egypt), in the arbitrary location of the action (places being sometimes precisely defined and sometimes not indicated at all), in the arbitrary treatment of time (as exemplified by the use of dramatic characters from different time periods, sometimes called double time), in other "inaccuracies" (which may also be attributed to the demands of the stage, where the primary consideration is the effect produced in performance), in the use of the fantastic and the supernatural, in the blend of dramatic convention and naturalism, and in the general reconciliation of contrasts.

Another indication of Shakespeare's poetic view of the world is the presence of two or more plot lines in a single play. Parallel stories (such as those of Lear and Gloucester or of Hamlet and Laertes) convey an image of life governed by certain objective laws; in the absence of such parallelism (as in the portrayal of British and Roman relations in *Cymbeline*), the play as a whole turns into a poetic model of the world.

Shakespeare's poetic method is also evident in his representation of history in the chronicle plays and in the tragedies. He boldly transforms historical material, making it the foundation of his overall picture of life and blending the distinctive features of the past with contemporary understanding of human relations. Dramatizing history, Shakespeare portrays it through the conflict of individuals. Man is the focus of Shakespeare's dramatic art; the peak of the playwright's artistic achievement is the portrayal of the human personality in all its diversity, in its grandeur and significance, and in the complexity and dynamics of its spiritual development.

The changeable and many-faceted nature of the human personality, as presented by Shakespeare, is dramatic in its essence, since personality changes are associated above all with changes in the hero's actual situation—his role in life, his environment—and take place in spurts. In showing the many-sided nature of man's character, Shakespeare often sacrifices logic for the sake of dramatic intensity. Furthermore, his heroes' thoughts and feelings are clothed in poetic metaphors; indeed, many speeches are poems in their own right. Shakespeare makes the fullest use of poetic imagery. His series of images correspond to the evolution of the Shakespearean hero's character; for example, the images by which Othello expresses lofty ideals at the beginning of the play are later interlaid with meanspirited images that recall Iago's speech, and Othello's "purification" is accompanied by a similar purification of his language. Shakespeare's images serve as leitmotifs that correspond to the overall tone of the plays. The expressiveness and variety of his poetic and dramatic devices have placed his work among the world's supreme artistic achievements.

Among his contemporaries, too, Shakespeare was held in high esteem (for example, by F. Meres and B. Jonson). In the age of classicism and during the Enlightenment, although credited with the ability to be "true to nature," Shakespeare was criticized for his ignorance of "the rules." Voltaire called him a "barbarian of genius." English Enlightenment critics praised Shakespeare for being true to life. In Germany, J. Herder and Goethe raised him to the loftiest heights (Goethe, *Shakespeare und kein Ende*, 1813–16). During the romantic period, various writers contributed to a better understanding of Shakespeare's work—specifically, A. W. von Schlegel, G. Hegel, S. T. Coleridge, Stendhal, and V. Hugo.

The question of Shakespeare's evolution as an artist was first raised in the mid-19th century by G. Gervinus of Germany. The cultural-history school of Shakespearean studies includes works by H. Taine, E. Dowden, M. Koch, and G. Brandes. G. Rümelin and, to some extent, G. B. Shaw were among the positivist critics who opposed the "canonization" of Shakespeare the artist. In the 20th century, the works of E. K. Chambers represent a very im-

portant contribution to factual knowledge of Shakespeare and his work.

In Russia, Shakespeare was first mentioned by A. P. Sumarokov in 1748, but he was still relatively unknown there even in the second half of the 18th century. It was only in the first half of the 19th century that Shakespeare was given a place in Russian culture; references to Shakespeare are found in various writers of that period, including W. K. Küchelbecker, K. F. Ryleev, A. S. Griboedov, and A. A. Bestuzhev, who were all associated with the Decembrist movement, and A. S. Pushkin, for whom Shakespeare's chief virtues were his objectivity, truthful portrayal of character, and faithful representation of his time. The Shakespearean tradition was developed by Pushkin in his own tragedy *Boris Godunov*.

Another writer who turned to Shakespeare in the struggle for realism in Russian literature was V. G. Belinskii. Shakespeare became increasingly important in Russia from the 1830's through the 1850's. A. I. Herzen and I. A. Goncharov were among those who, projecting Shakespeare's images onto contemporary events, promoted a more profound understanding of the tragic nature of their age. A notable event was the staging of *Hamlet* in 1837 in N. A. Polevoi's translation, with P. S. Mochalov playing the title role in Moscow and V. A. Karatygin in St. Petersburg. V. G. Belinskii and other progressive people of the time saw Hamlet's tragedy as a reflection of the tragedy of their own generation. Hamlet's attraction was also felt by I. S. Turgenev and F. M. Dostoevsky. Turgenev drew a parallel between Hamlet's image and certain distinctive traits of the "superfluous people" (see Turgenev's article "Hamlet and Don Quixote," 1860). In the acute social struggle of the 1860's, attitudes toward Shakespeare became, on the one hand, more academic (as in the works of N. I. Storozhenko, founder of the Russian school of Shakespearean scholarship) and, on the other, more critical (for example, in L. N. Tolstoy's *Shakespeare and the Drama*, 1903–04, published 1906).

The growing body of interpretation of Shakespeare's work in Russia was paralleled by increasing knowledge of and familiarity with the works themselves. In the 18th and early 19th centuries translators of Shakespeare into Russian worked primarily from French adaptations of his works. In the first half of the 19th century, translations of Shakespeare were either too literal (for example, M. Vronchenko's translation of *Hamlet*, 1828) or too free (Polevoi's translation of *Hamlet*). Various translations published between 1840 and 1860, including those of A. V. Druzhinin, A. A. Grigor'ev, and P. I. Veinberg, reveal a scientifically oriented approach to the problem of literary translation—for example, by applying the principle of linguistic adequacy. The first *Complete Collection of Shakespeare's Dramatic Works Translated by Russian Writers*, edited by N. V. Gerbel', was published in 1865–68. The second complete collection to be published in prerevolutionary Russia, edited by S. A. Vengerov, appeared in 1902–04.

Based on the profound generalizations of K. Marx and F. Engels, the Soviet school of Shakespearean scholarship carried on and developed the traditions of progressive Russian thought. A. V. Lunacharskii lectured on Shakespeare in the early 1920's. The primary focus of Shakespearean studies (for example, by V. K. Miuller and I. A. Aksenov) is on the artistic aspects of his work. Published works include historicoliterary monographs (such as A. A. Smirnov's) and studies dealing with specific problems (such as M. M. Morozov's). The works of A. A. Anikst and N. Ia. Berkovskii, as well as a monograph by L. E. Pinskii, represent major contributions to modern Shakespearean scholarship. The motion-picture directors G. M. Kozintsev and S. I. Iutkevich have presented their own original interpretations of works by Shakespeare.

Shakespeare's work has been translated into 28 of the languages of the USSR. In addition to separate editions of the plays and selected works, complete collections of Shakespeare's works were published in Russian in 1936–50 and 1957–60. A particular school of Soviet translators, including M. L. Lozinskii, B. L. Pasternak, V. V. Levik, T. G. Gnedich, and S. Ia. Marshak, has specialized in the close reading and interpretation of works by Shakespeare.

Shakespeare has occupied an important place in the Russian theater repertoire since the mid-1830's. Two Russian actors who gained renown for their Shakespearean roles were P. S. Mochalov (for his Richard III, Othello, Lear, and Hamlet) and V. A. Karatygin (for his Hamlet and Lear). In the second half of the 19th and in the early 20th century, the Malyi Theater of Moscow created its own school of Shakespearean interpretation, combining stage realism with elements of romanticism; among its outstanding Shakespearean interpreters were G. Fedotova, A. Lenskii, A. Iuzhin, and M. Ermolova. Beginning in the early 20th century, Shakespeare was included in the repertoire of the Moscow Art Academic Theater, or MKhAT (which presented *Julius Caesar* in 1903, directed by V. I. Nemirovich-Danchenko in collaboration with K. S. Stanislavsky, and *Hamlet* in 1911, directed by H. Craig, with V. I. Kachalov in the respective title roles).

Early Soviet productions of Shakespeare's plays were experimental and sometimes formalist in nature, as in the case of A. Tairov's production of *Romeo and Juliet* at the Kamernyi Teatr in 1921; they also included, however, such important productions as the second MKhAT's *Hamlet* (1924), with M. Chekhov in the title role.

The year 1935 was marked by three memorable productions that sought to convey the wide-ranging sociohistorical and philosophical significance of Shakespeare's tragedies by means of heroic images—namely, *Othello* (directed by S. Radlov at Moscow's Malyi Theater, with A. Ostuzhev in the title role), *King Lear* (directed by Radlov at the Moscow Jewish Theater, with S. Mikhoels playing Lear), and *Romeo and Juliet* (directed by A. D. Popov at the Theater of the Revolution, with M. Astangov playing Romeo and M. Babanova in the part of Juliet). These were followed by a series of successful Shakespearean interpretations, presented throughout the country in the various national languages (for example, by A. Khorava, A. Vasadze, V. Vagarshian, and V. Tkhapsaev). Productions that were particularly successful were those in which colorful staging and a festive spirit were combined with lofty humanism and psychological subtlety; such were the productions of *Twelfth Night* (directed by S. Giatsintova at the second MKhAT, 1933), *Much Ado About Nothing* (by S. Rapoport, Vakhtangov Theater, 1936), and *The Taming of the Shrew* (by A. D. Popov, Central Theater of the Red Army, 1937).

A new era in Soviet Shakespearean theater was opened in 1954 with two productions of *Hamlet*—by the Leningrad Academic Drama Theater (directed by G. Kozintsev) and by the Moscow Mayakovsky Theater (directed by N. Okhlopkov)—which had broad public reverberations. The new era was marked by productions that plumbed the depths of Shakespeare's tragic motifs, by rejection of the romanticized approach to Shakespeare (particularly in the productions of the 1960's and 1970's), by the primary role often assumed by the director in shaping the stage action, and by the increasing number of Shakespearean plays actually performed. Every Shakespearean play staged in the USSR is an outstanding event in the theatrical life of the country.

Film versions of Shakespeare's plays (including Soviet ones) have been produced in a steady flow that began with *The Taming of the Shrew*, filmed in 1929 and starring M. Pickford and D. Fairbanks.

I. A. RATSKII [29–1090–5]

SHAKHAN, an urban-type settlement in Karaganda Oblast, Kazakh SSR, under the jurisdiction of the Shakhta city soviet. Shakhan is situated 39 km northwest of the Karabas railroad station on the Karaganda-Mointy line, 12 km west of Karaganda. Coal is mined in the area. The settlement has a plant for the production of reinforced-concrete items. [29–890–5]

SHAKHAZIZ, SMBAT SIMONOVICH. Born Sept. 5 (17), 1841, in the village of Ashtarak, near Yerevan; died Dec. 24, 1907 (Jan. 6, 1908), in Moscow. Armenian poet and teacher.

In 1860, Shakhaziz graduated from the Moscow Lazarev Institute, where he then taught Armenian for 30 years. His verse collection *Leisure Hours* (1860) is typified by romantic longing. Shakhaziz maintained close ties with editors of the journal *Iusisapail* (Northern Lights) and was influenced by S. Nazarian and M. Nalbandian. It was natural therefore that he turned toward patriotic themes, for example, in the collection of verse *The Sorrow of Levon and Other Poems* (1865). Shakhaziz's lyric poem "The Dream" became a folk song. In the narrative poem *The Sorrow of Levon* he describes a teacher-hero.

SHAKHBERDYEVA, MAIIA (Medeniet Shakhberdyeva). Born Feb. 23, 1930, in the city of Kerki, Turkmen SSR. Soviet Turkmen singer (coloratura soprano). People's Artist of the USSR (1975).

In 1956, Shakhberdyeva graduated from the Moscow Conservatory, where she studied voice under V. F. Rozhdestvenskaia. Beginning in 1962 she studied under M. E. Donets-Tesseir in Kiev. In 1956, Shakhberdyeva became a soloist in the Turkmen Theater of Opera and Ballet.

Shakhberdyeva possesses an expressive voice of equal quality in all registers. Her roles have included the Snow Maiden and Marfa in Rimsky-Korsakov's *The Snow Maiden* and *The Tsar's Bride*, Rosina in Rossini's *The Barber of Seville*, Violetta in Verdi's *La Traviata*, the title role in Delibes' *Lakmé*, Ailar in V. Mukhatov's *The Bloody Watershed*, Aknabat in Agadzhikov's *Night of Alarm*, and Shasenem in Ovezov and Shaposhnikov's *Shasenem and Garib*.

Shakhberdyeva also performs in concert. She has toured in the German Democratic Republic, Poland, India, and Canada. In 1975 she began teaching at the Ashkhabad Institute of the Arts. Shakhberdyeva was a deputy to the sixth and seventh convocations of the Supreme Soviet of the Turkmen SSR. [29–890–7]

SHAKHBUZ, an urban-type settlement and the administrative center of Shakhbuz Raion, Nakhichevan ASSR. Shakhbuz is situated on the river Nakhichevanchai, a tributary of the Araks; it is located 30 km northeast of the Nakhichevan railroad station, on the highway linking Evlakh, Goris, and Nakhichevan. Industry is represented by a motor vehicle repair plant, a winery, and the Badamly Mineral Water Plant. [29–891–1]

SHAKHDAG, a peak in the eastern part of the Greater Caucasus, in the system of the Bokovoi Range, in the Azerbaijan SSR. The summit is 4,243 m above sea level. The peak is composed of limestones and dolomites. There are high mountain meadows and small glaciers on Shakhdag. [29–891–2]

SHAKHDAG (also Sevan), a mountain range in the system of the Lesser Caucasus. The range extends along the northeastern shore of Lake Sevan, along the border between the Azerbaijan SSR and the Armenian SSR. It measures approximately 70 km in length and rises to a maximum elevation of 3,367 m. It is composed mainly of volcanogenic rocks and sandstones. Broad-leaved forests grow on the northern slope, primarily mountain steppes on the southern slope, and high-mountain meadows are found along the ridge. [29–891–3]

SHAKHDARA (also Iuzhnaia Shakhdara, Dzhaushangoz), a river in Gorno-Badakhshan Autonomous Oblast, Tadzhik SSR; a left tributary of the Gunt River of the Amu Darya basin. The Shakhdara is 142 km long and drains an area of 4,180 sq km. Fed by glaciers and snow, the river has a mean flow rate of 35.2 cu m per sec. High water occurs in July. The Shakhdara is used for irrigation. [29–891–4]

SHAKHDARA, a mountain range in the southern part of the Western Pamir, in the Tadzhik SSR. The range is the watershed for the Shakhdara and Piandzh rivers. Its western part, the meridional Ishkashim Range, measures 95 km in length, rising to a maximum elevation of 6,096 m at Mt. Mayakovsky. The sublatitudinal Shakhdara Range proper, which constitutes the middle and eastern parts, measures 105 km long and rises to a maximum elevation of 6,726 m at Karl Marx Peak. High-mountain steppe and meadow steppe are found on the slopes. There are also glaciers; total glaciated area is approximately 433 sq km. [29–891–5]

SHAKHIMARDAN, a climatic health resort in the Uzbek SSR, 52 km from Fergana. Shakhimardan is situated at an elevation of 1,540–1,570 m. Summers are hot and dry (average July temperature, 22°C), and the winters are mild (average January temperature, −3°C); annual precipitation is approximately 350 mm. Sanatoriums treat patients suffering from tuberculosis. [29–892–4]

SHAKHLICHA (also *shakhlycha, shakhlich*), a Chuvash folk wind instrument, a type of vertical flute. The *shakhlicha* appears in end-blown and fipple versions, the former resembling the Moldavian *fluer*. It is made of maple wood, linden bark, and thin tin. The end-blown version has five or six finger holes, and the fipple version two, four, or seven. Only men, primarily young men, play the *shakhlicha*, which is used to perform improvised lyric melodies or dance tunes. The instrument produces a gentle, soft tone.

SHAKHLIN, BORIS ANFIIANOVICH. Born Jan. 27, 1932, in Ishim, Tiumen' Oblast. Soviet gymnast and coach. Honored Master of Sport (1955). International-class official (1968). Member of the CPSU since 1964.

Shakhlin was overall champion of the Olympic Games (1960), of the world (1958), of Europe (1955), and of the USSR (six times from 1954 to 1963). He was Olympic champion six times (1956, 1960, 1964), world champion three times (1958), European champion five times (1955–63), and USSR champion 13 times (1957–63) in various competitions of combined events.

Shakhlin has been awarded the Order of Lenin, two other orders, and medals.

SHAKHMATOV, ALEKSEI ALEKSANDROVICH. Born June 5 (17), 1864, in Narva; died Aug. 16, 1920, in Petrograd. Russian linguist; specialist in Russian chronicles. Academician of the St. Petersburg Academy of Sciences (1894).

Shakhmatov graduated from Moscow University in 1887 and became a privatdocent there in 1890. He became a professor at the University of St. Petersburg in 1910 and was chairman of the Division of Russian Language and Literature of the Academy of Sciences from 1906 to 1920. Shakhmatov was the founder of the historical study of the Russian literary language. He brought to light ancient koines—languages used for communication within a group speaking related languages or dialects—that differed from the individual dialects normally spoken. He studied the formation of the Russian nationality, Slavic ethnogeny, and questions of the original Slavic homeland and of Proto-Slavic.

Shakhmatov traced the history of Russian chronicle writing from the 11th to 16th centuries. He was the first to apply the comparative historical method to the study of chronicles, and he laid the foundations of the textual criticism of chronicles and of textual criticism as a science. Making extensive use of dialectal data in the interpretation of written sources, Shakhmatov gave consideration to ancient orthographic systems that hindered the reflection in writing of the special characteristics of the spoken language.

Shakhmatov studied the modern Olonets, Kaluga, and Riazan' dialects, set up projects for the investigation of dialects, and analyzed and published the large amount of information acquired in these projects. In addition to research in Slavic accentology and the comparative phonetics and grammar of the Slavic languages, he carried out studies on ancient and modern Indo-European languages and the Finnish and Mordovian languages. He made an important contribution to the historical morphology of Russian. In theoretical linguistics, he did valuable work on grammatical forms, parts of speech, word groups, types of sentences, and the relationship of morphology and syntax.

Shakhmatov edited several parts of the academy's *Dictionary of the Russian Language* (1891–1916). Under his leadership the academy's Division of Russian Language and Literature became the center of philological studies in Russia. It organized the study of many ancient literary works and modern dialects. The division undertook the compilation of dictionaries and the preparation of the multivolume *Encyclopedia of Slavic Philology*; it resumed publication of the *Complete Collection of Russian Chronicles*. Shakhmatov organized the publication of a series of texts in the Old Church Slavonic and Russian languages and works of world literature, and he played a large role in reforming Russian orthography.

SHAKHMURZAEV, SAID OSMANOVICH. Born Feb. 26 (Mar. 10), 1886, in the village of Eltiubi, in what is now Chegem Raion, Kabarda-Balkar ASSR; died Nov. 30, 1975, in Nal'chik. Soviet Balkar poet.

Shakhmurzaev graduated from the Crimean Pedagogical Technicum in 1929. From 1924 to 1958 he engaged in pedagogical work, serving as deputy people's commissar of education of the Kabarda-Balkar ASSR from 1939 to 1941. He was first published in 1916.

The agitational and publicist verse that Shakhmurzaev wrote in the 1930's dealt with the building of a new life. His collections of verse include *Zurna* (1957), *Know the Plants* (1960), *To Friends* (1966), and *The Wind of Time* (1967). His novella *At Daybreak*, (published 1965) deals with S. Kalabekov, a Balkar associate of S. M. Kirov. Shakhmurzaev compiled a Balkar primer in 1929 and, together with D. Kokov, published *Balkar Toponymic Dictionary* in 1970.

Shakhmurzaev was awarded the Order of Lenin, the Order of the Red Banner of Labor, and various medals.

WORKS

SHAKHOV, FELIKS NIKOLAEVICH. Born Oct. 12 (24), 1894, in the village of Beloiarskoe, in what is now Altai Krai; died Oct. 30, 1971, in Novosibirsk. Soviet geologist. Corresponding member of the Academy of Sciences of the USSR (1958).

After graduating from the Tomsk Technological Institute in 1922, Shakhov remained to work there. In 1935 he became a professor and head of a subdepartment at the institute (now the Tomsk Polytechnic Institute). In 1957 he was appointed head of a laboratory and head of the division of geochemistry of the Institute of Geology and Geophysics of the Siberian Division of the Academy of Sciences of the USSR in Novosibirsk. Shakhov's main works dealt with the geology and origin of ore deposits and with rare and radioactive elements, problems of metallogeny, and the methodology of prospecting and geological exploration.

Shakhov was awarded the Order of Lenin and two other orders.

SHAKHOVSKAIA, an urban-type settlement and the administrative center of Shakhovskaia Raion, Moscow Oblast, RSFSR. Shakhovskaia has a railroad station on the Moscow-Rzhev line, 154 km from Moscow. The settlement has a milk plant, a logging and timber distribution establishment, a wood-products plant, and a shop of the Volokolamsk Textile Mill. [29–902–2]

SHAKHOVSKOI, ALEKSANDR ALEKSANDROVICH. Born Apr. 24 (May 5), 1777, on the *pomest'e* (estate) of Bezzaboty, Smolensk Province; died Jan. 22 (Feb. 3), 1846, in Moscow. Prince. Russian writer and theatrical figure. Academician of the Russian Academy (1810).

Shakhovskoi graduated in 1792 from the Boarding School for the Nobility at Moscow University. From 1802 to 1826, he headed a St. Petersburg dramatic troupe. He belonged to the Society of the Lovers of the Russian Word from 1811 to 1815.

Shakhovskoi wrote more than 100 plays, including vaudevilles, historical dramas, and adaptations of works by European authors. Among his most important works are the prose play *The New Stern* (staged 1805), which attacks sentimentalism, and the comedy of manners *A Lesson to Coquettes, or the Lipetsk Spa* (1815). Shakhovskoi's plays are distinguished by their diverting plots and their use of popular language. Shakhovskoi's apt and aphoristic verse written in iambic lines of varying lengths foreshadowed the style of A. S. Griboedov's verse in *Woe From Wit*.

SHAKHOVSKOI, DMITRII IVANOVICH. Born 1861 in Moscow; died Apr. 15, 1939. Russian state and public figure. Prince. Grandson of the Decembrist F. P. Shakhovskoi.

D. I. Shakhovskoi graduated from the University of St. Petersburg in 1885. He served in the district *zemstvo* (assembly) of the city of Ves'egonsk. A contributor to the journal *Osvobozhdenie*, which he had helped found, Shakhovskoi was a member of the council of the Union of Liberation. He took part in the *zemstvo* congresses of 1904 and 1905.

Shakhovskoi joined the Constitutional Democratic (Cadet) Party in 1905. In the following year he was a deputy to the State Duma and secretary of both the Duma and the Cadet faction. After the February Revolution of 1917, Shakhovskoi became minister of welfare in the bourgeois Provisional Government. In August 1917 he joined a committee of the Council of Public Figures, and in 1918 he helped establish the counterrevolutionary Union for the Rebirth of Russia.

During the 1920's, Shakhovskoi engaged in literary activity and published material pertaining to P. Ia. Chaadaev (*Literaturnoe nasledstvo*, vols. 22–24, 1935). [29–903–2]

SHAKHOVSKOI, FEDOR PETROVICH. Born Mar. 12 (23), 1796, in Moscow; died May 24 (June 5), 1829, in Suzdal'. Prince. Decembrist; retired major of the Semenovskii Life Guards Regiment.

Shakhovskoi helped found the Union of Salvation in 1816 and the Union of Welfare in 1818. He supported the plans proposed for assassinating the tsar, but took no part in subsequent Decembrist organizations.

Shakhovskoi displayed great courage during the investigation that followed the Decembrist Uprising. He was sentenced to exile for life, but the term was subsequently commuted to 20 years. He was sent to Turukhansk in 1826 and was transferred to Eniseisk in 1827. In exile, he engaged in botanical research and, after a crop failure, gave considerable amounts of money to the people of Turukhansk. In 1829, Shakhovskoi was moved to the Spaso-Efimiev Monastery in Suzdal', where he died.

SHAKHOVSKOI, GRIGORII PETROVICH. Date of birth unknown; died after 1612. Prince, boyar. Political and military figure in Russia of the early 17th century.

The first mention of Shakhovskoi dates from 1596. During the late 16th and early 17th centuries he was appointed to minor posts in a number of southern fortresses. His career was aided when his father, Petr Mikhailovich, went over to the side of the First False Dmitrii. During the reign of Vasilii IV Shuiskii, Shakhovskoi was sent to Putivl' as *voevoda* (military governor). He joined in the peasant uprising led by I. I. Bolotnikov, and he apparently became a boyar during the rebellion. In early 1607, Shakhovskoi moved with the army of Ileika Muromets from Putivl' to Tula. After Tula was captured by the tsarist forces, he was exiled to the Spaso-Kamennyi Monastery. He became a leading member of the Boyar Duma of the Second False Dmitrii in late 1608, and he later fled with the pretender to Kaluga. Shakhovskoi took part in the First Volunteer Corps of 1611. [29–903–1]

SHAKHOVSKOI, IAKOV PETROVICH. Born Oct. 8 (19), 1705; died July 23 (Aug. 3), 1777, in Moscow. Prince. Russian state figure and memoirist.

Shakhovskoi began his military career as a soldier in the Semenovskii Life Guards Regiment in 1719, and he served in the Russo-Turkish War of 1735–39. He became a senator in 1741 and was chief procurator of the Synod from 1742 to 1753. Named procurator-general of the Senate in 1760, he retired in 1761. Shakhovskoi's memoirs describe the social life of 18th-century Russia and provide a characterization of the leaders of the St. Petersburg administration.

SHAKHRIKHAN (until Nov. 13, 1970, the settlement of Moskóvskii), a city under oblast jurisdiction and administrative center of Moskovskii Raion, Andizhan Oblast, Uzbek SSR. Shakhrikhan has a railroad station 32 km southwest of Andizhan. Enterprises include a cotton-ginning plant, a silk factory, and a branch of the Andizhan Clothing Factory. The city has a museum of local lore. [29–905–4]

SHAKHRISABZ, a city under oblast jurisdiction and administrative center of Shakhrisabz Raion, Kashkadar'ia Oblast, Uzbek SSR. Situated in the Kitab-Shakhrisabz Oasis, on the Great Uzbek Highway (Tashkent-Termez), 5 km from the Kitab railroad station, the terminal stop on a branchline of the Karshi-Termez line. Population, 30,000 (1974).

Shakhrisabz has a cotton-ginning plant, a cannery, a winery, a creamery, a gravel plant, and an asphalt plant. Other enterprises include the Khudzhum Factory, which manufactures articles of Uzbek national arts and crafts, a silk factory, a furniture factory, and a meat-packing plant. The city also has an agricultural technicum, a pedagogical school, and a medical school.

Shakhrisabz was settled in the 13th century or later. The name of the city of Kesh, which belonged to Sogdiana, was also applied for a long time to Shakhrisabz, as well as to the historical region in the Kashkadar'ia Valley on another trade route between Samarkand and Balkh. Between the 14th and 16th centuries, Shakhrisabz was a major city in Middle Asia. Under the Sheibanids and the Ashtarkhanids it was a separate domain. In the 18th century the ruler (*bek*) of Shakhrisabz proclaimed his independence. After being occupied by Russian troops in 1868, Shakhrisabz and the surrounding area ruled by the *bek* were annexed by Bukhara.

Architectural remains include ruins of the enormous gates of the palace of Timur Ak-Sarai (1380–1404), with their rich tile ornamentation. Part of a Timurid mausoleum, the Dorus-Siadat (14th century), has also been preserved. It consists of the tall Khazrat-Imam, with its tent-shaped dome, hall, and vault. Nearby is the vault of Dzhekhangir, faced with carved marble. An ensemble of memorial structures for worship includes remains of the mausoleum of Sheikh Kulial (c. 1370) and that of the descendants of Ulug Beg, the Gumbezi-Seiidan (1437–38), which has carved marble epitaphs. Also of note are the portal and dome of the Kok-Gumbez mosque (1435–36), which once had arched galleries.

Shakhrisabz has long been a center of artistic folk embroidery and ceramics.

SHAKHRISTAN, a pass through the Turkestan Range. It is at an elevation of 3,378 m. Through the pass runs the highway that links the cities of Leninabad and Dushanbe, both of which are in the Tadzhik SSR. [29–905–2]

SHAKHSENEM, the site of an ancient fortified settlement of Khwarazm, located 90 km southwest of the city of Kunia-Urgench, Tashauz Oblast, Turkmen SSR. The city existed from the fourth century B.C. through the 13th century A.D., although for certain periods it was uninhabited. The cultural layers form a hill surrounded by the remains of fortress walls. The height of the walls in the tenth to 12th centuries was 15 m. In the center of the settlement there are ruins of a mosque and of a four-pillared building, probably a pre-Islamic temple. Pavilions and a small wall from a medieval park have been preserved southwest of the settlement.

Excavations have uncovered carved alabaster ornamentation from the mosque, ceramics, coins, a richly decorated bronze vessel from the 12th century, and an early medieval clay idol.

SHAKHSEVENY, an ethnographic group of Azerbaijanis living in northwestern Iran and parts of the southern Azerbaijan SSR. The formation of the Shakhseveny was initiated in the 16th century by Shah Abbas I, who, in an attempt to weaken the influence of the Kizilbash tribal leaders, organized a special guard recruited from members of the Kizilbash tribal confederation (*see* KIZILBASH). The guard was named Shakhseveny, from the Azerbaijani *shakhsevan* (literally, "shah-lovers"). Abbas I granted the Shakhseveny extensive holdings in the regions of Ardebil, Mugan, Saveh, and Qazvin. Most of the Shakhseveny adopted a settled way of life in the late 19th century. [29–906–1]

SHAKHTA, an urban-type settlement in Perm' Oblast, RSFSR, under the jurisdiction of the Kizel city soviet. Situated on the highway linking Solikamsk and Gremiachinsk, Shakhta is 6 km north of the Kizel railroad station on the Solikamsk-Chusovskaia line. The city has a furniture factory. Hard coal is mined nearby. [29–907–2]

SHAKHTERSK (until 1953, the settlement of Katyk), a city under oblast jurisdiction and the administrative center of Shakhtersk Raion, Donetsk Oblast, Ukrainian SSR. Railroad station (Postnikovo) on the Chernukhino-Ilovaisk line. Population, 73,000 (1977).

Coal is mined near Shakhtersk, which has three coal-preparation plants. The city also has a machinery and repair plant, a knitwear factory, a bread-baking combine, and a brewery. Educational institutions include a trade technicum, a film-making technicum, and a pedagogical school. [29–907–4]

SHAKHTERSK, a city in Uglegorsk Raion, Sakhalin Oblast, RSFSR; located on the western coast of Sakhalin Island, on the Tatar Strait of the Sea of Japan, 17 km north of Uglegorsk. Coal is mined near Shakhtersk. The city has a coal-preparation plant, a building materials combine, a brickyard, and an electric power plant. [29–907–3]

SHAKHTERSKII, an urban-type settlement in Anadyr' Raion, Chukchi Autonomous Okrug (formerly Chukchi National Okrug), Magadan Oblast, RSFSR. Shakhterskii is situated on the shore of Anadyr' Gulf of the Bering Sea. Industry is represented by the Anadyr' Fish-processing Plant. [29–907–6]

SHAKHTERSKII, an urban-type settlement in Tula Oblast, RSFSR, under the jurisdiction of the Donskoi city soviet. Shakhterskii is situated 9.5 km from the city of Donskoi. The settlement has a footwear factory. [29–907–5]

SHAKHTINSK, a city under oblast jurisdiction in Karaganda Oblast, Kazakh SSR. Situated on the Sherubai-Nura River, 28 km west of the Karabas railroad station on the Karaganda-Mointy line and 23 km southwest of Karaganda. Population, 52,000 (1977). Shakhtinsk is a coal-mining center of the Karaganda Coal Basin. The city has a garment factory, a detergent factory, two plants for the manufacture of reinforced concrete products, and a plant for the production of nonstandard equipment and devices for small-scale mechanization. Shakhtinsk also has a technological technicum. [29–907–7]

SHAKHTNOE, an urban-type settlement in Donetsk Oblast, Ukrainian SSR, under the jurisdiction of the Khartsyzsk city soviet. Shakhtnoe is situated 3 km from the Skosyrskaia railroad station on the Chernukhino-Ilovaisk line. A stone quarry is located near the settlement, and coal is mined in the vicinity. [29–912–1]

SHAKHTNOE STROITEL'STVO (Underground Mine Construction), a monthly scientific and technical and production journal published jointly by the State Committee for Construction, the Ministry of the Coal Industry of the USSR, the Ministry of Construction for Heavy Industrial Enterprises of the USSR, and the Scientific and Technical Society of Mining. The journal was founded in Moscow in 1957.

Shakhtnoe stroitel'stvo carries articles that deal with the design, construction, and modernization of mining enterprises. It also publishes articles on the development of shaft-sinking techniques, the construction of various types of underground structures, accident prevention, the exchange of information relating to advanced technology, and socialist competition in branches of industry. Circulation, 5,000 (1978). [29–914–1]

SHAKHTNYI, an urban-type settlement in Perm' Oblast, RSFSR, under the jurisdiction of the Gubakha city soviet. Shakhtnyi is situated on the Solikamsk-Perm' highway and is 4 km from the Polovinka railroad station on the Solikamsk-Chusovskaia line. Hard coal is mined near Shakhtnyi, which has a shop of a plant for the repair of mining equipment; the main plant is located in the city of Kizel. [29–914–2]

SHAKHTY (until 1920, Aleksandrovsk-Grushevskii), a city under oblast jurisdiction in Rostov Oblast, RSFSR. Railroad station 75 km northeast of Rostov-on-Don; highway junction. Population, 223,000 (1977; 135,000 in 1939, 196,000 in 1959, 205,000 in 1970). Shakhty consists of three raions.

Shakhty's economy is dominated by light industry, with a cotton textile combine, two footwear factories, a flax mill, a garment factory, and a ceramics combine. The coal mined in the area is processed at two enrichment plants. The Gidroprivod Plant is located in Shakhty, which also has a machine-building plant. Food-processing enterprises include a meat-packing plant, a brewery, and a milk plant. The building-materials industry in the city comprises a building-materials combine and two plants producing reinforced-concrete structural components. The city has a research and development institute of coal mining, a technological institute of consumer services, a branch of the Novocherkassk Polytechnic Institute, a mining technicum, an energy technicum, a medical school, and a music school. A drama theater and a museum of local lore are also located in Shakhty.

SHAKHTY TRIAL OF 1928, a trial of anti-Soviet-minded specialists who attempted to wreck the hard coal industry of the Donbas.

The case was initiated by organs of the Unified State Political Directorate (OGPU) in early 1928 and was heard in Moscow between May 18 and July 6 of the same year. Appearing before the Special Presence of the Supreme Court of the USSR were 53 defendants, primarily engineers and technicians. The trial demonstrated that among the old specialists employed by the coal indus-

try were persons associated with the former owners of the mines. The Shakhtintsy, as these persons were called, were guilty of subversive activities, for which they had received remuneration from the former bosses, who had fled abroad.

When the New Economic Policy had been introduced, the former mine owners had assigned their agents the task of regaining what they called "their" enterprises through denationalization or concessions. As the socialist structure of the economy grew stronger, however, these hopes were dashed; the former owners then became the instigators of an active, organized wrecking campaign.

The activities of the Shakhtintsy were directed by the Association of Former Mining Industrialists of Southern Russia, which was headed by B. N. Sokolov in Paris, and the Polish Association of Former Directors and Owners of Mining Enterprises in the Donets Basin, which was headed by Dwórzanczyk. These associations were linked with the governments and intelligence services of capitalist countries, and they established wrecking groups in the Donbas, Kharkov (1923–24), and Moscow (1926). The Shakhtintsy sought to weaken the defenses and economic strength of the USSR and to create favorable conditions for intervention by the imperialist states. Their acts of sabotage included dynamiting and flooding mines and setting fire to power plants.

On July 6, 1928, the Supreme Court of the USSR sentenced five persons—N. N. Gorletskii, N. K. Krzhizhanovskii, V. Ia. Iusevich, S. Z. Budnyi, and N. A. Boiarinov—to be shot; 40 persons were sentenced to imprisonment for one to ten years. Four others received suspended sentences, and four were acquitted.

The Central Committee of the Communist Party and the Soviet government took measures to increase the vigilance of the Soviet people and to create cadres of Soviet specialists devoted to the cause of socialism. (The Central Committee reached its decisions at a united plenum with the Central Control Commission of the ACP[B] that was held in Moscow between Apr. 6 and Apr. 11, 1928, and at a plenum held in Moscow from July 4 to 12.) As a result, the effects of the wrecking were remedied at the enterprises.

SHAKHUN'IA, a city (since 1943) and the administrative center of Shakhun'ia Raion, Gorky Oblast, RSFSR. Railroad station on the Gorky-Kirov line. Population, 20,000 (1974). Shakhun'ia has a logging and timber distribution establishment, a sawmill, a wood-products plant, a drawn-thread embroidery workshop, a dry-milk combine, and enterprises serving railroad transportation. [29–916–3]

SHAKHURIN, ALEKSEI IVANOVICH. Born Feb. 25, 1904, in the village of Mikhailovskoe, in what is now Moscow Oblast; died July 3, 1975, in Moscow. Soviet state figure. Hero of Socialist Labor (1941). Lieutenant general of the engineers (1944). Member of the CPSU from 1925.

The son of a peasant, Shakhurin became a worker in 1921. After graduating from the Moscow Institute of Engineering and Economics, he worked in the aircraft industry and at the N. E. Zhukovskii Air Force Academy. In 1938 he became first secretary of the party's Yaroslavl oblast committee and then of the Gorky oblast committee.

Shakhurin was made people's commissar of the aviation industry of the USSR in 1940. During the Great Patriotic War of 1941–45, he helped evacuate enterprises of the aviation industry to the eastern part of the country and facilitated the production of matériel for the air force. After the war he served as deputy minister of the aviation industry of the USSR and vice-chairman of the State Committee on Foreign Economic Relations of the Council of Ministers of the USSR. He became a personal pensioner in 1959.

Shakhurin was a delegate to the Eighteenth Congress of the ACP(B) in 1939 and was elected a member of the party's Central Committee. Shakhurin was awarded two Orders of Lenin, three other orders, and various medals. [29–916–4]

SHAKLOVITYI, FEDOR LEONT'EVICH. Date of birth unknown; died Oct. 11 (21), 1689, in Moscow. Russian state figure and diplomat.

The son of a petty nobleman, Shaklovityi became a *pod'iachii* (minor official) of the Prikaz Tainykh Del (Bureau of Secret Affairs) in 1673 and a *dumnyi d'iak* (administrative clerk of the Boyar Duma) in 1682. After the Moscow Uprising of 1682, he headed the Streletskii Prikaz (central office for the administration of the *strel'tsy*, or semiprofessional musketeers).

A supporter of Sof'ia Alekseevna in her struggle against Peter I, Shaklovityi, together with his followers, was arrested when Peter came to power. Shaklovityi was interrogated under torture and executed.

SHAKSHA, an urban-type settlement in Ufa Raion, Bashkir ASSR. Shaksha is situated on the Ufa River, a right tributary of the Belaia River, 10 km east of Ufa. It has a railroad station on the Ufa-Cheliabinsk line. Industry is represented by a brickyard and a shop of the Bashkir Ceramic Plant; building materials are also produced in the settlement. [29–812–4]

SHAKVA (also Shakovka), a river in Perm' Oblast, RSFSR; a right tributary of the Sylva River of the Kama River basin. The Shakva is 167 km long and drains an area of 1,580 sq km. It rises in the spurs of the Central Urals and is fed primarily by snow. The city of Kungur is located near the confluence of the Shakva and the Sylva. [29–812–1]

SHALAKUSHA, an urban-type settlement in Niandoma Raion, Arkhangel'sk Oblast, RSFSR. Shalakusha is situated on the Mosha River, a tributary of the Onega. The settlement is served by a railroad station on the Konosha-Obozerskaia line. It has a sawmill and a logging and timber distribution establishment. [29–813–4]

SHALAUROV, NIKITA PAVLOVICH. Date of birth unknown; died 1764. Russian trader.

From 1760 to 1762, Shalaurov and I. Bakhov journeyed down the Lena River and sailed along the seacoast, stopping for the winters, to Chaun Bay, which Shalaurov became the first to explore. He charted the coast from the Kolyma River to Chaun Bay. In 1764, Shalaurov, traveling alone, rounded Cape Shelagskii. He perished near the mouth of the Verkun' River. The following have been named in honor of Shalaurov: islands in Chaun Bay and the mouth of the Kolyma, a cape on the Novosibirskie Islands, Cape Shalaurova Izba, and a mountain east of Chaun Bay.

SHALIA, an urban-type settlement and the administrative center of Shalia Raion, Sverdlovsk Oblast, RSFSR. Shalia is situated on the Central Urals. It has a railroad station on the Sverdlovsk-Perm' line, 146 km northwest of Sverdlovsk. Industry is represented by a logging and timber distribution establishment, a milk plant, and a workshop of a furniture factory that is based in the city of Krasnoufimsk. [29–817–3]

SHALIKOV, PETR IVANOVICH. Born 1767; died Feb. 16 (28), 1852, in Serpukhov District, Moscow Province. Prince. Russian writer and journalist.

Shalikov's collections of verse *The Fruit of Free Feelings* (parts 1–3, 1798–1801) and *The Flowers of the Graces* (1802) and his prose works *Journey to Little Russia* (1803–04) and *Journey to Kronstadt* (1805) evince a sentimentalism similar to that of Karamzin. As publisher of the magazines *Moskovskii zritel'* (1806), *Aglaia* (1808–12), and *Damskii zhurnal* (1823–33), Shalikov took a reactionary stance. Shalikov edited the newspaper *Moskovskie vedomosti* for 25 years.

SHALKAR (also Chelkar), a salt lake in Ural'sk Oblast, Kazakh SSR. The lake has an area of 200 sq km, an average depth of 5.1 m, and a maximum depth of 13 m. Salt bottoms are adjacent to the lake on the north. Fed by snow and underground springs, the lake has its highest water level in May; the level varies by 1.8 m. Lake Shalkar freezes over in November, and the ice breaks up in May. The Esenankaty River empties into the lake, and the Solianka River of the Ural River basin flows out of it. The lake is fished commercially. [29–814–1]

SHALKARTENIZ (also Chelkartengiz), a salt bottom northeast of the Aral Sea, in the Kazakh SSR. It has an area of approximately 1,800 sq km. In the spring, waters of the Turgai and Irgiz rivers flow into Shalkarteniz, which becomes a bitter lake with depths of 2–3 m. [29–814–2]

SHAL'NIKOV, ALEKSANDR IOSIFOVICH. Born Apr. 27 (May 10), 1905, in St. Petersburg. Soviet physicist. Corresponding member of the Academy of Sciences of the USSR (1946).

Shal'nikov graduated from the Leningrad Polytechnic Institute in 1928. In 1935 he began working at the Institute of Physical Problems of the Academy of Sciences of the USSR, and in 1938 he became a professor at Moscow State University. His main works are devoted to various aspects of experimental physics, for example, low-temperature physics and the study of properties of thin metal films and colloids.

Shal'nikov received the State Prize of the USSR in 1948, 1949, and 1953. He has been awarded the Order of Lenin and various medals.

SHALOM ALEICHEM (also Sholem or Sholom Aleichem; pen name of Sholom Nokhumovich Rabinovich). Born Feb. 18 (Mar. 2), 1859, in Pereiaslav, Ukraine; died May 13, 1916, in New York. Jewish writer.

Shalom Aleichem wrote in Hebrew, Yiddish, and Russian. He studied at a heder and at the Russian district school in Pereiaslav. His first published work, in 1879, was in Hebrew. The novella *Two Stones* and the short story "The Elections," both published in 1883, were the first of his works to appear in Yiddish. His writing conformed to the democratic and enlightenment traditions of Jewish and Russian literature. In the pamphlet *The Trial of Shomer* (1888) and in the series of articles "The Theme of Poverty in Jewish Literature," Shalom Aleichem fought against the "trash" literature and idyllic romance, advocating a realistic folk literature. He also founded a literary annual, *The Popular Jewish Library* (1888–89), which brought together the work of many democratic writers and played a notable role in the history of modern Jewish literature.

In his satirical novel *Sender Blank and His Household* (1887), Shalom Aleichem criticized the bourgeoisie. He followed this with romantic portrayals of gifted common people in the novels *Stempenyu* (1888) and *Yosele Solovey* (1889). In 1892 the first chapters of *Menakhem-Mendl* were published; this was a novella about a *luftmentsh*, or impractical dreamer—a petit bourgeois who tries unsuccessfully to climb up the capitalist ladder. Another "little man," but of a completely different stamp than Menakhem-Mendl, was portrayed in the novella *Tevye the Dairyman*, some chapters of which appeared in 1894. Tevye is a toiler and a pure spirit; he is a wise, unselfish, and good man who is full of compassion for another's misfortune. These stories demonstrate Shalom Aleichem's masterful use of humor, as do his short-story cycles, which he began in the 1890's and on which he continued to work throughout his writing life—*Kasrilevke, Railroad Stories, The Undaunted, Stories for Children*, and *Monologues*.

The Revolution of 1905–07 was a significant landmark in Shalom Aleichem's development as a writer. In the early 1900's he established contacts with L. N. Tolstoy, A. P. Chekhov, M. Gorky, and V. G. Korolenko, gave readings from his works at illegal and semilegal gatherings of the intelligentsia and young workers in Poland, Lithuania, and Latvia, issued satirical pamphlets against autocracy (*Uncle Pinye and Aunt Reyzl, Sleep, Alesha*, and *The Newly Born*—all published in 1905), and wrote about revolutionaries in the short stories "Yosif" and "Shmulik" (1905). In the novel *The Deluge* (1906) he sought to draw a broad picture of the age, including figures of revolutionaries and common people. The novel, albeit full of sympathy for the people and the revolution, is nevertheless characterized by an abstract humanism that testifies to the author's inadequate understanding of the social significance of events.

With the reestablishment of reactionary rule, having survived the pogrom in Kiev, Shalom Aleichem left for America, and subsequently he moved to Switzerland. The anticapitalist tendencies in his writings, made more pronounced by his observations on the "American way of life," were reflected in the novel *Wandering Stars* (1909–11), in various short stories, and especially in the novella *Motl, the Son of the Cantor Peyse* (part 1, 1907); here, as well as in *Menakhem-Mendl* and *Tevye the Dairyman*, the author poses the question of the fate of the masses under capitalism. *Motl* was highly praised by M. Gorky in 1910.

Shalom Aleichem returned to Russia in 1908; in October of that year he was widely acclaimed on the 25th anniversary of the start of his literary activity, and in 1909 his works were published in Russian. In the last years of his life he published the novel *The Bloody Jest* (1912), written in response to the Beilis case; he also worked on the play *The Grand Prize* (1915) and on the unfinished autobiographical novel *Back From the Fair*.

World War I found Shalom Aleichem in Germany, where he was undergoing medical treatment; he was interned and sent to Berlin, then to Denmark, and in December 1914 he arrived in New York. The imperialist war evoked his anger, which he expressed in the short-story cycle *Tales of a Thousand and One Nights* (1914). He experienced loneliness and depression in a country that was alien to him, and these feelings aggravated the illness that led to his death.

Shalom Aleichem's realistic writing gained worldwide recognition, and his works have been translated into many languages. Modern Jewish literature continues in the best of Shalom Aleichem's traditions.

SHAL'SKII, an urban-type settlement in Pudozh Raion, Karelian ASSR. Shal'skii has a port—Shala—on the eastern shore of Lake Onega, at the mouth of the Vodla River. Industry is represented by the Pudozh Sawmill, the Steklianskii Timber-rafting Enterprise, and a fish-processing station of the Petrozavodsk Fish-processing Combine. [29–817–1]

SHALYGINO, an urban-type settlement in Glukhov Raion, Sumy Oblast, Ukrainian SSR. Shalygino is 126 km northwest of the city of Sumy and 12 km from the Krupets railroad station on the Khutor-Mikhailovskii–Vorozhba line. Shalygino has a sugar factory. [29–816–1]

SHAMALDY-SAI, an urban-type settlement in Osh Oblast, Kirghiz SSR, under the jurisdiction of the Tash-Kumyr city soviet. Shamaldy-Sai is situated on the Naryn River. It has a railroad station on the Uchkurgan—Tash-Kumyr branch line. The Uchkurgan Hydroelectric Power Plant is located in the settlement. Shamaldy-Sai has a milk plant and a metal structural components plant. [29–819–1]

SHAMAN, a priest in the cult of shamanism. The shaman has the ability to enter into *kamlanie*, a state of ritual ecstasy, during which, his followers believe, he communicates with spirits. With the spirits' aid, he can, for example, heal the sick or predict the future. [29–819–2]

SHAMANISM, an early form of religion among most peoples.

Originating in the period of the primitive communal system, shamanism was based on faith in the shaman's communication with spirits, which occurred when the shaman was in a state of *kamlanie* (ritual ecstasy). The forms of *kamlanie*, the concept of the spirits, and the shaman's degree of specialization differed among different peoples. Some peoples retained vestiges of shamanism even under the conditions of class society.

Shamanism acquired complex forms among such Siberian peoples as the Tuvinians, Evenki, and Yakuts. The Siberian shamans dressed in special costumes, and their *kamlanie*, which involved the playing of tambourines, included frenzied dances and the use of hypnosis, ventriloquy, and various tricks. In *kamlanie* the shaman enacted a trip to the world of the spirits (sometimes on a "horse" or "deer," represented by the tambourine) and a struggle against the spirits. Professional shamans were nervous, easily excited people who were able to put themselves into a state of ecstasy or hallucination that became a self-regulated hysterical fit.

Among some peoples of Asia, Africa, Central America, and Polynesia, shamanism coexisted with other forms of religion. Vestiges of shamanism are retained in many later religious systems; examples include the *radenie* (prayer accompanied by dance) of the Khlysty and the *dhikr* ritual of the dervishes in Islam. Among the peoples of the USSR, shamanism has almost completely disappeared.

SHAMARY, an urban-type settlement in Shalia Raion, Sverdlovsk Oblast, RSFSR. Shamary, situated on the Sylva River at its confluence with the Vogulka River, has a railroad station on the Sverdlovsk-Perm' line, 185 km northwest of Sverdlovsk. The Shamarales Logging Production Association is located in the settlement. [29–820–2]

SHAMASH, in Babylonian-Assyrian religion and mythology, the god of the sun, justice, and oracles. [29–820–3]

SHAMASH-SHUM-UKIN (Greek, Sammugen or Saosduchinos). King of Babylon (667–648 B.C.). Son of Esarhaddon.

Circa 653 B.C., Shamash-shum-ukin raised a rebellion against his brother Ashurbanipal, king of Assyria, who had supreme authority over Babylon. The rebellion was supported by most of the peoples subjugated by the Assyrians—the Arab tribes and the citizens of the Chaldean and Syrian principalities, Elam, Media, Judea, Lydia, and Egypt. Shamash-shum-ukin committed suicide after the defeat of his army and the capture of Babylon in 648 by Ashurbanipal's forces.

SHAMBALA (also, Washambala, Sambara), a people living in Tanzania. According to a 1975 estimate, the Shambala, together with the related Zigua (Zigula), Bondei, Kwere, and Doe peoples, number more than 650,000. Their language belongs to the eastern group of Bantu languages. The Shambala practice ancestor and nature worship; Christianity and Islam are also widespread. The Shambala engage chiefly in land cultivation, growing sisal, maize, coffee, and yams and other vegetables; many have left their farms to seek work in economically more developed areas. [29–821–1]

SHAMIAKIN, IVAN PETROVICH. Born Jan. 30, 1921, in the village of Korma, Dobrush Raion, Gomel' Oblast. Soviet Byelorussian writer and state figure. People's Writer of the Byelorussian SSR (1972). Member of the CPSU since 1943.

The son of a peasant, Shamiakin took part in the Great Patriotic War of 1941–45. He graduated from the Party School of the Central Committee of the Communist Party of Byelorussia in 1950, and in 1971 he became chairman of the Supreme Soviet of the Byelorussian SSR.

Shamiakin's first work appeared in print in 1941. The themes of military duty and of heroic deeds at the front and rear were long characteristic of his works. For example, the novel *Deep Current* (1949; State Prize of the USSR, 1951) deals with the selfless battle of Byelorussian partisans against the fascist German aggressors. Postwar life in the village is depicted in his novels *Good Luck!* (1953; Russian translation, 1955) and *The Wells* (1957; Russian translation, 1959); the second novel exposes in telling fashion bureaucratic red tape and apathy. Between 1956 and 1966, Shamiakin published a series of five topical novellas that constitute the book *Troublous Happiness* (1966; Ia. Kolas State Prize of the Byelorussian SSR, 1967); this work is a lyric and epic narrative about love, fidelity, and the inner beauty of the Soviet man.

One of Shamiakin's best novels, *Heart on Your Sleeve* (1964;

Ia. Kolas State Prize of the Byelorussian SSR, 1965), treats of moral and ethical problems; although a story about present-day events, it includes some scenes of wartime life. The novel *Snowy Winters* (1970) is constructed on the same compositional principle. Lenin appears in the novellas *Bread* (1969), *The First General* (1970), and *The "Comrade Lenin" Armored Train* (1970), as well as the short story "The Sailor From the *Oleg*" (1970). The life and work of the Soviet intelligentsia are the subject of the novel *Atlanta and the Caryatids* (1974; Russian translation, 1974). Shamiakin has also written children's stories. He is the author of the plays *Don't Trust the Silence* (1958), *The Banishment of the Lascivious Women* (1961), and *And the Birds Fell Silent* (1977) and of the book of essays of literary criticism entitled *A Conversation With the Reader* (1973). Shamiakin makes use of timely themes and dynamic plots. Many of his works have been translated into languages of the USSR and other countries of the socialist community.

Shamiakin was a deputy to the sixth through ninth convocations of the Supreme Soviet of the Byelorussian SSR; he is a member of the Central Committee of the Communist Party of Byelorussia. He became the deputy chairman of the administrative board of the Writers' Union of the Byelorussian SSR in 1954 and the board's secretary in 1976. Shamiakin has been awarded five orders and various medals.

SHAMIL (also Shamyl). Born 1797 in the *aul* (village) of Gimry, in Dagestan; died March 1871 in Medina, in what is now Saudi Arabia. Head of a Muslim military and theocratic state in Dagestan who led the struggle of the Dagestan and Chechen mountaineers against the tsarist colonialists (*see* CAUCASIAN WAR OF 1817–64).

The son of an Avar peasant, Shamil was raised among Muslim clergy. In the 1820's he became an associate of Gazi-Magomed's and later of Gamzat-Bek's; in 1834 he was elected imam. Through his organizational abilities and force of will he succeeded in uniting the mountaineers and in subjugating the local Dagestani feudal lords. His personal bravery and remarkable eloquence made Shamil an extremely popular figure. In 1848 his rule was declared hereditary. Supported by the free peasants and the clergy, he established an imamate, that is, a military theocracy in which secular and religious power was invested in him (*see* IMAMATE).

Shamil, who proved to be a skilled military commander, successfully warred against the tsarist forces and achieved several major victories in the 1840's. In the 1850's, however, his movement declined, owing to the superior numbers of the tsarist troops, growing internal social contradictions, the ruin and exhaustion of the people, a food crisis, and the treachery of his vicegerents.

On Aug. 25, 1859, Shamil, with 400 Murids (*see* MURIDISM), was besieged in the *aul* of Gunib, and on August 26 he surrendered under honorable conditions. He and his family were resettled in Kaluga, and in 1870 he was permitted to make a pilgrimage to Mecca. Dagestan and Chechnia were annexed by force, a method typical of tsarist policy. At the same time, the incorporation of these peoples into the Russian Empire contributed to their economic, political, and cultural development.

SHAMKHAL, an urban-type settlement in Kizil''iurt Raion, Dagestan ASSR. Shamkhal is situated on the Shuraozen' River, which flows into the Caspian Sea. It has a railroad station on the Gudermes-Baku line, and a 40-km branch line runs from the settlement to Buinaksk. Shamkhal has a poultry farm, a flour combine, a feedlot sovkhoz, and a sovkhoz for the production of dairy products and vegetables. [29–830–4]

SHAMKHAL, the title borne by the rulers of various peoples of Dagestan, including the Kumyks, Laks, and Darghins, from the late 12th century until 1867. The title was conferred at a meeting of the feudal aristocracy in Kazi-Kumukh; at the same time the *krym-shamkhal*, or future *shamkhal*, was also designated. In the 17th century the authority of the *shamkhal* became essentially hereditary, and only Kumyk rulers bore the title. The residence of the *shamkhal* was located in the settlements of Kazi-Kumukh, Buinak, and Tarki (*see* TARKI SHAMKHALATE). [29–830–3]

SHAMKHOR (also Shamkur, Shamkir), a city and the administrative center of Shamkhor Raion, Azerbaijan SSR. Located on the Tbilisi-Evlakh highway, 4 km from the Dolliar railroad station. Population, 21,000 (1974).

An ancient city, Shamkhor was captured in the seventh century by the Arabs. It later fell under the sway of the emirs of Gandzha (now Kirovabad), who belonged to the Shaddadid dynasty. The Mongol Tatars destroyed Shamkhor in 1235. The Kizilbash rulers controlled the city during the 16th and 17th centuries. The city became part of Russia in 1803.

Shamkhor has a brandy distillery, a winery, and a combine of local industry; a museum of local lore is located in the city.

SHAMKHORCHAI, a river in the Azerbaijan SSR; a right tributary of the Kura River. The Shamkhorchai is 95 km long and drains an area of 1,170 sq km. It rises in the Shakhdag Mountains and in its lower course divides into branches. It is fed primarily by underground waters. The mean flow rate 49 km from the mouth is 8.58 cu m per sec. A reservoir is located on the river. The *Shamkhorchai* is used for irrigation. [29–830–6]

SHAMLUG, an urban-type settlement in Tumanian Raion, Armenian SSR. Shamlug is situated 24 km from the city of Alaverdi and 8 km from the Akhtala railroad station. Copper ore is mined in the vicinity. Shamlug has a branch of the Alaverdi Garment Factory. [29–822–2]

SHAMOTA, NIKOLAI ZAKHAROVICH. Born Dec. 4 (17), 1916, in Poltava. Soviet literary scholar, critic, and public figure. Academician of the Academy of Sciences of the Ukrainian SSR (1967); member of the academy's presidium and academician-

secretary of the division of literature, language, and art (1966–71). Member of the CPSU since 1945.

Shamota took part in the Great Patriotic War of 1941–45. He graduated from the Nezhin Pedagogical Institute in 1939 and from the Academy of Social Sciences of the Central Committee of the CPSU in 1953. From 1961 to 1978 he served as director of the T. G. Shevchenko Institute of Literature of the Academy of Sciences of the Ukrainian SSR. Shamota's first published works appeared in 1946. His most important works deal with the theory of socialist realism, the contemporary literary process, and Soviet Ukrainian writers. His books have been translated into many languages, both in the USSR and abroad.

Shamota became a member of the Central Committee of the Communist Party of the Ukraine in 1976. He was a deputy to the eighth and ninth convocations of the Supreme Soviet of the USSR. Shamota has been awarded the Order of Lenin, four other orders, and various medals.

SHAMOV, AFZAL SHIGABUTDINOVICH. Born Feb. 19 (Mar. 4), 1901, in the village of Tatarskoe-Tanaevo, in what is now Zelenodol'sk Raion. Soviet Tatar writer. Member of the CPSU since 1943.

A veteran of the Civil War of 1918–20, Shamov studied in the literature department of Moscow State University from 1926 to 1930. He took part in the Great Patriotic War of 1941–45. In 1949 and 1950, Shamov was editor of the journal *Sovet ädebiyäti* (Soviet Literature).

Shamov was first published in 1919. His main theme—the spiritual growth and political development of Soviet man—appears in such works as the novellas *Raufa* (1926) and *The Story of a Love* (1933) and the short-story collections *In Petroleum City* (1955) and *On One of the Days* (1959). Shamov's lyric works were published in the collection *On a Rainy Evening* (1965). He has translated into Tatar works by such writers as L. N. Tolstoy, N. V. Gogol, F. V. Gladkov, and N. A. Ostrovskii.

Shamov was a member of the Presidium of the Supreme Soviet of the Tatar ASSR from 1959 to 1963. From 1958 to 1961 he was chairman of the administrative board of the Writers' Union of the Tatar ASSR. Shamov has been awarded the Order of the October Revolution, two other orders, and various medals.

SHAMOV, VLADIMIR NIKOLAEVICH. Born May 22 (June 3), 1882, in Menzelinsk, in what is now the Tatar ASSR; died Mar. 30, 1962, in Leningrad. Soviet surgeon. Academician of the Academy of Medical Sciences of the USSR (1945); lieutenant general in the military medical service (1943). Member of the CPSU since 1942.

Shamov graduated from the Military Medical Academy in 1908. Between 1923 and 1939 he was head of the subdepartment of faculty surgery at the Kharkov Medical Institute, chief of the surgical clinic of the Ukrainian Institute of Experimental Medicine, and director of the Ukrainian Institute of Hematology and Blood Transfusion. Between 1939 and 1958 he was chairman of the department of hospital surgery at the Military Medical Academy and director of the Institute of Neurosurgery in Moscow, Institute of Neurosurgery in Leningrad, and the Leningrad Institute of Blood Transfusion. During World War II, he served as deputy chief surgeon of the Soviet Army.

Shamov was the first physician in the USSR (1919) to transfuse blood based on the blood group of the donor and recipient and to transfuse cadaver blood (1928) under experimental conditions. He was one of the pioneers in organ and tissue transplantation in the USSR. He also worked out problems connected with the organization of the specialized medical care of the wounded. Shamov conducted research in neurosurgery, urology, and pulmonary and abdominal surgery. He developed (1926) a method of completely isolating an intestinal loop from all of its nerve connections and was thus able to conduct physiological observations of the functioning of an isolated segment of the intestine.

Shamov received the Lenin Prize (1962). He was awarded two orders of Lenin, four other orders, and various medals.

SHAMS AL-DIN ILDIGUZ (also Shams al-Din Eldiguz). Date of birth unknown; died 1174. Founder of the Turkic Ildiguzid feudal dynasty in Azerbaijan and northwestern Iran.

A Kipchak slave by birth, Shams al-Din Ildiguz was in the service of the Seljuk vizier Simirumi and later of Sultan Masud ibn Muhammad, who appointed him governor of northern and southern Azerbaijan in 1136. Having become an independent ruler of lands in Azerbaijan and head of the Iraqi-Seljuk sultanate after Masud's death, he united under his rule various territories, including southern Azerbaijan, northern Azerbaijan as far as Shirvan and Georgia, and all western Iran.

SHAMSHURENKOV, LEONTII LUK'IANOVICH. Born 1687 in the village of Bol'shepol'skaya, Iaransk District, Kazan Province; died there 1758. Russian inventor; *dvortsovyi krest'ianin* (court peasant).

In 1736, Shamshurenkov designed the original models of the hoisting mechanisms to be used in lifting the Tsar Bell. (Damaged by fire, the bell was never hoisted into place.) In 1752 he built a four-wheeled carriage that was powered by two men. Shamshurenkov also proposed designs for self-propelled sleighs and a mechanical verstmeter (a device that records the mileage covered by a vehicle).

SHAMURATOVA, AIMKHAN. Born June 10, 1917, in the city of Kungrad. Soviet Kara-Kalpak actress. People's Artist of the USSR (1968). Member of the CPSU since 1957.

Since 1932, Shamuratova has spent practically her entire career

as an actress with the Stanislavsky Kara-Kalpak Theater of Drama and Comedy. She also studied at the Moscow Conservatory and gave concerts of songs of the peoples of the USSR. Her roles have included Aisara in Iashen's *Giul'sar*, Gul'parshin in Davkaraev's *Alpamys*, the title role in *Raushan* by Aimurzaev and Allanazarov, Parshagul' and Aibike in Khodzhaniiazov's *Love Can't Be Won by Force* and *Taluas*, Tolgonai in Aitmatov's *Maternal Field*, and Anna Ivanovna in A. N. Ostrovskii's *Poverty Is No Crime*.

Shamuratova was a deputy to the fourth and seventh convocations of the Supreme Soviet of the Kara-Kalpak ASSR. She has been awarded two orders and several medals. [29–830–1]

SHAMURIN, EVGENII IVANOVICH. Born Oct. 16 (28), 1889, in Yerevan; died Dec. 1, 1962, in Moscow. Soviet specialist in book science. Doctor of pedagogical sciences; professor at the Moscow Library Institute beginning in 1944.

Shamurin graduated from the law faculty of the University of Kazan in 1912. From 1921 to 1937 he worked in Moscow at the Russian Central Book Chamber, known as the All-Union Book Chamber from 1936. He became the editor of *Knizhnaia letopis'* (Book Chronicle) in 1923 and the deputy director of the Book Chamber in 1932.

Shamurin made a great contribution to the development of bibliography and library science. His chief works are *Cataloging* (1925), *Methods of Bibliographical Work* (1933), *The Systematic Catalog and Its Organization* (1936), and *Essays on the History of the Library Bibliographical Classification* (vols. 1–2, 1955–59). Shamurin was the compiler of *A Dictionary of Book Science Terminology* (1958).

SHAN (self-designation, *Thainyo*), a nationality in Burma, inhabiting primarily the Shan Upland. According to a 1975 estimate, the Shan number 2.1 million.

The Shan, who speak a Thai language, profess Buddhism; the folk religion is based on tiger worship. The Shan first settled in Burma at about the beginning of the Common Era; a Shan state, with its capital at Muanmau, is known to have existed as early as the seventh century. In the 14th and 15th centuries all northern and central Burma was controlled by the Shan, who in turn came under the control of the Burmese kings in the mid-16th century.

The Shan are undergoing national consolidation in their own region of Burma, the Shan State. They engage chiefly in irrigation farming, including the cultivation of rice; the plow is still the principal agricultural implement. Highly developed handicrafts include smithery, jewelry-making, the making of lacquer ware, weaving, and mat braiding.

SHAN, a national state in Burma, in the Shan Upland. Area, 158,000 sq km. Population, 2,725,000 (1969), most of whom are of Shan nationality. The capital is the city of Taunggyi. The chief crops grown in the Shan state are rice, potatoes, tea, and citrus fruits. Nonagricultural economic activities include logging, the mining of lead-zinc ores (center, Baldwin), the mining of brown coal (center, Lashio), nonferrous metallurgy, and the processing of timber and agricultural raw materials. [29–832–2]

SHANFARA. Lived around the turn of the sixth century. Arab poet from southwest central Arabia.

Shanfara was numbered among the *saluqiin*, who were the ancient Arab counterparts of the *izgoi* in Kievan Rus'; specifically, the *saluqiin* were the poor who had no tribal affiliation as a result of the decay of the clan tribal system. In Shanfara's poetry motifs of self-praise (*fahr*) predominate, affirming the heroism of individuals and a lack of tolerance for social injustice. Shanfara is best known for his *lamiyah* (literally, "poem rhyming in *l*"); however, scholars now think the work was actually written by the eighth-century Iraqi philologist Halaf al-Ahmar.

SHANGHAI, a city in China. Situated near the mouth of the Yangtze River, on its right tributary the Huangp'u Chiang, 50 km from the East China Sea. Most populous city in China and one of the largest cities in the world. Shanghai and its adjacent territory constitute an autonomous municipality administered directly by the central government. Area, 5,800 sq km. Population, approximately 11 million (1974).

Shanghai is one of China's major centers of industry, transportation, and commerce. As a seaport and river port it handles approximately 50 million tons of cargo annually, including nearly half the country's overseas cargo. It is also an important railroad and highway junction. Shanghai has more than 1 million industrial workers and accounts for more than one-seventh of the value of China's industrial production (1973–74).

Heavy industry produces more than 50 percent of the city's gross industrial output; in 1949 the figure was only 14 percent. The machine-building industry produces more than one-fourth of the country's output and manufactures equipment for the power-engineering, petroleum, mining, printing, paper, textile, and food-processing industries. Other products include electrical instruments, radio and electronic equipment, motor vehicles, ships, machine tools, motion-picture and still cameras, and watches. The city has iron and steel enterprises, which produce more than 2 million tons of steel annually; nonferrous metallurgy is represented as well. The diversified chemical industry, which is based on imported raw materials, accounts for about one-third of the nation's output; products include mineral fertilizers, toxic chemicals, acids, plastics, synthetic resins, chemical fibers, rubber goods, and pharmaceuticals. The city also has an oil refinery.

Shanghai remains one of the most important centers of the textile industry in the world. Its textile mills employ more than one-third of its industrial workers and produce about one-fifth of China's total output of fabrics, including more than half the country's wool and silk. The tobacco industry, which accounts for more than half of China's output, and the food-processing industry are also of considerable size.

Several large publishing houses are located in Shanghai. Among the city's educational institutions are Futan and T'ungchi universities, medical and pedagogical institutes, and an institute of foreign languages. Other institutions include a branch of the Academy of Sciences of the People's Republic of China, research institutions, several scholarly societies, and the Zikaiwei Observatory. Cultural institutions include the Shanghai Library (more than 3.5 million volumes in 1977), the Shanghai Municipal People's Library (more than 900,000 volumes), and museums.

The central part of the city and its principal industrial sections lie along the left bank of the Huangp'u and along its tributary the canalized river Wusung Chiang (also Suchou Ho). There are industrial enterprises and artisans' workshops south of the city's center in Nantao (Southern City), Shanghai's historical nucleus, where the principal architectural monuments are concentrated.

The old industrial districts, dominated by the textile industry, include Ch'ap'ei, P'ut'o, and Yangp'u. The new districts of Tengp'u, Minhang, and Kaoch'iao contain, for the most part, machine-building and chemical enterprises. There are wharves and cargo-handling facilities on the right bank of the Huangp'u in the Tungch'ang (P'utung) district. S. N. RAKOVSKII

Shanghai grew from the fishing settlement of Hu Tu, which had been established in antiquity, and by the 16th century was a busy center of trade and handicrafts. Under the Treaty of Nanking (1842), the city was opened to foreign trade. A British settlement was established in Shanghai in 1843, and an American settlement in 1848; the French obtained a concession in 1849 (*see* EXTRATERRITORIAL CONCESSIONS). In 1854, Great Britain, France, and the USA seized the city's customs administration, which they controlled until 1937. In 1860 and 1862 the Taiping rebels and Anglo-French interventionists clashed outside Shanghai.

In the second half of the 19th century Shanghai rapidly developed into the country's leading industrial and commercial center

and served as the principal base for the capitalist nations' aggression in China. Beginning with the patriotic May Fourth Movement in 1919, the city was an important center of the national liberation and revolutionary movement. The First Congress of the Communist Party of China was held in Shanghai in 1921, and the national Revolution of 1925–27 began in the city, which was the site of three workers' uprisings in 1926 and 1927 (*see* SHANGHAI UPRISINGS OF 1926–27). Shanghai was occupied by the Japanese from November 1937 to August 1945. The city was liberated from Kuomintang rule by the People's Liberation Army of China on May 27, 1949. V. P. ILIUSHECHKIN

The central part of Shanghai comprises business and commercial areas with broad, tree-lined streets and multistory (up to 35 floors) buildings, whose architecture is either European or a stylized version of traditional Chinese design. On the outskirts of the city narrow, winding streets are lined with one-story houses, clay-walled cottages, and bamboo huts. Architectural monuments of the 16th–19th centuries include the Former Temple of Confucius, the five-story octagonal Lung Hua Pagoda, and the Yu Fu Monastery, which contains a nephrite statue of Buddha that was brought from Burma. Shanghai's craftsmen produce basketry, wood carvings, embroidery, woven goods, and articles of bone, stone, and metal. [29–838–1]

SHANGHAI UPRISINGS OF 1926–27, three armed uprisings by the workers of Shanghai, led by the Communist Party of China. The workers hoped to liberate Shanghai from the rule of the warlords and to help the National Revolutionary Army (NRA), which was engaged in the Northern Campaign of 1926–27.

The first two uprisings, on Oct. 24, 1926, and Feb. 22 and 23, 1927, were poorly organized and ended in defeat. The Communists, having learned from their earlier setbacks, prepared the third uprising in absolute secrecy; they armed 5,000 workers, and a main headquarters was established for the uprising. On March 21, as units of the NRA approached Shanghai, the Communist Party and the Shanghai General Council of Trade Unions called a general strike, which grew into an armed workers' uprising. By the evening of March 22, the warlords in Shanghai had been overthrown. The victory of the workers of Shanghai was an important event in the Revolution of 1925–27 in China.

SHANG YANG. Born 390 B.C.; died 338 B.C. Ancient Chinese state figure and reformer; a founder of the Legist school (*see* FA-CHIA).

A scion of an impoverished aristocratic family, Shang Yang in 361 B.C. entered the service of the Ch'in king Hsiao Kung and rose to become his chief adviser. From 359 to 348 he carried out a series of reforms that helped to consolidate central authority and strengthen the Ch'in state. As a result of Shang Yang's reforms, the right of private ownership of land was legalized for the first time in China's history, and the purchase and sale of land were officially permitted. In other reforms, land cultivation was encouraged, freedom to engage in trade and handicrafts was restricted, and some artisans and petty merchants were made slaves of the state. The aristocracy was deprived of the right to inherit administrative posts, and its system of hereditary landholding was abolished. The territory of the state was divided into 31 prefectures, large (patriarchal) families were forcibly split up, and a system of mutual responsibility and spying was introduced in the villages.

Shang Yang's reforms aroused the displeasure of the hereditary aristocracy, at whose insistence he was put to death. Many of the changes aimed at strengthening central authority were applied throughout the country after the unification of China by the Ch'in state in 221 B.C.

SHANHAIKUAN, a city in North China, in Hopeh Province. Port on the coast of the Gulf of Liaotung of the Yellow Sea. Situated in the Shanhaikuan Corridor, at the eastern end of the Great Wall of China. Population, more than 30,000 (1957). Shanhaikuan is served by a railroad station on the Peking-Mukden line. In addition to a plant that produces structural units for bridges, the city has enterprises of the machine-building and chemical industries. [29–846–1]

SHANHAIKUAN CORRIDOR, a narrow, low-lying strip of coastland in China, between the Yanshan Mountains and the Gulf of Liaotung of the Yellow Sea. It connects the North China Plain with Northeast China and has a length of approximately 200 km and widths of up to 25 km. The railroad and highway that link Peking with Shenyang run through it.

For many centuries, the corridor was China's main gateway to the north, and as such it held great strategic importance. In the sixth century, the Chinese began building forts in the corridor, which derives its modern name from the Shanhaikuan Fort, erected in the 14th century; the eastern end of the Great Wall of China was joined to the fort. In May 1644 a battle took place near Shanhaikuan between the rebel forces of Li Tzu-ch'eng and the combined forces of Manchu aggressors and Chinese feudal lords under the leadership of Wu San-kuei. The rebels were defeated in the battle; shortly thereafter, the Manchu forces seized Peking and proceeded to conquer all of China. [29–846–2]

SHANIAVSKII UNIVERSITY (full name, A. L. Shaniavskii Moscow City People's University), a university that existed in Moscow from 1908 to 1918. The initiative and funds for founding the university were provided by General A. L. Shaniavskii (1837–1905), a liberal figure in the field of public education. Under pressure from democratic elements of society, the Duma passed a bill in 1908 approving the establishment of the new university. Regular instruction began in the same year. Students of both sexes over the age of 16 were admitted without regard to nationality, religion, or political views. Since admission requirements did not include a secondary school diploma, the student body was quite diverse.

Shaniavskii University had two divisions—general and scholarly. The former provided a general secondary education; the latter provided a higher education in the natural, social, and philosophical sciences. Programs of study in the fields of preschool education, library science, and education outside the classroom became very well known. Many prominent scholars who had left government educational institutions because of their progressive views joined the staff of the university; among them were P. N. Lebedev, Iu. V. Got'e, A. N. Reformatskii, and P. P. Blonskii. In 1912 more than 3,600 students were enrolled in the university.

Shaniavskii University was closed in late 1918 as a result of a reorganization of the system of public education.

SHANIDAR, a Stone Age cave site in the foothills of the Zagros Mountains (northern Iraq), near Lake Urmia, where in the period 1951–61 an American archaeological expedition discovered nine Neanderthal skeletons, along with Levalloisian stone implements of the Mousterian culture. Anthropologically, the people from Shanidar, who lived 50,000 to 70,000 years ago, are related to the Neanderthals of Western Europe, but they have quite a few traits in common with modern man.

SHANIDZE, AKAKII GAVRILOVICH. Born Feb. 14 (26), 1887, in the village of Noga, in what is now the Georgian SSR. Soviet philologist. Corresponding member of the Academy of

Sciences of the USSR (1939). Academician of the Academy of Sciences of the Georgian SSR (1941).

Shanidze graduated from the University of St. Petersburg in 1913. He helped found the University of Tbilisi, where he became a professor. Shanidze's principal works deal with the history and structure of the Kartvelian languages, Georgian dialectology, the writing system of the Caucasian Albanians, and the history of Georgian literature.

Shanidze analyzed and published several Old Georgian texts, and his publication of Khevsur poetry constituted a landmark in the study of Georgian folklore. He published Svanetian poetic texts and a series of original and translated Old Georgian literary works. He reconstructed the original text of S. Rustaveli's narrative poem *The Man in the Panther's Skin*. Shanidze has been awarded three Orders of Lenin and two other orders.

SHANNON, CLAUDE ELWOOD. Born Apr. 30, 1916, in Gaylord, Mich., USA. American scientist and engineer; one of the founders of mathematical information theory. Member of the National Academy of Sciences (1956) and of the American Academy of Arts and Sciences.

Shannon graduated from the University of Michigan in 1936. From 1941 to 1957 he was a research mathematician with Bell Telephone Laboratories. In 1941 he became a consultant for the National Defense Research Committee. Shannon became a professor of electrical engineering and mathematics at the Massachusetts Institute of Technology in 1957.

Shannon's principal works deal with the algebra of logic, the theory of relay and switching systems, the mathematical theory of communication, information theory, and cybernetics.

WORKS

In Russian translation:
Raboty po teorii informatsii i kibernetike. Moscow, 1963. [29–1129–2]

SHANNON, the longest river in Ireland. The Shannon has a length of 368 km (356 km according to some calculations) and drains an area of 15,700 sq km. The river flows through the Central Lowland and passes through a number of lakes, including loughs Allen, Ree, and Derg. Before emptying into the Atlantic Ocean, it forms an estuary with a length of approximately 100 km.

The Shannon is fed by rain. The water level rises in the autumn and winter and falls in the summer. The river never freezes over. The mean flow rate in the lower course is approximately 200 cu m per sec. The Shannon is navigable for almost its entire length, and at high tide oceangoing vessels can sail as far as the city of Limerick. The river is linked with Dublin by the Royal Canal and the Grand Canal. The Ardnacrusha Power Station is on the Shannon above Limerick. The cities of Carrick-on-Shannon, Athlone, Killaloe, and Limerick are situated on the Shannon. [29–834–4]

SHANNON'S CODING THEOREM, a basic theorem of information theory on the transmission of signals over communication channels in the presence of noise that results in distortion.

Suppose a sequence of symbols that appear with certain probabilities is to be transmitted, there being some probability that a transmitted symbol will be distorted during transmission. The simplest method of reliably restoring the original sequence from the received sequence is to repeat each transmitted symbol many (N) times. The rate of transmission, however, will thereby be slowed by a factor of N—that is, will be made close to zero. According to Shannon's theorem, there exists a positive number ν, dependent solely on the probabilities under consideration, such that, for arbitrarily small $\epsilon > 0$, methods of transmission at a rate ν' ($\nu' < \nu$) arbitrarily close to ν can be found that permit restoration of the original sequence with a probability of error of less than ϵ. If the rate of transmission ν' is greater than ν, then such methods cannot be found. The methods of transmission referred to involve the use of "noise-proof" codes. The critical rate ν is given by the equation $H\nu = C$, where H is the entropy of the source in bits per symbol and C is the capacity of the channel in bits per second. [29–1129–3]

SHANSHIASHVILI, SANDRO IL'ICH. Born July 13 (25), 1888, in the village of Dzhugaani, in what is now Signakhi Raion, Georgian SSR; died Oct. 28, 1979, in Tbilisi. Soviet Georgian writer. Honored Art Worker of the Georgian SSR (1930).

Shanshiashvili took part in the revolutionary movement and was arrested. From 1911 to 1914 he studied in Switzerland, and later he attended lectures at the universities of Berlin and Leipzig. Beginning in 1922 he contributed to the journal *Drosha* (The Banner) and helped build Soviet culture.

Shanshiashvili began writing in 1904. His early plays, notably *Anzor* (staged 1928), *The Three* (1931), and *New Roots* (published 1951), brought him popularity and literary recognition. In 1949, Shanshiashvili was awarded the State Prize of the USSR for the plays *Arsen* (staged 1936), *The Heroes of Krtsanisi* (staged 1942), and *Imeretian Nights* (1948). The drama *Arsen* depicts the struggle of the Georgian peasants against feudal tyranny and colonial policy, and *The Heroes of Krtsanisi* deals with the struggle of the Georgian people against the Iranian conquerors. The struggle of the Georgian proletariat at the barricades in the Revolution of 1905–07 is portrayed in the play *Arsen Dzhordzhiashvili* (1956). Shanshiashvili's works were important in the development of Soviet Georgian theater.

Shanshiashvili was awarded the Order of the Red Banner of Labor.

SHANSI, a province in China, in the basin of the middle course of the Huang Ho. Area, 150,000 sq km. Population, 18 million (1975). The capital is the city of T'aiyüan.

Shansi occupies the Shansi Plateau, which constitutes the eastern part of the Loess Plateau and the western slopes of the T'aihang Shan. The province has a temperate monsoon climate, with a mean January temperature that ranges from −16°C in the north to −2°C in the south and a mean July temperature of 20°–25°C. Annual precipitation is 400–500 mm. Vegetation in the west and northwest is mostly of the semidesert type; in the east are mixed and broad-leaved forests that have survived mainly in the upper zone of the mountains.

In value of output, Shansi's economy is dominated by industry, although most of the economically active population is employed in agriculture. The coal, metallurgical, machine-building, chemical, textile, and food-processing industries are highly developed. In addition to T'aiyüan, which accounts for about half the province's total industrial output, the principal industrial centers are Tat'ung and Yangch'üan. Coal is mined at the Tat'ung, Yangch'üan (Chintungnan), Hsit'an (Chinchuang), Luan, Fenhsi, Ningwu, and Hotung coalfields. Shansi produces about one-seventh of China's coal.

The metallurgical plant in T'aiyüan makes pig iron and steel, including rolled stock. Pig iron is produced in Yangch'üan, Ch'angchi, and Linfen. The machine-building industry, which is of nationwide importance, is represented by heavy machine building in T'aiyüan, textile machine building in Yützu, and tex-

tile and agricultural machine building in T'aiyüan and Tat'ung. The chemical industry, whose principal products are soda, acids, and sulfur, is concentrated in T'aiyüan and Yünch'eng.

The textile industry is represented by cotton mills in T'aiyüan and Yützu, and the food-processing industry produces wine, butter, and flour. The province's handicrafts include silk fabrics, rugs, and metal and porcelain articles. The production of building materials is centered in T'aiyüan and Tat'ung.

Shansi is an ancient farming region. Approximately one-third of the province is under cultivation, and part of the land, mainly in the Fen Ho valley and the Hsinhsien Basin (Yünch'eng), is irrigated. Terracing is practiced on the mountain slopes. More than half the plowland is sown to grains: wheat, foxtail millet, kaoliang, maize, and oats. The major industrial crops are cotton and flax, but sesame, peanuts, rape, and sugar beets are also grown. In the central and southern areas the land is double-cropped. Cattle, donkeys, and mules are raised chiefly for use as draft animals; sheep (in the mountains) and swine are also raised.

S. N. RAKOVSKII

Traces of the Neolithic Yangshao culture and remains of the material culture of the Shang period (16th–11th centuries B.C.) have been discovered in Shansi. The region was part of the Chin state from the seventh to fifth centuries B.C., the Chou kingdom from the fifth to third centuries B.C., the Northern Wei state from the fourth to sixth centuries A.D., the province of Hotung from the seventh to ninth centuries, the Khitan state of Liao from the tenth to 12th centuries, and the Jurchen state of Chin in the 12th and 13th centuries. Shansi received its present name in the 14th century.

In the 17th century, rebel peasant detachments under Li Tzu-ch'eng were active in Shansi, which was officially formed as a province in the middle of the century. For many years after the Hsinhai Revolution of 1911–13 the province was controlled by the warlord Yen Hsi-shan. From 1937 to 1945, Shansi was occupied by the Japanese. The province was liberated from Kuomintang rule by the People's Liberation Army of China in April and May 1949.

V. P. ILIUSHECHKIN [29–844–2]

SHANT, LEVON (pen name of Levon Segbosian). Born 1869 in Constantinople; died Nov. 29, 1951, in Beirut. Armenian writer.

Shant graduated from a theological school in Üsküdar and studied at the Echmiadzin Theological Academy. From 1892 to 1899 he studied at the universities of Leipzig, Jena, and Munich, and he later returned to Armenia. His early works, the first of which were published in 1891, include the narrative poem *The Girl From the Mountains* (1893), the novella *The Strangers* (1896), and the dramas *The Egoist* (1901) and *On the Road* (1904). All of these works deal with the quest for freedom in a world of illusions.

In his later works, Shant often employed historical themes. After the defeat of the Revolution of 1905–07 he wrote the drama *Old Gods* (1909; Russian translation, 1912), and during World War I (1914–18) he wrote the drama *The Emperor* (1916). Shant subsequently became closely associated with the bourgeois nationalist party Dashnaktsutiun, and his views displayed reactionary tendencies. He emigrated in 1921 and lived in Europe, Asia, and North America, taking up residence in Beirut in 1949.

Shant wrote about the distant past of the Armenian people, for example, the tragedy *Oshinpail* (1932) and the novel *Thirsting Souls* (1941). Shant's heroes reflect the author's gradual loss of interest in social matters. Eventually symbolist perception of reality came to prevail in his works.

SHANTAR ISLANDS, an archipelago in the southwestern part of the Sea of Okhotsk comprising 15 islands (Khabarovsk Krai, RSFSR). The total area of all the islands is approximately 2,500 sq km. The largest islands are Bol'shoi Shantar (area, 1,790 sq km), Feklistov (about 400 sq km), Malyi Shantar (about 100 sq km), and Belichii (about 70 sq km). The maximum elevation is 701 m. The islands, which are primarily mountainous, are composed of sandstones and clayey shales, with granitic and ultrabasic intrusions. The climate is harsh. The mountain slopes are covered with larch and dark coniferous forests; on the peaks there are thickets of dwarf stone pine. [29–836–2]

SHANTINGTUNG (Chinese, "upper cave"), the site of a Late Paleolithic settlement, located at the railroad station of Chouk'outien, about 45 km from Peking. The items found at Shantingtung include the bones of Neoanthropinae (the Shantingtung man) and stone and bone implements. The Shantingtung man's chief occupations were fishing, gathering, and hunting. A burial site attests to the existence of religious beliefs. The skulls found at Shantingtung are characterized by indistinct differentiation of racial features. In general they exhibit some Mongoloid characteristics, such as a tendency toward a broad nose and alveolar prognathism.

SHANTSER, VIRGILII LEONOVICH (party pseudonym, Marat). Born Sept. 21 (Oct. 3), 1867, in Odessa; died Jan. 29 (Feb. 11), 1911, in Moscow. Figure in the Russian revolutionary movement.

Shantser was the son of an engineer. In the late 1880's, while a student at a *Gymnasium* in Nikolaev, he became associated with supporters of the People's Will. He graduated in 1899 from the University of Iur'ev (previously Dorpat, now Tartu), where he took part in Social Democratic student circles.

In 1901 he undertook party work in Moscow and was, as a result, exiled to Eastern Siberia. After the Second Congress of the RSDLP (1903), Shantser became a Bolshevik. In 1904 he was made a member of the Moscow committee of the RSDLP. In 1905 the Central Committee of the RSDLP named him its representative for the central industrial region. In the same year he became a leader of the Moscow committee of the RSDLP and an editor of the newspaper *Rabochii*. He took part in the preparations for the December Armed Uprising of 1905 in Moscow.

Exiled to Eniseisk Province in 1906, Shantser escaped in the same year and became a member of the Omsk committee of the RSDLP and, subsequently, of the St. Petersburg committee. At the Fifth (London) Congress of the RSDLP, he was elected to the Bolshevik Center. Shantser was arrested in 1907 and exiled to Siberia, where he continued his revolutionary activities. Exiled in 1908 to Turukhansk Krai, he escaped again and went abroad.

In Paris, in June 1909, Shantser took part in the conference of the enlarged editorial board of *Proletarii*. He joined the *otzovisty* (recallers) and in December became a member of the antiparty Vpered Group. Seriously ill, Shantser returned to Russia in 1910.

SHANTSY, a term for various types of Russian field fortifications from the 17th to the 19th century. [29–841–1]

SHANTUNG, a province in East China, occupying the Shantung Peninsula and part of the North China Plain, along the lower Huang Ho. The province is washed by the Yellow Sea and the Pohai Wan. Area, 150,000 sq km. Population, 58 million (1975). The capital is the city of Tsinan.

The coast of the Shantung Peninsula, which is indented by numerous bays and inlets convenient for ships, is rocky. The coast of the North China Plain is flat and marshy. Part of the province is taken up by the T'ai Shan. Shantung has a temperate monsoon

climate. The principal rivers in the province's dense network of rivers are the Huang Ho and the Wei Ho. The lakes Tungp'ing Hu and Tushan Hu are connected by the Grand Canal system.

Shantung, an industrially developed province, is an important industrial region of the People's Republic of China; in 1971 it accounted for 5.5 percent of the country's gross industrial output. The highly developed mining industry includes the extraction of coal, petroleum, iron ore, bauxites, graphite, and salt (on the coast). The Tzupo Coalfield, in which 6–7 million tons were mined annually in the 1970's, and the Shengli oil fields, which yielded an estimated 15 million tons in 1975, produce for the entire country. The petroleum-refining industry is undergoing development.

The province produces a substantial quantity of electric power at fossil-fuel-fired steam power plants. Ferrous metallurgy is represented by plants in Tsinan and Tsingtao, and nonferrous metallurgy by an aluminum plant in Tsingtao. The diversified machine-building industry manufactures locomotives and railroad cars at the Ssufang Plant in Tsingtao, as well as internal-combustion engines, machine tools, electrical equipment, and machinery for the textile industry and agriculture. There are shipyards in Tsingtao.

The chemical industry is highly developed in Tsinan (rubber goods and mineral fertilizers), Tsingtao (plastics, mineral fertilizers, toxic chemicals, and dyes), and Poshan (Tzupo). Tsingtao ranks second in the People's Republic of China as a center of the cotton industry, with more than ten cotton mills, as well as knitwear and dye factories. The textile industry is also well developed in Tsinan, whose plants include a spinning mill, a textile mill, and a burlap plant. The porcelain and faïence industry in Poshan produces for the entire country. The highly developed food-processing industry produces vegetable oil, flour, tobacco, and wine.

Shantung, an important agricultural region, ranks second among China's provinces in the production of wheat; the other main food crops are soybeans, millet, rice, kaoliang, maize, and sweet potatotes. Shantung leads China's provinces in the production of peanuts; other industrial crops are cotton, tobacco, and hemp. There is fruit growing and viticulture. Animal husbandry, which plays an auxiliary role, is devoted to the raising of cattle, donkeys, swine, sheep, goats, and horses and to poultry farming. Other economic activities include fishing and the hunting of marine animals.

There is navigation on the Huang Ho, the Hsiaoch'ing Ho, and the Grand Canal. The province's main seaports are Tsingtao, Yant'ai, Weihai, Lungk'ou, and Shihtao. Tsingtao is a seaside resort. I. M. FEDOROV

Numerous objects from a Neolithic culture known as the Lungshan have been discovered in Shantung, and settlements from the Shang period (16th–11th centuries B.C.) are known to have existed in the province. From the eighth to third centuries B.C. most of Shantung formed part of the Ch'i and Lu kingdoms; during this period the ancient Chinese thinkers Confucius and Mencius were born in the region. Shantung received its present name in the tenth century.

Shantung was on numerous occasions the scene of major popular uprisings, notably the Red Eyebrows Rebellion in the first century, the Rebellion of the Yellow Turbans in the second century, a peasant uprising under Tou Chien-te in the seventh century, a peasant war led by Huang Ch'ao in the ninth century, and an uprising led by Sung Chiang in the 12th century. Shantung was officially formed as a province in the mid-17th century.

Detachments taking part in the northern campaign of the Taiping rebels operated in Shantung in 1854 and 1855, and detachments of Nien rebels were active in the province from 1864 to 1868. In 1898, Chiaochou Wan and the port of Tsingtao were forcibly "leased" by Germany, and the port of Weihai by Great Britain. At this time Germany declared Shantung within its sphere of influence and was granted several concessions in the province. Shantung was a center of the anti-imperialist Boxer Rebellion (1899–1901).

At the beginning of World War I, the territory leased by Germany was taken over by Japan, which returned it to China in 1922 under pressure from its imperialist competitors. From 1937 to 1945 the province was occupied by the Japanese. Shantung was liberated from Kuomintang rule by the People's Liberation Army of China in the summer of 1949. V. P. ILIUSHECHKIN [29–842–3]

SHANTUNG, a peninsula in East China, extending 350 km into the Yellow Sea. The coast is indented by numerous bays and inlets. The hills are covered with shrubs; the coastal plains and the plains that lie between the hills are densely populated. Wheat, peanuts, and tobacco are cultivated, and there are fruit orchards. The seaports of Tsingtao, Yant'ai and Weihai are situated on the Shantung Peninsula. [29–842–2]

SHANTUNG MOUNTAINS, mountains, in East China, in Shantung Province. The Shantung Mountains extend, with breaks, for more than 500 km and rise to 1,524 m. They are composed of Archean schists and granites, as well as of Lower Paleozoic sedimentary rocks. They are strongly dissected by deep tectonic valleys; normal faults have developed. The region has stands of oak forest and shrub thickets. [29–844–1]

SHAN UPLAND (also Shan Plateau), an upland region in eastern Burma that extends into China (where it is called the Yünnan Plateau), Laos, and Thailand.

In the western part of the Shan Upland, high rolling plains and flat-topped mountain masses alternate with intermontane basins. In the east, mountain ranges with elevations of 2,500–2,600 m are dissected by the deep gorges of various rivers, notably the Salween and Mekong. The Shan Upland, which is composed primarily of gneisses, schists, quartzes, and limestones, exhibits numerous karst phenomena.

The upland has a subequatorial monsoon climate, with a mean January temperature of 18°–24°C and a mean July temperature of about 30°C. Annual precipitation is 1,300–1,700 mm, with more than 2,000 mm on the windward mountain slopes. Most of the precipitation falls in the summer. The rivers, which have many rapids, are a valuable source of hydroelectric power. They are used for timber flotation and, in some cases, irrigation. The largest of the area's numerous lakes is Lake Inle.

Alpine evergreen and deciduous forests of teak, sal, magnolia, laurel, and bamboo give way to coniferous forests as elevations increase. Savannah vegetation grows in those areas of the Shan Upland that are relatively arid. L. I. KURAKOVA [29–834–6]

SHAOHSING, a city in East China, in Chekiang Province. Population, 170,000 (1953). Shaohsing has a landing on the canal that links Hangchou with Yüyao; it also has a railroad station on the Hangchou-Ningpo line. The city has tea-curing and rice-polishing plants; other industry includes the production of rice wine, silk fabrics, paper, and tinfoil. [29–847–2]

SHAOKUAN (also Ch'üchiang), a city in China, in Kwangtung Province. Population, more than 100,000 (1970). An important transportation center on the Peking-Canton railroad line, Shaokuan has a landing at the confluence of two rivers: the Wu Shui and Chen Shui. Industry includes ferrous and nonferrous metallurgy and the production of various kinds of industrial equipment. The city also has a tannery and enterprises of the cement, glass, wood-products, chemical, and textile industries. [29–847–1]

SHAOYANG (also Paoch'ing), a city in China, in Hunan Province. Population, more than 100,000 (1971). Shaoyang, a highway junction, has a landing on the Tzu Shui, a river that empties into the lake Tungt'ing Hu. In addition to cottage industries, the city has enterprises of the paper and food-processing industries. [29–847–3]

SHAPIRO, FEDOR L'VOVICH. Born Mar. 24 (Apr. 6), 1915, in Vitebsk; died Jan. 30, 1973, in Moscow. Soviet physicist. Corresponding member of the Academy of Sciences of the USSR (1968).

Shapiro graduated from Moscow State University in 1941. Beginning in 1945, he worked at the Institute of Physics of the Academy of Sciences of the USSR. In 1959 he was appointed deputy director of the Neutron Physics Laboratory of the Joint Institute for Nuclear Research in Dubna. He was also a professor at Moscow State University (from 1967).

Shapiro's main works dealt with nuclear and neutron physics. Shapiro developed and experimentally substantiated the method

of time-delay neutron spectroscopy in lead and subsequently discovered the excited state of ^{4}He using this method and generalized the law for the absorption of slow neutrons by nuclei. He also proposed a method of producing polarized neutrons by sending them through a polarized proton target and used the method to investigate the interaction of such neutrons with polarized nuclei, including deuterium nuclei. Shapiro was the first to detect experimentally ultracold neutrons and investigate their properties. He demonstrated the feasibility of measuring the magnetic moments of neutron resonances from their shift in a magnetic field.

Shapiro received the State Prize of the USSR in 1971 (with others) for a series of studies on developing and improving pulsed reactors. He was awarded two orders and various medals.

SHAPKIN, TIMOFEI TIMOFEEVICH. Born Feb. 21 (Mar. 5), 1885, at the *khutor* (farmstead) of Semimaiachnyi, in the *stanitsa* (large cossack village) of Verkhnekondruchenskaia, in what is now Rostov Oblast; died Mar. 22, 1943, in Rostov-on-Don. Soviet military figure. Lieutenant general (1940). Member of the CPSU from 1938.

The son of a Don Cossack, Shapkin fought in World War I. He graduated from the Novocherkassk Military School in 1916. During the Civil War of 1918–20, Shapkin served in General Denikin's White Guards as commander of a *sotnia* (squadron) of the 6th Don Cossack Regiment. After joining the Red Army in March 1920, he served as commander of a cavalry troop, a regiment, and a brigade and, in 1921, assumed command of the 14th Cavalry Division. Shapkin graduated from the Advanced Academic Courses in 1922 and the M. V. Frunze Military Academy in 1935.

Shapkin commanded a cavalry division from 1922 to 1924, after which he served as a cavalry inspector in the Western Siberia Military District, commander of the 7th Separate Turkestan Brigade, and commander of the 20th Cavalry Division. In 1941 he became commander of the IV Cavalry Corps. During the Great Patriotic War of 1941–45, from September 1942, he served in that post on the Transcaucasian, Stalingrad, and Southern Fronts. Shapkin was awarded four Orders of the Red Banner for distinction in battle during the Civil War and against the Basmachi in 1930, as well as an Order of Kutuzov Second Class.

[29–848–3]

SHAPKINA (also Pil'vor''iaga), a river in Arkhangel'sk Oblast and the Komi ASSR. A right tributary of the Pechora River, the Shapkina is 499 km long and drains an area of 6,570 sq km. It flows through the Bol'shezemel'skaia Tundra and is fed chiefly by snow. Highwater occurs between May and June, and the mean flow rate 82 km from the mouth is 582 cu m per sec. [29–848–4]

SHAPLEY, HARLOW. Born Nov. 2, 1885, in Nashville, Mo.; died Oct. 20, 1972, in Boulder, Colo. American astronomer.

Shapley graduated from the University of Missouri at Columbia in 1910, and from 1912 to 1914 he worked at Princeton University. From 1914 to 1921 he was an astronomer at the Mount Wilson Observatory. From 1921 to 1952 he was director of the Harvard Observatory.

Shapley was a pioneer in a new method of investigating the structure of the Milky Way Galaxy and other stellar systems based on the study of variable stars. Between 1910 and 1912 Shapley and H. Russell developed a method of determining the orbital elements of eclipsing binaries. Shapley also worked out a method of determining distances to remote stellar systems and star clusters based on observations of the constituent variable stars known as the cepheids. From 1915 to 1917 he investigated a system of globular clusters and determined the direction to the center of the Milky Way Galaxy. Shapley's research in extragalactic stellar systems is of great importance. Shapley also studied the Magellanic Clouds and investigated the structural features and spatial distribution of other galaxies. In addition, he was instrumental in organizing the study of meteors using the photographic method.

SHAPORIN, IURII ALEKSANDROVICH. Born Oct. 27 (Nov. 8), 1887, in the city of Glukhov, in what is now Sumy Oblast; died Dec. 9, 1966, in Moscow. Soviet composer, teacher, and figure in the music world. People's Artist of the USSR (1954).

The son of an artist, Shaporin graduated from the faculty of law at the University of St. Petersburg in 1913. In 1918 he graduated from the Petrograd Conservatory, where he had studied composition with N. A. Sokolov, orchestration with M. O. Shteinberg, and score reading with N. N. Cherepnin. An important influence on Shaporin was his meetings with A. A. Blok, to whose poetry he often turned in his own works. From 1919 to 1934, Shaporin was a music director and composer at various theaters in Leningrad.

In 1936, Shaporin took up residence in Moscow. In 1939 he began teaching at the Moscow Conservatory, where he was made a professor the following year; among his students were G. A. Zhubanova, E. F. Svetlanov, A. G. Fliarkovskii, R. K. Shchedrin, and R. M. Iakhin. Shaporin became secretary of the Composers' Union of the USSR in 1952.

In his finest compositions, Shaporin further developed the tradition of the Russian musical classics. Important historical events of the past and present are reflected in his large-scale works, which are notable for their epic scope; these include the opera *The Decembrists* (1953), the symphony-cantata *The Field of Kulikovo* (1939; libretto by Blok, with additions by M. L. Lozinskii; State Prize of the USSR, 1941), and the oratorios *Tale of the Battle for the Russian Land* (1944, words by various authors; State Prize of the USSR, 1946) and *While the Bird of Prey Circles* (1963). These works, imbued with a lofty patriotic ardor, are characterized by the use of a broad musical canvas and a realistic interpretation of literary source material. The images and themes of Shaporin's sole symphony (1932) are associated with revolutionary events. The suite *The Flea* (1926) is based on music composed for a dramatic version of N. S. Leskov's novella *The Left-handed Smith and the Steel Flea*.

Shaporin, a master of vocal music, continued the tradition of the art song established by P. I. Tchaikovsky, S. I. Taneev, and S. V. Rachmaninoff in his song cycles set to the poetry of such writers as A. S. Pushkin (1937), Blok (*Distant Youth*, 1939), and F. I. Tiutchev (*The Heart's Memory*, 1958). Particularly well known are such art songs as "The Incantation," "Under the Blue Sky," "Autumn Holiday," and "At Evening the War Became Silent" and his adaptations of the folksongs "Nothing Is Fluttering in the Field" and "The Barge Haulers' Song" (State Prize of the USSR, 1952). In addition to ballads for voice and orchestra set to words by I. A. Bunin, Blok, M. V. Isakovskii, and K. M. Simonov, Shaporin composed choral works, two piano sonatas, and incidental music for theater and motion pictures. He also wrote articles on music. Shaporin was awarded the Order of Lenin, two other orders, and various medals.

M. M. Iakovlev [29–849–2]

SHAPOSHNIKOV, BORIS MIKHAILOVICH. Born Sept. 20 (Oct. 2), 1882, in the city of Zlatoust, in what is now Cheliabinsk Oblast; died Mar. 26, 1945, in Moscow. Soviet military figure and theorist. Marshal of the Soviet Union (May 7, 1940). Professor (1935). Member of the CPSU from 1930.

The son of a white-collar worker, Shaposhnikov joined the

army in 1901. He graduated from the Moscow Military School in 1903 and the Academy of the General Staff in 1910. During World War I he served in staff positions, becoming a regiment commander in October 1917; in December of the same year he was elected commander of the Caucasian Grenadier Division, with the rank of colonel.

Shaposhnikov volunteered for the Red Army in May 1918 and held various staff positions on the Supreme Military Council and in the People's Commissariat for Military and Naval Affairs of the Ukraine. He was appointed chief of the Intelligence Section of the Field Staff of the Revolutionary Military Council of the Republic in August 1919 and chief of the Field Staff's Operations Directorate in October 1919.

After the Civil War, Shaposhnikov served from 1921 to 1925 as first assistant to the chief of the Staff of the Workers' and Peasants' Red Army. He was commander of the Leningrad and Moscow military districts between 1925 and 1928, chief of the Staff of the Workers' and Peasants' Red Army from 1928 to 1931, and commander of the Volga Military District in 1931 and 1932. Shaposhnikov served as head and military commissar of the M. V. Frunze Military Academy from 1932 to 1935 and commander of the Leningrad Military District from 1935 to 1937. Between 1937 and 1940 he was both chief of the General Staff and deputy people's commissar of defense. From August 1940 through July 1941 he was deputy people's commissar of defense.

During the Great Patrotic War of 1941–45, Shaposhnikov served as chief of the General Staff from July 1941 to May 1942, deputy people's commissar of defense from May 1942 through June 1943, and head of the K. E. Voroshilov Higher Military Academy from 1943 to 1945.

Shaposhnikov worked extensively and successfully to strengthen and improve the Red Army, particularly its strategic and operational leadership apparatus. He summarized his combat experiences of the Civil War of 1918–20 in *Cavalry*, which he published in 1923, and in *On the Vistula*, which he published in the following year. At the same time, he did a great deal of work on the commission charged with formulating military regulations, which he imbued with the basic principles of Soviet military doctrine. In a fundamental work, *The Brain of the Army* (vols. 1–3, 1927–29), Shaposhnikov drew on the experience of World War I to outline the nature of future warfare. He characterized the leadership requirements of modern warfare and presented a clear picture of the role, functions, and structure of the General Staff as the organ of the Supreme Command for the direction of the armed forces.

Shaposhnikov's command of Marxist-Leninist methods of research, his broad erudition in the field of military history, his extensive practical experience in staff work and troop command, and his excellent memory made him one of the outstanding military theorists of his time.

Shaposhnikov was a member of the Central Executive Committee elected by the Seventh Congress of Soviets and a deputy to the first convocation of the Supreme Soviet of the USSR. He became a candidate member of the Central Committee of the ACP(B) in 1939. He was awarded three Orders of Lenin, two Orders of the Red Banner, the Order of Suvorov First Class, and two Orders of the Red Star. The Vystrel Higher Infantry and Tactical School has been named in honor of Shaposhnikov, who is buried in Red Square at the Kremlin Wall.

SHAPOSHNIKOV, VLADIMIR GEORGIEVICH. Born May 25 (June 6), 1870, in Vol'sk, in what is now Saratov Oblast; died Oct. 3, 1952, in Kiev. Soviet organic chemist and chemical engineer. Member of the Academy of Sciences of the Ukrainian SSR (1922).

Shaposhnikov graduated from the St. Petersburg Institute of Technology in 1893. Beginning in 1900, he was a professor at the Kiev Polytechnic Institute. Shaposhnikov's principal works dealt with the technology of natural fibers and the chemistry of dyes. Shaposhnikov proposed a system of nomenclature for the azo dyes. He also developed a new method of obtaining azophenines.

SHAPOSHNIKOV, VLADIMIR NIKOLAEVICH. Born Feb. 12 (24), 1884, in Moscow; died there Oct. 23, 1968. Soviet microbiologist; founder of Soviet industrial microbiology. Academician of the Academy of Sciences of the USSR (1953).

Shaposhnikov graduated from Moscow University in 1910 and from 1911 to 1926 taught in the department of plant physiology, becoming a professor in 1921. From 1926 to 1967 he was a professor in the university's department of microbiology, where he was also head of a subdepartment from 1938 to 1967. In addition, he was in charge of the industrial microbiology laboratory of the Scientific Research Institute of Pharmaceutical Chemistry (1920–35), the Central Scientific Research Laboratory of the Fermentation Industry (1935–38), and the department of industrial microbiology of the Institute of Microbiology of the Academy of Sciences of the USSR (1938–63).

Shaposhnikov's main work was in the area of industrial microbiology. Shaposhnikov contributed much to the understanding of the physiology of microorganisms, mapped out the evolutionary pathways of the main types of fermentation, and discovered the two-phase nature of many microbiological processes, which made it possible, in many cases, to control them. His work laid the foundation for the industrial manufacture of lactic acid, acetone, and vinegar in the USSR.

Shaposhnikov founded a large scientific school. A recipient of the State Prize of the USSR (1950), he was awarded two Orders of Lenin, two other orders, and various medals.

SHAPOVALOV, ALEKSANDR SIDOROVICH. Born Aug. 28 (Sept. 9), 1871, in the village of Chernaia Sloboda, Poltava Province; died Apr. 30, 1942. Participant in the Russian revolutionary movement. Member of the Communist Party from 1895.

The son of a peasant, Shapovalov became a worker in 1886. In 1894 he joined the Gruppa Narodovol'tsev (a group that supported the People's Will), and in 1895 he became a member of the St. Petersburg League of Struggle for the Emancipation of the Working Class. He was arrested in 1896 and exiled to Eastern Siberia. In 1899, Shapovalov was one of 17 exiles who endorsed Lenin's attack on economism "A Protest by Russian Social Democrats." Beginning in 1901, Shapovalov carried out party work in Batumi, Kiev, Tver' (now Kalinin), Ekaterinoslav (now Dnepropetrovsk), and Odessa. He took part in the Revolution of 1905–07 in Kharkov.

Between 1906 and 1917, Shapovalov lived abroad and carried out work for various Bolshevik organizations. He returned to Russia in June 1917. After the October Revolution he engaged in soviet and party work in Moscow. In 1924 and 1925 he was a member of the Central Control Commission of the RCP(B). Shapovalov became a personal pensioner in 1928.

SHAPSHAL, a mountain range in the Altai on the boundary between Gorno-Altai Autonomous Oblast and the Tuva ASSR. The Shapshal Range forms the divide between the Ob' system (the Chulyshman River) and the left sources of the Enisei (the Alash and Khemchik rivers). The range is approximately 130 km long and rises to 3,507 m. It is composed primarily of schists. In the northern part of the range, the divides have undergone planation; in the southern part, they are dissected by alpine landforms. Small glaciers occur. Mountain tundras predominate on the slopes of the Shapshal Range, and larch forests are encountered in some river valleys. [29–852–5]

SHAPSUG, part of the Adygeians; in the past one of the Adygeian tribes. The Shapsug, who inhabit the Adygei Autonomous Oblast and Tuapse and Lazarevskoe raions of Krasnodar Krai, speak the Shapsug dialect of the Adygei language. Their economy is based on land cultivation and fruit growing. [29–852–3]

SHAPUR. In the Sassanid state:

Shapur I. Died 272. King from 239 or 241.

Shapur I conquered vast territories and thus continued the efforts of his father, Ardashir I, to strengthen and expand the state. He defeated the Roman emperor Valerian near Edessa in 260 and took the emperor and most of his army captive. During Shapur I's reign, numerous irrigation and construction projects were carried out in Persia, and many cities were founded.

Shapur II. Died 379. King from 309.

Shapur II's wars with Rome resulted in a considerable expansion of the Sassanid state. The king founded a number of cities. Beginning in about 339, Shapur II's reign saw widespread persecution of the Christians, whose religion was becoming the official faith of the Roman Empire. [29–852–4]

SHARAF KHAN (also Sharaf al-Din ibn Shams al-Din Bitlisi). Born Feb. 25, 1543, in Bitlis; died 1603 or 1604. Kurdish historian and military and state figure.

Sharaf Khan's family had the hereditary right to rule the city of Bitlis in eastern Anatolia. Sharaf Khan was raised and educated at the court of the Iranian shah Tahmasp I. He later became the chief leader of the Kurdish tribes of Iran. In the late 1570's he became the ruler of the princely state of Bitlis. In 1595 and 1596, Sharaf Khan wrote *Sharaf-nameh* (in Persian)—the fundamental and earliest source on the medieval history of the Kurdish people.

WORKS
In Russian translation:
Sharaf-name, vols. 1–2. Translation, foreword, notes, and appendixes by E. I. Vasil'eva. Moscow, 1967–76.
[29–854–5]

SHARAKAN, Armenian church songs. *Sharakan* evolved from the early Middle Ages through the epoch of developed feudalism (tenth–15th centuries). A collection of *sharakan* is called a *sharaknots*. [29–863–4]

SHARALIEV, BORISLAV. Born Aug. 22, 1922, in Plovdiv. Bulgarian film director. Honored Artist of the People's Republic of Bulgaria (1971). Member of the Bulgarian Communist Party since 1944.

Sharaliev studied at a theatrical school in Sofia. In 1950 he graduated from the directing school of the All-Union State Institute of Cinematography in Moscow (M. I. Romm's studio), and in 1951 he began working in a feature-film studio in Sofia. He won fame early in his career with his first independent work, *Song of a Man* (1954), a biographical film about the revolutionary and poet N. Vaptsarov. He dealt with the resistance movement of World War II (1939–45) in *Two Victories* (1956) and *One Quiet Evening* (1960).

Sharaliev's other films include *Two Under the Sky* (1962), *Knight Without a Visor* (1966), *God Be With You, Friends* (1970; shown in the USSR as *Farewell, Friends*), *The Indispensable Sinner* (1971), and *Anticipation* (1973). In 1975 he directed the television series *Notes on Bulgarian Uprisings*, based on a book by Z. Stoianov, a participant in the partisan movement.

Sharaliev was awarded the Dimitrov Prize in 1955. [29–853–5]

SHARANGA, an urban type settlement and the administrative center of Sharanga Raion, Gorky Oblast, RSFSR. Sharanga is situated 75 km southeast of the Uren' railroad station on the Gorky-Kirov line. Industry is represented by a souvenir factory of the Khokhlomskaia Rospis' Production Association, a butter factory, a flax-processing plant, and a vegetable-drying plant. [29–854–1]

SHARAV, BALDUUGIIN (nickname, Marzan [jester]). Born 1869; died 1939. First Mongolian painter to deal with contemporary subjects.

Sharav founded a Mongolian school of art that combined the traditions of Lamaist miniature painting and Chinese painting with elements of Western European art, such as chiaroscuro. He is noted for his inexhaustible powers of observation, bold imagination, sense of humor, and satirical manner. In addition to paintings on extremely large canvases, such as *The Events of One Day* and *Holiday of Abundance* (both at the Museum of Fine Arts of the Mongolian People's Republic, Ulan Bator), his works include ethnographically accurate sketches, illustrations, and political posters. Sharav also painted portraits; of particular note is his *V. I. Lenin* (1922, Museum of Fine Arts of the Mongolian People's Republic, Ulan Bator). [29–853–2]

SHARGOROD, an urban-type settlement and the administrative center of Shargorod Raion, Vinnitsa Oblast, Ukrainian SSR. Shargorod is situated on the Murashka River of the Dnestr River basin, 25 km from the Iaroshenka railroad station on the Zhmerinka-Vapniarka line and 125 km southwest of Vinnitsa. The settlement has a wine-making combine and a butter factory. [29–855–2]

SHARGUN' (until 1973, the settlement of Takchiian), a city in Saryasiia Raion, Surkhandar'ia Oblast, Uzbek SSR. Shargun' is situated at the foot of the southwestern spur of the Gissar Range, 15 km from the Saryasiia railroad station on the Kagan-Dushanbe line. Hard coal is mined in the vicinity. Shargun' has a briquetting factory. [29–855–3]

SHAR'IA, a city (since 1938) under oblast jurisdiction and the administrative center of Shar'ia Raion, Kostroma Oblast, RSFSR. Situated on the left bank of the Vetluga River. Railroad junction. Population, 26,000 (1974). Industry is represented by the Shar'iadrev Production Association, an experimental machine shop, a milk plant, a garment factory, a furniture factory, and a plant that manufactures reinforced-concrete structural members. There are also two logging and timber distribution establishments. Educational institutions include a pedagogical school, a medical school, and a sovkhoz technicum. The city has a museum of local lore and a people's amateur theater. [29–873–1]

SHARIA (literally, "correct path," "correct way of behaving"), the body of Islamic religious, ethical, and legal precepts, based on the Koran, *sunna* (sacred tradition), and *fiqh* (Islamic jurisprudence).

The *sharia* was developed in the Arabian Caliphate between the seventh and 12th centuries. In addition to precepts on the fundamental religious obligations of Muslims, it includes the norms of Islamic state, civil, criminal, and procedural law. The *sharia* is in force in countries where Islam is the state religion, and it is applied especially in the spheres of marriage, the family, and inheritance.

After the October Revolution of 1917, the Soviet government at first restricted the jurisdiction of the *sharia* and later elimi-

nated *sharia* courts; those norms of the *sharia* that conflicted with Soviet laws were made inoperative. The norms of the *sharia* have no legal force in the USSR, and the precepts of the *sharia* are preserved only in the rituals and way of life of some Muslims.

In most foreign countries where the population professes Islam, the norms of the *sharia* have been incorporated into secular law. The *sharia* continues to be regarded as the source of Islamic law and one of the foundations of Muslim ideology. [29–857–2]

SHARIF, AZIZ ALIEVICH. Born Mar. 16 (28), 1895, in the city of Nakhichevan. Soviet literary scholar and translator. Honored Scientist of the Azerbaijan SSR (1963).

Sharif studied at the Moscow Commercial School from 1915 to 1917 and graduated from the M. Gorky Institute of Literature in 1943. His doctoral dissertation, completed in 1956, was entitled "The Life and Work of Dzh. Mamedkulizade." He became a professor at Moscow State University in 1962.

Sharif was first published in 1910. He is the author of many articles, pamphlets, critical-biographical studies, and monographs in Azerbaijani and in Russian dealing with classical and contemporary Azerbaijani literature, literary relations, and problems of translation. Sharif has translated works by M. F. Akhundov, A. Akhverdov, N. Vezirov, Dzh. Dzhabarly, S. Ragimov, and M. Ibragimov into Russian and works by N. V. Gogol, A. N. Ostrovskii, M. Gorky, and A. A. Fadeev into Azerbaijani.

WORKS

In Russian translation:
Rozhdenie Molla Nasreddina. Baku, 1968.
Vagif—pevets liubvi i krasoty. Moscow, 1968. [29–857–5]

SHARIF, in pre-Islamic Arabia, a member of a distinguished family, the leader of a tribe, or the ruler of a town. The term was later used as an honorary title for Muslims tracing their genealogy to the prophet Muhammad. Only the descendants of Hasan, a grandson of Muhammad's, had a formal right to the title, but usually all of the descendants of Muhammad were called sharifs and sayyids. In Arabia from the tenth century until 1916, the grand sharif was the ruler of the Hejaz and Mecca. [29–1140–4]

SHARIFZADE, ABBAS MIRZA (also Sharifov). Born 1892; died 1937. Soviet Azerbaijani actor and stage director. Honored Artist of the Azerbaijan SSR (1935).

Sharifzade performed in amateur productions, and in 1908 he began his professional career as the leading actor in the Gadzhibekov brothers' opera company. In 1920 he joined the Azizbekov Theater. Sharifzade was greatly influenced by the work of G. Arablinskii. He created a number of roles in the Azerbaijani repertoire, including the title role in Gusein Dzhavid's *Iblis*; Aidyn, Oktai, El'khan, and Eivaz in Dzhabarla's *Aidyn, Oktai El' ogly, Bride of Fire*, and *In the Year 1905*; and the title role in Narimanov's *Nadir-shakh*. He played lead roles in such foreign classics as Shakespeare's *Othello, Hamlet*, and *Macbeth*, Schiller's *The Robbers*, and Gutzkow's *Uriel Acosta*. Sharifzade also acted in motion pictures and was one of the first Azerbaijani film directors. His films included *In the Name of God* (1925) and *Hadji Kara* (1929). [29–858–1]

SHARJAH, a city in the United Arab Emirates; the capital of the emirate of Sharjah. Population, 19,200 (1968). Sharjah is a trading center and a port on the Persian Gulf. Fishing is the traditional occupation; other economic activities include the chasing of gold and silver articles. [29–856–1]

SHARKEY, LAWRENCE LOUIS. Born Aug. 6, 1898, near Orange, New South Wales; died May 13, 1967, in Sydney. Figure in the Australian and international working-class movement.

The son of a small farmer, Sharkey went to work at the age of 14 as an unskilled laborer. From his youth he took part in the trade union movement; he organized and led a number of strikes. Sharkey joined the Communist Party of Australia (CPA) in 1924 and became a member of the party's Central Committee in 1928. In 1930 he was chosen a member of the Politburo of the Central Committee and was named party chairman, a position he held until 1948. From 1948 to 1965 he served as general secretary of the party, and from 1965 to 1967 he was vice-chairman of the Central Committee. During the 1930's, Sharkey edited party newspapers. He took part in the work of the Seventh Congress of the Comintern (1935) and was elected a candidate member of the Executive Committee of the Comintern.

Sharkey was persecuted for his revolutionary activities. In 1949 he was sentenced to three years' imprisonment for supporting the peaceful foreign policy of the USSR. A steadfast opponent of Liquidationism, right opportunism, dogmatism, sectarianism, and revisionism, Sharkey fought for the unity of the world communist movement. [29–859–3]

SHARK IULDUZI (*Shark yulduzi*; Star of the East), a Soviet Uzbek journal of art, literature, politics, and public affairs. *Shark iulduzi*, a publication of the Communist Party of the Uzbek SSR, has been published weekly in Tashkent since 1933 under various names. Publication was curtailed during the Great Patriotic War (1941–45) but was resumed in 1946, when the current name was adopted. Editors of the journal have included the writers Aibek, A. Mukhtar, Kh. Guliam, and Mirmukhsin (1950–60 and since 1971).

The journal deals with current events in public affairs, politics, and literature. It also publishes articles on the history of Uzbek classical literature and Soviet literature and art, problems of literary criticism and theory, and works of Soviet and world literature. Circulation, 160,000 (1979). [29–859–1]

SHARK KAPYSY (*Sharq gapïsï*; Gate to the East), an Azerbaijani-language newspaper of the Nakhichevan ASSR. *Shark kapysy* has been published since 1921. It comes out in Nakhichevan six times a week. Circulation, 16,000 (1977). The newspaper has been awarded the Order of the Badge of Honor. [29–858–3]

SHARKOVSHCHINA, an urban-type settlement and the administrative center of Sharkovshchina Raion, Vitebsk Oblast, Byelorussian SSR. Sharkovshchina has a railroad station on the Druia-Voropaevo line. The settlement is situated on the Disna River, a left tributary of the Zapadnaia Dvina. Sharkovshchina has a building-materials combine, a butter factory, and a vegetable-drying plant. [29–861–2]

SHARMA, RAM SHARAN. Born Sept. 1, 1920. Indian historian. One of the founders of the Marxist school in Indian historical science.

Sharma's main works are on the socioeconomic history of antiquity and the early Middle Ages. He was head of the department of history at the University of Patna from 1953 to 1973. In 1973, Sharma became head of the department of history at the University of Delhi and chairman of the Indian Council of Historical Research.

SHAROKHIN, MIKHAIL NIKOLAEVICH. Born Nov. 11 (23), 1898, in the village of Ivanovskoe, in what is now Danilov Raion, Yaroslavl Oblast; died Sept. 19, 1974, in Moscow. Soviet military leader. Colonel general (1945). Hero of the Soviet Union (Apr. 28, 1945). Member of the CPSU from 1920.

The son of a peasant, Sharokhin joined the Red Army in 1918. He fought in the Civil War of 1914–18 as a platoon commander and as a troop commander in the cavalry. He graduated from advanced cavalry courses for command personnel in 1926, the M. V. Frunze Military Academy in 1936, and the Military Academy of the General Staff in 1939.

During the Great Patriotic War of 1941–45, Sharokhin served in 1941 and 1942 as deputy chief of the Operations Directorate of

the General Staff and as deputy chief of the General Staff. In 1942 he served as chief of staff of the Third Shock Army on the Kalinin Front and chief of staff of the Northwestern Front; he was chief of staff of the Volkhov Front in 1942 and 1943. Sharokhin served on the Steppe, Second Ukrainian, and Third Ukrainian fronts as commander of the Thirty-seventh Army from August 1943 to October 1944 and the Fifty-seventh Army from October 1944 to the end of the war.

After the war, Sharokhin served in command positions and as a directorate chief in the General Staff of the Armed Forces. He was appointed deputy chief of the Main Military and Scientific Directorate of the General Staff in December 1951 and a directorate chief of the Higher Military Educational Institutions of the Ministry of Defense in April 1953. After becoming a scientific consultant to the deputy minister of defense on questions of military science in May 1957 and military consultant to the Group of Inspectors General of the Ministry of Defense in April 1958, Sharokhin retired in September 1960.

Sharokhin was awarded three Orders of Lenin, four Orders of the Red Banner, the Order of Suvorov First Class, the Order of Kutuzov Second Class, the Order of Bogdan Khmel'nitskii First Class, the Order of the Red Star, and various medals. He was also the recipient of foreign orders and medals. [29–868–4]

SHARONOV, VSEVOLOD VASIL'EVICH. Born Feb. 25 (Mar. 10), 1901, in St. Petersburg; died Nov. 27, 1964, in Leningrad. Soviet astronomer. Member of the CPSU from 1949.

Sharonov was a professor at Leningrad State University from 1944. Beginning in 1951, he was also director of the university observatory. Sharonov worked out new methods of absolute photometry and colorimetry, which have been applied to the study of the solar corona and the determination of the light solar constant. He also invented a number of devices for investigating the visibility of distant objects and fires.

SHARPEY'S FIBER, any one of the collagenous fibers of different thicknesses that cause the periosteum to adhere firmly to bones. Sharpey's fibers pass at different angles from the inner layer of the periosteum and at different depths to the layer of the external general lamellae of the diaphysis of tubular bones. They become branched mainly in this layer, sometimes reaching the osteon layer but never penetrating the substance of the osteon lamellae. They can be readily distinguished on histological sections of growing bones. They become partly or completely calcified and almost invisible in the bones of persons of advanced age. Sharpey's fibers were described by the British scientist W. Sharpey (1802–80). [29–870–2]

SHARQAWI, ABD AL-RAHMAN AL-. Born Nov. 10, 1921, in the province of Minufiya. Egyptian writer.

Al-Sharqawi was born into a peasant family. His first works were published while he was a student at the law school of the University of Cairo, which he attended from 1938 to 1943. Al-Sharqawi took part in the antimonarchy struggle. He founded the progressive journal *Al-Katib* (1951–53), which advocated peaceful cooperation among peoples. He was head of Egyptian delegations to various conferences on peace from 1951 to 1955.

Al-Sharqawi became widely known after the publication of his novel *The Earth* (1954), which deals with the oppressed peasantry's awakening to struggle; the book was translated into many languages. The concepts of "Arab socialism" in its leftist form are evident in the novel *Muhammad—the Messenger of Freedom* (1962). In this work the author attempted to correlate the life of the prophet to our times and social struggle. The history of Islam and its projection in contemporary times are the basic themes of al-Sharqawi's plays about Caliph Husein (1969). In the novel *Fellah* (1967), which is pervaded with themes of revolution and democracy, the author returns to the subject of village life after the enactment of land reform.

Al-Sharqawi is a member of the World Peace Council.

SHARUA, in Kazakh feudal society, a category of dependent peasants who raised cattle and cultivated the land. Legally, the *sharua* were not serfs, but they were subject to the corvée and had to make payments in kind. [29–872–2]

SHARUKAN', a city of the 11th to early 13th centuries apparently located on the Severskii Donets near the cities of Chuguev and Zmiev. Sharukhan', whose name derives from that of the Polovtsian khan Sharukan, arose as an Alani settlement. The city had an ethnically mixed population and served as the winter refuge of the Polovtsy. In 1111 it was captured by troops under the command of Vladimir Vsevolodovich Monomakh and other Russian princes. During the 12th and early 13th centuries, Sharukan' was gradually abandoned.

SHARZHENGA, a river in Vologda Oblast, RSFSR; a left tributary of the Iug River of the Severnaia Dvina basin. The Sharzhenga is 183 km long and drains an area of 1,500 sq km. The river rises in the Severnye Uvaly. It is fed primarily by snow. High water occurs in April and May, and freshets occur in the summer and fall. The mean flow rate is approximately 14 cu m per sec. The Sharzhenga freezes over in late October or in November, and the ice breaks up in late April or early May. [29–856–3]

SHASENEM AND GARIB, a Turkmen folk *dastan*. The legend of the love between Garib and Shasenem dates to the third story of the ancient Ghuz epos *Kitab-i dede Qorqut*. The events in the *dastan* take place during the Safavid era (1502–1736). Several versions of *Shasenem and Garib* have been circulated in Turkmenia. The version *Khelalay and Garib* is quite distinctive. Themati-

cally, *Shasenem and Garib* is similar to the Azerbaijani and Turkish *dastans* entitled *Ashuk Garib*, which became well known to Russian readers in M. Iu. Lermontov's *Ashik Kerib* (1837, published 1846), which is presented as a Turkish fairy tale. The plot of *Shasenem and Garib* was the basis for an opera of the same name by A. G. Shaposhnikov and D. Ovezov, staged in 1944 at the Turkmen Theater of Opera and Ballet.

SHASHIH, a city in China, in Hupeh Province. Population, more than 100,000 (1971). Shashih, a port on the left bank of the Yangtzu River, produces textiles, flour, chemicals, wood products, paper, and ceramics. [29–920–2]

SHASHKA, a Caucasian or Russian saber. Consisting of a blade and a hilt, the *shashka* is carried in a scabbard on a shoulder belt. Unlike other sabers, the *shashka* is worn with its back edge forward.

The *shashka* first appeared among the mountain peoples of the Caucasus. It was adopted by a Nizhny Novgorod dragoon regiment of the Russian regular army in 1834. By 1881, it was used throughout the army, although only with field uniform in guards units. The blade of the Caucasian *shashka* is slightly curved—its rise measures up to 30 mm—with the cutting edge on the convex side and with double edges along portions of the foible and the forte. The blade has longitudinal hollows, is 700 to 900 mm long and up to 40 mm wide, and often is engraved.

The Russian *shashki* introduced in, for example, 1834 and 1841, differed from the Caucasian *shashki* in hilt and scabbard. The Russian *shashka* of 1881 had six variants: three soldiers' versions (for dragoons, cossacks, and artillerymen), two officers' versions (for regular-army officers and cossack officers), and a version that combined the cossack saber and the dragoon scabbard. At one time standard Red Army issue, the Russian *shashka* of 1881 was replaced by the 1927 cavalry *shashka*.

A *shashka* for generals was authorized in 1940. By the mid-1950's, however, *shashki* were worn only as part of the full-dress uniform. [29–920–3]

SHASHKEVICH, MARKIAN SEMENOVICH. Born Nov. 6, 1811, in the Village of Podles'e, in what is now Zolochev Raion, L'vov Oblast; died June 7, 1843, in Novoselki, in what is now Busk Raion, L'vov Oblast. Ukrainian poet. Pioneer of the new Ukrainian literature in the Western Ukraine.

Shashkevich was a village priest. Together with I. N. Vagilevich and Ia. F. Golovatskii, he headed a literary society of progressive youth in L'vov that came to be called the Russian Trinity (Rus'ka Triitsia). He initiated the publication of the journal *The Dnestr Water Nymph* (1837), to which he also contributed.

Shashkevich's lyrical poems, ballads, and historical narrative poems are patriotic and vividly romantic.

Shashkevich, an advocate of political unity for all Ukrainian lands, urged his people to preserve and develop their native language and culture. He glorified the heroic past of the Ukrainian people.

SHASHKOV, SERAFIM SERAFIMOVICH. Born Nov. 5 (17), 1841, in Irkutsk; died Aug. 28 (Sept. 9), 1882, in Novgorod. Russian historian and publicist.

The son of a priest, Shashkov entered the Kazan Theological Academy in 1860. He was expelled on Sept. 16, 1861, for taking part in a requiem for the victims of the Bezdna uprising of 1861. He moved to St. Petersburg in 1861 and became a member of the "Siberian circle" of G. N. Potanin and N. M. Iadrintsev, as well as a contributor to the journals *Vek, Iskra* and *Slovo.* In 1863 he moved to Krasnoiarsk, where in 1864 and 1865 he gave public lectures on the history of Siberia. In the summer of 1865, Shashkov was arrested in Irkutsk for membership in the Society for Siberian Independence. He spent the period from 1868 to 1874 in exile in Arkhangel'sk and Voronezh provinces.

Beginning in 1866, Shashkov was a major contributor to the journal *Delo.* A representative of the democratic trend in Russian historiography, he was the author of works on the woman question, the worker question, and the history of Russian social thought. Shashkov's works on the history of Siberia are of particular interest.

SHASHMAKOM, in Uzbek and Tadzhik music:

(1) A system of six tonal systems used in *makom* (large-scale vocal and instrumental works in several sections)—*Buzruk, Rost, Navo, Dugokh, Segokh*, and *Irok.*

(2) The complete body of *makom* written in these tonal systems; musical works, each of which bears the name of its tonal system and consists of 20–40 instrumental and vocal sections. A *shashmakom* is performed by an ensemble of instrumentalists, soloists, and a chorus and sometimes is accompanied by dancing. The first collection of *shashmakom* (without text) was recorded by V. A. Uspenskii and published in 1924; a full cycle (with text) was first published between 1950 and 1967.

SHASTA, MOUNT, an extinct volcano in the southern Cascades, in the USA. Mount Shasta has an elevation of 4,317 m and is composed of andesites. Glaciers line its slopes. [29–875–1]

SHASTRI, LAL BAHADUR. Born Oct. 2, 1904, in Mughalsarai, now in the state of Uttar Pradesh; died Jan. 11, 1966, in Tashkent. Indian statesman and politician.

Shastri was the son of a teacher. He was educated at a university in Varanasi (Benares) and took part in the national liberation struggle. As a follower of M. Gandhi and a comrade of J. Nehru, Shastri quickly moved into the ranks of the leadership of the Indian National Congress Party (INCP). From 1935 to 1938, Shastri served as general secretary of the INCP committee in Uttar Pradesh, and he became the party's general secretary in 1951. After India won its independence in 1947, Shastri served in several ministerial positions in the central government from 1952 to 1963. After the death of Nehru, Shastri became the leader of a parliamentary faction of the INCP; in June 1964 he became prime minister, chairman of the Atomic Energy Commission, and chairman of the Planning Commission. In 1965 he made an official visit to the USSR. Shastri died in Tashkent, where he was attending a meeting between the Indian and Pakistani heads of state that had been called to mediate the Indian-Pakistani conflict. [29–875–3]

SHATALIN, STANISLAV SERGEEVICH. Born Aug. 24, 1934, in the city of Pushkin, Leningrad Oblast. Soviet economist. Corresponding member of the Academy of Sciences of the USSR (1974). Member of the CPSU since 1963.

In 1958, Shatalin graduated from the economics department of Moscow State University. From 1959 to 1965, he was a research worker and head of the intersector balance section of the Scientific Research Economics Institute of the State Planning Committee of the USSR. From 1965 to 1976 he was deputy director of the Central Economic Mathematical Institute of the Academy of Sciences of the USSR. In 1976, Shatalin became deputy director and in 1977 department head of the All-Union Scientific Research Institute of Systems Research of the State Committee for Science and Technology and the Academy of Sciences of the USSR and head of the subdepartment of mathematical methods of economic analysis in the economics department at Moscow State University. His principal works are devoted to the building of mathematical economic models and the methodology of national economic planning.

Shatalin has been awarded the Order of the Badge of Honor, and he received the State Prize of the USSR in 1968.

SHATALOV, VLADIMIR ALEKSANDROVICH. Born Dec. 8, 1927, in Petropavlovsk, Severnyi Kazakhstan Oblast. Soviet cosmonaut. Lieutenant general of aviation (1975). Twice Hero of the Soviet Union (Jan. 22, 1969, and Oct. 22, 1969). Candidate of technical sciences (1972). Member of the CPSU since 1953.

Shatalov graduated from the Lipetsk special air force school for primary pilot training in 1945 and from the Kacha Military Aviation Pilot School in 1949. He worked as a flight instructor. After graduating from the Order of the Red Banner Air Force Academy (now named after Iu. A. Gagarin), in 1956, Shatalov served in aviation units of the Soviet Army. He became a cosmonaut in 1963.

From Jan. 14 to Jan. 17, 1969, Shatalov completed a spaceflight as commander of the Soyuz 4 spacecraft. He performed a manual rendezvous and docking with the Soyuz 5 spacecraft, piloted by B. V. Volynov, allowing A. S. Eliseev and E. V. Khrunov to cross through open space to the Soyuz 4 spacecraft. The first experimental space station was thus established, remaining in flight for 4 hr 33 min 49 sec. Shatalov spent 71 hr 14 min in space. From Oct. 13 to Oct. 18, 1969, Shatalov, as commander of Soyuz 8, made a second spaceflight, with Eliseev. During the 118 hr 11 min spent in space, he was involved in a group flight with the Soyuz 6 and Soyuz 7 spacecraft. From Apr. 23 to Apr. 25, 1971, Shatalov, as commander of the Soyuz 10 spacecraft, completed a third spaceflight, with Eliseev and N. N. Rukavishnikov. During this flight, which lasted 47 hr 46 min, he docked with the orbiting station Salyut, in orbit since Apr. 19, 1971. The flight in a docked mode lasted 5 hr 30 min. Shatalov spent a total of 237 hr 18 min in space in the course of his three spaceflights.

Shatalov was a deputy to the ninth convocation of the Supreme Soviet of the USSR. He has been awarded three Orders of Lenin and various medals. A crater on the far side of the moon is named after him.

SHATBERTI, an ancient Georgian monastery that flourished during the rule of the Tao-Klardzhenti principality, which existed in what is now Turkey. Shatberti was founded in the first half of the ninth century by the Georgian archimandrite Grigorii Khandzti. One of the greatest centers of Georgian culture, it was renowned for its illuminated manuscripts. The exact location of the monastery is unknown. [29–876–1]

SHATELEN, MIKHAIL ANDREEVICH. Born Jan. 1 (13), 1866, in Anapa, in what is now Krasnodar Krai; died Jan. 31, 1957, in Leningrad. Soviet electrical engineer. Corresponding member of the Academy of Sciences of the USSR (1931); Hero of Socialist Labor (1956).

Shatelen graduated from the University of St. Petersburg in 1888. In 1891 he joined the teaching staff of the University of St. Petersburg; he also taught at the St. Petersburg Mining Institute. In 1893 he was appointed a professor at the St. Petersburg Electrical Engineering Institute. Shatelen was a founder of the St. Petersburg Polytechnic Institute (now the Leningrad Polytechnic Institute), where he taught from 1901 to 1957. He took part in the development and implementation of the GOELRO plan. In 1929, Shatelen became the president of the Central Board of Weights and Measures; from 1929 to 1949, he was a member of the International Committee on Weights and Measures.

Shatelen's main works dealt with general problems of electrical engineering, illuminating engineering, metrology, and the history of technology. Shatelen received the State Prize of the USSR in 1949 and was awarded four Orders of Lenin, the Order of the Red Banner of Labor, and various medals.

SHATER, a tent-shaped superstructure in Russian architecture. *Shatry* were erected on bell towers and other towers, churches, and porches. They have the form of a tall pyramid on a base of four or more sides. In wooden architecture they were common through the late 18th century, and in stone architecture, in the 16th and 17th centuries.

Wooden *shatry* were formed by overlapping rows of logs with sides of decreasing length, and brick *shatry*, by sloping rows or by overlapping horizontal rows of brick. [29–877–2]

SHATERNIKOV, MIKHAIL NIKOLAEVICH. Born Oct. 9 (21), 1870, in Moscow; died there Sept. 1, 1939. Soviet physiologist. Honored scientist of the RSFSR (1935).

A student and close co-worker of I. M. Sechenov, Shaternikov graduated from Moscow University in 1896. From 1903 to 1924 he was a professor at the Moscow Advanced Courses for Women (later, the Second Moscow State University); from 1917 until his death, Shaternikov was a professor in the faculty of medicine at Moscow University (later, the First Moscow Medical Institute). At the same time, from 1920, he was the first director of the Institute of the Physiology of Nutrition.

Shaternikov's main works dealt with neuromuscular physiology, the physiology of the sense organs, and problems of metabolism and nutrition. Shaternikov developed a methodology for studying gas exchange in man; he studied gas exchange in the presence of various physiological and pathological conditions, using a number of instruments of his own design. The development of physiological nutritional norms for various professions and age groups of the population was begun under Shaternikov's direction.

SHATILOV FOREST, a forest area near the village of Mokhovoe, Orlov Oblast, RSFSR. Shatilov Forest consists of 17 sections, with a total area of 1,082 hectares (ha). The total area of

forested land amounts to 918 ha, the main species being oak (47 percent), larch (13 percent), pine (11 percent), spruce (8 percent), birch (7 percent), and aspen (7 percent). Ash, maple, elm, and other species constitute 7 percent. There are 531 ha of planted timber stands. The forest was first planted in 1824, and many plantings from the 19th century have been preserved.

Shatilov Forest was one of the first forests to be planted to combat soil erosion in a steppe region and therefore has considerable practical and scientific significance in field protection. The forest was named in honor of I. N. Shatilov, a prominent figure in agriculture who played a large role in the development of the forest. [29–877–4]

SHA T'ING (pen name of Yang T'ung-fang). Born 1905 in Anhsien, Szechwan Province. Chinese writer.

Sha T'ing graduated from a teachers' seminary in Chengtu. He became associated with the Chinese League of Left Writers. His collections of short stories, *The Illegal Trip* (1932), *Mud Pies* (1936), and *Adversities* (1937), are filled with protest against social injustice. During the Sino-Japanese War of 1937–45, Sha T'ing fought in combat with the Eighth People's Army, an experience that he described in *With the Army* (1940) and *The Extraordinary Campaign* (1944). He depicted the struggle for existence in a remote rural area in the novels *The Gold Prospectors* (1943), *Beasts at Bay* (1945), and *Coming Home* (1948) and in various short stories. Sha T'ing edited the journal *Ssuch'uan wenhsüeh*.

SHATIRIAN, MIKHAIL ALEKSANDROVICH. Born Feb. 14 (27), 1916, in Tbilisi. Soviet Armenian writer. Member of the CPSU since 1940.

Shatirian, who graduated from the Moscow Library Institute in 1939, took part in the Great Patriotic War of 1941–45. His work was first published in 1942. He wrote the novel *Soldiers* (1955; Russian translation, 1958), the historical novella on a revolutionary theme *The Spring Came Again* (1960), and the novel *The Tale of the Palm* (1967; Russian translation, 1971), which deals with the 26 Baku Commissars. Shatirian has been awarded three orders and various medals.

SHATKI, an urban-type settlement and the administrative center of Shatki Raion, Gorky Oblast, RSFSR. Situated on the Tesha River, a tributary of the Oka, Shatki is served by a railroad station on the Arzamas–Krasnyi Uzel line. Industry is represented by a butter factory, a cereal-products combine, and a plant that produces reinforced-concrete structural members. Shatki has a house of rest. [29–878–3]

SHATLYK GAS-CONDENSATE DEPOSIT, a deposit in the eastern part of the Turkmen SSR. Geologically, the Shatlyk deposit is located in an epiplatform region, with a Paleozoic basement and a Mesozoic and Cenozoic sedimentary mantle. It is confined to the Shekhitli-Dzhudzhuklin anticlinal fold, composed of sedimentary rocks ranging in age from the Jurassic to the Anthropogene.

Exploratory drilling was begun in 1967, and the pool of gas condensate in the Shatlyk horizon (the upper part of the Karabilian suite of the Upper Jurassic) was discovered in 1968. Exploitation of the deposit, which occupies an area of 615 sq km, was begun in the period 1973–75.

The Karabilian suite at the Shatlyk gas-condensate deposit has an estimated reserve of about 500–600 billion cu m of gas. The gas density is 0.588 g/cm^3. The methane content reaches 92–96 percent, with 2–3 percent heavy hydrocarbons. The initial content of stable condensate is 13.3 g/m^3; the condensate has a density of 0.790 g/cm^3. The daily extraction of gas amounts to about 90 million cu m (1976). [29–878–4]

SHATOV, VLADIMIR SERGEEVICH. Born December 1887 in Kiev; died Aug. 7, 1943. Participant in the October Revolution of 1917 and the Civil War of 1918–20. Soviet economic figure.

Shatov studied at the Kiev Polytechnic Institute and took part in Social Democratic circles. In 1906 he emigrated to the USA, where he became a member of the Industrial Workers of the World. He returned to Russia in 1917. During the October Days he was a member of the Petrograd military revolutionary committee as a representative of the Union of Anarchosyndicalist Propaganda. From 1918 to 1921, Shatov was extraordinary commissar for railroad defense for the Petrograd Military District and a member of the Revolutionary Military Council of the Seventh Army of the Western Front. After serving as minister of war and minister of railroad transport of the Far East Republic in 1921 and 1922, he turned to administrative work.

From 1927 to 1930, Shatov directed the construction of Turkestan-Siberian railroad and was head of the Board of Siberian Railroad Construction. From 1932 to 1936 he was head of the People's Commissariat of Railroads and of the Central Board of Railroad Construction. Shatov was awarded the Order of the Red Banner. [29–880–1]

SHATROVA, ELENA MITROFANOVNA. Born May 19 (31), 1892, in Moscow; died there July 15, 1976. Soviet Russian actress. People's Artist of the USSR (1968). Member of the CPSU from 1950.

Shatrova, upon graduating from a private theater school in 1912, worked in N. N. Sinel'nikova's theater in Kharkov. From 1918 to 1932 she was a leading actress with the former Korsh Theater and occasionally performed in other theaters. Her roles included Varia in Ostrovskii and Solov'ev's *The Wild Girl*, Liza in a dramatization of Turgenev's *A Nest of Gentry*, Marfin'ka in a dramatization of Goncharov's *The Precipice*, Liza and Masha in A. N. Tolstoy's *The Bitter Blossom* and *The Swallow*, Amalie in Schiller's *The Robbers*, Katharina in Shakespeare's *The Taming of the Shrew*, and Kupavina in Ostrovskii's *Wolves and Sheep*. She often played in translated versions of drawing-room comedies, for example, as Germaine in Verneuil's *The Lie*, Susie in Pagnol and Nivoux's *The Swamp*, and Georgine in de Flers and de Caillavet's *Golden Autumn*.

Shatrova, an actress of delicacy and grace, was distinguished for the lyricism and subtle humor of her characterizations. She often performed opposite her husband, N. M. Radin. The two became known for their comic wit and mastery of dialogue. In 1932, Shatrova joined the Malyi Theater. She appeared in comic and character roles in works from the classic repertoire, for example, as Lidiia, Mamaeva, and Kukushkina in Ostrovskii's *Easy Money, Even a Wise Man Stumbles*, and *A Profitable Post*, Anna Andreevna in Gogol's *The Inspector-General*, and Matrena in L. Tolstoy's *The Power of Darkness*. Shatrova's roles in Soviet plays included Potapova in Sofronov's *The Moscow Character* and Madame Stessel in Stepenov and Popov's *Port Arthur*.

Shatrova was a deputy to the Fourth and Fifth Congresses of the Supreme Soviet of the RSFSR. In 1964 she became vice-chairwoman of the presidium of the All-Union Theatrical Society. A recipient of the State Prize of the USSR in 1948 and 1949, she was awarded two Orders of Lenin, the Order of the October Revolution, the Order of the Red Banner of Labor, and several medals.

SHATSK, a city and the administrative center of Shatsk Raion, Riazan' Oblast, RSFSR. Shatsk is situated on the Moscow-Kui-

byshev highway, 165 km southeast of Riazan' and 31 km south of the Nizhnemal'tsevo railroad station, which is on the Riazan'-Ruzaevka line. Established in 1553 as a fortified military post for the defense of the southern boundaries of the Russian state against invasion by the Tatars, Shatsk became a city in the Tambov Vicegerency in 1779 and a part of Tambov Province in 1796. Shatsk has a garment factory, a milk combine, and a plant producing liqueurs and spirits. The city also has an agricultural-mechanization technicum and a cultural-educational school. [29–919–1]

SHATSK, an urban-type settlement in Liuboml' Raion, Volyn' Oblast, Ukrainian SSR. Situated on the Iagodin-Kovel' line, 33 km from the Liuboml' railroad station, Shatsk has food-processing enterprises, an industrial combine, and a forestry technicum. [29–919–2]

SHATSKII, NIKOLAI SERGEEVICH. Born Aug. 16 (28), 1895, in Moscow; died there Aug. 1, 1960. Soviet geologist. Academician of the Academy of Sciences of the USSR (1953; corresponding member, 1943).

Shatskii enrolled in Moscow University in 1913 but was drafted into the army in his third year. From 1921 he taught at the Moscow Academy of Mines. Beginning in 1930, he taught at the Moscow Geological Prospecting Institute. At the same time, he worked at Gidroproekt (the S. Ia. Zhuk All-Union Project Surveying and Scientific Research Institute) and, after 1934, at the Geological Institute of the Academy of Sciences of the USSR, becoming the institute's director in 1956.

Shatskii's main works dealt with the comparative tectonics of ancient platforms (the Eastern European, Siberian, and North American platforms), the theory of geosynclines, and the duration of the processes of fold formation. Shatskii originated several new techniques and lines of investigation in solving tectonic problems, including the structural analysis of large tectonic forms of the crust, the comparative tectonic method of analysis, and a technique for analyzing facies and thicknesses of sedimentary formations. He was the first to formulate the principle of inheritance in geology and made a major contribution to the theory of geological formations. Under his guidance, the first *Geological Map of Eurasia* (scale of 1:6,000,000), *Tectonic Map of the USSR* (1953, 1956), and the *International Tectonic Map of Europe* (1964) were compiled. Shatskii identified the Riphean group and the Baikal folding. He introduced the concepts of anteclise, placosyncline, placanticline, and aulacogen, among others. Shatskii is the author of works about a number of classic naturalists, including C. Lyell, A. P. Karpinskii, C. Darwin, R. Murchison, A. D. Arkhangel'skii, and V. A. Obruchev. The school of Soviet tectonic specialists, which has received world recognition, took shape under Shatskii's leadership.

Shatskii received the State Prize of the USSR in 1946 and the Lenin Prize in 1958. He was awarded two Orders of Lenin, the Order of the Red Banner of Labor, and various medals.

SHATSKII, STANISLAV TEOFILOVICH. Born June 1 (13), 1878, in the village of Voronino, in what is now Dukhovshchina Raion, Smolensk Oblast; died Oct. 30, 1934, in Moscow. Soviet educator; member of the collegium of the People's Commissariat for Education of the RSFSR (1929–34). Member of the CPSU from 1928.

Shatskii graduated from the division of natural sciences of the faculty of physics and mathematics at Moscow University. He began his educational work in 1905 in one of the outlying districts of Moscow, where he organized the first clubs in Russia for the children of workers. In 1911, using public funds, he and his wife, V. N. Shatskaia, organized a summer work colony known as Cheerful Life for members of the children's clubs.

After the October Socialist Revolution of 1917, Shatskii became head of the First Public Education Experiment Station of the People's Commissariat for Education of the RSFSR; he held this position from 1919 to 1932. The station had an urban division in Moscow and a rural division in Kaluga Oblast that included the Cheerful Life school-colony. It was a complex of pedagogical scientific research institutions, kindergartens, schools, extracurricular establishments for children, and cultural-educational establishments for adults. Methods of communist education were developed and put to practical test at the station. Particular attention was given to combining education with socially useful labor, to making classroom instruction more efficient, to developing group awareness, and to studying the interdependence of the school and its environment.

From 1932 to 1934, Shatskii headed the Central Experimental Laboratory of the People's Commissariat for Education of the RSFSR and served as the director of the Moscow Conservatory.

L. N. SKATKIN [29–919–3]

SHATSKIN, LAZAR' ABRAMOVICH. Born 1902; died Jan. 10, 1937. Figure in the Soviet and international communist youth movements. Member of the Communist Party from May 1917.

Shatskin helped organize the Moscow committee of the Russian Communist League of Youth (RKSM) in 1917 and took part in the Civil War of 1918–20. From 1918 to 1922 he was a member of the Central Committee of the RKSM and served as the committee's secretary. Between 1919 and 1921 he also served as first secretary of the Communist Youth International (KIM). He was a member of the Central Committee of the Komsomol (All-Union Lenin Communist Youth League) from 1926 to 1928. Beginning in 1928, he engaged in state and party work.

Shatskin was a delegate to the First, Fourth, and Eighth Congresses of the Komsomol and to the Eighth through Thirteenth and the Fifteenth and Sixteenth Party Congresses. At the Fifteenth and Sixteenth Congresses he was elected to the Central Control Commission of the ACP(B). Shatskin was a delegate to the First through Third Congresses of the KIM and to the Second through Fifth Congresses of the Communist International (Comintern). Between 1919 and 1923 he served on the Executive Committee of the KIM.

In December 1930, Shatskin was removed from the Central Control Commission of the ACP(B) for factionalism.

SHATT AL-ARAB, a river in the Mesopotamian Lowland.

The Shatt al-Arab is 195 km long and drains an area of more than 1 million sq km. Formed near the city of al-Qurnah by the confluence of the Tigris and Euphrates rivers, it forms a delta before emptying into the Persian Gulf. The channel of the river is between 700 and 1,000 m wide and from 7 to 20 m deep. The Karun River is a left tributary of the Shatt al-Arab.

High water on the Shatt al-Arab occurs in the spring; the water level is low in the autumn. The mean flow rate generally ranges from 1,000–2,000 cu m per sec to 6,000–8,000 cu m per sec; in particularly wet years it may reach 10,000–12,000 cu m per sec. The river is navigable; oceangoing vessels can sail as far as Basra. The cities of Basra (Iraq) and Abadan (Iran) are situated on the Shatt al-Arab. [29–882–1]

SHATUNOVSKII, SAMUIL OSIPOVICH. Born Mar. 12 (25), 1859, in the village of Velikaia Znamenka; died Mar. 27, 1929, in Odessa. Russian mathematician.

Shatunovskii was a professor at Novorossiia University in Odessa. His principal works deal with algebra, the axiomatics of linear magnitude and area, the substantiation of the concept of the volume of a polyhedron without the use of the concept of limit, and the structure of algebra. Particularly noteworthy is Shatunovskii's work on Galois theory as the study of congruences with respect to functional moduli, without the use of the law of the excluded middle, as applied to infinite sets.

REFERENCE

SHATURA, a city (since 1936) under oblast jurisdiction and the administrative center of Shatura Raion, Moscow Oblast, RSFSR. Railroad station on the Moscow-Murom line, 127 km east of Moscow. Population, 27,000 (1974). Located in Shatura is the V. I. Ul'ianov-Lenin Shatura Electric Power Plant, as well as the Shaturtorf peat production association. The city also has a garment factory, a furniture combine, a meat-packing combine and a milk plant. Educational institutions include a technicum of the power industry. [29–883–1]

SHATURA ELECTRIC POWER PLANT (full name, V. I. Ul'ianov-Lenin Shatura Electric Power Plant), a fossil-fuel-fired steam electric power plant in the city of Shatura, Moscow Oblast, with a rated power of 1,330 megawatts (MW). Construction of the plant was begun in 1923, and the official ceremony of starting up the first generator of the state regional power plant was held on Dec. 6, 1925. Work on increasing capacity was begun soon after. The complete first stage, with a total rated power of 180 MW (three units of 44 MW each and three units of 16 MW each), went on line in 1933. The second stage, with a total rated power of 630 MW (three units of 210 MW each), went on line between 1966 and 1972. A third stage, now (1980) under construction, has a total rated power of 520 MW (two units of 210 MW each and one unit of 100 MW).

Milled peat and mazut are used as fuels. The water necessary for the plant's operation is supplied by a circulating system from the Shatura Lakes, with additional water from the Polia River. Electric power is transmitted through high-power, 110- and 220-kilovolt, transmission lines. The plant supplies electric power to the Moscow Power Grid of the Unified Central Power System, which is part of the Unified Power System of the USSR.

The plant was awarded the Order of Lenin (1939) and the Order of the Red Banner of Labor (1945).

V. N. OKHOTIN [29–883–2]

SHATURTORF, an urban-type settlement in Shatura Raion, Moscow Oblast. Shaturtorf has a railroad station on the Moscow-Murom line, 7 km from the city of Shatura. Industry is represented by a peat-processing enterprise. [29–883–3]

SHAUMIAN, LEV STEPANOVICH. Born Apr. 25, 1904, in Tbilisi; died May 24, 1971, in Moscow. Soviet journalist. Member of the CPSU from 1919. Son of S. G. Shaumian.

L. S. Shaumian studied at the Ia. M. Sverdlov Communist University in 1922 and 1923. He graduated from the Higher Party School under the Central Committee of the ACP(B) in 1948.

During the struggle of the Baku Commune against the Turkish interventionists in June and July 1918, L. S. Shaumian fought in a workers' *druzhina* (armed detachment). After the fall of Soviet power in Baku, he was arrested in September 1918 by counterrevolutionaries and imprisoned together with the Baku Commissars. In 1919 and 1920 he conducted underground party work in Baku and Tbilisi.

Between 1924 and 1932, Shaumian engaged in party work in Tsaritsyn (now Volgograd) and Rostov-on-Don. Between 1932 and 1946 he headed the editorial staffs of a number of newspapers; he was managing editor of *Ural'skii rabochii* from 1941 to 1946. In 1949 he joined the staff of the Sovetskaia Entsiklopediia Publishing House; in 1954 he became a member of the Chief Editorial Board of the *Great Soviet Encyclopedia* and the encyclopedia's deputy editor in chief.

Shaumian was awarded the Order of Lenin, two other orders, and various medals.

SHAUMIAN, STEPAN GEORGIEVICH (party pseudonyms include Suren, Surenin, and Aiaks). Born Oct. 1 (13), 1878, in Tbilisi; died Sept. 20, 1918, between Pereval and Akhcha-Kuima stations on the Transcaspian Railroad. Communist party figure. One of the leaders of the revolutionary movement in the Caucasus; journalist; literary critic. Member of the Communist Party from 1900.

The son of a shop clerk, Shaumian graduated from the Tbilisi *Realschule* in 1898. In 1899, in the village of Dzhalal-Ogly (present-day city of Stepanavan), he organized the first Marxist circle in Armenia. He helped found the Union of Armenian Social Democrats in 1902 and emigrated late in that year to Germany, where he graduated in 1905 from the faculty of philosophy at Berlin University. He worked in foreign organizations of the RSDLP and published Social Democratic literature in Armenian and Georgian. He translated works by K. Marx, F. Engels, and V. I. Lenin into Armenian. Shaumian returned to Tbilisi in 1905.

One of the leaders of the Caucasian Union Committee of the RSDLP, Shaumian was a delegate to the Fourth and Fifth Congresses of the RSDLP in 1906 and 1907. He helped establish the Bolshevik organization in Baku. Shaumian founded and edited a number of Bolshevik newspapers and journals. In 1911 he was a member of the Russian Organizing Commission for the Sixth (Prague) All-Russian Conference of the RSDLP, which was held in 1912. He was co-opted at the conference as a candidate member in the Central Committee of the party. Shaumian became head of the Bolshevik organization in Baku in 1914 and a member of the Caucasian Bureau of the RSDLP in 1915.

After the February Revolution of 1917, Shaumian was chosen as chairman of the Baku soviet. A delegate to the First All-Russian Congress of Soviets, he was elected to the All-Russian Central Executive Committee. At the Sixth Congress of the RSDLP(B) he was elected a member of the Central Committee. In October 1917, Shaumian directed the First Congress of Bolshevik Organizations of the Caucasus, and in December he was appointed by the Council of People's Commissars of the RSFSR extraordinary commissar for Caucasian affairs. He led the suppression of the anti-Soviet revolt of the Musavatists in Baku in March 1918 and became chairman of the Baku Council of People's Commissars and commissar of external affairs in April. Shaumian was one of 26 Baku commissars executed by the Socialist Revolutionaries and British interventionists.

Shaumian was the author of works on Marxist-Leninist theory and philosophy and on art and literature. During their formative stages, his literary and esthetic views were influenced by the Russian revolutionary democrats. Shaumian considered literature and art specific forms of ideology and weapons in the class struggle. He defended the Leninist principle of *partiinost'* (party spirit) in literature and advocated the principles of realism and *narodnost'* (popular nature) of art. He wrote articles about L. N. Tolstoy and M. Gorky—for example, "Letter to the Editor in Memory of L. N. Tolstoy" (1910), "A Little About L. N. Tolstoy's Religion" (1911), and "Gorky" (1911). Shaumian's articles and letters contain original evaluations of Russian and foreign classics. With S. Spandarian, A. Miasnikov, and A. Karinian, he laid the foundations of Armenian Marxist criticism and esthetics.

Shaumian deserves considerable credit for the development of proletarian literature in Armenia and is known to have had a direct influence on the work of A. Akopian. In his articles "V. Papazian as Historian" (1912) and "Concerning the Anthology of Armenian Literature" (1916), Shaumian dealt with complex aspects of the history, literature, and social thought of the

Armenian people in the 19th and early 20th centuries, singling out in particular the work of Kh. Abovian and the activities of M. Nalbandian.

SHAUMIANI (until 1925, Shulavery), an urban-type settlement in Marneuli Raion, Georgian SSR. Shaumiani is situated 7 km from the Shulaveri railroad station on the Tbilisi-Leninakan line. It has a grape-growing sovkhoz. The settlement is named in honor of S. G. Shaumian. [29–886–1]

SHAUMIANOVSK (until 1938, Nizhnii Agdzhakend), an urban-type settlement and the administrative center of Shaumianovsk Raion, Azerbaijan SSR. Shaumianovsk is situated 40 km southwest of the Geran' railroad station, which is on the Tbilisi-Baku line. There is a food-preserves plant in the settlement, which was renamed in honor of S. G. Shaumian. [29–886–2]

SHAUQI, AHMAD (also Ahmad Shawqi). Born Oct. 16, 1868, in Cairo; died there Oct. 14, 1932. Egyptian writer.

Shauqi came from an aristocratic family that was on close terms with the khedive's court. He studied law in France from 1887 to 1891. For his anti-British opinions, Shauqi was exiled to Spain from 1915 to 1919. In 1924 he was elected to the senate. He took part in congresses of Orientalists in Berlin (1891) and Geneva (1894).

Shauqi's poetry is thematically varied, ranging from panegyrics to children's poems and humorous verses. Four volumes of his divans have been published (1898, 1927, 1936, and 1943). They are works of the Egyptian neoclassical school and adhere to traditional literary models. However, their melodiousness (many of them have been set to music), as well as their generally understandable content and sincerity, made Shauqi the most popular poet of the Arabic world in the first half of the 20th century. In 1927 he was proclaimed "prince of poets."

Shauqi expressed sympathy toward Egyptian nationalism in his verse dramas on historical themes, which are obviously imitative and not particularly clear or well constructed. One of them, *The Great Ali Bey* (1893), may be considered the first original Arabic drama. Shauqi also wrote historical narratives and short stories.

SHAVER, a gear-cutting tool used for gear shaving. The cutting edges are arranged along the surface of the teeth of a spur or worm generating gear or along the surface of a generating rack. [29–1068–3]

SHAVERDIAN, DANUSH (also Daniel Aleksandrovich Shaverdov). Born Jan. 11 (23), 1882, in the village of Igaat, in what is now the Armenian SSR; died Oct. 24, 1941. Figure in the revolutionary movement in Transcaucasia. Member of the Communist Party from 1902.

The son of a *dvorianin* (nobleman), Shaverdian graduated from the faculty of law of the University of St. Petersburg in 1911. In 1902 he helped found the Union of Armenian Social Democrats, and in 1904 he began conducting party work in St. Petersburg and Tbilisi. He became a member of the executive committee of the Tbilisi soviet in March 1917, and in October of the same year he became a member of the Caucasian Regional Committee of the RSDLP(B). From 1918 to 1920, Shaverdian performed underground party work in Georgia, which was then controlled by the Mensheviks, and in Armenia, which was under the power of the bourgeois nationalist party Dashnaktsutiun. In 1919 he became a member of the Armenian Committee of the RCP(B) and the Foreign Bureau of the Communist Party (Bolshevik) of Armenia.

In 1921 and again from 1924 to 1928, Shaverdian was the trade representative of the Armenian Soviet Socialist Republic and the Transcaucasian Soviet Federated Socialist Republic in Turkey, and he organized the mass repatriation of Armenian working people. In 1922 and 1923 he served as people's commissar of justice and deputy chairman of the Council of People's Commissars of the Armenian SSR. Beginning in 1929 he was associated with the People's Commissariat for Foreign Trade of the USSR.

Shaverdian was a delegate to the Fourteenth Congress of the ACP(B) in 1925.

SHAVGULIDZE, GEORGII VLADIMIROVICH. Born Nov. 6 (19), 1910, in Kutaisi; died Apr. 13, 1959, in Tbilisi. Soviet Georgian actor. People's Artist of the Georgian SSR (1955).

Shavgulidze was a pupil of K. A. Mardzhanishvili, under whose guidance he began his stage career in 1928 at the Kutaisi Theater (now the Mardzhanishvili Theater in Tbilisi). Known for his integral characterizations, he excelled in bold, romantic parts and was also physically striking and expressive in character roles. His best roles were Saiat-Nova in Gotua's *King Iraklii*, Farkhad in Khikmet's *Legend of Love*, Shpekin in Gogol's *The Inspector-General*, and Nikifor in Mosashvili's *His Star*. He also appeared in motion pictures, for example, in the title role in *David Guramishvili* (1946) and as Nino in *Keto and Kote* (1953).

Shavgulidze, a recipient of the State Prize of the USSR in 1952, was awarded two orders and several medals. [29–794–5]

SHAVING, in gear cutting, the finishing of untempered teeth on gear wheels by cutting thin chips with a shaver. Gear shaving is carried out on gear-shaving machines. It produces surfaces with an accuracy up to class 6 and a surface roughness up to class 8. [29–1068–4]

SHAVISHVILI, MIKHAIL KALISTOVICH. Born Sept. 2 (14), 1894, in Ozurgeti (now the city of Makharadze); died Mar. 8, 1966, in Tbilisi. Soviet architect. Honored Art Worker of the Georgian SSR (1947).

Shavishvili graduated from the Institute of Civil Engineering in Tbilisi in 1931. He joined the teaching staff in the same year and taught at the Georgian Polytechnical Institute from 1951 to 1954.

His most important structures were the physics and chemistry building of the University of Tbilisi (1940), building complexes for the Tbilisi Medical Institute (1940), the Georgian Polytechnical Institute in Tbilisi (1954), the Kutaisi Meskhishvili Theater (1955, with Sh. Tavadze), the residential settlement at the automotive plant (1958, with G. Chigogidze) in Kutaisi, and the Palace of Culture of Metallurgical Workers in Zestafoni (1962). [29–795–2]

SHAVLY, STIKHVAN (Stepan Antonovich Shumkov). Born Sept. 2 (15), 1910, in the village of Kamenka, in what is now Shentala Raion, Kuibyshev Oblast; died Feb. 15, 1976, in Cheboksary. Soviet Chuvash poet. People's Poet of the Chuvash ASSR (1974). Member of the CPSU from 1943.

Shavly, the son of poor peasants, graduated from the language and literature department of the Pedagogical Institute in Kazan (1939). Major themes in his works included V. I. Lenin (the narrative poem *The Green Statue*, 1957), the October Revolution, the struggle for the consolidation of Soviet power in Chuvashia (*October Poem*, 1953), and the courage and heroism of the Soviet people during the Great Patriotic War of 1941–45 (the narrative poems *The Pioneer From Kiev*, 1944; *Egor Madurov*, 1945; and *Zoia*, 1945). The narrative poem *Celestial Man* (1963) is a tribute to cosmonaut A. G. Nikolaev. Shavly wrote the collections of satirical verse *Pointing the Finger* (1958) and *Thorns* (1965) and the short-story collection *I Took the Sonorous Gusli in Hand* (1968).

Shavly translated into Chuvash the works of P. P. Ershov, M. Iu. Lermontov, I. A. Krylov, and J. Rainis. Shavly's works have been translated into the languages of the peoples of the USSR and into foreign languages.

SHAVROV, IVAN EGOROVICH. Born Mar. 14 (27), 1916, in the village of Shabuni, in what is now Vitebsk Raion, Vitebsk Oblast. Soviet military leader. General of the army (1973). Member of the CPSU since 1940.

The son of a peasant, Shavrov joined the Red Army in 1935. He graduated from a school for armored troops in 1938, the Military Academy of Mechanization and Motorization of the Workers' and Peasants' Red Army in 1941, and the K. E. Voroshilov Higher Military Academy in 1948. He completed the Higher Academic Courses at the Voroshilov academy in 1968.

During the Great Patriotic War, Shavrov served between 1941 and 1943 as a battalion chief of staff and as deputy chief of staff and chief of staff of a tank brigade. In 1943 he became chief of the operations section of the directorate in charge of the armored and mechanized forces of the Don Front and then held the same position in the Fourth Guards Tank Army. He was chief of staff of a tank corps between 1943 and 1945 on the Briansk, Southwestern, Don, Central, Fourth Ukrainian, and First and Second Baltic fronts.

After the war, Shavrov held staff and command positions in the armored and mechanized combat arms. He became first deputy commander of the Baltic Military District in October 1963, commander of the Leningrad Military District in May 1967, and head of the K. E. Voroshilov Military Academy of the General Staff of the Armed Forces of the USSR in February 1973. Shavrov was a member of the Central Committee of the CPSU from 1971 to 1976 and a deputy to the eighth convocation of the Supreme Soviet of the USSR. He has been awarded the Order of Lenin, four Orders of the Red Banner, the Order of Suvorov Second Class, two Orders of Kutuzov Second Class, two Orders of the Red Star, the Order For Service to the Motherland in the Armed Forces of the USSR Third Class, and various medals. Shavrov has also received foreign orders and medals. [29–796–1]

SHAVSHETI RANGE, a mountain range in southwestern Transcaucasia, on the border of the Adzhar ASSR and Turkey. The range measures approximately 65 km in length and rises to a maximum elevation of 2,812 m at Mt. Kheva. Plateau-like surfaces predominate in the relief. The range is composed of volcanogenic flysch and sandstones. The slopes are covered with broad-leaved and fir-spruce forests with evergreen undergrowth. Subalpine meadows grow along the ridge. [29–796–3]

SHAVTELI, IOANE. Dates of birth and death unknown. Georgian poet and odist of the 12th and early 13th centuries.

Shavteli wrote the religious panegyric *Praise to Our Lady of Vardzia*. The odic narrative poem *Abdul-Messiah*, which is worldly in content but full of Christian religious motifs, is also attributed to Shavteli. Some scholars believe that Abdul-Messiah is modeled on a historical figure.

SHAVYRIN, BORIS IVANOVICH. Born Apr. 27 (May 10), 1902, in Yaroslavl; died Oct. 9, 1965, in Moscow. Soviet designer of mortars and rocket launchers. Hero of Socialist Labor (1945); doctor of technical sciences (1952). Member of the CPSU from 1943.

After his graduation from the Yaroslavl Evening Workers' School in 1925 and the N. E. Bauman Moscow Higher Technical School in 1930, Shavyrin, the son of a railroad worker, worked as an engineer and taught. He became a senior engineer and designer in 1932 and later headed design offices in various factories. In April 1942 he was appointed manager and chief designer of a newly created specialized design office, which he headed until the end of his life.

In 1937 and 1938, Shavyrin supervised and took part in the development of a Soviet mortar system, which comprised the 50-mm company mortar, the 82-mm battalion mortar, the 107-mm mortar to be carried on packsaddles, and the 120-mm regiment mortar. The simplicity and superiority of design of these mortars made it possible to mass-produce them quickly and to meet the needs of the front. In 1949 and 1950, Shavyrin directed the development of the 160-mm and 240-mm mortars as well as of a number of other weapons.

Shavyrin received the Lenin Prize in 1964 and the State Prize of the USSR in 1942, 1950, and 1951; he was awarded two Orders of Lenin, three other orders, and various medals.

A. N. LATUKHIN [29–796–4]

SHAW, GEORGE BERNARD. Born July 26, 1856, in Dublin; died Nov. 2, 1950, in Ayot St. Lawrence. English playwright. Irish by birth.

Shaw spent his early years in Dublin and worked as a clerk after he graduated from school in 1871. In 1876 he moved to London and devoted himself to journalism, including work as a music reviewer, and literature. His novels *The Irrational Knot* (1880), *Love Among the Artists* (1881), and *Cashel Byron's Profession* (1882) and the novel of sharp social content *An Unsocial Socialist* (1883, separate edition 1887; Russian translation *The Amateur Socialist*, 1910) were rejected by bourgeois publishers and were printed in socialist periodicals. As one of the leaders of the Fabian Society, Shaw worked for a number of years to propagate the ideas of socialism, publishing tracts, pamphlets, and books.

Even in Shaw's first literary work, his novels, the heart of his creative method was determined—the use of paradox as a means of overcoming prevailing ideologies. His first play, *Widowers' Houses* (1892), caused a scandal and was unsuccessful, as was the play that followed, *The Philanderer* (1893). *Mrs. Warren's Profession* (1894), which dealt with the theme of prostitution, was first staged in England in 1907. The difficulties with production forced Shaw to publish his plays (the press was not subjected to prior censorship). *Widowers' Houses*, *The Philanderer*, and

Mrs. Warren's Profession were published in a collection entitled *Plays Unpleasant* (1898); a second cycle, *Plays Pleasant*, was then published, including *Arms and the Man* (1894), *Candida* (1894), *The Man of Destiny* (1895), and *You Never Can Tell* (1895). These were followed by a third cycle, *Three Plays for Puritans* (1901), which included *The Devil's Disciple* (1896–97), *Caesar and Cleopatra* (1898), and *Captain Brassbound's Conversion* (1899).

One of the founders of the modern "drama of ideas," Shaw created a type of discussion play, in which the clash of ideas and hostile ideologies posed the most acute problems of social and personal morality. *Man and Superman* (1901–03), a "comedy and philosophy" by Shaw's definition, transforms the traditional theme of Don Juan: the hero is pursued by a woman. In the interlude of this play, "Don Juan in Hell," a strikingly forceful criticism of the vices of capitalist civilization is expressed through the mouth of the Devil. In *John Bull's Other Island* (1904), Shaw used his two main characters to contrast not only national types—the Irishman and the Englishman—but correspondingly the "romantic" and the "realist," as Shaw interpreted them. *Major Barbara* (1905) contains a criticism of bourgeois philanthropy; in the play Shaw first expressed the idea that bourgeois violence must be opposed by a force that serves social progress and justice. Even in the solution of personal problems, Shaw remained a distinctly social dramatist. *The Doctor's Dilemma* (1906) shows how medicine loses its humane character under bourgeois conditions; *Androcles and the Lion* (1913) criticizes dogmatic Christianity. *Getting Married* (1908), *Misalliance* (1910), and *Fanny's First Play* (1911) are devoted to questions of family, marriage, and education. *The Shewing-Up of Blanco Posnet* (1909) depicts the exposure of the religious sanctimoniousness of the petite bourgeoisie. *Pygmalion* (1913), which deals with problems of culture based on differing speech patterns and with general spiritual development, shows the moral superiority of a girl from the lower classes over an outwardly intelligent, aristocratic professor of phonetics.

Shaw responded to the October Revolution of 1917 in Russia with the grotesque farce *Annajanska, the Bolshevik Empress* (1918), in which he spoke out very determinedly for the use of violent methods to transform society. In the play *Heartbreak House* (1913–19), written under the obvious influence of A. P. Chekhov, he denounces the parasitism of the ruling class, their loss of spiritual values, and the erosion of individuality of character. On the other hand, old Captain Shotover in the play sees salvation in work and in the decisive reform of the entire structure of life. *Back to Methuselah* (1918–20), a "metabiological" drama consisting of five parts not connected by a common plot, depicts a whimsical utopia inhabited by a race of long-livers. *Saint Joan* (1923) is a tragedy, the only one written by Shaw. In his treatment of the story of Joan of Arc, Shaw introduced a new theme: the Maid's power comes not from a psychological obsession, but from reason, which is feared equally by the French and the English. When the "danger" represented by Joan has disappeared after her execution, she is exonerated; however, no one desires that she should come back to life.

After an interval of several years, Shaw returned to writing plays, startling the world with the freshness and wit of his "political extravaganzas" (so-called eccentric comedies): *The Apple Cart* (1929), *Too True to Be Good* (1931), *On the Rocks* (1933), *The Simpleton of the Unexpected Isles* (1934), and *Geneva* (1938), as well as with the historical play *Good King Charles's Golden Days* (1939) and the comedy *The Millionairess* (1936). The idea that capitalist society has reached an impasse and bourgeois democracy is experiencing an acute crisis runs through all of the plays; fascism is condemned in *Geneva*.

In 1931, Shaw visited the USSR, of which he had been a friend from the first years of the Great October Socialist Revolution. The fighting spirit of the publicist was evident in his public appearances until Shaw's last years. His last plays were *Buoyant Billions* (1948) and *Farfetched Fables* (1950).

Although their staging was delayed, Shaw's plays gradually gained widespread recognition and became a major force in the literature of the late 19th and the first half of the 20th century. His work bore the clear stamp of the publicist and was inspired by deep philosophical meditation on the social, cultural, and biological future of mankind. His remarkable skill turned his plays into a forum for social and philosophical discussion. Shaw's best plays have become part of the standard repertoire of many theaters in the Soviet Union. Shaw was awarded the Nobel Prize in 1925.

A. A. ANIKST [29–1379–4]

SHAW, IRWIN. Born Feb. 27, 1913, in New York City. American writer.

Shaw graduated from Brooklyn College in 1934. His first play, *Bury the Dead* (1936), is notable for its sharp antiwar leanings. The play *The Gentle People: A Brooklyn Fable* (1939; Russian translation, 1965) sounded a warning to America about violence and gangsterism. Shaw's novel *The Young Lions* (1948; Russian translation, 1962) is among the best works about World War II; scenes of fascist barbarism alternate with realistic sketches of tyranny and discrimination in the US Army. In his sharply social novels, Shaw emphasizes the problem of preserving moral values and dwells on the spiritual strivings of the heroes (*The Troubled Air*, 1950; *Evening in Byzantium*, 1973; Russian translation, 1975). Shaw has also written collections of short stories, the publicist work *In the Company of Dolphins* (1964), and screenplays.

SHAW, WILLIAM NAPIER. Born Mar. 4, 1854, in Birmingham; died Mar. 23, 1945, in London. English meteorologist. Member of the Royal Society of London (1891).

After graduating from Cambridge University in 1877, Shaw worked at the university. In 1900 he began working for the British Meteorological Council, and in 1905 he was named director of the Meteorological Office, where he remained until 1920. From 1920 to 1924 he was a professor of meteorology at the Imperial College in London. Shaw was president of the International Meteorological Committee from 1907 to 1923.

Shaw's principal works dealt with dynamic meteorology. Shaw studied the origin of cyclones. In 1925 he proposed a method of investigating the vertical temperature and moisture distributions in the atmosphere by means of adiabatic diagrams.

SHAWI, NIQULA. Born Mar. 14, 1912, in Tripoli, Lebanon. Figure in the Lebanese working-class and national liberation movement.

In 1933, Shawi joined the Syrian Communist Party, which at that time included both Syrian and Lebanese Communists. In 1934 he was elected to the Central Committee of the SCP, and in 1937 he became secretary of the Central Committee. After the division of the SCP in 1944 into the independent Syrian and Lebanese Communist parties, Shawi became secretary and a member of the Central Committee of the Lebanese Communist Party (LCP). From 1948 to 1958, while the two parties were reunited as the Communist Party of Syria and Lebanon, he was a member of the party's Central Committee and Central Leadership. From 1958 to 1965, Shawi was secretary of the Central Committee of the LCP, and from 1965 to 1979 he was general secretary of the Central Committee. In 1979, Shawi became honorary president of the LCP. [29–883–5]

SHAWINIGAN (until 1958, Shawinigan Falls), a city in Canada, on the St. Maurice River, in Quebec Province. Population, 27,500 (1971). A hydroelectric power plant with a capacity of 1.5 gigawatts is located at Shawinigan. In addition to an aluminum smelter and textile enterprises, the city has a chemical industry and a pulp and paper industry. [29–1333–2]

SHAWNEE, an Algonquian-speaking tribe of North American Indians. Until the early 17th century the Shawnee lived in southeastern North America, along the Cumberland River in Tennessee, where they engaged in land cultivation and hunting. In the 17th and 18th centuries they were driven off their lands; they were initially pushed northward to Pennsylvania, then westward to Missouri. In the early 19th century Tecumseh, the war chief of the Shawnee, tried to organize a confederacy of Indian tribes to resist the advance of settlers beyond the Ohio River. The forces of the confederacy were dispersed, and the Shawnee were settled on a reservation in Kansas; eventually they were resettled in Oklahoma. According to the 1970 census, the Shawnee number 2,200, most of whom work as hired laborers. [29–886–3]

SHAYDA (Kazimkhan Khattak). Born 1727 in Afzalabad, now in Pakistan; died late 18th century in Rampur, now in India. Afghan (Pashtoon) poet. Representative of feudal secular poetry. Great-grandson of Khushhalkhan Khattak.

Shayda traveled widely in India. Influenced by Sufism, he joined the Naqshabandi, a Sufi sect. The Indian style and especially the work of Mirza Abdulkadir Bedil had a distinct influence on Shayda's poetry. For the first time in Afghan poetry, images, symbolism, and devices of the Indian style were widely reflected in Shayda's *Divan* (1767).

The themes of Shayda's poetry range from the intimate and lyrical to the philosophical and didactic. His works are exceptionally complex in form and abound in foreign vocabulary, mainly borrowed from classical Persian and Tadzhik poetry.

SHAYKHI, followers of a Muslim Shiite sect established in the late 18th century by Sheikh Ahmad al-Ahsai (born 1744; died 1827 or 1828), who preached in Iran and Iraq. The first tenet of the sect was belief in the inevitability of the coming of the Mahdi, who would destroy the injustice that the Shaykhi thought had spread throughout the land. The second tenet was belief in the appearance of a man whom the Shaykhi called the Gate (*bab*), who would be an intermediary between the Mahdi and the people. The foundations of the sect's teachings were developed by the Bab (*see* BABISM). In the 1840's the sect essentially disintegrated. [29–1087–3]

SHAYKH 'UTHMAN, a city in the People's Democratic Republic of Yemen, a suburb of Aden. Population, 35,000 (1960). The city is a highway junction and a trade center. It has cottage industries specializing in pottery-making, weaving, and dyeing, as well as wine-making. [29–1088–1]

SHAYS, DANIEL. Born circa 1747 in Hopkinton, Mass. (now in New Hampshire); died Sept. 29, 1825, in Sparta, N.Y. Leader of a rebellion of poor farmers in the USA in 1786 and 1787.

From 1775 to 1780, Shays fought in the American Revolution. In 1777 he received the rank of captain for distinction in battle. After the war, Shays engaged in farming. In 1786 he headed a rebellion in Massachusetts (*see* SHAYS' REBELLION). After it was defeated, Shays was sentenced to death in 1787 but was pardoned in 1788. [29–1086–1]

SHAYS' REBELLION (1786–87), an uprising of poor farmers in the USA led by D. Shays; it took place under the conditions of the aggravation of the class struggle that existed after the close of the American Revolution.

The rebellion was joined by craftsmen and former soldiers. The rebels demanded equal distribution of land and wealth, the abolishment of all debts, and fair legal proceedings. They attacked courtrooms, destroyed files of debt prosecutions, and freed debtors. In December 1786, about 1,100 rebels unsuccessfully tried to seize the arsenal in Springfield, Mass. In February 1787 the rebels were defeated by government troops. Thirteen leaders of the uprising were sentenced to death, but they were subsequently pardoned. The rebellion was the culmination of the democratic movement in the USA in the last quarter of the 18th century. [29–1086–2]

SHAZHERE (also Shadzhara), the name used by some peoples of the East for oral or written historical and genealogical traditions. Knowledge of the origins of a family, clan, tribe, or people and their former clan and tribal organization was supplemented by descriptions of historical events and by documents. The *shazhere* of the Iurmats, a Bashkir tribe, contain information on the incorporation of the Bashkirs into the Russian empire. Some *shazhere* were in verse.

SHCHADENKO, EFIM AFANAS'EVICH. Born 1885, in the *stanitsa* (large cossack village) of Kamenskaia, now the city of Kamensk-Shakhtinskii, Kamensk Raion, Rostov Oblast; died Sept. 6, 1951, in Moscow. Soviet military leader. Colonel general (1942). Member of the CPSU from 1904.

The son of a worker, Shchadenko became chairman of the Kamensk Committee of the RSDLP(B) in February 1917. During the October Revolution of 1917 he organized Red Guard detachments and helped crush counterrevolutionary centers in the Don region. In January 1918 he was elected a member of the Don Military Revolutionary Committee. After joining the Red Army in June 1918, Shchadenko served as a member of the Revolutionary Military Council of the First Horse Army from November 1919 to July 1920 and held the same position in the Second Horse Army from July until December 1920. Shchadenko completed two courses at the Military Academy of the General Staff in 1923. He commanded a cavalry division and was chief of a district political directorate. He became a member of the Military Council of the

Kiev Military District in May 1937 and deputy people's commissar of defense and chief of the Directorate for Command and Staff Personnel of the Workers' and Peasants' Red Army in November.

During the Great Patriotic War of 1941–45, Shchadenko served as deputy people's commissar of defense of the USSR. He was chief of the Main Directorate for Recruitment and Staffing of the Red Army from 1941 to 1943, a member of the Military Council of the Southern Front in September and October 1943, and a member of the Military Council of the Fourth Ukrainian Front from October 1943 to January 1944.

Shchadenko was a member of the Central Control Commission from 1930 to 1934 and a member of the Central Committee of the ACP(B) from 1939 to 1941. He became a candidate member of the Central Committee of the ACP(B) in 1941 and was a deputy to the first convocation of the Supreme Soviet of the USSR. Shchadenko was awarded four Orders of Lenin, four Orders of the Red Banner, the Order of Suvorov Second Class, the Order of the Red Star, and various medals. [29–1572–1]

SHCHAPOV, AFANASII PROKOF'EVICH. Born Oct. 5 (17), 1831, in the village of Anga, Verkholensk District, Irkutsk Province; died Feb. 27 (Mar. 10), 1876, in Irkutsk. Russian historian and publicist.

The son of a sexton, Shchapov studied at the Kazan Theological Academy from 1852 to 1856; he graduated with a baccalaureate degree. He taught Russian history at the theological academy from 1856 to 1860 and at Kazan University in 1860 and 1861. On Apr. 16, 1861, he delivered a revolutionary speech at a requiem for the victims of the Bezdna uprising of 1861; he was arrested and sent to St. Petersburg. After an investigation Shchapov was prohibited from teaching and was appointed an official for sectarian affairs in the Ministry of the Interior. In 1862 he was dismissed from his position and put under police supervision.

Shchapov was a contributor to such journals as *Otechestvennye Zapiski, Russkoe slovo, Vremia*, and *Vek*. Exiled to Siberia in 1864 on suspicion of being associated with A. I. Herzen and N. P. Ogarev, he went first to Anga and then to Irkutsk. In 1866 he served as an ethnographer on an expedition to Turukhansk Krai conducted by the Siberian Department of the Russian Geographic Society. In the summer of 1865, Shchapov was arrested in connection with the case of the Siberian *oblastniki* (revolutionary group of Siberian intellectuals). After his release he became a contributor to the journals *Delo* and *Zapiski Sibirskogo otdela RGO* (Notes of the Siberian Department of the Russian Geographic Society). He died of tuberculosis.

Shchapov wrote many works on the history of sectarianism and the schism (*raskol*), which he viewed as expressions of popular protest against social oppression. From 1856 to 1864, under the influence of G. Z. Eliseev and S. V. Eshevskii, he supported the *zemstvo-oblast* theory, which was accepted in Russian demographic historiography and which viewed the history of Russia from the standpoint of the interrelationships of separate areas ("oblasts"). Later, while in exile, Shchapov subjected the theory to criticism; influenced by the ideas of N. G. Chernyshevskii, D. I. Pisarev, H. T. Buckle, and the positivists, he attempted to apply the methods of natural science to the study of the history of the development of the Russian people.

Under the influence of the ideas advanced by Shchapov, a trend toward studying the effects of geography and economics developed in Russian historical science. This trend, which was progressive for its time, found expression in the works of such historians as V. O. Kliuchevskii.

SHCHARA, a river in the Byelorussian SSR, a left tributary of the Neman. The Shchara is 325 km long and drains an area of 9,990 sq km. The river rises in the Byelorussian Shelf. It is fed by mixed sources, but predominantly by snow; high water occurs between late February and May. The mean flow rate 63 km from the mouth is 31 cu m per sec. The river freezes over between November and January, and the ice breaks up between late February and the first half of April. The Shchara is linked with the Iasel'da River of the Dnieper basin by the Oginskii Canal and Vygonovskoe Lake. There are locks on the lower and middle course of the river, along the last 200 km of its length. The city of Slonim is situated on the Shchara. [29–1573–1]

SHCHEBETOVKA, an urban-type settlement in Sudak Raion, Crimean Oblast, Ukrainian SSR. Shchebetovka is situated 27 km from Feodosiia. Its enterprises include the Koktebel' viticultural sovkhoz and plant. [29–1573–3]

SHCHEDRIN, FEODOSII FEDOROVICH. Born 1751 in St. Petersburg; died there Jan. 19 (31), 1825. Russian sculptor. Brother of Semen F. Shchedrin.

Shchedrin studied with N. F. Gillet at the St. Petersburg Academy of Arts from 1764 to 1773. He studied in Florence and Rome from 1773 to 1775 and in Paris from 1775 to 1785 on a stipend from the academy. In 1794, Shchedrin became an academician and an instructor at the academy; he was made rector in 1818.

Although his early work was baroque in tradition (for example, his dynamic *Mars*, gypsum, 1776, Scientific Research Museum of the Academy of Arts of the USSR, Leningrad), Shchedrin had become one of the foremost masters of Russian classicist sculpture by the late 1770's. His free-standing works are characterized by classical clarity, elegance, and subtle modeling (*Sleeping Endymion*, bronze, 1779; *Venus*, marble, 1792—both in the Russian Museum, Leningrad). A master of monumental decorative sculpture, Shchedrin attained an organic interdependence of the decorative and representational—a true synthesis of arts—particularly evident in the heroic and deeply patriotic sculptural ornament of the Admiralty in St. Petersburg (the figures on the colonnade of the central tower, three figures on the cornice wall, and the two groups of sea nymphs; limestone, 1812–13). Shchedrin also did a number of portraits, for example, *N. I. Panin* (bas-relief, marble, 1794, Historical Museum, Moscow) and *A. A. Nartov* (marble, 1811, Russian Museum, Leningrad).

SHCHEDRIN, NIKOLAI PAVLOVICH. Born 1858 in Petropavlovsk, in what is now the Kazakh SSR; died Jan. 10, 1919, in Kazan. Russian revolutionary Narodnik (Populist).

The son of a *dvorianin* (nobleman), Shchedrin studied at the Omsk Military Gymnasium. In 1876 he joined the organization Land and Liberty in St. Petersburg; after it split in 1879, he became a member of the Black Partition. In the spring of 1880 he and E. N. Koval'skaia organized the Southern Russian Workers' Union in Kiev. Schedrin wrote the union's program and many proclamations.

In October 1880, Shchedrin was arrested. On May 29, 1881, the Kiev Military District Court sentenced him to death, but the sentence was commuted to life at hard labor. He served the first part of his sentence at the Kara Penal Colony, where he was chained to a wheelbarrow. In 1882 he was transferred to the Aleksei Ravelin, and in 1884, to Shlissel'burg Fortress; soon after his arrival at the fortress he became mentally ill. In 1896, Shchedrin was transferred to the Kazan Psychiatric Hospital, where he remained until his death.

SHCHEDRIN, RODION KONSTANTINOVICH. Born Dec. 16, 1932, in Moscow. Soviet composer. People's Artist of the RSFSR (1976).

In 1955, Shchedrin graduated from the Moscow Conservatory, where he had studied composition with Iu. A. Shaporin and piano with Ia. V. Flier. He has created important works in a variety of genres, including the operas *Not For Love Alone* (1961) and *Dead Souls* (based on the novel by N. V. Gogol; libretto by the composer, 1977) and the ballets *The Humpback Horse* (1960), *The Carmen Suite* (based on the opera by G. Bizet, 1967), *Anna Karenina* (1972), and *The Seagull* (1980). All the above works were first staged at the Bolshoi Theater in Moscow.

In his music Shchedrin methodically combines elements of Russian folklore and innovative compositional devices. Among his works are the oratorio *Lenin in the Heart of the People* (1969), *Poetic Oratorio* (to words by A. A. Voznesenskii; 1968), and two symphonies (1958 and 1965; second version, 1976). Shchedrin has also composed two concerti for orchestra—*Mischievous Ditties* (1963) and *Chimes* (1968); three concerti for piano and orchestra (1954, 1966, and 1973); works for piano, including 24 preludes and fugues (1970); and the *Polyphonic Notebook* (1972).

Shchedrin became chairman of the administrative board of the Composers' Union of the RSFSR in 1973. He was a deputy to the sixth, ninth, and tenth convocations of the Supreme Soviet of the RSFSR. He received the State Prize of the USSR in 1972 and was made an honorary corresponding member of the Bavarian Academy of Fine Arts in 1976. In 1962 he became a member of the Soviet Committee for the Protection of Peace. Shchedrin has been awarded two orders and various medals. [29–1578–2]

SHCHEDRIN, SEMEN FEDOROVICH. Born Apr. 6 (17), 1745, in St. Petersburg; died there Sept. 1 (13), 1804. Russian landscape painter. The brother of F. F. Shchedrin.

Shchedrin studied at the St. Petersburg Academy of Arts from 1759 to 1767. He received a stipend to study in Paris with F. Casanova from 1767 to 1769 and in Italy from 1769 to 1772. He stayed in Italy until 1776, at which time he returned to St. Petersburg to teach at the Academy of Arts. Shchedrin became an academician in 1779 and adjunct-rector in 1798. In 1799 he became head of the academy's landscape engraving class.

Shchedrin's paintings are in the spirit of sentimentalism. His park scenes—primarily of Peterhof, Gatchina, and Pavlovsk—combine principles of decorative and landscape painting. Yet despite conventional composition and color, they convey the beauty of nature and depict specific locales (for example, *The View of Gatchina Palace From Dlinnyi Island*, 1796; the panel *Stone Bridge at Gatchina Near Konetabl' Square*, 1799–1800—both at the Tret'iakov Gallery, Moscow).

Shchedrin helped establish the landscape as an independent genre in Russian painting and gave it a national character.

REFERENCE

Fedorov-Davydov, A. A. "S. F. Shchedrin." In *Russkoe iskusstvo: Ocherki o zhizni i tvorchestve khudozhnikov, Vosemnadtsatyi vek*. Moscow, 1952. [29–1578–3]

SHCHEDRIN, SIL'VESTR FEODOSIEVICH. Born Feb. 2 (13), 1791, in St. Petersburg; died Oct. 27 (Nov. 8), 1830, in Sorrento. Russian landscape painter; one of the founders of the Russian realistic landscape school. Son of the sculptor F. F. Shchedrin and nephew of the landscape painter S. F. Shchedrin.

Shchedrin studied with M. M. Ivanov and F. Ia. Alekseev at the Academy of Arts in St. Petersburg from 1800 to 1812. In 1818 he received a stipend from the academy to study in Italy. Shchedrin's early landscapes were in the spirit of classicism. In Italy the artist evolved from a devotion to antiquity to a careful study of nature. Unlike his predecessors, he did studies in oil, observing the color and light relationships in the landscape (*The Coliseum*, 1819, Tret'iakov Gallery, Moscow).

In the series *The New Rome* (1823–25), Shchedrin conveyed a total picture of the city, depicting its modern and ancient buildings and scenes from everyday life. His desire for naturalness and for a thorough portrayal of nature in his works sparked Shchedrin's efforts to present a unity of nature and lighting; the same goals are evident in his plein-air representations and his use of uniform tonality and color. The paintings *Small Dock in Sorrento*, *On the Island of Capri*, and *View of Sorrento Near Naples* (all 1826, Tret'iakov Gallery) reveal a poetic treatment of nature. The ambience of light and air is conveyed by a very subtle range of silver hues, and genre motifs dissolve into the landscape. The series *Terraces in Sorrento* (1825–28) is permeated with a feeling of the sweetness of midday in summer, peaceful tranquility and happiness, and the beauty of everyday life. Genre motifs occupy a large place in the series, but at the same time there is a certain color intensity and emphasized emotionalism. Shchedrin's landscapes from 1828 through the 1830's, in particular the two versions of *Moonlit Night in Naples* (1828–29, Tret'iakov Gallery and Russian Museum, Leningrad), are marked by romantic animation and complex light and color effects.

Shchedrin's landscapes of Italy are full of poetic harmony, a harmony similar to that found in the works of the Russian poets K. N. Batiushkov, A. S. Pushkin, and E. A. Baratynskii. His realistic portrayal of nature and achievements in plein-air painting marked a new stage in the history of Russian landscape painting.

SHCHEDROVSKII, IGNATII STEPANOVICH. Born Sept. 15 (27), 1815, in Raseiniai, Lithuania; died Dec. 25, 1870 (Jan. 6, 1871), in Moscow. Russian graphic artist, lithographer, and painter.

Shchedrovskii studied with J. Rustemas at the university in Vilnius. From 1833 to 1836 he attended the St. Petersburg Academy of Arts. Shchedrovskii produced detailed drawings whose truthful depiction of urban scenes and vivid social characterization of urban dwellers are reminiscent of the Venetsianov school. His works include the lithograph albums *Scenes From Russian Popular Life* (published 1839; the same works were redone for albums of colored autolithographs published in 1845 and republished in 1846, 1852, and 1855), *The Sbiten' Vendor* (1837, Russian Museum, Leningrad), and *The Carpentry Shop* (1839, Tret'iakov Gallery, Moscow).

SHCHEGLIAEV, ANDREI VLADIMIROVICH. Born Oct. 7 (20), 1902, in Moscow; died there Aug. 27, 1970. Soviet specialist in heat engineering. Corresponding member of the Academy of Sciences of the USSR (1953).

In 1926, Shchegliaev graduated from the N. E. Bauman Moscow Higher Technical School, where he was on the staff until 1930. Between 1930 and 1970, he was, successively, an instructor, a professor, and the head of a subdepartment at the Moscow Power Engineering Institute. In 1924, Shchegliaev joined the staff of the All-Union Scientific Research Heat Engineering Institute.

Shchegliaev's main works dealt with the study of thermal processes in steam turbines and with the development of systems for the control and automation of steam turbines. Shchegliaev developed a theory and proposed unique methods for the study of high-speed control processes.

Shchegliaev received the State Prize of the USSR in 1948 and 1952. He was awarded the Order of Lenin, four other orders, and various medals.

SHCHEGLOV, AFANASII FEDOROVICH. Born Jan. 2 (15), 1912, in the village of Mikhali, in what is now Olenino Raion, Kalinin Oblast. Soviet military leader. General of the army (1970). Hero of the Soviet Union (Feb. 13, 1944). Member of the CPSU since 1939.

The son of a peasant, Shcheglov joined the Red Army in 1929. He graduated from the All-Russian Central Executive Committee Combined Military School in 1933, the M. V. Frunze Military Academy in 1939, and the K. E. Voroshilov Higher Military Academy in 1948. Shcheglov served in the Soviet-Finnish War of 1939–40 as an assistant department chief in the operations section of army headquarters. During the Great Patriotic War of 1941–45 he was commander of an artillery regiment in 1941 and 1942 and deputy chief of the operations section of the headquarters of the Leningrad Front in 1942 and 1943. He served on the Northern and Leningrad fronts as commander of the 63rd Guards Rifle Division in 1943 and 1944 and the 30th Guards Rifle Corps from October 1944 until the end of the war.

After the war, Shcheglov held command positions in the National Air Defense Forces and served from 1959 to 1966 as commander of the Baku Air Defense District. He became first deputy commander in chief of the National Air Defense Forces in July 1966 and was appointed the representative of the commander in chief of the Joint Armed Forces of the Warsaw Pact in one of the member countries in April 1974.

Shcheglov was a deputy to the sixth through eighth convocations of the Supreme Soviet of the USSR. He has been awarded four Orders of Lenin, three Orders of the Red Banner, the Order of Suvorov Second Class, the Order of Alexandr Nevsky, the Order of the Patriotic War First Class, the Order of the Red Banner of Labor, the Order of the Red Star, the Order for Service to the Motherland in the Armed Forces of the USSR Third Class, and various medals. Shcheglov has also received foreign orders and medals. [29–1575–1]

SHCHEGLOV, ALEKSANDR SERGEEVICH. Born Mar. 20, 1916, in the village of Chindianovo, in what is now Dubenki Raion, Mordovian ASSR. Soviet Mordovian writer. Member of the CPSU since 1940.

The son of a peasant, Shcheglov graduated from the Leningrad Institute of Journalism in 1939 and took part in the Great Patriotic War of 1941–45. He was first published in 1932. His works include the poetry collection *The Little Patriot* (1941), the narrative poem *Play, Bandura* (1944), the collections *Short Stories* (1951) and *Everybody Is Beautiful Here* (1963), the play *The Komsomol Card* (1950), and poems for children. His main themes are the heroism of the people during the Great Patriotic War and the comtemporary life of the Mordovian village.

Shcheglov was editor in chief of the journal *Siatko* from 1967 to 1971. His works have been translated into several languages of the USSR. Shcheglov has been awarded the Order of the Red Star and various medals.

SHCHEGLOV, MARK ALEKSANDROVICH. Born Oct. 27, 1925, in Chernigov; died Sept. 2, 1956, in Novorossiisk. Soviet critic and literary scholar.

Shcheglov graduated from the philology department of Moscow State University in 1953. His work on Soviet authors includes articles on V. V. Ivanov, S. P. Antonov, and L. Leonov's novel *Russian Forest*; his work on the classical heritage includes articles on L. N. Tolstoy, F. M. Dostoevsky, and A. A. Blok. Shcheglov was also the author of critical-theoretical articles, such as "Realism in Contemporary Drama" (published 1956), "Faithfulness to Details" (published 1957), and "The Literary Sketch and Its Characteristics" (published 1958). His works reveal his subtle taste, public-minded spirit, and extensive knowledge of philology. Shcheglov's diaries and letters were published in 1963 under the title *Student Notebooks* and became widely known.

SHCHEGLOVITOV, IVAN GRIGOR'EVICH. Born Feb. 13 (25), 1861; died Sept. 5, 1918. Reactionary state figure of tsarist Russia. Landowner in Chernigov Province.

Shcheglovitov graduated from a school of jurisprudence in 1881. In 1894 he became procurator of the St. Petersburg district court, and in 1903 he was made chief procurator of the criminal appellate department of the Senate. He prosecuted I. P. Kaliaev in 1905. Shcheglovitov served as minister of justice from 1906 until July 1915. One of the organizers of the coup d'etat of June 3, 1907, he was a close associate of P. A. Stolypin and a patron of the League of the Russian People. He was directly involved in organizing the Beilis case.

In 1915, Shcheglovitov was chairman of the congress of monarchists. With the help of G. E. Rasputin he was appointed chairman of the Council of State in 1917. Imprisoned in the Peter and Paul Fortress in the first days of the February Revolution of 1917, Shcheglovitov was executed by order of a revolutionary tribunal. [29–1576–1]

SHCHEGLOVSK, until 1932, the name of the city of Kemerovo, center of Kemerovo Oblast, RSFSR. [29–1576–2]

SHCHEGOLENOK, VASILII PETROVICH. Born 1805(?) in the village of Boiarshchina, Kizhi Volost (small rural district), in what is now the Karelian ASSR; died not earlier than 1886. Russian *skazitel'*, or singer of *byliny* (epic folk songs). Peasant.

In his performance of *byliny* Shchegolenok tended to combine different plots. Texts written down from his performances were published by P. N. Rybnikov, A. F. Gil'ferding, and E. V. Barsov. Shchegolenok was acquainted with L. N. Tolstoy, who borrowed a number of plots from him.

SHCHEGOLEV, PAVEL ELISEEVICH. Born Apr. 5 (17), 1877, in the village of Verkhniaia Katukovka, in what is now Panino Raion, Voronezh Oblast; died Jan. 22, 1931, in Leningrad. Soviet literary scholar and historian.

In 1895, Shchegolev enrolled in the faculty of Oriental languages at the University of St. Petersburg. He was expelled in 1899, however, for taking part in student demonstrations. In 1903 his work *Vladimir Raevskii: The First Decembrist* appeared in print, and in 1905 *Griboedov and the Decembrists* was published. In 1906 and 1907, Shchegolev, together with V. Ia. Bogucharskii and V. L. Burtsev, published the journal *Byloe*, which dealt with revolutionary history, and in 1908 he helped edit the journal *Minuvshie gody*. Between 1905 and 1917, Shchegolev published the memoirs of the Decembrists M. A. Fonvizin, E. P. Obolenskii, V. I. Shteingel', A. E. Rozen, and N. V. Basargin. The first edition of Shchegolev's well-known book *The Duel and Death of Pushkin* came out in 1916. In July 1917 he resumed publication of *Byloe*, and the journal continued to be published until 1926.

After the February Revolution of 1917, Shchegolev served on the Extraordinary Investigatory Commission of the Provisional Government and reviewed the archives of the Police Depart-

ment. After the October Revolution of 1917, he published the collections of documents *The Fall of the Tsarist Regime* (vols. 1–7, 1924–27) and *The Petrashevskii Circle* (vols. 1–3, Moscow-Leningrad, 1926-27). An excellent textual critic and a specialist in sources, Shchegolev wrote a number of works that drew heavily on archival materials, including works on the history of the revolutionary movement in Russia and studies on the life and works of A. S. Pushkin, A. S. Griboedov, and M. Iu. Lermontov.

In 1930 and 1931, Shchegolev was a member of the editorial committee for the publication of the first complete edition of Pushkin's works to be issued in the Soviet period; the works were published in six volumes. In the 1920's he collaborated with A. N. Tolstoy in writing the plays *Azef* and *The Conspiracy of the Empress*. Together with O. D. Forsh, he wrote the scenario for the motion picture *The Palace and the Fortress*. Shchegolev was one of the founders of the Museum of the Revolution in Leningrad.

SHCHEKATIKHINA-POTOTSKAIA, ALEKSANDRA VASIL'EVNA. Born May 8 (20), 1892, in Aleksandrovsk (present-day Zaporozh'e) died Oct. 23, 1967, in Leningrad. Soviet master of painting on porcelain, painter, and graphic artist.

From 1908 to 1915, Shchekatikhina-Pototskaia studied at the Drawing School of the Society for the Encouragement of the Arts in St. Petersburg, where she was the student of I. Ia. Bilibin and of N. K. Rerikh from 1913 to 1915. She also studied at the Rançon Academy in Paris under F. Vallotton and M. Denis. She helped create the genre of Soviet "agitational porcelain."

Shchekatikhina-Pototskaia's highly expressive style of painting can be attributed to her subtle mastery of graphic technique, as well as to her use of stylized decorative forms, bright, simple color schemes, and free brushstrokes. Examples of her work include a dish from the series "The Hunt" (1933) and the decanter with goblets "The Little Fish" (1941).

Shchekatikhina-Pototskaia was awarded the Order of the Badge of Honor and several medals.

SHCHEKINO, a city under oblast jurisdiction and the administrative center of Shchekino Raion, Tula Oblast, RSFSR. Situated on the Moscow-Simferopol' highway. Railroad station on the Tula-Orel line, 22 km south of Tula. Population, 72,000 (1977).

Coal is mined near Shchekino, in the Moscow Basin. The city's chemical industry includes the production association Azot and a synthetic-fiber plant, both located in the settlement of Pervomaiskii, which is under the jurisdiction of the Shchekino city soviet. Shchekino has an experimental machine shop for the production of entry-driving mining equipment and a plant for the repair of industrial equipment. Shchekino's construction-materials enterprises include a pilot plant and the plant Kislotoupor. The city has food enterprises as well as a chemical engineering technicum, an economics technicum, and a museum of local lore. [29–1582–3]

SHCHEKOTOV, NIKOLAI MIKHAILOVICH. Born May 18 (30), 1884, in Moscow; died there Dec. 6, 1945. Russian and Soviet art historian, art critic, and artist.

From 1902 to 1908, Shchekotov attended lectures at the Polytechnic Academy in Friedberg and at the Engineering School in Mannheim. During that period he also traveled in Greece, Italy, Germany, and Austria. He first studied ancient Russian art with I. S. Ostroukhov; at the same time (1910–11) he studied painting at K. F. Iuon's school in Moscow. In 1918 he began his career as a critic, publicist, and museum official. Shchekotov was a member of the collegium of the People's Commissariat of Education from 1918 to 1922, director of the Russian Historical Museum from 1921 to 1925, and director of the Tret'iakov Gallery in 1925 and 1926. He was a member of the Association of Ártists of Revolutionary Russia from 1923 to 1932. His principal theoretical works are on the history of Russian and Soviet art.

WORKS

Stat'i, vystupleniia, rechi, zametki. Moscow, 1963. (Contains bibliography.) [29–1582–4]

SHCHEL'IAIUR, an urban-type settlement in Izhma Raion, Komi ASSR. Shchel'iaiur has a landing on the left bank of the Pechora River, 147 km northwest of the Irael' railroad station on the Kotlas-Vorkuta line. The settlement is a repair and operational center for river shipping. [29–1589–3]

SHCHELKALOV, ANDREI AND VASILII IAKOVLEVICH, two state and political figures in Russia in the second half of the 16th century and the early 17th century.

Andrei Iakovlevich Shchelkalov. Date of birth unknown; died circa 1597.

Shchelkalov was a *d'iak* (administrative clerk) by 1562 and a *dumnyi d'iak* (duma clerk) by 1566, and he took part in the *zemskii sobor* (national assembly) of 1566. He rose in office in the summer of 1570, during the period of the *oprichnina*, when the most prominent administrators in the *prikazy* (central administrative offices) were executed. Shchelkalov headed the Razriadnyi Prikaz (War Office), Pomestnyi Prikaz (Office of Land Grants), the Prikaz Kazanskogo Dvortsa (Kazan Palace Prikaz), and one of the *cheti* (financial departments in charge of collection of taxes). He retired from office in 1594.

Vasilii Iakovlevich Shchelkalov. Date of birth unknown; died late 1610 or early 1611.

Shchelkalov was a *d'iak* in the Razboinyi Prikaz (Justice Office) in the 1560's, and he took part in the *zemskii sobor* of 1566. He headed the Razriadnyi Prikaz from 1576 or 1577 to 1594 and one of the *cheti* from 1570 to 1601. In mid-1594 he became the head of the Posol'skii Prikaz (Foreign Office), and in 1595 he was made keeper of the seal. Shchelkalov fell from favor in 1601, but the First False Dmitrii conferred on him the rank of *okol'nichii* (the rank immediately below boyar). [29–1584–4]

SHCHELKIN, KIRILL IVANOVICH. Born May 4 (17), 1911; died Nov. 8, 1968, in Moscow. Soviet physicist. Corresponding member of the Academy of Sciences of the USSR (1953). Three times Hero of Socialist Labor. Member of the CPSU from 1940.

After graduating from the Crimean Pedagogical Institute in Simferopol' in 1932, Shchelkin worked at the Institute of Chemical Physics of the Academy of Sciences of the USSR. He was also a professor at the Moscow Institute of Engineering Physics. Shchelkin's main works were devoted to the physics of combustion and explosion. Shchelkin proved that the influence of the flow turbulence of the initial mixture on the process of flame acceleration is significant. He developed the concept of the transition of slow combustion to detonation and experimentally inves-

tigated combustion in a turbulent flow. He showed that upon artificially inducing turbulence in a mixture that is incapable of detonation, the flame propagation velocities are close to the detonation velocities. Shchelkin proposed the theory of spin detonation.

Shchelkin was awarded four Orders of Lenin, two other orders, and various medals. He was a laureate of the Lenin Prize and four State Prizes of the USSR.

WORKS

Gazodinamika goreniia. Moscow, 1963. (With Ia. K. Troshin.)
[29–1585–1]

SHCHELKOVO, a city (since 1925) under oblast jurisdiction and administrative center of Shchelkovo Raion, Moscow Oblast, RSFSR. Located on the Kliazma River, a tributary of the Oka. Railroad station 35 km northeast of Moscow. Population, 91,000 (1977). Shchelkovo produces chemicals, machinery, cotton cloth, industrial fabrics, silk, and felt. The city also has a chemical and mechanical technicum. [29–1585–2]

SHCHELOKOV, NIKOLAI ANISIMOVICH. Born Nov. 13 (26), 1910, in the *stanitsa* (large cossack village) of Almaznaia, now within the city limits of Kadievka, Voroshilovgrad Oblast, Ukrainian SSR. Soviet state and party figure. General of the army (1976). Doctor of economic sciences (1978). Hero of Socialist Labor (1980). Member of the CPSU since 1931.

The son of a metallurgical worker, Shchelokov graduated from the Dnepropetrovsk Metallurgical Institute in 1933. For most of the period between 1933 and 1938, he worked as an engineer and shop head at metallurgical plants in the Ukraine. In 1938 and 1939 he was first secretary of the Krasnogvardeiskoe raion committee of the Communist Party of the Ukraine (Bolshevik) in Dnepropetrovsk, and from 1939 to 1941 he was chairman of the Dnepropetrovsk city executive committee. Shchelokov served in the Soviet Army from 1941 to 1946 and fought in the Great Patriotic War.

In 1946 and 1947, Shchelokov was deputy minister of local industry of the Ukrainian SSR, and from 1947 to 1951 he was in the administrative apparatus of the Central Committee of the Communist Party of the Ukraine. From 1951 to 1962 and again in 1965 he served as first deputy chairman of the Council of Ministers of the Moldavian SSR; in 1957 and 1958 and from 1962 to 1965 he was chairman of the Council of the National Economy of the Moldavian SSR. In 1965 and 1966, Shchelokov was second secretary of the Central Committee of the Communist Party of Moldavia. In 1966 he became minister of internal affairs of the USSR and a candidate member of the Central Committee of the CPSU. Shchelokov became a member of the Central Committee in April 1968. He served as a deputy to the fourth through tenth convocations of the Supreme Soviet of the USSR.

Shchelokov has been awarded three Orders of Lenin, two Orders of the Red Banner, the Order of Bogdan Khmel'nitskii Second Class, the Order of the Patriotic War First Class, the Order of the Red Banner of Labor, the Order of the Red Star, and various medals. [29–1586–1]

SHCHELOKOV, NIKOLAI KONONOVICH. Born May 23 (June 4), 1887; died Apr. 12, 1941, in Moscow. Soviet military leader. Major general (1940).

The son of a Ural Cossack, Shchelokov graduated from the Mikhail Artillery School in 1907. He commanded a battery and an artillery battalion during World War I and rose to the rank of colonel. Shchelokov was demobilized in 1918.

After refusing an offer by the counterrevolutionary Ural Host Government to head the White Cossack Ural Army, Shchelokov enlisted in the Red Army in July 1918 and organized cavalry units. He commanded a cavalry regiment from January to October 1919 and the 8th Cavalry Division, a unit in S. M. Budennyi's horse cavalry corps, in October and November of the same year. Shchelokov was chief of staff of the First Horse Cavalry Army from January to April 1920 and from February to April 1921 and the Second Horse Cavalry Army from July to November 1920.

Between 1923 and 1928, Shchelokov served in the Workers' and Peasants' Red Army as an assistant inspector and a deputy inspector of the cavalry. He taught tactics and artillery at the All-Russian Central Executive Committee Military School from 1928 to 1934, when he was granted a pension. He was head of the department of cavalry at the M. V. Frunze Military Academy in 1940 and 1941. Shchelokov was awarded the Order of the Red Banner. [29–1586–2]

SHCHEPILLO, MIKHAIL ALEKSEEVICH (also M. A. Shchepilla). Year of birth unknown; died Jan. 3 (15), 1826. Decembrist. Lieutenant in the Chernigov Regiment. Member of the Society of the United Slavs and the Southern Society of Decembrists.

On Dec. 29, 1825, Shchepillo, together with I. I. Sukhinov, A. D. Kuz'min, and V. N. Solov'ev, freed S. I. Murav'ev-Apostol from arrest. During the uprising of the Chernigov Regiment, Shchepillo commanded the 6th Musketeer Company. Leading an advance party, he died in fighting near the village of Trilesy. Shchepillo is buried in a common grave with A. D. Kuz'min and I. I. Murav'ev-Apostol near the village of Ustinovka, in what is now Vasil'kov Raion, Kiev Oblast. [29–1589–6]

SHCHEPIN-ROSTOVSKII, DMITRII ALEKSANDROVICH. Born 1798; died Oct. 22 (Nov. 3), 1858, in Shuia. Decembrist. Captain in the Moscow Life Guards Regiment. Prince.

Shchepin-Rostovskii graduated from the Naval Cadet Corps. Although he was not formally a member of any of the Decembrists' secret societies, he attended meetings at the homes of K. F. Ryleev and E. P. Obolenskii, where the plans for the uprising were discussed. On Dec. 14, 1825, Shchepin-Rostovskii, along with A. A. Bestuzhev and M. A. Bestuzhev, led the soldiers of the Moscow Regiment onto Senate Square. Sentenced to 20 years at hard labor, he was confined to the Chita stockade until 1839, when he was moved to a settlement in Eneseisk Province to serve the remainder of his sentence. Shchepin-Rostovskii returned to Yaroslavl Province after the amnesty of 1856 and moved to Shuia in 1858. [29–1589–7]

SHCHEPKIN, EVGENII NIKOLAEVICH. Born May 13 (25), 1860, in Moscow; died Nov. 12, 1920, in Odessa. Russian historian, pedagogue, and public figure. Grandson of the actor M. S. Shchepkin.

After graduating from Moscow University in 1883, E. N. Shchepkin remained associated with the chair of world history; he became a privatdocent in 1892. In 1898 he was named a professor at Novorossiia University in Odessa. Shchepkin was active in the liberal movement of the early 20th century and was a member of the Constitutional Democrat (Cadet) fraction in the First State Duma. After being dismissed from his position for signing the Vyborg Appeal of 1906, he taught at private schools in Odessa. He broke with the Cadets during the period of reaction. After the February Revolution of 1917, Shchepkin returned to Novorossiia University and joined the Borot'bysty party. He became a member of the Communist Party in 1919.

Shchepkin studied the diplomatic and military history of the era of the Seven Year's War, the personality of the First False Dmitrii, Russian-Varangian relations, and feudalism in Western Europe. Shchepkin was the author of a number of textbooks.

SHCHEPKIN, MIKHAIL SEMENOVICH. Born Nov. 6 (17), 1788, in the village of Krasnoe, Oboian' District, in what is now Belgorod Oblast; died Aug. 11 (23), 1863, in Yalta. Russian actor famous for introducing realism in the Russian theater.

Shchepkin was the son of a serf who managed the estates of Count G. S. Vol'kenshtein. In 1799 he was enrolled at the provincial public school in Sudzha, where in 1800 he appeared on the stage for the first time, as Rozmarin in a school production of Sumarokov's *The Quarreler*. During the years 1801–03 he acted in the Vol'kenshteins' private theater and also waited on table at the estate. Shchepkin began his professional stage career in 1805,

in the Barsovs' troupe in Kursk. In 1816 he joined I. F. Shtein's troupe in Kharkov, the best in southern Russia, and soon became the troupe's foremost comic actor. In 1822 his freedom was bought by subscription.

On the provincial stage Shchepkin played various roles in plays and comic operas. He was a brilliant, spirited actor noted for his humor and true-to-life characterizations. Early in his career Shchepkin had already revealed exceptional powers of observation and an amazing capacity for work; he had also made a serious theoretical and practical study of acting.

In 1823, Shchepkin was accepted into the company of the Moscow Theater, known since 1824 as the Malyi Theater. His social and artistic views developed considerably as a result of his close ties with such leading figures of Russian culture as A. S. Pushkin, N. V. Gogol, V. G. Belinskii, A. I. Herzen, and T. G. Shevchenko. Shchepkin appeared in the first productions of the plays of A. S. Griboedov, Gogol, Pushkin, I. S. Turgenev, and A. V. Sukhovo-Kobylin. He also went to great lengths to popularize the plays and to have them freed from the censor's bans.

Shchepkin's work in the 1830's and 1840's was of enormous importance. He virtually revolutionized the contemporary school of acting, bringing it closer to the realistic principles of Pushkin and Gogol. Shchepkin asserted the actor's important civic mission and devoted his work to the moral upbringing of the public and to the criticism of social ills. Believing that the actor should not rely on momentary inspiration, he worked to determine objective rules of acting and developed a creative method based on generalized observations of life. He stressed the actor's need to think through his artistic tasks thoroughly and to subordinate the entire creative process to a "general idea," stating that the actor should not merely imitate, but penetrate "into the soul of the role" and crawl, "so to speak, into the skin of the character" (*Zapiski, pis'ma* . . . , 1952, p. 250).

Shchepkin created his best characterizations in works of the Russian satirical playwrights, seeking to portray characters that would reflect the essence of an entire social group. Overcoming the resistance of the censor, he succeeded in staging scenes from Griboedov's *Woe from Wit* in 1831 and the complete version in 1832. He also played the role of Famusov in these productions; in his interpretation, Famusov was devoid of aristocratic respectability, fawning on Molchalin and hating everything new. Shchepkin created a profoundly truthful characterization as the Mayor in Gogol's *The Inspector-General* (1836), raising the role to the level of satirical generalization and exposing the injustice of Nicholas I's regime. He also created satirical characterizations of the gentry in Gogol's plays—as Podkolesin and Kochkarev in *Marriage*, Uteshitel'nyi in *The Gamblers*, and Burdiukov in *The Lawsuit*, as well as the Baron in Pushkin's *The Covetous Knight*.

Another side of Shchepkin's creative art was linked with characters drawn from the common people. He conveyed a distinctive national spirit in plays by Ukrainian dramatists, for example, as Chuprun in Kotliarevskii's *The Magician Soldier* and Makagonenko in *Natalka Poltavka*, also by Kotliarevskii, and in the title role in Kvitko-Osnov'ianenko's *Shel'menko the Orderly*. In the vaudeville *The Sailor*, Shchepkin penetrated the tragic soul of the old sailor. "The triumph of his art," wrote Belinskii, "consists in the fact that he is able to interest the audience in the fate of a simple man—to cause them to weep and be disturbed about the sufferings of a mere sailor" (*Poln. sobr. soch.*, vol. 8, 1955, p. 533). Psychological depth and poignancy were typical of Shchepkin's performances of Moshkin and Kuzovkin in Turgenev's *The Bachelor* and *The Boarder*.

One of Shchepkin's best roles during his last period was that of Muromskii in Sukhovo-Kobylin's *Krechinskii's Wedding* (1855). He also performed roles in plays by other writers, notably Liubim Tortsov in A. N. Ostrovskii's *Poverty Is No Crime*, Harpagon in Molière's *The Miser*, and Polonius in Shakespeare's *Hamlet*.

Shchepkin's letters, remarks, memoirs, and accounts of his talks with students reveal that he had evolved a complete system of views on an actor's creative art. His work affirmed critical realism as the leading creative method in the Russian theater. The traditions of stage realism, as established by Shchepkin, were of major significance in the Malyi Theater, which is referred to as the House of Shchepkin. Shchepkin's heritage and ethical principles served as the basis for the realistic system of acting created by K. S. Stanislavsky.

SHCHEPKIN, VIACHESLAV NIKOLAEVICH. Born May 25 (June 6), 1863, in Timonino (Nikol'skoe), in what is now Moscow Oblast; died Dec. 2, 1920, in Moscow. Russian Slavicist, linguist, paleographer, and historian of ancient Russian art. Corresponding member of the St. Petersburg Academy of Sciences (1913). Grandson of the actor M. S. Shchepkin.

A student of F. F. Fortunatov's, V. N. Shchepkin graduated from Moscow University in 1885. He became a professor at the university in 1907 and at the Advanced Courses for Women in 1906. In 1887 he took up a position at the Historical Museum in Moscow, where he devised a scientific cataloging system for the Department of Manuscripts and Books in Old Russian Typeface. Shchepkin's master's dissertation, *Treatise on the Language of the Savvina Kniga* (1898–99), was a major study of the phonetics of Old Church Slavonic. His doctoral dissertation, *The Bologna Psalter* (1906), dealt with the phonetics and morphology of the Middle Bulgarian work and presented valuable material for the study of Old Bulgarian dialects. Shchepkin's works include *Introduction to Slavic Studies* (1914), *Textbook of Russian Paleography* (1918), and studies of the Novgorod school of icon painting.

S. B. BERNSHTEIN [29–1590–1]

SHCHEPKINA-KUPERNIK, TAT'IANA L'VOVNA. Born Jan. 12 (24), 1874, in Moscow; died there July 27, 1952. Soviet Russian writer and translator. Honored Art Worker of the RSFSR (1940). Great-granddaughter of the actor M. S. Shchepkin.

Shchepkina-Kupernik began her career as a playwright in 1892. Her prose works, such as the short-story collections *Those Who Labor and Are Burdened* (1903), *In the Wings* (1903), and *That Was Yesterday* (1907; destroyed by the censor), were similar in ideology to the democratic literature of the late 19th and early 20th centuries. Her poem "From the Fallen Strongholds of Port Arthur" (1905) became a folksong.

Shchepkina-Kupernik also wrote travel sketches and memoirs. The most valuable part of Shchepkina-Kupernik's literary legacy is her translations of Western European classics, including works by E. Rostand, Lope de Vega, Molière, Goldoni, and R. B. Sheridan.

SHCHERBA, LEV VLADIMIROVICH. Born Feb. 20 (Mar. 3), 1880, in St. Petersburg; died Dec. 26, 1944, in Moscow. Soviet linguist. Academician of the Academy of Sciences of the USSR (1943) and the Academy of Pedagogical Sciences of the RSFSR (1944).

In 1903, Shcherba graduated from the University of St. Petersburg, where he had studied under I. A. Baudouin de Courtenay. He became a professor at the University of Petrograd in 1916. In 1943 he was given a position in the Academy of Sciences of the USSR and the Academy of Pedagogical Sciences of the RSFSR.

Shcherba's principal works dealt with problems of general linguistics, Russian studies, Romance philology, Slavic studies, lexicography, and pedagogy. In his master's dissertation, "Russian Vowels With Respect to Quality and Quantity" (1912), he provided an analysis of the phoneme that anticipated the theory of

phonemes subsequently developed in European linguistics. He also studied problems of orthography and orthoepy. Shcherba's works on the theory and methods of teaching foreign languages were instrumental in creating a Soviet school of methodology.

V. A. VINOGRADOV [29–1592–2]

SHCHERBACHEV, DMITRII GRIGOR'EVICH. Born Feb. 6 (18), 1857; died Jan. 18, 1932, in Nice. Russian military leader. General of the infantry (1914).

The son of a nobleman, Shcherbachev graduated from the Mikhail Artillery School in 1876 and the Academy of the General Staff in 1884. Between 1901 and 1906 he commanded a regiment and a rifle brigade. He was head of the Academy of the General Staff from 1907 to 1912, when he assumed command of the IX Army Corps, which fought in the battle of Galicia at the start of World War I and occupied L'vov.

Shcherbachev was commander of the Eleventh Army of the Southwestern Front from April to October 1915 and the Seventh Army of the same front from October 1915 to April 1917. In April he was appointed assistant to the king of Rumania for military operations and commander in chief of the Russian armies on the Rumanian Front.

The Rumanian and Southwestern fronts were combined in December 1917 to form the Ukrainian Front under Shcherbachev's command. Shcherbachev adopted a counterrevolutionary position and supported the Ukrainian Directory until January 1918. In February of that year he concluded an armistice with Germany in Focşani, and in March he consented to the introduction of Rumanian troops into Bessarabia.

Shcherbachev attempted to form six corps based on nationality (two Polish, two Ukrainian, one Russian, and one Muslim), which were to be used for counterrevolutionary purposes. His efforts, however, were unsuccessful. In April 1918, in Paris, he set up an agency of the Volunteer Army. The agency helped the White Guards with the Entente's supplies but failed in its efforts to form White Guard units in Bohemia and Serbia from among Russian prisoners of war and from volunteers.

After the Civil War, Shcherbachev withdrew from public life. [29–1596–2]

SHCHERBACHEV, VLADIMIR VLADIMIROVICH. Born Jan. 12 (24), 1889, in Warsaw; died Mar. 5, 1952, in Leningrad. Soviet composer and teacher.

Shcherbachev studied in the faculty of history and philology at the University of St. Petersburg from 1906 to 1910. In 1914 he graduated from the St. Petersburg Conservatory, where he had studied composition with A. K. Liadov and M. O. Shteinberg. He played an active role in the construction of Soviet musical culture: in the period from 1918 to 1923 he was a lecturer in, and head of, the music department of the People's Commissariat for Education and was music director of the Touring Theater.

Shcherbachev composed in various genres. He is known primarily for his five symphonies, but the *Thunderstorm Suite* (1934), based on his music to the motion-picture version of A. N. Ostrovskii's play, and the musical comedy *The Tobacco Captain* (1943) also gained popularity. His other compositions include chamber music, piano pieces, and art songs. Shcherbachev was a professor at the Leningrad Conservatory from 1923 to 1931 and from 1944 to 1948 and at the Tbilisi Conservatory in 1931 and 1932. Among his students were V. V. Zhelobinskii, G. N. Popov, and M. I. Chulaki. He served as chairman of the administrative board of the Leningrad Division of the Composers' Union of the RSFSR from 1935 to 1937 and from 1944 to 1948.

Shcherbachev was awarded the Order of the Red Banner of Labor and a medal. [29–1596–1]

SHCHERBAK, ALEKSANDR EFIMOVICH. Born June 13 (25), 1863 (according to some sources, Aug. 30, 1863), in Chernigov Province; died Apr. 23, 1934, in Sevastopol'. Soviet physician; a pioneer in scientific physical therapy, health resort science, and physical preventive medicine.

Shcherbak graduated from the St. Petersburg Military Medical Academy in 1887. In 1894 he became a professor in the department of nervous and mental diseases of Warsaw University. He left his position in 1910 in protest against the reactionary policies of L. A. Kasso, the minister of education. In 1914 he organized the institute of physical methods of therapy in Sevastopol' and became the institute's director. Shcherbak's research was devoted to the pathogenesis and symptoms of nervous and mental diseases, the physiological effects of physical factors, and anatomical and physiological interactions in physical therapy procedures. He devised and introduced into practice new techniques of reflex and segmental physical therapy (for example, of the cervical and lumbar areas) and proposed a method for investigating thermoregulatory, skin-muscle, and skin-skin reflexes.

Shcherbak founded a school of physical therapy and health resort science.

WORKS

Klinicheskie lektsii po nervnym i dushevnym bolezniam. Warsaw, 1901.
Osnovnye trudy po fizioterapii. Leningrad-Sevastopol', 1936.

Likhterman, B. V. "A. E. Shcherbak i ego vklad v sovetskuiu fizioterapiiu." *Voprosy kurortologii, fizioterapii i lechebnoi fizicheskoi kul'tury*, 1963, no. 5 [29–1593–1]

SHCHERBAKOV, ALEKSANDR SERGEEVICH. Born Sept. 27 (Oct. 10), 1901, in the city of Ruza, in what is now Moscow Oblast; died May 10, 1945, in Moscow. Soviet state and party figure. Colonel general (1943). Member of the Communist Party from 1918.

The son of a worker, Shcherbakov became a worker himself in 1912. He engaged in Komsomol work between 1918 and 1922 and was a delegate to the Third and Fourth Congresses of the Russian Communist League of Youth. He studied at the Ia. M. Sverdlov Communist University from 1921 to 1924 and the Institute of the Red Professors from 1930 to 1932.

Shcherbakov worked in the apparatus of the Central Committee of the ACP(B) from 1932 to 1936. In 1934 he became first secretary of the Writers' Union of the USSR. Between 1936 and 1938 he was secretary of the Leningrad and Irkutsk oblast committees of the ACP(B) and secretary of the Donetsk oblast committee of the Communist Party of the Ukraine. Between 1938 and 1945 he held the position of first secretary of the Moscow oblast committee and of the Moscow city committee of the ACP(B). In 1941, Shcherbakov was named a secretary of the Central Committee of the ACP(B). In addition, in 1942 he became chief of the Main Political Directorate of the Soviet Army, head of the Soviet Information Bureau, and deputy people's commissar of defense.

A delegate to the Sixteenth through Eighteenth Congresses of the ACP(B), Shcherbakov was elected a member of the Central Committee at the Eighteenth Congress. He was a deputy to the first convocation of the Supreme Soviet of the USSR. Shcherbakov, who was awarded three Orders of Lenin, three other orders, and various medals, is buried on Red Square at the Kremlin Wall. [29–1593–2]

SHCHERBAKOV, DMITRII IVANOVICH. Born Jan. 1 (13), 1893, in Novozybkov, in what is now Briansk Oblast; died May 25, 1966, in Moscow. Soviet geologist and geochemist. Academician of the Academy of Sciences of the USSR (1953; corresponding member, 1946).

Shcherbakov was a student of V. I. Vernadskii and A. E. Fers-

man. After graduating from Tavrida University (now the University of Simferopol') in 1922, he worked for the Commission for the Study of Natural Productive Forces and in other organizations of the Academy of Sciences of the USSR. Between 1928 and 1938 he was scientific director first of the Tadzhik-Pamir expedition and then of the Middle Asian expedition of the Academy of Sciences of the USSR. From 1930 to 1938 he worked at the M. V. Lomonosov Geochemical Institute (later the Institute of Geochemistry, Mineralogy, and Petrography of the Academy of Sciences of the USSR). From 1938 to 1941 he was head of the section on mineralogy and geochemistry of the Institute of Geological Sciences of the Academy of Sciences of the USSR. Between 1943 and 1948 he was scientific director of a section at the All-Union Institute of Mineral Raw Materials. In 1963 he became director of two scientific divisions of the Institute of the Geology of Ore Deposits, Petrography, Mineralogy, and Geochemistry of the Academy of Sciences of the USSR. Between 1953 and 1963 he was academician-secretary of the department of geological and geographic sciences of the Academy of Sciences of the USSR.

Shcherbakov conducted geological studies in Middle Asia and the Caucasus, on the Kola Peninsula, and in Transbaikalia. His major research was in the field of trace and rare elements. His scientific prognoses provided the basis for the discovery of commercial deposits of antimony and mercury in Kirghizia, native sulfur in the Karakum Desert, and molybdenum, tungsten, and arsenic in the Caucasus. Shcherbakov was one of the pioneers in orientation and superdeep drilling and in the determination of the absolute ages of geological formations and the compilation of metallogenic maps. He is also known as a popularizer of the geological and geographic sciences.

A recipient of the Lenin Prize, Shcherbakov was awarded two orders of Lenin, three other orders, and various medals. The mineral shcherbakovite (a silicate of niobium and tantalum) is named after Shcherbakov.

SHCHERBAKOV, PETR PETROVICH. Born Apr. 7 (19), 1887, in Moscow Province; died Oct. 27 (Nov. 9), 1917, in Moscow. Participant in the struggle for Soviet power in Moscow. Member of the Communist Party from 1911.

The son of a weaver, Shcherbakov in 1908 became a factory worker in Moscow, where he conducted revolutionary work. In 1915 he was named secretary of the Lefortovo raion committee of the RSDLP. He was exiled to Irkutsk Province in 1916, but in April 1917 he became a member of the Blagushe-Lefortovo raion committee of the RSDLP(B) in Moscow and a deputy to the raion soviet. Shcherbakov was a member of the presidium of the Trade Union of Moscow Textile Workers, chairman of the administrative board of the raion division of the union, and one of the organizers of the Red Guards in the raion. During the October Days of 1917 he organized the provision of medical care for the Red Guards of Lefortovo Raion. He died during the fighting against the cadets of the Aleksei Military School.

Shcherbakov is buried in Red Square near the Kremlin Wall.

SHCHERBAKTY, an urban-type settlement and the administrative center of the Shcherbakty Raion, Pavlodar Oblast, Kazakh SSR. Shcherbakty is served by a railroad station on the Pavlodar-Kulunda line, 85 km northeast of Pavlodar. It has a machinery and repair plant, a butter factory, a poultry farm, and a grain elevator. The settlement also has a forestry and land reclamation station and a technicum for farm mechanization. [29–1595–1]

SHCHERBATOV, MIKHAIL MIKHAILOVICH. Born July 22, 1733; died Dec. 12, 1790. Prince. Russian state and public figure. Historian and publicist.

While still a young child, Shcherbatov was registered in the Semenovskii Guards Regiment. He received a broad and thorough education at home. In 1759 and 1760 he wrote a series of articles presenting reactionary sociopolitical views; for example, he rejected the equality of all people and called for strong state authority. In 1762, Shcherbatov retired from military service with the rank of captain, and in 1767 he entered the civil service. In the late 1760's he served on the commission for the compilation of a new legal code and emerged as a leader of the *rodovitoe dvorianstvo* (hereditary nobility) opposed to the government. In 1778 he served as president of the Chamber Collegium, and in 1779 he became a senator. Shcherbatov retired circa 1788 with the rank of actual, or active, privy councillor.

In the 1770's, Shcherbatov produced a series of publicist articles and notes, and in the late 1780's he wrote *On the Decline of Morals in Russia*, in which he sharply criticized government policies and the morals of those at the court. In 1783 he wrote the utopian novel *Journey to the Land of Ophir*, in which he set forth his conception of the ideal state—essentially a police state supported by the nobility and exploiting the labor of slaves. In his *History of Russia From Earliest Times*, which ended at 1610, Shcherbatov stressed the role of the feudal aristocracy and treated historical progress as nothing more than advances in knowledge, science, and the intelligence of individuals. Nevertheless, the work is of considerable value, since it incorporates a wealth of material from such sources as chronicles and legal documents.

SHCHERBATSKOI, FEDOR IPPOLITOVICH. Born Aug. 30 (Sept. 11), 1866, in Kielce, Poland; died Mar. 18, 1942, in Borovoe, Akmolinsk Oblast, Kazakhstan. Soviet specialist in Indian, Tibetan, and Buddhist studies. Academician of the Academy of Sciences of the USSR (1918).

A student of I. P. Minaev's, Shcherbatskoi graduated from the University of St. Petersburg in 1889. Subsequently sent abroad, he studied Indian poetry with G. Bühler in Vienna and philosophy with H. Jacobi in Bonn. Appointed a professor at the University of St. Petersburg in 1900, he continued to teach at the university after it became Leningrad State University.

In 1897, Shcherbatskoi and S. F. Ol'denburg established the series *Bibliotheca Buddhica*, in which many of the world's leading Orientalists published texts, translations, and studies of written works from India, Tibet, and Mongolia. In 1928, Shcherbatskoi became head of the Institute of Buddhist Culture in Leningrad; the institute was later converted into the Indo-Tibetan Center of the Institute of Oriental Studies of the Academy of Sciences of the USSR. Shcherbatskoi went to Mongolia in 1900 and studied Tibetan manuscripts in the libraries of Buddhist monasteries. In 1910 he traveled to India to study Buddhist scientific literature written in Sanskrit.

Shcherbatskoi's principal works were devoted to the philosophy of Buddhism and an analysis of the philosophical foundations of northern Mahayana Buddhism, a tradition widespread in Tibet, Mongolia, China, Japan, and Korea. His studies of Buddhist philosophy and logic provided original analyses and included translations and interpretations of sources; they influenced the development of Buddhist and Indian studies and opened the field of ancient Indian logic to European science. Shcherbatskoi was the founder of the Russian school of Buddhist studies. He translated and published a number of works of Sanskrit and Tibetan literature.

Shcherbatskoi was an honorary member of learned societies in Great Britain, Germany, and France.

A. S. BARKHUDAROV [29–1595–3]

SHCHERBINA, BORIS EVDOKIMOVICH. Born Oct. 5, 1919, in the city of Debal'tsevo, Donetsk Oblast, Ukrainian SSR. Soviet state and party figure. Member of the CPSU since 1939.

The son of a railroad worker, Shcherbina graduated from the Kharkov Institute of Railroad Transport Engineers in 1942 and from the party school of the Central Committee of the Communist Party of the Ukraine (Bolshevik) in 1948. For most of the period between 1942 and 1944 he was secretary of the Kharkov oblast committee of the Komsomol of the Ukraine, and in 1942 and 1943 he worked in the apparatus of the Central Committee of the All-Union Komsomol. Shcherbina began performing party work in 1944. In 1950 and 1951 he was secretary of the Kharkov city committee of the Communist Party of the Ukraine (Bolshevik), and between 1951 and 1961 he was secretary and second secretary of the Irkutsk oblast committee of the CPSU. In 1961 he became first secretary of the Tiumen' oblast committee of the CPSU; in 1963 and 1964 he was first secretary of the Tiumen' rural oblast committee of the CPSU. In 1973, Shcherbina became minister of construction of petroleum and gas industry enterprises of the USSR.

Shcherbina became a candidate member of the Central Committee of the CPSU in 1961 and a member in 1976. He served as a deputy to the sixth through tenth convocations of the Supreme Soviet of the USSR. Shcherbina has been awarded two Orders of Lenin, the Order of the October Revolution, two other orders, and various medals. [29–1597–1]

SHCHERBINA, FEDOR ANDREEVICH. Born Feb. 1 (13), 1849, in the *stanitsa* (large cossack village) of Novodereviankovskaia, in the Kuban'; died 1936 in Prague. *Zemstvo* (local self-government) statistician; Narodnik (Populist). Corresponding member of the St. Petersburg Academy of Sciences (1904).

Shcherbina received his education at the Petrovskoe Agricultural Academy (now Timiriazev Agricultural Academy) and Novorossiia University (now University of Odessa). He headed the Voronezh Zemstvo Statistical Bureau from 1884 to 1903 and served in the Second State Duma as a member of the Popular Socialists in 1907. Shcherbina emigrated after the October Revolution of 1917.

Shcherbina was the first to compile Russian budget statistics. His studies—especially the work *Peasant Budgets* (1900)—long provided the methodological framework for the analysis of peasant and worker consumption patterns. V. I. Lenin used Shcherbina's findings extensively in his works *What the "Friends of the People" Are and How They Fight the Social-Democrats* and *The Development of Capitalism in Russia*. Although Shcherbina made a number of methodological errors in his research—largely as a result of his use of the wrong statistical-analysis methods ("abuse of 'average magnitudes'")—Lenin valued his work highly. At the same time, however, Lenin sharply criticized Shcherbina the Narodnik (*Poln. sobr. soch.*, 5th ed., vol. 1, pp. 224–25; vol. 3, pp. 162–63).

Shcherbina wrote several historical works, including the *History of the Kuban' Cossack Host* (vols. 1–2, 1910–13), and engaged in social commentary, with articles on such matters as agricultural communes, the artel movement, and peasant life.

WORKS

Svodnyi sbornik po 12 uezdam Voronezhskoi gubernii. Voronezh, 1897.
"Krest'ianskie biudzhety i zavisimost' ikh ot urozhaev i tsen na khleb." In the collection *Vliianie urozhaev i khlebnykh tsen na nekotorye storony russkogo narodnogo khoziaistva*, vol. 2. St. Petersburg, 1897. [29–1598–1]

SHCHERBINA, NIKOLAI FEDOROVICH. Born Dec. 2 (14), 1821, in the village of Gruzko-Elanchinskaia, near Taganrog; died Apr. 10 (22), 1869, in St. Petersburg. Russian poet.

Shcherbina wrote poems on classical themes and in the style of the ancient Greeks. They affirm the cult of beauty and a rational serene perception of the world, for example, the collection *Greek Verses* (1850). In the second half of the 1850's civic motifs became prominent in such works of his as the cycle *Iambs and Elegies*. Toward the end of his life, Shcherbina primarily wrote satires, including *Album of a Hypochondriac* (1841–61) and *Satirical Chronicle* (1861–69).

Shcherbina's satires and epigrams were hostile to the government, but they also contained frequent attacks on the revolutionary democrats.

SHCHERBINA, VLADIMIR RODIONOVICH. Born June 24 (July 7), 1908, in the city of Georgievsk, in what is now Stavropol' Krai. Soviet Russian critic and literary scholar. Corresponding member of the Academy of Sciences of the USSR (1976). Member of the CPSU since 1939.

Shcherbina graduated from the literature department of the Krasnodar Pedagogical Institute in 1929. He was first published in 1933. He became deputy director of the A. M. Gorky Institute of World Literature in 1953.

Shcherbina is the author of books on A. S. Novikov-Priboi and A. N. Tolstoy. In his critical articles and scholarly works he propagandizes on behalf of the achievements of socialist realism and polemizes with bourgeois theorists of aesthetics. His works include *Our Contemporary: The Concept of the Human Being in 20th-century Literature* (1964), *Problems of Literary Scholarship in the Light of the Heritage of V. I. Lenin* (1971), and *The Writer in the Contemporary World: Literature, Ideology, Culture* (1973).

Shcherbina was awarded the Order of the Red Banner of Labor in 1968.

SHCHERBINKA, a city (since 1975) in Podol'sk Raion, Moscow Oblast, RSFSR. Shcherbinka is located on the Moscow-Simferopol' highway, and it has a railroad station 34 km south of Moscow. Its enterprises include the Moscow Experimental Elevator Plant, a plant for the production of refractories for electric smelting, a branch of the Podol'sk Refractory Plant, and a factory producing metal clothing accessories. [29–1598–2]

SHCHERBITSKII, VLADIMIR VASIL'EVICH. Born Feb. 17, 1918, in Verkhnedneprovsk, in what is now Dnepropetrovsk Oblast, Ukrainian SSR. Soviet party and state figure. Twice Hero of Socialist Labor (1974, 1977). Member of the CPSU since 1941.

The son of a worker, Shcherbitskii graduated from the Dnepropetrovsk Institute of Chemical Engineering in 1941. He had engaged in Komsomol work in 1934 and 1935. Shcherbitskii served in the Soviet Army from 1941 to 1945 and fought in the Great Patriotic War. Beginning in 1946, he held a series of engineering and technical positions in Dneprodzerzhinsk.

From 1948 to 1951, Shcherbitskii served as second secretary of the Dneprodzerzhinsk city committee of the Communist Party (CP) of the Ukraine. He was party organizer of the Central Committee of the CPSU at the F. E. Dzerzhinskii Dnieper Metallurgical Plant in Dneprodzerzhinsk in 1951 and 1952 and first secretary of the Dneprodzerzhinsk city committee of the CP of the Ukraine from 1952 to 1954.

Shcherbitskii served as second secretary of the Dnepropetrovsk oblast committee of the CP of the Ukraine in 1954 and 1955 and as first secretary from 1955 to 1957. He was a secretary of the Central Committee of the CP of the Ukraine from 1957 to 1961 and chairman of the Council of Ministers of the Ukrainian SSR from 1961 to 1963.

Shcherbitskii was first secretary of the Dnepropetrovsk oblast committee of the CP of the Ukraine from 1963 to 1965 and chairman of the Council of Ministers of the Ukrainian SSR from 1965 to 1972. In 1972 he became first secretary of the Central Committee of the CP of the Ukraine.

Shcherbitskii was a member of the Central Auditing Commission of the CPSU from 1956 to 1961, when he became a member of the Central Committee of the CPSU. He was a candidate member of the Presidium of the Central Committee of the CPSU from 1961 to 1963 and in 1965 and 1966. He was chosen a candidate member of the Politburo of the Central Committee of the CPSU in 1966 and a member in April 1971. Shcherbitskii became a member of the Presidium of the Central Committee of the CP of the Ukraine in 1957 and a member of the Politburo in 1966.

Shcherbitskii was a deputy to the fifth through ninth convocations of the Supreme Soviet of the USSR. He was named a member of the Presidium of the Supreme Soviet of the USSR in 1972. Shcherbitskii has been awarded six Orders of Lenin, the Order of the October Revolution, and various medals. [29–1598–3]

SHCHETINKIN, PETR EFIMOVICH. Born Dec. 21, 1884 (Jan. 2, 1885), in the village of Chufilovo, in what is now Spas-Klepiki Raion, Riazan' Oblast; died Sept. 30, 1927, in Ulan Bator; buried in Novosibirsk. Partisan leader in Siberia in the Civil War of 1918–20. Member of the CPSU from 1918.

The son of a peasant, Shchetinkin lived in Siberia and worked as a carpenter. He was awarded four Crosses of St. George and two French orders during World War I and, as a bearer of all four classes of the Cross of St. George, was promoted to ensign. In 1917 he became a staff captain.

After the October Revolution of 1917, Shchetinkin played an active role in the establishment of Soviet power in Achinsk and served as chief of the criminal investigation department and head of the operations department of the Achinsk soviet. In late May 1918 he assumed command of a Red Guard detachment assigned to fight the White Czechs and White Guards.

Shchetinkin went underground after the fall of Achinsk and directed the formation of partisan detachments. In late 1918 he led a combined detachment that routed an enemy punitive detachment. After joining A. D. Kravchenko's partisan detachment in Eniseisk Province in early 1919, Shchetinkin became chief of staff of the partisan army.

Shchetinkin served in 1920 as a member of the Extraordinary Revolutionary Tribunal, which tried the former Kolchak ministers. Later that year he became deputy chairman of the Achinsk district executive committee and a member of the district party committee. In 1920 he also served in a detachment of partisans and volunteers that fought against General P. N. Wrangel. Heading a Red Army expeditionary detachment that was sent at Sukhe-Bator's request and V. I. Lenin's orders, Shchetinkin helped rid the Mongolian People's Republic of General Ungern von Sternberg's counterrevolutionary bands in 1921.

Shchetinkin was chief of staff of the Unified State Political Directorate in the Siberian Frontier District from 1922 to 1926. At the invitation of the government of the Mongolian People's Republic, he served as an instructor to the State Military Guard in Mongolia in 1927. Shchetinkin was awarded the Order of the Red Banner.

S. N. PUCHKOV [29–1599–3]

SHCHETOVO, an urban-type settlement in Voroshilovgrad Oblast, Ukrainian SSR, under the jurisdiction of the Antratsit city soviet. Shchetovo has a railroad station on the Chernukhino-Dolzhanskaia Line. Coal is mined at Shchetovo, and the settlement has a milk plant. [29–1602–2]

SHCHIGRY, a city (since 1779) under oblast jurisdiction and administrative center of Shchigry Raion, Kursk Oblast, RSFSR. Railroad station on the Kursk-Kastornaia line, 61 km northeast of Kursk. Population, 18,000 (1974). Enterprises in Shchigry include the Geomash Production Association, the Avangard Production Association, which manufactures plastics, a plant manufacturing reinforced-concrete products, and a brickyard. The food-processing industry is represented by a bread-products combine, a butter factory, and a meat- and poultry-packing plant. [29–1603–4]

SHCHIPACHEV, STEPAN PETROVICH. Born Dec. 26, 1898 (Jan. 7, 1899), in the village of Shchipachi, in what is now Kamyshlov Raion, Sverdlovsk Oblast; died Jan. 2, 1980, in Moscow. Soviet Russian poet. Member of the CPSU from 1919.

The son of a peasant, Shchipachev graduated from the literature division of the Institute of the Red Professors in 1934. His first collections of verse were noted for their declamatory quality and their concern with cosmic themes. His poems written in the mid-1930's included in such collections as *Under the Skies of My Motherland* (1937) and *Lyrics* (1939) have a lyric intonation.

Shchipachev's verse exhibits the songlike quality of classical Russian poetry but gives the themes of nature and love a modern ring. In his wartime verses and narrative poems, such as *Verses From the Front* (1942), the lyric principle merges with the heroic. The poet deals with the motherland and V. I. Lenin in the narrative poem *Little House in Shushenskoe* (1944). In the postwar years Shchipachev published the collection *Verse* (1948; State Prize of the USSR, 1949) and the narrative poem *Pavlik Morozov*, (1950; State Prize of the USSR, 1951). He also produced the narrative poems *The Heir* (1965), *Song of Moscow* (1968), and *Twelve Months Around the Sun* (1969).

Civic motifs pervade Shchipachev's verses written in the 1970's, which are included in such collections as *To My Life's Comrades* (1972) and *I Am Thinking of the Motherland* (1974). The poems of this period are also characterized by a keen interest in the inner world of the individual.

Shchipachev was awarded the Order of Lenin and the Order of Friendship of Peoples; some of his works have been translated into other languages of the USSR and into foreign languages.

L. P. PECHKO [29–1603–5]

SHCHIRETS, an urban-type settlement in Pustomyty Raion, L'vov Oblast, Ukrainian SSR. Shchirets is located on the Shcherek River, a tributary of the Dnestr. It has a railroad station. The settlement is the site of the Steklopribor plant, a mixed-feed plant and a gypsum plant. A plant manufacturing reinforced-concrete products and an asphalt plant were under construction in Shchirets in 1978. [29–1605–1]

SHCHIRSKII, IVAN (monastic name, Innokentii). Year of birth unknown; died after 1714. Ukrainian painter and engraver.

Shchirskii worked in Vilnius (until 1682), in Chernigov (from 1683), at the Kiev-Pecherskaia Laura (from 1687), in Moscow (from 1688 to 1689), and in Lübech (from 1690). All that remains of Shchirskii's works are 28 copper engravings. The engravings include works devoted to religious themes, for example, *Ioann Zlatoust* (1682). In the festive allegorical *Heaven and Truth* (1683) the artist reproduced images from real life. Shchirskii also

did battle scenes, genre scenes, and landscapes. His interest in rendering three-dimensional space and form broke with the conventions of medieval art. [29–1605–4]

SHCHOGOLEV, IAKOV IVANOVICH. Born Oct. 24 (Nov. 5), 1823, in the city of Akhtyrka, in what is now Sumy Oblast; died May 27 (June 8), 1898, in Kharkov. Ukrainian poet.

Shchogolev graduated from the University of Kharkov in 1848. He was a civil servant until 1871. Shchogolev was first published in 1843. The author of the poetry collections *Vorsklo* (1883) and *Slobozhanshchina* (1898), he was close to the Ukrainian romantics. Shchogolev idealized the bygone times of the Zaporozh'e cossacks and condemned the bourgeois mores that were undermining the traditions of patriarchal life. In many poems he expressed sympathy for the unfortunate and oppressed. A master of lyric descriptions of nature, Shchogolev often used images and motifs from folklore.

SHCHORS, NIKOLAI ALEKSANDROVICH. Born May 25 (June 6), 1895, in the settlement of Snovsk, now the city of Shchors, Chernigov Oblast, Ukrainian SSR; died Aug. 30, 1919, near the village of Beloshitsa, now the village of Shchorsovka, Korosten' Raion, Zhitomir Oblast, Ukrainian SSR; buried in Samara, now Kuibyshev. Hero of the Civil War of 1918–20. Member of the Communist Party from 1918.

The son of a railroad engineer, Shchors graduated from a military feldsher school in Kiev in 1914 and an accelerated course at the Vil'na Military School in Poltava in 1916. He served in World War I, first as a feldsher and then as a junior officer on the Southwestern Front. He was promoted to sublieutenant in 1917.

After the October Revolution in 1917, Shchors returned to Snovsk, where he formed a partisan detachment in February 1918. In March and April he commanded a combined detachment from Novozybkov District. The detachment fought as part of the First Revolutionary Army against German interventionists. In September 1918, Shchors formed the Bogun 1st Ukrainian Soviet Regiment from partisan detachments in the Unecha region. He led the regiment in fighting against German occupation troops and supporters of the hetman in October and November. In November, Shchors assumed command of the 2nd Brigade of the 1st Ukrainian Soviet Division, which included the Bogun and Tarashcha regiments and which liberated Chernigov, Kiev, and Fastov from the forces of the Ukrainian Directory.

On Feb. 5, 1918, Shchors was appointed commandant of Kiev and was presented with an honorary weapon by the Provisional Workers' and Peasants' Government of the Ukraine. He commanded the 1st Ukrainian Soviet Divison from Mar. 6 to Aug. 15, 1919. In a swift advance, the division liberated Zhitomir, Vinnitsa, and Zhmerinka from Petliura's troops and smashed Petliura's main forces in the Sarny-Rovno-Brody-Proskurov region. Attacked by Petliura and the forces of bourgeois Poland in the summer of 1919, the division defended itself heroically in the Sarny–Novograd-Volynskii–Shepetovka region. Outnumbered, however, the division was forced to withdraw to the east.

On Aug. 21, 1919, Shchors was named commander of the 44th Rifle Division, into which the 1st Ukrainian Soviet Division had been incorporated. The division stubbornly defended the Korosten' rail junction, enabling the evacuation of Kiev and allowing the Southern Group of the Twelfth Army to escape from encirclement.

Shchors was killed as he fought in the front ranks of the Bogun Regiment. He showed himself to be a talented military commander and set an example in combat leadership. Shchors demonstrated great personal courage and skillfully trained and inspired his men.

SHCHORS (prior to 1935, Snovsk), a city (since 1924) and administrative center of Shchors Raion, Chernigov Oblast, Ukrainian SSR. Shchors is situated on the Snov River, a tributary of the Desna, 69 km northeast of Chernigov. It has a railroad station on the Gomel'-Bakhmach Line. Shchors has a furniture factory, a butter factory, a food-processing combine, and enterprises servicing the railroad industry. The N. A. Shchors Memorial Museum is located in the city. [29–1615–1]

SHCHORSK, an urban-type settlement in Krinichki Raion, Dnepropetrovsk Oblast, Ukrainian SSR. Shchorsk has a railroad station (Bozhedarovka) on the Verkhovtsevo–Krivoi Rog line. A grain elevator and an asphalt-concrete plant are located in the settlement. [29–1615–2]

SHCHUCH'E, a city and the administrative center of Shchuch'e Raion, Kurgan Oblast, RSFSR. Railroad station on the Cheliabinsk-Kurgan line, 170 km west of Kurgan. Shchuch'e has a butter factory, a grain elevator, a food-processing combine, and a machine-building plant that manufactures fire-fighting equipment. [29–1623–4]

SHCHUCH'E OZERO, an urban-type settlement in Oktiabr'skii Raion, Perm' Oblast, RSFSR. Railroad station on the Kazan'-Sverdlovsk line, 250 km south of Perm'. Shchuch'e Ozero has a logging and timber distribution establishment. [29–1623–5]

SHCHUCH'IA (in the upper course, Bol'shaia Shchuch'ia), a river in Tiumen' Oblast, RSFSR; a left tributary of the Ob'. The Shchuch'ia has a length of 565 km and drains an area of 12,300 sq km. The river rises in Bol'shoe Shchuch'e Lake in the Polar Urals and empties into an arm of the Malaia Ob'. The Shchuch'ia is fed by snow and rain, and high water occurs between June and September. The mean flow rate 141 km from the mouth is 109 cu m per sec. The river freezes over in October and is completely frozen from February to the end of April; the ice breaks in late May or early June. Various species of whitefish (*Coregonus*), including ciscoes and broad whitefish, spawn in the Shchuch'ia. [29–1623–6]

SHCHUCHIN, a city (since 1962) and the administrative center of Shchuchin Raion, Grodno Oblast, Byelorussian SSR. Shchuchin is located 7 km from the Rozhanka railroad station on the Lida-Grodno line. Industry is represented by the Avtoprovod Plant, a creamery, and a bread-baking combine. [29–1623–1]

SHCHUCHINSK, a city under oblast jurisdiction and administrative center of Shchuchinsk Raion, Kokchetav Oblast, Kazakh SSR. Located on Lake Shchuch'e, 75 km southeast of Kokchetav. Railroad station (Kurort-Borovoe) on the Petropavlovsk-Tselinograd line. Population, 46,000 (1974).

Shchuchinsk has railroad and motor-vehicle transportation enterprises, as well as a glassworks, plants producing nonmetallic construction materials and reinforced-concrete articles, a milk plant, a meat-packing plant, a garment factory, and a branch of the Kokchetavmebel' Production Association. Educational institutions include an industrial-pedagogical technicum, a polytechnical school, and a pedagogical school. The city has a nature museum. The resort of Borovoe is located 25 km northeast of Shchuchinsk. [29–1623–2]

SHCHUGOR, a river in the Komi ASSR, a right tributary of the Pechora. The Shchugor has a length of 300 km and drains an area of 9,660 sq km. It rises on the western slopes of the Northern Urals. The river is fed by rain and snow. High water occurs between May and July, and there are freshets in the autumn. The mean flow rate 30 km from the river's mouth is 252 cu m per sec. The Shchugor freezes over in late October or November, and the ice breaks up in May or early June. The river is a spawning ground for salmon. [29–1615–3]

SHCHUKAREV, ALEKSANDR NIKOLAEVICH. Born Nov. 2 (14), 1864, in Moscow; died Apr. 25, 1936, in Kharkov. Soviet physical chemist.

Shchukarev graduated from Moscow University in 1889 and worked there from 1891 to 1909. Beginning in 1911, he was a professor at the Kharkov Technological Institute (now the Kharkov Polytechnic Institute). Shchukarev's main works were devoted to chemical kinetics and chemical thermodynamics, the study of solutions, thermochemistry, and electrochemistry. Shchukarev investigated critical phenomena in gas-liquid systems and in solutions. He designed an isothermic calorimeter for the study of slow thermal processes.

SHCHUKIN, ALEKSANDR NIKOLAEVICH. Born July 9 (22), 1900, in St. Petersburg. Soviet scientist in the fields of radio engineering and radiophysics. Academician of the Academy of Sciences of the USSR (1953). Lieutenant general of engineer troops; twice Hero of Socialist Labor. Member of the CPSU from 1944.

In 1927, Shchukin graduated from the Leningrad Electrical Engineering Institute, where he taught from 1929 to 1941. From 1933 to 1945 he also taught at the Naval Academy, where he became a professor in 1939 and head of a subdepartment in 1940. During these years, Shchukin also worked at the Central Radio Laboratory (1923–28), the Leningrad Electrophysical Institute of the Academy of Sciences of the USSR (1928–32), and the Naval Scientific Research Institute of Communications and Telemechanics (1932–38). From 1965 he was deputy chairman and from 1969 chairman of the scientific council on the complex problem of radio wave propagation of the Academy of Sciences of the USSR. Shchukin is one of the organizers of radar research in the USSR. His main works deal with the propagation of electromagnetic oscillations in various media, the processes of ionization in the earth's atmosphere, and the effects of such processes on the propagation of radio waves; a large part of Shchukin's research has been devoted to communications and automatic control and the applications of probability theory in these areas. His course *Propagation of Radio Waves*, written in 1940, has played a major role in the training of Soviet radio specialists.

Shchukin received the Lenin Prize and the State Prize of the USSR. He has been awarded five Orders of Lenin, the Order of the October Revolution, two other orders, and various medals.

SHCHUKIN, BORIS VASIL'EVICH. Born Apr. 5 (17), 1894, in Moscow; died there Oct. 7, 1939. Soviet Russian actor. People's Artist of the USSR (1936).

In 1920, Shchukin enrolled in the dramatic studio directed by E. B. Vakhtangov, subsequently joining the troupe of the Vakhtangov Theater. Shchukin was greatly influenced by his teacher's aesthetics, which emphasized vivid theatricality, irony, and associations with folk buffoonery and the grotesque. One of the most important actors of the Soviet realistic school, Shchukin brilliantly combined the principles of comedy and drama. On the stage his simple outer appearance belied a refined intellect.

Shchukin made an important contribution to the development of the Soviet theater in the title role in Gorky's *Egor Bulychov and the Others*, as Pavel Suslov in *Virineia* by Seifullina and Pravdukhin, and as Polonius in Shakespeare's *Hamlet*. Shchukin was one of the first actors to portray V. I. Lenin on the stage and in motion pictures, in Pogodin's play *Man With a Gun* (1937) and in M. I. Romm's films *Lenin in October* (1937) and *Lenin in 1918* (1939).

Shchukin was awarded the State Prize of the USSR (1941, posthumously) and the Order of Lenin.

SHCHUKIN, IVAN SEMENOVICH. Born Apr. 28 (May 10), 1885, in Moscow. Soviet physical geographer. Doctor of geographical sciences (1935). Honored Scientist of the RSFSR (1957).

Shchukin graduated from Moscow University in 1911. In 1918 he became a docent in the subdepartment of geography of Moscow State University. From 1935 to 1941 he was a professor and senior research worker at the Geographic Institute of the Academy of Sciences of the USSR.

Shchukin is one of the founders of the Soviet school of geomorphology. In 1944 he organized the subdepartment of geomorphology in the department of geography at Moscow State University and headed the subdepartment from 1944 to 1960. His long years of expeditionary research in the Caucasus and Middle Asia have provided the basis for his works on general and regional geomorphology and physical geography. He has compiled a four-language encyclopedic dictionary of terms of physical geography.

Shchukin has been awarded the Order of Lenin, two other orders, and various medals. Since 1955 he has been an honorary member of the Geographical Society of the USSR. Two peaks in the Gissar-Alai, an inlet on Lake Urup, a mountain range in East Antarctica, and a glacier in the Dzungarian Alatau have been named after Shchukin.

SHCHUKIN, NIKOLAI LEONIDOVICH. Born Apr. 13 (25), 1848; died June 2, 1924. Russian scientist in railroad transport.

After graduating from the St. Petersburg Institute of Technology in 1873, Shchukin taught at the institute, becoming a professor in 1889. From 1883 to 1907, he taught at the Military Engineering Academy. In 1906, he became a teacher in the Advanced Courses for Women in St. Petersburg.

A number of steam locomotives were built according to Shchukin's designs, including the 1–3–0 series N locomotives and 0–4–0 tank locomotives. Shchukin also designed, for example, passenger cars for the Nikolaevskaia Railroad (now called the Oktiabr' Railroad), a freight car with a load capacity of 1,200 *poody* (about 20 tons), and the class 4 passenger car. Between 1897 and 1907, the world's first kerosine pipeline, which extended from Baku to Batumi, was built according to Shchukin's design and under his direction; it was converted to a petroleum pipeline in 1931. In 1922, Shchukin was put in charge of a technical council for the building of the first Soviet diesel locomotive, which was designed by Ia. M. Gakkel'.

SHCHUKIN, STEPAN SEMENOVICH. Born 1758 in St. Petersburg; died there Oct. 10 (22), 1828. Russian portrait painter.

Shchukin studied with D. G. Levitskii at the St. Petersburg

Academy of Arts from 1776 to 1782. He studied in Paris with J. B. Suvée from 1782 to 1786. Beginning in 1788, Shchukin taught at the academy in St. Petersburg (academician from 1797), where his students included A. G. Varnek and V. A. Tropinin.

Shchukin's portraits combine idealized elements of formal portraiture with realistic characterization. At times they anticipate the traits of romanticism in Russian painting of the early 19th century; examples are Shchukin's portraits of Paul 1 (1797) and a self-portrait (mid-1790's) at the Russian Museum in Leningrad. Shchukin also painted miniatures. [29–1618–1]

SHCHUKO, VLADIMIR ALEKSEEVICH. Born July 5 (17), 1878, in Tambov; died Jan. 18, 1939, in Moscow. Soviet architect and theater artist.

Shchuko studied with L. N. Benois at the St. Petersburg Academy of Arts from 1896 to 1904. He became an academician of architecture in 1911. Shchuko's best works are marked by a creative application of the principles of classical architecture and a search for simple forms closely related to the new types of public buildings and new equipment. In the prerevolutionary period he designed Building No. 63–65 on Kirov Prospect (formerly Kamennoostrovskii Prospect) in Leningrad (1908–11) and the Russian pavilion at the International Exhibition in Rome (1911).

Shchuko's major projects during the Soviet period were done in collaboration with V. G. Gel'freikh. They include the monumental entry to Smolny (1923–25), the architectural part of the monument to V. I. Lenin at Finland Station in Leningrad (1926), the M. Gorky Drama Theater in Rostov-on-Don (1930–35), the new building of the V. I. Lenin Library of the USSR (1928–40, Moscow), the Bol'shoi Kamennyi Bridge (1936–38, Moscow, with participation by M. A. Minkus), the main pavilion of the All-Union Agricultural Exhibition (1939, Moscow), the Government Building of the Abkhaz ASSR in Sukhumi (1932–39), and the viaduct in Sochi (1936–37, with others).

Shchuko also was a theater artist. He designed the set and costumes for the Starinnyi Theater in St. Petersburg in 1907 and for various theaters in Leningrad from 1919 to 1932. He also was the set and costume designer for a production of *Boris Godunov* at the Malyi Theater in Moscow in 1937. Shchuko was an accomplished graphic artist and watercolorist (*V. A. Shchuko Album: Drawings and Watercolors*, Moscow, 1940).

SHCHUROVSKII, GRIGORII EFIMOVICH. Born Jan. 30 (Feb. 11), 1803, in Moscow; died there Mar. 20 (Apr. 1), 1884. Russian geologist.

Shchurovskii graduated from the medical faculty of Moscow University in 1826. In 1835 he became a professor of mineralogy and geology at the university. Between 1863 and 1880 he was head of the department of geognosy and paleontology, which he had organized. Shchurovskii studied the geological structure of the Urals and the Altai. He was president of the Society of Lovers of Natural Science, Anthropology and Ethnology from its founding in 1864 and one of the founders of the Polytechnical Museum in Moscow.

SHCHUSEV, ALEKSEI VIKTOROVICH. Born Sept. 26 (Oct. 8), 1873, in Kishinev; died May 24, 1949, in Moscow. Soviet architect. Honored architect of the USSR (1930); academician of the Academy of Sciences of the USSR (1943).

Shchusev studied with L. N. Benois at the St. Petersburg Academy of Arts from 1891 to 1897; he became an academician in 1910. He was director of the Tret'iakov Gallery from 1926 to 1929. Shchusev established the Museum of Architecture in Moscow in 1946 and served as its director until 1949. He taught at the Stroganov Industrial Arts School from 1913 to 1918, the State Higher Arts and Technical Studios from 1920 to 1924, and the Moscow Architectural Institute in 1948 and 1949.

Shchusev's early projects were restorations of ancient Russian architecture: reconstruction of the 12th-century Church of St. Basil in Ovruch, the Marfa-Mar'ia Cloister (1980–12), and the Kazan Railroad Station in Moscow (begun 1914). His work was particularly diverse in Soviet times. He participated in the plans for rebuilding Moscow (1918–25) and served as chief architect for the All-Russian Agricultural and Domestic Industrial Exhibition in Moscow (1922–23). His work of the 1920's showed some influence of constructivism, as seen in the Research Institute of Health Resort Science and Physical Therapy in Sochi (1927–31) and the building of the People's Commissariat of Agriculture in Moscow (1928–33, today the Ministry of Agriculture).

Shchusev's greatest achievement is the V. I. Lenin Mausoleum in Moscow. The mausoleum was designed in a very short period of time, and construction of a wooden structure was completed in 1924. In 1930 the wooden structure was replaced by a monumental granite structure of similar design. (Shchusev's concept was realized, under his direction, by the architects Iu. A. Dul'gier, L. B. Karlik, V. A. Mikhailov, A. K. Rostkovskii, I. A. Frantsuz, and G. K. Iakovlev.) Only a limited part of the architectural complex of Red Square, the mausoleum is not only a very impressive memorial structure but also serves as a reviewing stand for parades, as if emphasizing the majesty of Lenin's ideas.

Shchusev's work in the 1930's and 1940's shows a desire to develop the progressive traditions of past architecture. He used elements of classical architecture in construction of the Hotel Moskva (1932–38, with others), the Moskvoretskii Bridge (1936–38), and an administrative building on Dzerzhinskii Square in Moscow (1946). Shchusev used themes of Georgian national architecture in the design of the branch of the Institute of Marxism-Leninism of the Central Committee of the CPSU in Tbilisi (1938). He used Uzbek traditions in the A. Navoi Bol'shoi Opera and Ballet Theater in Tashkent (1938–47). Elements of 17th-century Russian architecture can be seen in the design of the Komsomol'skaia-Kol'tsevaia Subway Station (opened 1952) in Moscow. City planning projects occupy an important place in Shchusev's work, including plans for rebuilding the following cities destroyed during the Great Patriotic War of 1941–45: Istra (1942–43), Novgorod (1943–45), and Kishinev (1947).

Shchusev wrote more than 200 scholarly works and articles dealing with a broad range of architectural problems. He was awarded the State Prize of the USSR four times—in 1941, 1946, 1948, and 1952. He also received the Order of Lenin, two other orders, and various medals.

SHE, a nationality of China. The She, who inhabit the provinces of Fukien, Chekiang, and Kwangtung, belong to the aboriginal population of South China. According to a 1975 estimate, they number 300,000. Related linguistically to the Yao, they have no writing system. The She have been sinicized to a great extent and often speak Chinese even among themselves. They have retained animist beliefs. The She engage chiefly in the cultivation of rice on paddies; handicrafts are highly developed among them.

SHEBALIN, MIKHAIL PETROVICH. Born May 27 (June 8), 1857, in the village of Novoselki, Kazan Province; died Feb. 24, 1937, in Moscow. Russian revolutionary; member of the People's Will organization.

Shebalin came from a noble family. He graduated from the mathematics faculty of the University of St. Petersburg in 1882. In the fall of that year he joined the People's Will, and in 1883 he organized underground "traveling printshops" in St. Petersburg and Kiev. Shebalin printed the first two issues of *Listki "Narod-*

noi voli". He reestablished the Kiev organization of the People's Will and merged it with the Youth Party of the People's Will. Shebalin was arrested in Kiev on Mar. 4, 1884. He was sentenced in the Trial of the 12, held in the Kiev Military District Court on Nov. 1–9, 1884, to 12 years of penal servitude; he served the sentence in the Shlissel'burg Fortress.

Shebalin subsequently lived in exile in Yakutsk Oblast until 1906, when he returned to European Russia and took part in the social movement. From 1909 to 1911 he was in exile in Arkhangel'sk Province. He was a member of the Socialist Revolutionary Party from 1911 until 1918. In February 1922, Shebalin became head of the P. A. Kropotkin Museum in Moscow and a member of the All-Union Society of Former Political Prisoners and Exiles.

WORKS

Klochki vospominanii. Moscow, 1935. [29–1064–1]

SHEBALIN, VISSARION IAKOVLÉVICH. Born May 29 (June 11), 1902, in Omsk; died May 28, 1963, in Moscow. Soviet composer, pedagogue, and public figure. People's Artist of the RSFSR (1947); doctor of the arts (1941).

In 1928, Shebalin graduated from the Moscow Conservatory, where he had studied composition under N. Ia. Miaskovskii. Shebalin's music, which is pictorial in nature, communicates an ideological message and affirms a lofty and positive ideal; it develops the traditions of the Russian classics and is characterized by its noble use of melody, which often recalls the lyric and epic songs of Russian folklore.

Shebalin composed the operas *The Taming of the Shrew* (based on the play by Shakespeare; 1957, Bolshoi Theater) and *Sun Over the Steppes* (concert performance, Moscow, 1959), the musical comedy *Bridegroom From the Embassy* (1942), and the cantata *Moscow* (1946; words by B. V. Lipatov; State Prize of the USSR, 1947). An important composition is the dramatic symphony *Lenin* (1931; revised version, 1959), scored for narrator, soloists, chorus and orchestra; the work is based on V. V. Mayakovsky's narrative poem *Vladimir Il'ich Lenin*.

Shebalin is also known for his five symphonies, violin concerto (1940), and chamber music, including nine string quartets, of which the most famous is the String Quartet No. 5, on Slavic Themes (1942; State Prize of the USSR, 1943). His other works include art songs, choruses, music for motion pictures and plays, and arrangements of Russian folk songs. An important part of Shebalin's oeuvre are his completed versions of Russian and Ukrainian musical classics, such as the operas *Sorochintsy Fair* by Mussorgsky and *The Zaporozhian Cossack Beyond the Danube* by Gulak-Artemovskii and Glinka's *Symphony on Two Russian Themes*.

Shebalin became a professor at the Moscow Conservatory in 1935 and served as its director from 1942 to 1948. In addition to the Czech composer V. Kučera, his students included L. M. Auster, E. V. Denisov, K. Kh. Kuzham'iarov, A. A. Nikolaev, A. N. Pakhmutova, V. R. Tormis, T. N. Khrennikov, and K. S. Khachaturian. Shebalin was chairman of the administrative board of the Moscow organization of the Composers' Union of the USSR in 1941 and 1942 and served as a deputy to the second convocation of the Supreme Soviet of the RSFSR. Shebalin was awarded the Order of Lenin, the Order of the Red Banner of Labor, and various medals.

SHEBEKE. (1) Openwork designs or designs imitating them in the applied art of Azerbaijan.

(2) Window frames and gratings assembled from standard wooden components held together only by dowels and frequently ornamented with pieces of varicolored glass. *Shebeke* were in wide use in 18th- and 19th-century Azerbaijani architecture. Openwork lattices are also common in Arab countries, where they are called *musharabiia*, and in Middle Asia, where they are known as *pandzhara*. [29–1064–2]

SHEBEKINO, a city (since 1938) under oblast jurisdiction and administrative center of Shebekino Raion, Belgorod Oblast, RSFSR. Located on the Nezhegol' River in the Don River basin. Railroad station on a branch line from the Belgorod-Kupiansk line, 39 km southeast of Belgorod. Population, 36,000 (1974).

Enterprises in Shebekino include chemical and biochemical plants. Various plants produce machinery, leather goods, butter, household chemicals, and reinforced-concrete products. There is also an automotive repair plant. The settlement also has combines producing construction materials, bread, and food products. Educational institutions in Shebekino include a research-and-design institute specializing in the planned production of surface-active agents, a chemistry and mechanics technicum, and a technicum of automotive transport. [29–1064–3]

SHEBERGHAN, a city in northern Afghanistan, located at an oasis. Administrative centre of Jozjan Province. Population, 56,500 (1970). Sheberghan is a center for raising karakul sheep. There is rug making in the city. Some of the natural gas that is extracted near Sheberghan is sent by pipeline to the USSR. [29–1173–1]

SHEBOLDAEV, BORIS PETROVICH. Born May 15 (27), 1895, in Paris; died Oct. 30, 1937. A leader in the struggle to establish Soviet power in the Caucasus. Member of the Communist Party from 1914.

The son of a doctor, Sheboldaev moved with his family to St. Petersburg in 1900. He was drafted into the army in 1916 and became deputy chairman of the Revolutionary Military Committee of the Caucasian Army in the following year. In 1918 he became a member of the Baku committee of the RCP(B), deputy people's commissar for military affairs of the Baku council of people's commissars, and a commissioner of the Revolutionary Military Council of the Twelfth Army.

In 1920, Sheboldaev became secretary of an oblast committee of the RCP(B) and deputy chairman of the Revolutionary Committee of Dagestan. In the period from 1923 to 1925 he initially headed a department of the Central Committee of the Communist Party (Bolshevik) of Turkmenistan and served as secretary of the Tsaritsyn (Volgograd) provincial committee of the RCP(B); he then took up a position in the administrative apparatus of the Central Committee of the ACP(B). He served as a secretary of the Lower Volga Krai Committee of the ACP(B) from 1928 to 1930, the Northern Caucasus Krai Committee from 1931 to 1934, the Azov–Black Sea Krai Committee from 1934 to 1937, and the Kursk oblast committee of the ACP(B) in 1937.

Sheboldaev was a delegate to the Fifteenth, Sixteenth, and Seventeenth Party Congresses. At the Fifteenth Congress he was elected a member of the Central Control Commission, and at the Sixteenth and Seventeenth Congresses a member of the Central Committee of the ACP(B). Sheboldaev was awarded the Order of the Red Banner. [29–1065–3]

SHEBUEV, VASILII KOZ'MICH. Born Apr. 2 (13), 1777, in Kronstadt; died June 16 (28), 1855, in St. Petersburg. Russian painter.

Shebuev studied at the St. Petersburg Academy of Arts with I. A. Akimov and G. I. Ugriumov from 1782 to 1797. He received a stipend from the academy to study in Rome from 1803 to 1807. He taught at the academy in 1807, becoming a professor in 1812 and rector in 1832. Shebuev was one of the leading masters of late classicism and academism. His works, which were mainly on historical and religious subjects, are noted for strict academicism of line, skillful composition of many-figured scenes, and an interest in national history. Examples of his work are *The Feat of the Merchant Igolkin* (1839, Russian Museum, Leningrad) and a ceiling in the meeting hall of the Council Building at the St. Petersburg Academy of Arts (1833). Some of his works reflect romantic and realistic trends, including *Fortunetelling: Self-portrait* (1805, Tret'iakov Gallery) and *Portrait of the Retired Official Shvykin* (1833, Russian Museum). [29–1066–1]

SHEBUNINO, an urban-type settlement in Nevel'sk Raion, Sakhalin Oblast, RSFSR. Shebunino is situated in the southwestern part of Sakhalin Island, on the Sea of Japan. It is the terminus of the Il'inskii-Shebunino railroad line. Lignite is mined nearby. [29–1066–2]

SHED, a structure for keeping furbearing animals. A shed consists of a lean-to with a gable roof, under which cages are arranged in two, four, or six rows. The supporting structure, or framework, is made of wood, steel, or reinforced concrete. The roof is tile or slate. The passages between the rows of cages are paved with asphalt. In regions with large snowdrifts the cages are set on posts, and there are closed corridors. [29–1078–1]

SHEEHY AFFAIR, the prosecution by British authorities of the Irish patriot Nicholas Sheehy, who publicly condemned the national and religious discrimination against the Irish. In 1765, Sheehy was accused of belonging to the White Boys, a clandestine peasant organization. Owing to a lack of any evidence, the court found Sheehy not guilty. However, Sheehy was soon brought to trial again on a charge of murdering a police informant and was convicted on the testimony of suborned witnesses; he was sentenced to death and was hanged. The legal reprisal against Sheehy was a manifestation of the policy of terror practiced by the British colonizers in Ireland. [29–1176–4]

SHEEPSKIN SHEEP RAISING, the raising of sheep to obtain high-quality sheepskins for coats. Sheepskin sheep raising began developing in Russia in the late 18th century, when a cottage industry producing sheepskins for coats emerged in certain districts of Yaroslavl' and Kostroma provinces to meet the demand for warm fur clothing. The sheepskins were obtained from local northern short-tailed sheep. The Romanovo breed, from which sheepskins are obtained today, was developed through long-term breeding of sheep herds and the selection of sheep for the quality of their sheepskins.

Romanovo sheepskins are light, strong, and very warm and have an attractive appearance. The good qualities of the sheepskins are determined by the characteristics of the wool, which, unlike the wool of other coarse-wooled sheep, consists entirely of down and guard hairs. Three to four months after shearing, the down, which grows more rapidly, overgrows the guard hairs by 2–3 cm and forms locks with attractive tight curls. The optimal proportion between the guard hairs and the down and the difference in their coloration are responsible for the lovely light blue tint of the wool. The relatively short guard hairs provide the down with an elastic support and prevent the wool from matting.

Sheepskins from young animals, five to eight months of age, are the most valuable. In production, animals are usually slaughtered at nine to ten months of age, when the wool has grown out at least 3 cm after the first shearing; this results in a good-size carcass and hide. Sheepskin sheep raising is highly productive: Romanovo sheep are very fertile, capable of lambing three times in two years. On leading farms, 300–330 lambs are born per year per 100 ewes.

As of Jan. 1, 1976, there were 578,000 Romanovo sheep in the USSR. A small number has been exported to France and Rumania to help upgrade local breeds.

SHEEP SORREL (*Rumex acetosella*), a perennial herbaceous plant of the family Polygonaceae. The leaves are alternate. The lower leaves are petiolate and speary, and the upper ones are sessile and lanceolate. The small unisexual flowers are in panicles. (The plant is dioecious.) The fruit is a shiny three-angled nutlet.

Sheep sorrel is distributed in the temperate and subtropical zones of the northern hemisphere. It is almost ubiquitous in the USSR. A sucker-forming weed, the plant occurs mainly in plantings of thinned perennial herbs. It often forms thickets on fallow fields, wastelands, and dry meadows, as well as along roads and in dumps. Sheep sorrel serves as forage for sheep and pigs. When eaten in large quantity, however, it causes severe poisoning owing to the presence of a large quantity of calcium oxalate in all its parts. The plant is especially toxic during the period of seed maturation.

SHEERNESS, a city and port in Great Britain, in the county of Kent. Situated at the entrance to the Thames estuary, on the Isle of Sheppey. Part of the borough of Queensborough-in-Sheppey. Population, 106,700 (1976). Government dockyards are located in the city. [29–1227–2]

SHEET-METAL FORMING AND FORGING (in Russian, *shtampovka*), in metalworking, pressure-shaping processes in which articles are formed by a special tool—a press tool or die; such production processes constitute a branch of the forging and stamping industry. A distinction is made between die forging and sheet-metal stamping on the basis of the type of stock and between the analogous cold and hot pressure-shaping processes on the basis of the temperature of the process. Compared with classical (smith) forging, these processes provides greater efficiency, since the entire workpiece or a significant part of it is subjected to simultaneous plastic deformation.

Die forging is capable of producing articles with more complex shapes than is possible with smith forging, and the articles require significantly less machining to complete production. Metal flow is limited by the walls of the die, which increases the resistance to deformation with increasing complexity of the shape of the article. Heating of the workpiece reduces the resistance to deformation by a factor of 10–15 and increases the ductility of the metal. Cold die forging is used for the production of small articles weighing less than 1 kg; hot die forging is used for articles weighing up to 1.5–2 tons. Heavier items are produced by smith forging. The boundary between the two processes is changing with the improvement of forging equipment and the increasing deformation forces generated by such equipment. Since the cost of dies and stock metal is a major component of the cost of the finished products, the use of die forging is economically advantageous in series production.

Die forging is accompanied by metal loss when the flash is removed. The use of closed dies lessens waste, but the unit loads are greater than in open dies, which reduces the durability of the dies. When open dies are used, waste can be reduced by preliminary processing of the stock in preforming die impressions and forging rolls, by the use of stock blanks that approximate the shape of the final product, and by selecting the proper shape for the flash gutter. In hot working processes the surface of the metal stock is oxidized, forming a layer of scale, which also leads to metal losses. Such losses can be reduced by nonoxidizing heating in fuel-fired furnaces (in a protective atmosphere) or by rapid heating in induction heating units. The use of high-speed processes (with hammer velocities of 10–25 m/sec) lessens the cooling of the stock during deformation and produces articles with thin edges. Isothermic pressure-shaping processes, mainly for nonferrous metals, are also used to lessen cooling of the stock; the technique calls for the die to be heated to temperatures close to the forging temperature. The combined use of casting and hot pressure-shaping processes is being introduced. In this method, the stock blank is cast in a shape close to that of the final product; after the metal hardens and cools to forging temperatures, the blank is die-forged in open or closed dies. The die forging improves the mechanical properties of the cast blank; the waste formed is immediately remelted.

In sheet-metal forming, the metal stock consists of sheet, strip, or ribbon metal. The process is used in the production of flat (sheet) and folded articles (including those with complex shapes), in which the thickness is considerably less than the other dimensions—usually less than 10 mm. Stock of greater thickness is usually hot-stamped to forging temperature. Sheet-metal forming (especialy cold stamping) does not usually require metal cutting to finish the article. The technique is suitable for production runs with various output quantities.

Special techniques are used in small-series production: pressure shaping with elastic media (a fluid, rubber, or polyurethane) and techniques that use the energy of a shock wave in a fluid (explosive and electrohydraulic forming) or the action of powerful, rapidly varying magnetic fields (magnetic pulse forming). Processes with differential heating are sometimes used to increase the maximum permissible deformation of the metal stock. The section of the metal blank to be deformed is heated by contact

with a heated tool or the passage of an electric current. The correct distribution of temperatures and of the corresponding metal properties in the stock significantly increases the maximum possible deformation.

Various types of equipment are used in sheet-metal forming and forging, including hammers, crank presses, horizontal forging machines, hydraulic presses, and automatic forging and stamping machines. Large-series production uses automatic machines and automated production lines as well as all types of loading and manipulating devices (including industrial robots), which contribute to a significant increase in labor productivity.

SHEET PILING, a solid wall formed by wooden, reinforced-concrete, or steel sheet piles driven into the ground. Sheet piling serves as a watertight barrier and prevents the ground from collapsing during the construction of hydraulic engineering installations, such as dams, embankments, lock chambers, docks, and cofferdams. It also provides a temporary enclosure for foundation areas or trenches. Very high sheet piling is equipped with stays, or steel braces, which are located in the upper part of the wall and are anchored in soil not subject to collapse. The piles are driven into the ground by pile drivers or by means of vibration drivers. [29–1410–4]

SHEFFIELD, a city and county borough in Great Britain, situated on the Don River. Capital of the metropolitan county of South Yorkshire. Population, 558,000 (1976). Sheffield, a major center of heavy industry, is the country's largest producer of quality steel. The city produces machinery, including machine tools and electrical-engineering and hydraulic equipment. It has long been known for its metalwork, hardware, cutlery, and jewelry. Arms are also produced. Other important branches of industry are food-processing and light industry.

Museums in Sheffield include the Sheffield Municipal Museum (founded 1875), which houses a collection of metalware, and the Mappin and Graves art galleries. The city has a university. [29–1168–1]

SHEFNER, VADIM SERGEEVICH. Born Dec. 30, 1914 (Jan. 12, 1915), in Petrograd. Soviet Russian writer. Member of the CPSU since 1945.

Shefner, the son of a military man, studied in the *rabfak* (workers' school) at the University of Leningrad and served in the Great Patriotic War (1941–45). His poetry collection *Defense* (1943), his narrative poem *Meeting in the Suburb* (1945), and his novella *Sister of Sorrow* (1970) were devoted to the heroic defenders of Leningrad. In his poetry collections *Signs of the Earth* (1961), *Vaults* (1967), and *Freeboard* (1970) he turned toward the traditions of Russian philosophical lyric poetry.

Shefner has also written tales of fantasy, entertaining and ironic in tone, that raise moral questions. They include the novellas *Girl at the Precipice, or The Notes of Kovrigin* (1964), *The Man With Five "No's," or the Confession of a Simpleton* (1967), and *The Utter Mystery* (1970).

SHEFSTVO, in the USSR, a type of social activity. It consists of systematic comradely assistance rendered by an organization or institution (the chief, or *shef*) to another group. For example, *shefstvo* may apply to a kolkhoz, school, or military unit. [29–1167–1]

SHEGARKA, a river in Novosibirsk and Tomsk oblasts, RSFSR; a left tributary of the Ob'. The Shegarka measures 382 km in length and drains an area of 12,000 sq km. It rises on the southeastern part of the Vasiugan Plain and is fed mainly by snow. The mean flow rate 177 km from the mouth is 12.6 cu m per sec.

The Shegarka freezes in late October or November, and the ice breaks up in the second half of April or early May. In the upper course it freezes through for two or three months in some winters, and in the summer it dries up. The Shegarka is used to float timber. It is navigable for a distance of 214 km from the mouth. [29–1077–2]

SHEHU, MEHMET. Born Jan. 10, 1913, in Corrushi, in southern Albania; died Dec. 17, 1981. Albanian state and political figure.

Shehu studied at a military school in Naples in the mid-1930's. From 1937 to 1939 he fought in the ranks of the international brigades in Spain. Interned in France in 1939, he returned to Albania in 1942 and took part in the struggle against the fascist occupiers and in the activities of the Communist Party of Albania (CPA; since 1948, Albanian Workers Party [AWP]). In 1943, Shehu was elected a candidate member of the Central Committee of the CPA. In 1943 and 1944 he commanded the 1st Partisan Brigade and then a division of the National Liberation Army. In 1944 and 1945 he was a member of the Antifascist National Liberation Council.

After the liberation of Albania from fascist troops in November 1944, Shehu became deputy chief of the General Staff of the People's Army; he twice served as chief of the General Staff, in 1946 and 1947 and again in 1948. He became a member of the Central Committee of the AWP and the Politburo of the Central Committee in 1948; from 1948 to 1953 he was secretary of the Central Committee. From 1948 to 1954, Shehu was deputy chairman of the Council of Ministers and minister of internal affairs. He became chairman of the Council of Ministers in 1954 and was appointed to the additional post of minister of national defense in 1974. Shehu was first elected a deputy to the People's Assembly in 1947. [29–1169–3]

SHEIBANIDS (also Shaybanids), the descendants of Shiban, a son of Jochi and brother of Batu.

One of the most important of the Sheibanids was the founder of the Sheibanid dynasty of Uzbek khans, Muhammad Sheibani (1451–1510), a son of Shah-Budag-Sultan and grandson of Abulkhair (Abu al-Khayr). In 1499, Sheibani Khan embarked on the conquest of Mavera-un-Nahr; in 1500 he took the Timurid capital of Samarkand and founded the Sheibanid state. He established his rule over all Mavera-un-Nahr and Khorasan and in 1508 and 1509 plundered the Kazakhs. In 1510, Sheibani Khan was defeated and killed at Merv by the Iranian shah Ismail I.

After the death of Sheibani Khan's uncle, Kochkunju Khan (ruled 1510–30), and the brief reign of his son Abu Said (ruled 1530–33), Sheibani Khan's nephew Abu al-Ghazi (ruled 1533–39) became the head of the Sheibanid state. The Sheibanids, who considered themselves the rightful successors to the Timurids, warred continuously with the Safavids for Khorasan and the second Timurid capital, Herat.

Under Abdullah-Khan II ibn Iskander (ruled 1557–98), from 1583 khan of all the Uzbeks, the power of the khan was strengthened considerably. After the death of Iskander and the assassination of his son Abd al-Mumin, the Sheibanid dynasty came to an end. Pir Muhammad II, the last Sheibanid, controlled only a small part of the state; he was killed, in an internecine struggle, the same year he took power. The Ashtarkhanids, succeeded the Sheibanids in 1599.

SHEIBANID STATE, a feudal state in Middle Asia from 1500 to 1598. The capital was at Samarkand until 1560, when it was moved to Bukhara.

The Sheibanid state was formed after nomadic Uzbeks under Sheibani Khan arrived in Middle Asia and conquered central Mavera-un-Nahr (*see* SHEIBANIDS). The state included all the former possessions of the Timurids. After Sheibani Khan was routed by the Iranian shah Ismail I Safavid in 1510, it divided into two Uzbek states: the Sheibanid state in Mavera-un-Nahr and the Khiva Khanate, which was independent of the Sheibanids and had its capital initially at Urgench and later at Khiva; the former Timurid possessions in Khorasan passed to Iran.

The Sheibanid state was divided into districts that were controlled by members of the dynasty. Among the largest districts were Bukhara, Samarkand, Tashkent, Balkh, and Khisar. To the ruler of the state belonged the outward prerogatives of power: he bore the honorific title of khan, his name was invoked during the Friday prayer, and silver coins were minted with his name.

The institution of land grants—the *soyurghal* and *tiyul*—underwent further development in the Sheibanid state. As a result of redistribution, the state lands came to be owned by the dynasty and by elite clans from nomadic Uzbek tribes that had come from the steppes. The exploitation of the peasantry consisted mainly of a tax rent, most of which was a fixed amount equal to 30–40 percent of the harvest and was collected in kind.

Numerous campaigns and raids on Khorasan and continual internecine strife among the feudal lords led to extensive destruction of the economy. A brief period of stability that began under Abdullah-Khan II ibn-Iskander was insufficient to repair the damage inflicted on handicrafts and trade. An important factor in the development of the Sheibanid state was the establishment of economic and diplomatic relations with Russia and with the Mogul Empire in India.

Under the Sheibanid state the designation "Uzbeks" was first applied to the Turkic-speaking population of Mavera-un-Nahr and Khorasan; the Old Uzbek literary language reached an advanced state of development. The leading cultural center was Bukhara, whose most famous poets and prose writers were Khodzha Hassan Nisari, Zainaddin Vasifi, Kamal al-Din Benai, and Abdurakhman Mushfiki. In the 16th century large-scale historical works devoted to the state were written, notably Benai's *Sheibani-name* and *Futukhati-khani*, Muhammad Salikh's *Sheibani-name*, Khwandamir's *Habib-al-siyar*, Ruzbehan's *Mekhmannamai Bukhara*, and Hafiz Tanysh's *Abdullah-name*.

SHEIDAI. Born circa 1730; died 1800. Turkmen poet.

Sheidai, a member of the Salor tribe, lived in the Bukhara Khanate. In his poems he denounced the vices of society and abuse of power, in particular the duplicity and sanctimoniousness of the clergy. Setting his hopes on the enlightenment and self-improvement of man, he called for diligence, humaneness, and modesty. In the poem "The Condition of the Turkmens," he glorified the Ghuz-Turkmen tribes of the ninth to 13th centuries, contrasting them with the spiritually impoverished society of the 18th century.

Sheidai's lyric love poems followed the canons of Eastern poetry with its stereotyped images, similes, and flowery epithets. His works were influenced greatly by Persian culture, for example, his *dastan* of love and adventure *Gul and Sanubar* (translated into Russian as *Prince Sanubar*, 1909).

SHEIKH, among Arab nomads the head or leader of a clan, tribe, or tribal alliance. In Islamic countries the term also acquired the general meaning of a venerable man; it is most often applied to leaders of Muslim sects and dervish orders (equivalent terms are "pir" and "murshid"), prominent theologians, and Muslim jurists. On the southern Arabian Peninsula and in the area of the Persian Gulf, several small states are ruled by sheikhs. [29–1086–4]

SHEIKHZADE, MAKSUD. Born Oct. 25 (Nov. 7), 1908, in Agdash, in what is now the Azerbaijan SSR; died Feb. 19, 1967, in Tashkent. Soviet Uzbek writer. Honored Art Worker of the Uzbek SSR (1964). Azerbaijani by nationality. Member of the CPSU from 1960.

Sheikhzade graduated from the Baku Pedagogical Institute in 1933 and taught the history of Uzbek literature at the Tashkent Pedagogical Institute from 1938. He first published his works in 1929. In the collection *The Third Book* (1934) he introduced free verse into Uzbek poetry. His poems employed motifs from contemporary life, and his civic lyric poetry was especially topical. He was the author of the collection of patriotic poems *For What Are We Fighting?* (1942) and such narrative poems as *Zhenia, The Third Son*, and *Aksakal*, which were devoted to the Great Patriotic War (1941–45). The drama *Dzhalaliddin* (1941) dealt with the struggle against the Mongol invasion in the 13th century. In 1958, Sheikhzade published the lyric philosophical *Poem About Tashkent* (Russian translation, 1959), and in 1961, the collection of lyric poems *Years and Roads*. The tragedy *Mirza Ulug Beg* (1964; Russian translation, 1966) is devoted to the famous 15th-century Uzbek astronomer. Sheikhzade translated the works of A. S. Pushkin, M. Iu. Lermontov, Shakespeare, V. V. Mayakovsky, and N. S. Tikhonov into Uzbek.

Sheikhadze was awarded the Order of the Badge of Honor and several medals.

SHEIN, ALEKSEI SEMENOVICH. Born 1662; died Feb. 12, 1700. Military leader and state figure of Russia; great-grandson of M. B. Shein.

A. S. Shein received the rank of boyar in 1682 and that of *blizhnii*, or privy, boyar in 1695. He served as *voevoda* (military governor) in Kursk in 1683 and 1684. Shein was one of the military commanders who fought in the Crimean campaigns of 1687 and 1689 and in the Azov Campaign of 1695. He was commander in chief of the land forces in the Azov Campaign of 1696 and was granted the title generalissimo.

During the period of the Great Embassy, Shein was appointed by Peter I as commander in chief of the Russian Army and head of three military *prikazy* (offices). Shein defeated large Crimean Tatar and Nogai forces in 1697 and suppressed the uprising of the *strel'tsy* (semiprofessional musketeers) in 1698. [29–1080–4]

SHEIN, MIKHAIL BORISOVICH. Date of birth unknown; died Apr. 28, 1634. Russian military leader and state figure. Helped suppress uprisings of peasants and *kholopy* (bondmen) in 1602 and 1603 and the peasant uprising led by I. I. Bolotnikov in 1606 and 1607.

Shein became an *okol'nichii* (a noble ranking below the boyars) in 1605 and a boyar in late 1606 or early 1607. In late 1607 he was appointed *voevoda* (military governor) of Smolensk. During the intervention in Russia by Polish and Lithuanian feudal lords, Shein directed the defense of Smolensk of 1609–11. When the Poles took Smolensk on June 3, 1611, the wounded Shein was captured and taken to Poland with his family.

Shein returned to Russia in 1619 and became one of the closest associates of Patriarch Filaret. Shein headed a *sysknoi prikaz*, or office for the search, pursuit, and capture of fugitive *posadskie liudi* (merchants and artisans), in 1620 and 1621 and from 1625 to 1628 and the Pushkarskii Prikaz (Office of Field Ordnance) from 1628 to 1632. In the 1620's and early 1630's he took part in numerous diplomatic negotiations, some of them secret.

In April 1632, Shein was appointed commander of the army in the Russo-Polish War of 1632–34. After the Russian troops were

forced to capitulate on Feb. 15, 1634, he was unjustly accused of numerous mistakes and crimes, including treasonous acts beneficial to Władysław IV, and was executed by order of the Boyar Duma. Shein's property was confiscated, and members of his family were exiled. [29–1081–1]

SHEIN, PAVEL VASIL'EVICH. Born 1826 in Mogilev; died Aug. 14 (27), 1900, in Riga. Russian and Byelorussian folklorist and ethnologist.

Shein began collecting folklore materials in the mid-1850's. His works, which are well organized and contain a wealth of material, include the collections *Russian Folk Songs* (1870), *Byelorussian Folk Songs* (1874), *Materials for the Study of the Life and Language of the Russian Population of Northwestern Krai* (vols. 1–3, 1887–1902), and *Great Russia in Its Songs, Ceremonies, Customs, Beliefs, Stories, and Legends* (vol. 1, fascs. 1–2, 1898–1900).

SHEINDLIN, ALEKSANDR EFIMOVICH. Born Aug. 22 (Sept. 4), 1916, in Kuibyshev. Soviet specialist in heat physics and power engineering. Academician of the Academy of Sciences of the USSR (1974; corresponding member, 1964). Member of the CPSU from 1945.

After graduating from the Moscow Power Engineering Institute in 1937, Sheindlin first worked as an engineer in a factory and then as an assistant at the institute. From 1941 to 1945 he was in the Red Army. From 1945 to 1967 he worked at the Moscow Power Engineering Institute, where he received the doctor of technical sciences degree in 1954 and became a professor in 1955. He became head of a laboratory at the Institute of High Temperatures of the Academy of Sciences of the USSR in 1960 and the institute's director in 1961. Since 1967 he has also been head of a subdepartment at the Moscow Physicotechnical Institute.

Of great importance have been Sheindlin's experimental and theoretical studies of the thermodynamic properties of water vapor at supercritical parameters. Sheindlin directed the construction and successful operation of the world's first experimental model magnetohydrodynamic installation (U-02, 1964) for the direct conversion of heat energy into electricity and the first such industrial pilot installation (U-25, 1971).

Sheindlin received the Lenin Prize in 1959, the State Prize of the USSR in 1976, and the Polzunov Prize in 1963. He has been awarded the Order of Lenin, two other orders, and various medals.

SHEINKMAN, IAKOV SEMENOVICH. Born Dec. 22, 1890, in Tobol'sk; died Aug. 8, 1918, in Kazan. Figure in the Russian revolutionary movement. Member of the Communist Party from 1910.

The son of a worker, Sheinkman entered the University of St. Petersburg in 1910; he was arrested for taking part in student disturbances and placed in the prison known as Kresty. After his release, Sheinkman emigrated to Switzerland in 1912 and took part in the Basel Congress of the Second International. He became involved in party work in Ekaterinburg (now Sverdlovsk) in 1914.

In September 1917, Sheinkman traveled to Kazan, where he served as deputy chairman of the provincial food committee and chairman of the RSDLP(B) faction in the Kazan soviet. He served on the Investigatory Commission of the Petrograd military revolutionary committee in October 1917 and became chairman of the Kazan soviet and of the provincial committee of the RCP(B) in November.

Sheinkman was a delegate to the Fifth All-Russian Congress of Soviets and a member of the commission appointed to frame a draft of the Constitution of the RSFSR. He helped suppress the Left Socialist-Revolutionary Revolt of 1918 and served on the investigatory commission of the Council of People's Commissars that conducted an inquiry into the revolt.

Beginning on July 19, 1918, Sheinkman directed the defense of Kazan against the White Czechs. After the city was taken, Sheinkman was captured by White Guards and shot.

SHEINMANN, IURII MIKHAILOVICH. Born June 17 (30), 1901, in Kiev; died Apr. 4, 1974, in Moscow. Soviet geologist. Doctor of geological and mineralogical sciences (1946). Honored Scientist of the RSFSR (1973).

Sheinmann graduated from the Leningrad Institute of Mines in 1927. Between 1923 and 1938 he worked on the Geological Committee and conducted studies in Transbaikalia, the Tien-Shan Mountains, and Sinkiang. Between 1939 and 1946 he worked on a study of the geological structure, tectonics, and magmatism of the northern part of the Siberian Platform. Beginning in 1947, he worked at various geological institutions in Siberia and Moscow and conducted field studies in the Altai and Saian mountains and in various areas of the northeastern part of the USSR. From 1960 he worked at the O. Iu. Shmidt Institute of Earth Physics of the Academy of Sciences of the USSR.

Sheinmann's main works were devoted to general problems of tectonics, the clarification of the relationship between magmatic and tectonic processes, and the origin of magmas, particularly alkaline magmas. Sheinmann developed the idea of the earth's abyssal structure, the tectosphere, which predetermines the appearance and development of geosynclines.

SHEINOVO, a village in Bulgaria, south of Shipka Pass, the scene of a battle on Dec. 27–28, 1877 (Jan. 8–9, 1878), during the Russo-Turkish War of 1877–78.

The Turkish forces of 30,000–35,000 men, commanded by Vesel Paşa, occupied positions in the mountains on the approaches to Shipka Pass and in a fortified camp at Sheinovo. During the winter Russian offensive, the Southern Detachment of General F. F. Radetskii (54,000 men), located in the region of Shipka and nearby passes, was assigned the mission of crossing the Balkans and advancing on Kazanluk and Adrianople. Two detachments were to cross the Balkans: the left column, under the command of General N. I. Sviatopolk-Mirskii (about 19,000 men, including one Bularian unit, and 24 guns), and the right column, under the command of General M. D. Skobelev (16,500 men, including five Bulgarian units, and 14 guns). They were to advance through Triavna (Tryavna) and Imitli passes, respectively, and envelop Vesel Paşa's main forces (23,000 men) from the flanks, near Sheinovo. Part of the Southern Detachment was to pin down the Turkish troops by attacks from the direction of Shipka Pass.

The offensive began on December 24 (January 5); the troops advanced slowly, especially the right column, because of the difficulty of traveling on narrow mountain roads deeply covered with snow. On December 26 (January 7), the left column assembled to the south of Triavna Pass; the right column was delayed, and its advance party did not take Imitli until the night of December 26 (January 7). On the morning of December 27 (January 8), the left column attacked the Sheinovo camp from the east, took the first line of fortifications, and repulsed a Turkish counterattack.

The right column, which had not had time to assemble, limited itself to feints. On December 28 (January 9), the Turkish troops attacked the left column twice but were driven back. The Russian troops occupied the village of Shipka (northeast of Sheinovo) and one eastern redoubt, approaching the Sheinovo camp from the east. Soon after, the right column, which had approached the Turkish camp from the west at a quick march, passed to the offensive and seized one western redoubt. The surrounded Turkish troops surrendered at 3 P.M.

A total of 22,000 men, under the command of Vesel Paşa, were taken prisoner, and 83 guns were captured. The Turkish losses were 1,000 dead and wounded, while the Russian losses amounted to 5,000. As a result of the elimination of the strong Turkish grouping in the Sheinovo area, the enemy line of defense was breached and the road to Adrianople lay open. [29–1085–1]

SHEKHTEL', FEDOR OSIPOVICH. Born July 26 (Aug 7), 1859, in St. Petersburg; died July 7, 1926, in Moscow. Soviet architect. Academician of Architecture of the St. Petersburg Academy of Arts (from 1902). Chairman of the Moscow Architectural Society (1906–22).

Shekhtel' taught at the Stroganov Industrial Arts School from 1896 to 1926. He was a prominent representative of *art nouveau* at the turn of the century. His works included a trade building on Kirov Street (1898), the former Riabushinskii house on Kachalov Street (1900), the Yaroslavl Railroad Station (1902), and architectural details on the Art Theater (1902), all in Moscow. His later buildings were distinguished by more rational and severe forms, including the trade building of the Merchants' Society on Malyi Cherkasskii Lane (1909) in Moscow.

SHEKHURDIN, ALEKSEI PAVLOVICH. Born Mar. 10 (22), 1886, in the village of Bykovo, Urzhum District, Viatka Province (present-day Urzhum Raion, Kirov Oblast); died Mar. 1, 1951, in Saratov. Soviet plant breeder. Honored Scientist of the RSFSR (1947).

Shekhurdin studied at the Aleksandrovo-Nartassy Agricultural School in Viatka Province from 1901 to 1904. He graduated from the Saratov Agricultural Institute in 1928. From 1904 to 1907, Shekhurdin trained at and then managed Professor I. A. Stebut's farm in the village of Krotnoe, Tula Province. In 1911 he became a laboratory assistant at the Saratov Agricultural Experiment Station (now the Scientific Research Institute of Agriculture of the Southeast). Between 1920 and 1924 he developed several varieties of spring wheat, including Lutestsens 62, Al'bidum 604, and Gordeiforme 432. He became a professor in 1945. From 1946 to 1948, Shekhurdin worked in the subdepartment of plant breeding and seed raising of the Saratov Agricultural Institute. He was the first in the USSR to develop and apply to the breeding of grain crops the techniques of nonrelated and multiple complex hybridization.

A recipient of the State Prize of the USSR in 1942, Shekhurdin was also awarded the Order of Lenin and two other orders.

SHEKI, a historical region in northern Azerbaijan, north of the Kura River. From the third to fifth centuries, Sheki was a region of Caucasian Albania. In 654 it was captured by the Arabs. In the ninth century its rulers attempted to extend their influence to Aran.

Sheki is first mentioned in historical sources as an independent state in the late 14th century; its ruler was Sidi Ahmed Orlat, who belonged to the turkized Mongol tribe of the Orlats. In 1402 troops from Sheki took part in Tamerlane's campaign against the Turkish sultan Bayazid. Under the Kara Keshish Ogly dynasty, which ruled from 1444 to 1551, Sheki was a flourishing agricultural country, and it produced beautiful silk, which was its principal export commodity. After the rise of the Safavid state, Sheki at times recognized the authority of the Safavids, but it retained a considerable degree of autonomy.

In 1551 Sheki's forces were defeated by the Iranian shah Tahmasp, and Sheki lost its independence. In the mid-18th century, however, the Sheki Khanate arose on the territory.

Krymskii, A. E. "Stranitsy iz istorii Severnogo ili Kavkazskogo Azerbaidzhana (Klassicheskoi Albanii): Sheki." In *Pamiati akad. N. Ia. Marra*. Moscow-Leningrad, 1938. Pages 369–84. [29–1088–5]

SHEKI (until 1968, Nukha), a city under republic jurisdiction and the administrative center of Sheki Raion, Azerbaijan SSR. Located in the southern foothills of the Greater Caucasus, 77 km north of the Evlakh railroad junction. Population, 44,000 (1974).

Sheki has a silk production association, a garment factory, a tobacco fermentation plant, a brickyard, a meat-packing plant, and a combine of the food-processing industry. Educational institutions include textile and agricultural technicums and pedagogical, medical, and music schools. A people's amateur theater and a museum of local lore are located in the city. A house-museum is devoted to the Azerbaijani writer and educator M. F. Akhundov, who was born in Sheki. The Palace of the Khans of Sheki is also open as a museum. [29–1089–1]

SHEKI KHANATE, a feudal state in northern Azerbaijan that existed from the mid-18th century to the early 19th century.

The khanate was established during the struggle of the Azerbaijanis, led by Itadji Chelebi-khan, against Persian domination. It was divided into eight *magals* (districts), each of which was governed by a *naib*. The economy was based on agriculture, especially sericulture, but handicrafts were also highly developed.

Beginning in the late 18th century, the khans of Sheki sought protection from Russia to meet the threat of Persian conquest. In 1805 a treaty was signed uniting the khanate with Russia; the union was confirmed by the Treaty of Gulistan in 1813. In 1819 the khanate became a *provintsiia* (subprovince) under Russian military administration. In 1840 the *provintsiia* was renamed Sheki District and incorporated into Caspian Oblast. The area became part of Baku Province in 1859 and Elizavetpol' Province in 1868.

SHEKSHEMA, an urban-type settlement in Shar'ia Raion, Kostroma Oblast, RSFSR. Shekshema is served by a railroad station on the Bui-Kotel'nich line. The settlement has a forestry station of the Shar'ia Logging and Timber Distribution Establishment and a plant that produces wooden containers. [29–1098–2]

SHEKSNA, an urban-type settlement and the administrative center of Sheksna Raion, Vologda Oblast, RSFSR. Water, railroad, and highway routes intersect at Sheksna. Situated on the Vologda-Leningrad highway, the settlement is served by the Sheksna railroad station and has a landing on the Volga-Baltic Waterway. It has a poultry farm, a butter factory, and plants that manufacture fiberboard and wood and flax products. The Muzlesdrev Timber Plant and a hydroengineering complex are also located at Sheksna. [29–1090–4]

SHEKSNA, a river in Vologda Oblast, RSFSR; a left tributary of the Volga. The Sheksna is 139 km long and drains an area of 19,000 sq km. It rises in Beloe Lake and empties into Sheksna Bay of the Rybinsk Reservoir. The river is fed primarily by snow.

Its mean flow rate 28 km from the mouth is 172 cu m per sec. The Sheksna freezes over between late October and December, and the ice breaks up in April or early May. Its flow is regulated by the Cherepovets Hydroengineering Complex, which raises the water level of Beloe Lake. The river is part of the Volga-Baltic Waterway and the Severnaia Dvina Waterway System. The city of Cherepovets is situated on the shore of Sheksna Bay, near the mouth of the river. [29–1090–3]

SHELAGSKII, CAPE, a cape in northeast Asia, at the entrance to Chaun Bay, an inlet of the East Siberian Sea. The cape is situated at 70° 06′ N lat. and 170° 36′ E long. It is rocky and juts out into the sea for 9 km. [29–1098–3]

SHELAPUTY (also Shaloputy), a Russian religious sect akin to the Khlysty (*see* KHLYST). [29–1098–4]

SHELEBI, NIKOLAI IVANOVICH (real surname, Polorussov). Born May 1 (13), 1881, in the village of Novoe Uzeevo, in what is now Aksubaevo Raion, Tatar ASSR; died Jan. 12, 1945, in Cheboksary. Soviet Chuvash poet. People's Poet of the Chuvash ASSR (1936).

Shelebi was the son of a poor peasant. In his first work, the song "Russia" (1905), he exposed the unjust social order of tsarist Russia and called upon the people to struggle against it. In the poem "The Serpent" (1907), he used allegory to express his confidence in the ultimate defeat of the forces of evil. Between 1912 and 1915, Shelebi composed the satirical poem "Vasianka" and the narrative poem *Cheremshan and Kondurcha*. His poems and songs written after the Great October Revolution include "Lenin," "A Chuvash Woman," and "The Chuvash Kolkhoz."

Although Shelebi lost his sight in 1931, he continued to write. The verses he produced during the Great Patriotic War of 1941–45 attracted a wide audience. Among the most famous of these works are "I Summon," "The Storm," and "The Song of a Hero Pilot." Shelebi was awarded the Order of the Badge of Honor.

SHELEKHOV (also Shelikhov), a city under oblast jurisdiction in Irkutsk Oblast, RSFSR. Shelekhov has a railroad station (Goncharovo) on the Trans-Siberian Railroad, 20 km southwest of Irkutsk. Shelekhov was founded in 1962 during the construction of an aluminum plant nearby. Industry is represented by shops that repair tractors and other machinery and plants that manufacture cable, lime, asphalt concrete, reinforced-concrete products, and wood products. The city was named in honor of G. I. Shelikhov. [29–1102–1]

SHELENKOV, ALEKSANDR VLADIMIROVICH. Born Dec. 13 (26), 1903, in the village of Zamesh'e, in what is now Smolensk Oblast. Soviet cameraman. Honored Art Worker of the RSFSR (1959).

Shelenkov graduated from the department of camera operation of the State Technicum of Cinematography in 1929. Until 1945 he was a cameraman for the Soiuzdetfil'm motion-picture studio, and after 1945 he worked for Mosfil'm. He worked with the cameraman I. E. Chen beginning in 1944.

Shelenkov's films have included *Dzhul'bars* (1936), *Salavat Iulaev* (1941), *Zoia* (1944), *Rainis* (1949), *Far From Moscow* (1950), *Admiral Ushakov* (1953), *The Ships Are Storming the Bastions* (1953), *Romeo and Juliet* (1955), the joint Soviet-Bulgarian film *A History Lesson* (1957), *The Communist* (1958), the joint film of the USSR and the German Democratic Republic (GDR) *Five Days, Five Nights* (1961), and the joint Soviet-Polish film *Jarosław Dąbrowski* (1974–76). Shelenkov and Chen also shot a number of scenes for the film *War and Peace* (1966–67), including the battles of Schöngrabern and Austerlitz and the hunt.

Shelenkov was awarded the State Prize of the USSR in 1946, 1947, 1950, and 1951. He has been awarded two orders and several medals.

SHELFORD, VICTOR ERNEST. Born Sept. 22, 1877, in Chemung, N.Y.; died Dec. 27, 1968. American zoologist; specialist in ecology, primarily the ecology of aquatic organisms. First president of the Ecological Society of America.

Between 1904 and 1914, Shelford worked at the University of Chicago. Beginning in 1914, he worked at the University of Illinois, where he held the rank of professor from 1927 to 1946.

Shelford's main works dealt with biocenology—with its theory and terminology and with the methodology of field and laboratory studies. In addition to hydrobiological experiments, Shelford studied the interaction of organisms in terrestrial communities, the effect of climate on a community, and succession. He worked on the classification of mixed communities. Shelford was the first to describe the nature of North America from the ecological point of view.

SHELGUNOV, NIKOLAI VASIL'EVICH. Born Nov. 22 (Dec. 4), 1824, in St. Petersburg; died there Apr. 12 (24), 1891. Russian revolutionary democrat, journalist, and literary critic.

The son of a nobleman, Shelgunov graduated from the Forestry Institute in 1841 and joined the staff of the forestry department of the Ministry of State Domains. He became a professor at the Forestry Institute in the late 1850's and produced a number of works on forestry.

Shelgunov made the acquaintance of M. L. Mikhailov in 1855. During a trip to London in 1858 and 1859, the two men met A. I. Herzen and N. P. Ogarev. Upon his return to Russia, Shelgunov became an associate of N. G. Chernyshevskii and contributed to the journals *Sovremennik*, *Russkoe slovo*, and *Vek*. He took part in the revolutionary movement of the 1860's and, with Mikhailov, wrote the proclamation *To the Younger Generation*. He was also the author of the proclamation "To Russian Soldiers From Their Well-wishers," which was not published. In his article "The Working Proletariat in England and France" (*Sovremennik*, 1861, nos. 9–11), Shelgunov familiarized the Russian public with F. Engels' work *The Condition of the Working Class in England*.

In 1862, Shelgunov resigned his position and went to Nerchinsk Krai, where Mikhailov was serving a sentence of hard labor. As a result of an official investigation of the proclamations, Shelgunov was arrested in Irkutsk in March 1863. He was brought to St. Petersburg and imprisoned in the Aleksei Ravelin. At the end of 1864 he was exiled to Vologda Province, and until 1877 he lived as an exile in various provincial cities.

Shelgunov became a leading contributor to the journal *Delo* in 1866 and took on the duties of editor after G. E. Blagosvetlov died in November 1880. Arrested on June 28, 1884, for maintaining contacts with émigrés, Shelgunov was exiled to Smolensk Province for five years.

Between 1886 and 1891, Shelgunov published in the journal *Russkaia mysl'* a series of articles entitled "Sketches of Russian

Life." In numerous articles on history, economics, and social relations, he called for a peasant revolution, which, he believed, could bring Russia straight to socialism, without going through capitalism. In his view, social progress depended on the struggle of the masses against exploitation. In the last years of his life Shelgunov, influenced by Marxism, moved toward an understanding of the leading role of the working class in the revolutionary movement. During the 1880's he criticized Tolstoyism and the small deeds theory.

In his literary criticism Shelgunov upheld the principles of realism and civic responsibility. He discussed the problem of the positive hero and national character in literature and criticized the advocates of the theory of art for art's sake.

Shelgunov's funeral on Apr. 15 (27), 1891, turned into a large antigovernment demonstration, in which many thousands of people, including workers, took part.

SHELGUNOV, VASILII ANDREEVICH. Born Aug. 8 (20), 1867, in the village of Slavkovichi, Pskov Province; died Apr. 2, 1939. One of the earliest participants in the social democratic movement in Russia. Member of the Communist Party from 1898.

The son of a peasant, Shelgunov became a factory worker in St. Petersburg in 1876, but his involvement in the revolutionary movement began in 1866. He belonged to the Social Democratic group of P. V. Tochisskii and later to that of M. I. Brusnev; in 1893 he was a member of the St. Petersburg League of Struggle for the Emancipation of the Working Class. Shelgunov was arrested in December 1895 and exiled to Arkhangel'sk Province. In 1900 he became a member of the Ekaterinoslav committee of the RSDLP, and from 1902 to 1904 he was a member of the Baku committee.

In the fall of 1904, Shelgunov moved to St. Petersburg to receive treatment for a worsening eye disease. In 1905 he performed agitational work on assignment from the St. Petersburg committee of the RSDLP, but in December he was arrested. He completely lost his sight in 1906 while he was in prison. Nevertheless, during the reactionary years of 1908 to 1910 he continued to carry out party work. In 1911, Shelgunov was the official editor of the Bolshevik newspaper *Zvezda*, and in 1912 he helped found *Pravda*. From 1912 to 1916 he was in administrative exile in the Northern Caucasus.

Shelgunov served on the agitational collegium of the St. Petersburg committee of the RSDLP(B) in 1917 and on the agitational collegium of the Moscow committee in 1918. From 1918 to 1920 he carried out underground work in the Kuban'. In 1920 he took up a position in Moscow.

Shelgunov became a personal pensioner in 1924. He was a member of the Presidium of the All-Union Society of Old Bolsheviks. In 1920 Shelgunov took part in the work of the Second Congress of the Comintern.

SHELGUNOV DEMONSTRATION, a demonstration that took place in St. Petersburg on Apr. 15 (27), 1891, at the funeral of N. V. Shelgunov. Planned as a limited display of antigovernment feeling, it turned into a major political demonstration against tsarism; between 6,000 and 7,000 people, including workers, students, and members of the democratic intelligentsia, took part.

The Brusnev group, one of the earliest Russian Social Democratic organizations, helped plan the demonstration, and approximately 100 of the group's working-class members marched behind Shelgunov's coffin. K. M. Norinskii and S. I. Funtikov carried a wreath sent by the workers of St. Petersburg.

On the following day, the police made arrests, and L. B. Krasin, N. K. Mikhailovskii, P. V. Zasodimskii, and others were exiled from the city. The demonstration was the first public act of working-class Social Democrats and, as such, represents a milestone in the growth of Social Democracy in Russia.

SHELIKHOV, GRIGORII IVANOVICH (also G. I. Shelekhov). Born 1747 in Ryl'sk, in what is now Kursk Oblast; died July 20 (31), 1795, in Irkutsk. Russian navigator and merchant.

Beginning in 1775, Shelikhov organized voyages of merchant vessels to the Kuril and Aleutian islands. Between 1783 and 1786 he led an expedition to the shores of Russian America; during this period the first Russian settlements were established in the territory. Shelikhov was one of the founders of the Russian-American Company, which was officially formed in 1799, and in 1790 he became governor of the Russian settlements in Russian America. Shelikhov's name was given to a gulf in the Sea of Okhotsk, a strait between the Alaska Peninsula and Kodiak Island, and a city in Irkutsk Oblast.

SHELIKOF STRAIT, a strait between the Alaska Peninsula and Kodiak Island, connecting Cook (Kenai) Inlet with the Pacific Ocean. Shelikof Strait is approximately 350 km long and ranges in width from 50 to 150 km. In most places, it is between 150 and 200 m deep. It has steep shores and experiences semidiurnal tides. The strait has a strong tidal current with a velocity of up to 15.5 km per hour. [29–1103–2]

SHELIKOV, GULF OF, northeastern extension of the Sea of Okhotsk bounded by the Kamchatka Peninsula. The gulf has a length of 650 km, a maximum width of 300 km, and a width of 130 km at the mouth. In the north, the gulf divides into the Gizhiga and Penzhina bays. The coasts are mainly rugged, except in the southeast, where they are low-lying. Depths range generally from 50 m to 150 m and reach a maximum of 350 m. The tides are diurnal and irregular, with heights of up to 12.9 m in Penzhina Bay. The gulf is covered with ice from December to May. The Gizhiga, Penzhina, and other rivers empty into it. Bird colonies are found on the coastal cliffs. Herring, flounder, navaga, and fish of the Osmeridae family are caught commercially. The gulf is named in honor of G. I. Shelikov. [29–1103–1]

SHELLAC, a natural resin secreted by the lac insect, which parasitizes tropical and subtropical woody plants. Shellac apparently consists mainly of aliphatic polyhydroxy acids. It is freely soluble in alkalies and lower aliphatic alcohols, poorly soluble in benzene, and almost insoluble in gasoline, fats, and oils. Shellac is peeled off the tree bark, processed with hot water, melted, and filtered. It may be dark colored, orange, or light colored. Colorless shellac is obtained by bleaching the colored types with animal

charcoal, bleaching powder, or sodium sulfate. Shellac has limited uses, principally in the manufacture of alcohol varnishes and polishes. [29–1110–4]

SHELLER, ALEKSANDR KONSTANTINOVICH (pen name, A. Mikhailov). Born July 30 (Aug. 11), 1838, in St. Petersburg; died there Nov. 21 (Dec. 4), 1900. Russian writer.

Sheller studied in the department of history and philology at the University of St. Petersburg from 1857 to 1861. He first published his works in 1859. His first novels, *Putrid Swamps* (1864) and *The Life of Shupov, His Relatives, and His Friends* (1865), which were published in *Sovremennik*, dealt with the younger generation's involvement in the social struggle and with the problem of "fathers and sons."

Sheller's many later novels were very popular with young people, including *The Obnoskovs* (1868), *At Sixes and Sevens* (1869), *When Trees Are Felled Chips Fly* (1871), *Bread and Circuses* (1875), *By Hook or by Crook* (1884), and *Difficult Years* (1892). However, Sheller's heroes were politically moderate and interested mainly in spreading culture and education. Their limitations were sharply criticized by M. E. Saltykov-Shchedrin.

SHELLEY, MARY WOLLSTONECRAFT. Born Aug. 30, 1797, in London; died there Feb. 1, 1851. English writer. Daughter of W. Godwin; wife of P. B. Shelley.

The hero of Shelley's novel *Frankenstein, or The Modern Prometheus* (1818; Russian translation, 1965) creates a monster that tries to do good, but, embittered by loneliness, kills its creator. A gloomy picture of the coming downfall of mankind through epidemics and starvation is at the center of her novel *The Last Man* (1826). Shelley also wrote the autobiographical novel *Lodore* (1835) and commentaries to a posthumous edition of works by P. B. Shelley (1839).

SHELLEY, PERCY BYSSHE. Born Aug. 4, 1792, at Field Place, Sussex; died July 8, 1822, in the Gulf of Spezia; buried in Rome. English poet. Son of a baronet.

Shelley studied at the aristocratic school of Eton from 1804 to 1810 and later at Oxford University, from which he was expelled for publishing the treatise *The Necessity of Atheism* (1811, with T. J. Hogg). His marriage to the daughter of an innkeeper in 1811 caused a break with his father. Shelley's sociopolitical views developed under the influence of the ideas of the French Revolution and the works of 18th-century French Enlightenment writers, T. Paine, and especially W. Godwin, with whom Shelley became acquainted in 1813. In 1812 in Ireland, Shelley contributed to the propaganda for the political emancipation of the country from Great Britain (*An Address to the Irish People, Declaration of Rights*). A rebellious mood also characterized Shelley's first works of literature—the anonymously published Gothic novels *Zastrozzi* (1810) and *St. Irvyne* (1811), the collection of poems *Original Poetry by Victor and Cazire* (1810, with his sister Elizabeth), and his early political poems. In 1814, Shelley met Godwin's daughter, Mary, with whom he shared his subsequent destiny. Fleeing from persecution and slander, he lived permanently in Italy after 1818. He was drowned in a storm at sea.

In his first significant poetic work, the philosophical narrative poem *Queen Mab* (1813), Shelley's revolutionary-democratic credo, borrowed largely from Godwin's *An Enquiry Concerning Political Justice*, was set forth in the form of medieval visions. From 1818 to 1822 the poet wrote most of his longer works, including the novella in verse *Rosalind and Helen* (1818, published 1819), with its destructive criticism of the idyllic patriarchal family; the narrative poem *Julian and Maddalo* (1818, published 1824), born out of debates with Lord Byron about the power of the human spirit; the romantic tragedy *The Cenci* (1819), which is set in the Italian Middle Ages and which vindicates violence in the struggle with tyranny; the narrative poem *The Masque of Anarchy* (1819), a reaction to the police's firing on workers at a meeting in Manchester; the dramatic satire *Oedipus Tyrannus, or Swellfoot the Tyrant* (1820); the lyric drama *Hellas* (1821), devoted to a national liberation uprising in Greece; the narrative poem in honor of Keats, *Adonais* (1821); and the narrative poem *The Triumph of Life* (1822).

The main theme of Shelley's philosophical-allegorical narrative poem *The Revolt of Islam* (1818; originally published as *Laon and Cythna*, 1817) and the revolutionary lyric drama *Prometheus Unbound* (1820) is the conflict between despotism and freedom. In these works, as in *Queen Mab*, Shelley declares the inevitability of the victory of good and justice, when the flourishing of the creative forces of nature and of liberated man will reveal to the world a realm of eternal beauty and harmony. A spirit of mythological antiquity runs through such philosophical poems of Shelley's as "Hymn of Apollo," "Hymn of Pan," and "Song of Proserpine."

Scenes of nature in Shelley are combined with a subtlety of observation and a sense of pantheism. Shelley the atheist believed in a spirit of nature; everything that was real for him was living ("Arethusa," 1820, and "Love's Philosophy," 1819). Shelley perceived the political emancipation of mankind as consisting in the overcoming of evil in nature, as in "Ode to the West Wind." The soul of the poet is seen as fused with ever-renewing nature, and it romantically transforms existence ("The Cloud" and "Lines Written Among the Euganean Hills"). Shelley's lyric love poetry, including "A Bridal Song" and "To Jane," is humane and joyous, although it frequently contains a sorrowful, tragic note, as in "A Lament," "To Night," and "The Sensitive Plant."

Essentially close to the ideas of socialism, Shelley, a "great prophet" in the words of F. Engels, left many war and agitation poems, for example "To the People of England" (1819). The social purpose of literature and the mission of the revolutionary poet are the central problem of the aesthetic treatise "A Defence of Poetry" (1822, published 1840).

Vivid imagination, melodiousness of verse, and richness of rhythm impart originality to Shelley's poetry. It has had a vast influence on the poetry of the English-speaking countries and the world. Shelley's works have been translated into many languages, including Russian.

SHELL OIL COMPANY, a US oil monopoly. The company engages in petroleum exploration, extraction, and refining; the transportation and distribution of petroleum products; and the production of petrochemical and chemical goods. It is controlled by the Royal Dutch–Shell Group, an Anglo-Dutch monopoly.

The Shell Oil Company was founded in 1922. It extracted petroleum primarily in the United States until the early 1970's, when it became involved in petroleum prospecting and extraction in Canada, Senegal, Cameroon, New Zealand, and the coastal waters of Malaysia. Shell Oil refines petroleum in the United States and conducts research on the use of alternative energy sources, including bituminous sands and solar energy. In 1975 the company did $8.1 billion worth of business, including 60 percent in petroleum products, 20 percent petroleum, and 15 percent petrochemical and chemical products. Its net profit that year was $555 million. Shell Oil employed 32,500 people in 1975 and extracted 232 million tons of petroleum. [29–1110–3]

SHEL'MOVANIE, in Russia from 1716 to 1766, a type of dishonor applied to noblemen who were sentenced to death or permanent exile. *Shel'movanie* was introduced by the Army Regulations (Voinskii Ustav) of Peter I in 1716; it later came into use in civil courts. *Shel'movanie* consisted in breaking a sword over the offender's head or nailing a board with his name on it to the gallows. The person who was humiliated in this way was deprived of legal protection and all civil rights. *Shel'movanie* was later replaced by deprivation of all rights of status. [29–1119–1]

SHELON', a river in Pskov and Novgorod oblasts, RSFSR. The Shelon' measures 248 km in length and drains an area of 9,710 sq km. It flows over the Il'men' lowland and empties into Lake Il'men'. It is fed predominantly by snow. High water is from April through May, and there is flash flooding in autumn. The mean flow rate 59 km from the mouth is 43.6 cu m per sec. The Shelon' freezes in November or December, sometimes as late as March (1925), and the ice breaks up in March or April. It is navigable in the lower course. The cities of Porkhov and Sol'tsy are situated on the river. [29–1117–4]

SHELON', BATTLE OF THE (1471), the decisive battle on the Shelon' River in the war between Moscow and Novgorod in 1471; the war had been provoked by the anti-Moscow policies of the boyar government of Novgorod and its violation of the conditions of the Iazhelbidy Treaty of 1456.

The battle took place on the morning of July 14 on the left bank of the Shelon' River (between the mouth of the Shelon' and the city of Sol'tsy, possibly near the village of Skirino) after an unexpected encounter between the Moscow troops led by Prince D. D. Kholmskii and the Novgorod army. Prince Kholmskii had about 5,000 men, and the Novgorodians had 20,000–40,000. The poorly organized Novgorodians were unable to withstand the forces of the Grand Principality of Moscow. The battle lasted about two hours and ended in victory for Kholmskii's forces. More than 12,000 Novgorodians were killed and about 2,000 captured during the battle and subsequent pursuit. The outcome of the battle of the Shelon' made it inevitable that the Novgorod Feudal Republic would lose its political independence.

SHELTER-DECK SHIP, an oceangoing vessel with a continuous top deck above the main deck. Shelter-deck ships have covered openings in the top deck, in the transverse bulkheads beneath the top decks, or in the sides above the main deck. Watertight bulkheads extend only from the main deck down. The quarters between the top and main decks do not meet the standards for watertightness set by classification societies, and they are not included in the ship's register tonnage. There are no shelter-deck ships of Soviet registry. [29–1119–2]

SHELUDIAK, FEDOR. Year of birth unknown; died 1672. Don Cossack. One of S. T. Razin's closest associates.

In the spring and summer of 1670, Sheludiak commanded cossack horse detachments in the march from Tsaritsyn to Chernyi Iar and then to Astrakhan. In May and June 1671 he led a large detachment of rebels in a campaign against Simbirsk. After unsuccessful attempts to take the city by assault he returned to Astrakhan and, after the death of Vasilii Us, became the leader of the rebels. Sheludiak was treacherously seized during negotiations and executed. [29–1118–1]

SHEMAKHA, a city and administrative center of Shemakha Raion, Azerbaijan SSR. Located in the southeastern foothills of the Great Caucasus, on the Baku-Tbilisi highway, 122 km west of Baku and 72 km northeast of the Kiurdamir railroad station. Population, 19,000 (1974). The center of a large agricultural region, Shemakha has wine-growing sovkhozes, a winery, a carpet-weaving factory, and a building materials plant. Educational institutions include an agricultural technicum and a pedagogical school. A museum of local lore and the house-museum of the Azerbaijani poet M. A. Sabir are located in the city.

Shemakha is one of the oldest cities of Azerbaijan. Archaeological excavations conducted in the northwestern part of the city have uncovered a settlement dating from the fifth and fourth centuries B.C. It is possible that Ptolemy (second century A.D.) mentioned it as Shemakhiya. From the ninth to 16th centuries, the city was the capital of Shirvan and the residence of the Shirvan shahs.

Shemakha was one of the centers of the Shirvan-Apsheron architectural school and of decorative applied art, including rug making and miniature work. Located at an intersection of caravan routes, it was one of the major trade and artisan centers of the Near East, occupying an important place in the international silk trade. Its traders included Azerbaijani, Iranian, Arabic, Middle Asian, Russian, Indian, and Western European merchants, who had trading posts there; the city had numerous silk-weaving, cotton-spinning, and rug-making workshops. In 1222, after a lengthy siege, Shemakha was destroyed by the Mongol Tatars. In the mid-18th century it was the capital of the Shemakha Khanate. In 1805 it became part of Russia. From 1840 to 1846 it was the administrative center of Caspian Oblast; it then became the administrative center of Shemakha Province, which became Baku Province in 1859. In the early 20th century, the Gummet Social Democratic organization and a local party organization of the RSDLP were active in the city. After February 1917, a soviet of workers', peasants', and soldiers' deputies was organized there. Soviet power was established in 1920.

Shemakha produced a number of outstanding Azerbaijani cultural figures, scholars, poets, and architects, including Khagani Shirvani (12th century), Zeinaddin Shirvani (13th century), Nesimi (late 14th to early 15th centuries), Nishat Shirvani (18th century), Hadji Zeinalabdin Shirvani (18th century), Seid Azim Shirvani (19th century), and M. A. Sabir (late 19th and early 20th centuries). The old buildings of the city, including the Dzhuma (Djuma) Mosque (tenth century), the palace of the Shirvan shahs (12th century), and the shah's and other caravansaries (17th century), were destroyed by earthquakes and are known only from descriptions or partial remains. The city acquired a grid plan after its restoration in the 1820's; a number of mausoleums were preserved, the most interesting of which is the group of octagonal dome mausoleums of Eddi-Giumbez (19th century).

SHEMAKHA ASTROPHYSICAL OBSERVATORY, a research institution of the Academy of Sciences of the Azerbaijan SSR. The observatory was founded in 1960 on the basis of the academy's astrophysics section, established in 1956. It is situated at an elevation of 1,435 m, 22 km northwest of the city of Shemakha. Its principal instruments are a 2-m reflector telescope, a 700-cm photoelectric telescope, a 35-cm meniscus telescope, a horizontal solar telescope, and a chromospheric-photospheric telescope.

The Shemakha Observatory studies active formations on the sun, nonstable stars of the T Tauri type, magnetic stars, relativistic objects, the atmosphere of the planets, and the structure, evolution, and origin of the ring of asteroids and comets. Since 1971, the observatory has operated a high-mountain station on Mount Batabat, Nakhichevan' ASSR, at an elevation of 2,300 m. The station has a large coronagraph, with a 40-cm mirror, which is used under conditions other than eclipse conditions. The Shemakha Astrophysical Observatory publishes *Soobshcheniia ShAO* (Reports of the Shemakha Astrophysical Observatory) and *Tsirkuliar ShAO* (Circular of the Shemakha Astrophysical Observatory).

G. F. SULTANOV [29–1121–1]

SHEMIAKIN, EVGENII IVANOVICH. Born Dec. 9, 1929, in Novosibirsk. Soviet scientist specializing in the mechanics of rocks. Corresponding member of the Academy of Sciences of the USSR (1976). Member of the CPSU from 1963.

Shemiakin graduated from Leningrad University in 1952. From 1955 to 1960 he worked as a research worker at the Institute of Chemical Physics of the Academy of Sciences of the USSR. From 1960 to 1971 he was head of a laboratory of the Institute of Theoretical and Applied Mechanics of the Siberian Division of the Academy of Sciences of the USSR. In 1971 he was named director of the Mining Institute of the Siberian Division of the Academy of Sciences of the USSR. He is also a professor at the University of Novosibirsk (since 1965).

Shemiakin's main works deal with the study of rocks, the effects of blasting and shock on rocks, and the deformation mechanics of solids. Shemiakin developed a model of a solid medium with frictional properties and used this model to study the process of wave propagation in underground blasts.

Shemiakin has been awarded two orders and a medal.

WORKS

Dinamicheskie zadachi teorii uprugosti i plastichnosti. Novosibirsk, 1968. [29–1123–5]

SHEMIAKIN, MIKHAIL MIKHAILOVICH. Born July 13 (26), 1908, in Moscow; died June 26, 1970, in Riga. Soviet organic chemist. Academician of the Academy of Sciences of the USSR (1958; corresponding member, 1953). Member of the Presidium of the Academy of Sciences of the USSR (1963). Hero of Socialist Labor (1969). Member of the CPSU from 1951.

Shemiakin graduated from Moscow State University in 1930. From 1930 to 1935 he worked at the Scientific Research Institute of Organic Semiproducts and Dyes, and from 1935 to 1945, at the All-Union Institute of Experimental Medicine. Between 1945 and 1961 he worked at the Institute of Biological and Medical Chemistry of the Academy of Sciences of the USSR; at the same time, from 1957 to 1960, he worked at the Institute of Organic Chemistry of the Academy of Sciences of the USSR. From 1959 to 1970 he was director of the Institute of the Chemistry of Natural Compounds of the Academy of Sciences of the USSR (now the M. M. Shemiakin Institute of Bio-organic Chemistry).

Shemiakin's main works dealt with theoretical organic chemistry and the chemistry of natural compounds. Shemiakin explained the mechanisms of many reactions, such as the pyrolysis of carboxylic acid salts and azoxy coupling. Together with A. E. Braunshtein, he developed (1952) the general theory of pyridoxal enzyme activity. He also synthesized the antibiotic tetracycline.

Shemiakin was a member of the Leopoldina German Academy of Naturalists (1968), the Chemical Society of France (1958), and the European Committee on Peptide Chemistry (1958). Shemiakin was awarded two Orders of Lenin and several medals.

IU. B. SHVETSOV [29–1123–6]

SHEMIAKIN SUD, a Russian term for an unjust trial. It derives from the title of a Russian satirical novella (*Shemiaka's Verdict*) written in the second half of the 17th century. The novella, which is based on a folktale common among many peoples, exposes corruption and arbitrariness in the courts. [29–1124–1]

SHEM'I-ZADE, ESHREF ABDURAMANOVICH. Born June 8 (21), 1908, in Evpatoriia; died Mar. 11, 1978, in Moscow. Soviet Crimean Tatar poet and literary critic. Honored Cultural Worker of the Uzbek SSR (1968).

Shem'i-zade graduated from the literature and screenwriting department of the Institute of Cinematography in Moscow in 1932. He first published his works in 1926. He is the author of the narrative poem *Dneprel'stan* (1930) and the collections of lyric and narrative poems *The Reed Pipe* (1965) and *The Eagle's Flight* (1969). He published articles on the history of Crimean Tatar literature and the book *Life and Work* (1974).

Shem'i-zade also translated the works of A. S. Pushkin, V. V. Mayakovsky, and A. T. Tvardovskii. His works have been translated into languages of the peoples of the USSR.

REFERENCE

SHEMOGSA CARVED BIRCH BARK, a Russian craft that originated in the mid-19th century in the region near the Shemogsa River, in Kurovo-Navolok, Pogorelovo, Krasavino, Berniatino, and other villages near Velikii Ustiug. In Soviet times a carved birch-bark shop was organized at the Shemogsa Furniture Combine in Vologda Oblast.

The traditional designs of Shemogsa carved birch bark, including plants, birds, animals, and people, are outlined on strips of birch bark with a blunt awl and are cut out with a sharp knife, with the background removed. Colored paper or foil is sometimes placed beneath the openwork, and the carving is supplemented with embossing. Strips of decorated birch bark are glued into recesses on the surface of decorative wooden boxes, dishes, and frames; they may also be made of two layers of birch bark, for example, *tuesa* (a type of round covered bowl).

Outstanding masters of Shemogsa carved birch bark include I. A. Veprev, his son A. I. Veprev, and his pupil N. V. Veprev. In the 1960's and 1970's the traditions of the trade have been continued at several enterprises in Vologda and Kirov oblasts.

SHEMONAIKHA, a city and administrative center of Shemonaikha Raion, Vostochnyi Kazakhstan Oblast, Kazakh SSR. Shemonaikha is located on the Uba River, a right tributary of the Irtysh, 130 km northwest of Ust'-Kamenogorsk. It has a railroad station on the Lokot'-Leninogorsk line. Enterprises include a furniture factory, a construction combine, a mixed-feed plant, a butter factory, a grain elevator, and shops servicing the railroad industry. [29–1123–1]

SHEMORDAN, an urban-type settlement in Bogatye Saby Raion, Tatar ASSR. Shemordan has a railroad station on the Kazan-Sverdlovsk line. It also has a poultry-packing plant, a combine for the processing of rabbit skins, a brewery, and a branch of the Mekhovshchik Baltasi Association. [29–1123–2]

SHENDRIKOV ORGANIZATION, a Menshevik organization formed by the brothers Lev, Il'ia, and Gleb Shendrikov in Baku in August 1904. Initially called the Organization of Balakhany and Bibi-Eibat Workers, it was renamed the Union of Baku Workers in May 1905.

The organization spread the ideas of economism among politically backward strata of workers, waged a slanderous campaign against the Bolsheviks, and broke up political demonstrations; it employed anarchic and provocative methods of struggle, such as setting fire to oil fields, thus giving the authorities cause for massive repression and the use of armed force against the workers. In late 1904 the Party Council, which was in Menshevik hands, recognized the Shendrikov organization as a party organization.

During the Revolution of 1905–07, the Shendrikov organization obstructed preparations for an armed uprising, exacerbated national differences among the workers, and carried on schis-

matic activities in the Baku soviet of workers' deputies. The Bolsheviks considered the actions of the Shendrikov organization akin to the tsarist government's policy of Zubatovshchina, and the organization's actions later became known as Shendrikovshchina.

L. Shendrikov was brought before a party court on charges of antiparty activity, and in the summer of 1906 he was expelled from the RSDLP. The Shendrikov organization, having lost its influence among the workers, disbanded.

SHENFER, KLAVDII IPPOLITOVICH. Born May 26 (June 7), 1885, in Radviliškis, in what is now the Lithuanian SSR; died May 18, 1946, in Moscow. Soviet electrical engineer. Academician of the Academy of Sciences of the USSR (1932; corresponding member, 1931).

Shenfer graduated from the Imperial Technical School (now the N. E. Bauman Moscow Higher Technical School) in 1910 and was named a professor there in 1917. He helped organize the electrical engineering department of the Moscow Higher Technical School in 1918 and the All-Union Electrical Engineering Institute in 1921. Shenfer began teaching at the Moscow Power Engineering Institute in 1930.

Shenfer's principal works were devoted to electric machines, commutation in commutator machines, and cascade connection of electric machines. He was the author of a number of textbooks. Shenfer received the State Prize of the USSR in 1943 and was awarded the Order of Lenin, two other orders, and various medals.

SHENG, a Chinese free-reed mouth organ with speaking pipes. The sheng is played not only in China but in Burma, Tibet, and Laos. It has a bowl-shaped wind-chest with holes in the bottom, a mouthpiece, and 13, 19, or 24 bamboo or reed pipes that are inserted into the wind-chest and arranged along its rim; the lower end of each pipe is fitted with a free copper reed. The player produces a sound by stopping with a finger the opening in the lower end of the appropriate pipe. The modern sheng has a tempered tuning of 12 tones of equal intervals. The instrument is used in ensembles and orchestras.

SHENGAVIT SETTLEMENT, a site of an ancient fortified settlement of the Kura-Araks Aeneolithic culture, situated on the left bank of the Razdan River, within the city limits of Yerevan. Excavations were conducted by E. A. Baiburtian from 1936 to 1938 and S. A. Sardarian from 1958 to 1967. The settlement occupied an area of about 4,000 sq m and had a cultural level measuring 4 m in thickness. It was fortified by a thick stone wall with towers, and an underground passageway led to the river. Excavations uncovered round houses, as much as 7 m in diameter, with adjoining rectangular structures made of mud brick on stone foundations. Other discoveries, including stone saddlequerns, pestles, and mortars, the remains of spikelets of various species of wheat and barley, and the bones of domestic animals, attest to developed land cultivation and stock raising. Bronze objects and various forms of black polished ware were also found. Burials dating from the early Bronze Age were also discovered, some containing gold ornaments.

SHENGELAIA, DEMNA KONSTANTINOVICH. Born May 9 (21), 1896, in the village of Sachilao, in what is now Samtredia Raion, Georgian SSR; died Dec. 7, 1980, in Tbilisi. Soviet Georgian writer, Academician of the Academy of Sciences of the Georgian SSR (from 1969). Member of the CPSU from 1940.

Shengelaia, the son of a railroad worker, studied in the philology department of the University of Tbilisi and later in the geology department of the Tbilisi Polytechnical Institute. He published his first short stories in 1915–16. His novel *Sanavardo* (1926) depicted the physical and spiritual degradation and downfall of a princely family, symbolizing the doom of the old world. The novels *Bata Kekiia* (1933) and *The Dawn* (published 1940) presented a panorama of the life of the people and the rise of the revolutionary labor movement in Georgia in the early 1890's. The novella *The Hidden Treasure* (1958) exposed vestiges of the past in present-day society. Shengelaia's other works include short stories on contemporary and historical themes, plays, articles on Georgian, Russian, and Western European classical literature, and researches on folklore.

Shengelaia was awarded the Order of Friendship of Peoples.

SHENGELAIA, NIKOLAI MIKHAILOVICH. Born July 26 (Aug. 8), 1903, in the village of Obudzhi, Mingrelia; died Jan. 4, 1943, in Tbilisi. Soviet motion-picture director and screenwriter. Honored Art Worker of the RSFSR (1935).

Shengelaia wrote poetry as a youth. He became involved in motion pictures in 1924. His first effort as a director was *Giulli* (1927), on which he collaborated with L. F. Push. In the 1920's he attended a lecture course given by L. V. Kuleshov. Shengelaia's film *Eliso* (1928), based on a novella by A. Kazbegi, is an outstanding Soviet silent film combining the poetry of the epic with historical authenticity. The film *The 26 Commissars* (1933), an innovative work of Soviet film-making, is devoted to the glorious and tragic days of the Baku Commune. In 1937, Shengelaia directed *The Golden Valley*. He was the author and coauthor of a number of the screenplays for the films he made.

Shengelaia, a recipient of the State Prize of the USSR in 1941, was also awarded the Order of the Red Banner of Labor.

SHENKURSK, a city and the administrative center of Shenkursk Raion, Arkhangel'sk Oblast, RSFSR. Shenkursk has a landing on the right bank of the Vaga River, which is a tributary of the Severnaia Dvina. The city is 148 km north of the Vel'sk railroad station on the Konosha-Kotlas line. It has two logging and timber distribution establishments, a timber-chemistry establishment, a fur farm, a butter factory, and a food-processing combine. A people's amateur theater, a museum of local lore, and a sanatorium are located in Shenkursk. [29–1128–3]

SHENKURSK OPERATION OF 1919, an offensive by the Soviet Sixth Army of the Northern Front and partisans from Jan. 19 to 25, 1919, against Anglo-American interventionist forces and White Guards during the Civil War.

In the fall of 1918 the enemy, chiefly American units with 2,800 men and 15 guns, had driven a deep wedge south of Shenkursk, threatening the flank and rear of the Sixth Army (commanded by A. A. Samoilo; members of the Revolutionary Military Council N. N. Kuz'min, A. M. Orekhov, and M. K. Vetoshkin), which was operating on the Arkhangel'sk axis. Soviet troops with 3,100 infantry, 48 machine guns, and 16 field guns, went over to the offensive in January 1919 with the objective of eliminating the Shenkursk salient. Three detachments, from Niandoma, Ust'-Padengskaia, and Kodima, attacked in converging directions. The Soviet forces smashed the interventionist troops at one strongpoint after another and reached the approaches to Shenkursk at the same time on January 24. The partisans took control of the village of Shegovary in the enemy rear by a surprise attack, thus cutting off the interventionists' path of retreat to the north. During the night of January 24, the enemy garrison at Shenkursk, abandoning all its military equipment, fled to the north along forest trails. Soviet troops liberated Shenkursk on January 25, capturing large military supply depots, 15 field guns, 60 machine guns, and 2,000 rifles.

As a result of the Shenkursk operation, the enemy was driven back 90 km to the north and conditions were created for the complete liberation of the North. [29–1128–4]

SHENNIKOV, ALEKSANDR PETROVICH. Born Aug. 29 (Sept. 10), 1888, in the village of Papulovo, Veliko-Ustiugskii District, Vologodskaia Province; died May 24, 1962, in Leningrad. Soviet botanist. Corresponding member of the Academy of Sciences of the USSR (from 1946).

Shennikov graduated from the University of St. Petersburg in 1912. He taught at several institutions of higher education—at the Forestry Institute (now the Leningrad Academy of Timber Technology) from 1912 to 1936, at the Bestuzhev Courses from 1914 to 1919, and at the University of Leningrad from 1919 to 1960 (professor from 1930; department head from 1944). Beginning in 1925, Shennikov was also affiliated with the Central Botanical Garden and the Botanical Institute of the Academy of Sciences of the USSR; he became laboratory director in 1960.

Shennikov's research centered on meadow vegetation, primarily the vegetation of the floodplain meadows of the northern European portion of the USSR and the northern Trans-Volga region. He also studied theoretical problems of meadow management and general phytocoenology. Shennikov was one of the founders of experimental phytocoenology in the USSR. He was also involved in plant classification and geobotanical regionalization. Shennikov was awarded the Order of Lenin and the Order of the Badge of Honor.

SHEN-SHIH, part of the ruling class in feudal China, roughly equivalent to the English gentry.

The *shen-shih* were persons who had passed the examinations for an academic degree, which gave them the right to hold official posts at the local and national levels. They supplied the personnel for all levels of the state bureaucracy and for the landowners' local organs of self-government and served as guardians of the official Confucian ideology and traditions; in addition, they directed the rural schools and local courts.

The *shen-shih* did not have to pay the poll tax, were exempt from military service, were not subject to corporal punishment, and wore a special costume.

The *shen-shih* estate developed between the second century B.C. and the tenth century A.D., during which period the examination system for filling most government posts took form. After the system was done away with in 1905, the term *shen-shih* was used to designate part of the ruling class in the countryside. With the victory of the revolution in 1949, the *shen-shih* estate was abolished.

SHENSI, a province in Northwest China. Area, 190,000 sq km. Population, 21.7 million (1975). The capital is the city of Sian.

The northern part of Shensi lies on the Loess Plateau and has an average elevation of approximately 1,500 m; the southern part is occupied by the Tsinling Shan, which rises to an elevation of 3,666 m. The northern and southern parts of the province are separated by the valley of the Wei Ho. Shensi's monsoon climate is temperate north of the Tsinling Shan and subtropical south of it. Annual precipitation ranges from 300 mm in the northwest to 1,000 mm in the southeast. The principal rivers are the Huang Ho, its tributary the Wei Ho, and the Han Shui, a tributary of the Yangtze. Forests occupy less than 9 percent of the province.

Shensi is an ancient agricultural region. Most of the population engages in agriculture, which is dominated by the cultivation of a wide variety of crops. The leading food crop is wheat, most of which is grown in the Wei Ho valley; the considerable plantings of millet are found chiefly on the Loess Plateau. Other crops include rice, kaoliang, and maize. The valleys of the Wei Ho and the Han Shui produce China's finest varieties of cotton, accounting for 7 percent of the country's total output. Oil-bearing plants and sugar beets are also cultivated. Animal husbandry, which is of secondary importance, is devoted to the raising of sheep, goats, cattle, and donkeys.

Industry underwent development after the formation of the People's Republic of China. Coal, small amounts of petroleum, and iron ore are mined. The Weipei coalfield produces more than 4 million tons of coal annually; the Yench'ang oil fields—the oldest in China—began operating in 1906. The main manufacturing centers are Sian and Paochi. Well-developed industries include ferrous metallurgy, the chemical industry, and the machine-building industry, which produces power-engineering equipment, machine tools, locomotives, railroad cars, and machinery for the textile industry and agriculture. There is a cement plant in Yaohsien and petroleum refineries in Yench'ang and Yenan. The cotton industry is represented by large factories in Sian and Hsienyang. I. M. FEDOROV

Traces of the Yangshao Neolithic culture have been found in Shensi. From the sixth to fourth centuries B.C. part of the province belonged to the Ch'in state, whose ruling dynasty unified ancient China at the end of the third century B.C. Between the 11th century B.C. and the tenth century A.D. the capital of China was several times located in Shensi: at Haoching, Hsienyang, and Ch'angan (now Sian). The region was given its present name in the ninth century.

In antiquity, the Middle Ages, and modern times Shensi has witnessed numerous large popular uprisings, notably the peasant rebellion led by Ch'en Sheng and Wu Kuang in 209 and 208 B.C., the peasant wars of 874–901 and 1628–45, the rebellion of the Pai Lien Chiao (White Lotus Sect) of 1796–1805, and the Dungan Rebellion of 1862–77. After the Hsinhai Revolution of 1911–13, Shensi was controlled by the Peiyang (northern) warlords.

Several peasant rebellions led by the Chinese Communists took place between 1928 and 1932, and in 1932 and 1933 two revolutionary bases of the soviet movement—Shensi-Szechwan and Shensi-Kansu—were established at the border of Shensi and two neighboring provinces (*see* SOVIETS IN CHINA). After the main forces of the Chinese Red Army moved from central and southern China between 1934 and 1936, the Shensi-Kansu-Ningsia border area was created from the Shensi-Kansu base. The province

of Shensi was freed from Kuomintang rule by the People's Liberation Army of China in July 1949.

V. P. ILIUSHECHKIN [29–1561–6]

SHEPARD, ALAN. Born Nov. 18, 1923, in East Derry, N.H. American astronaut; rear admiral in the US Navy.

After graduating from the US Naval Academy in 1944, Shepard took part in various military operations conducted by the United States in the Pacific. From 1950 to 1953 and from 1955 to 1957 he worked at the Navy Test Pilot School. In 1958 he graduated from the Naval War College; he also attended a school of civil aviation. In 1959 he became an astronaut with the National Aeronautics and Space Administration.

On May 5, 1961, Shepard became the first American to complete a manned suborbital flight of 15 minutes duration in the Mercury spacecraft (MR 3). From Feb. 1 to Feb. 10, 1971, Shepard, as commander of the Apollo 14 spacecraft, completed a lunar flight with E. Mitchell and S. Roosa. Shepard spent a total of 33 hr 30 min on the moon, including two moon walks, lasting about 9 hr. His time in space during the two flights totaled 216 hr 17 min. Shepard is now directing the training of American astronauts at the Manned Spacecraft Center in Houston. His hometown has been renamed Spacetown. [29–1132–2]

SHEPARD, FRANCIS PARKER. Born May 10, 1897, in Brookline, Mass. American geologist; one of the founders of modern marine geology. Doctor of philosophy (1922).

Shepard graduated from Harvard University in 1919. He became a professor of geology at the University of Illinois in Chicago in 1939. Beginning in 1942, he worked at the Scripps Institution of Oceanography in La Jolla (University of California at San Diego) and at various scientific institutions of the US Navy. Between 1951 and 1958 he directed a long-term study of the sediments of the Gulf of Mexico conducted by the American Petroleum Institute.

Shepard was president of the International Association of Sedimentologists from 1958 to 1963.

O. K. LEONT'EV [29–1132–3]

SHEPETOVKA, a city (since 1923) under oblast jurisdiction and administrative center of Shepetovka Raion, Khmel'nitskii Oblast, Ukrainian SSR. Railroad junction with lines to Zdolbunov, Ternopol', Khmel'nitskii, Berdichev, and Korosten'. Population, 42,000 (1974). Shepetovka has combines for the manufacture of sugar, meat products, wood products, and packaging materials, a butter factory, and plants producing soft drinks, tractor bushings, metal articles, and asphalt concrete. It also has enterprises of light industry and railroad transportation.

An agricultural bookkeeping technicum and a branch of the Kiev Industrial Technicum are located in Shepetovka. The literary memorial museum of N. A. Ostrovskii, who was a member of the Shepetovka district committee of the Komsomol in 1924, is also in the city. [29–1133–2]

SHERABAD, a city (since 1973) and administrative center of Sherabad Raion, Surkhandar'ia Oblast, Uzbek SSR. Sherabad is situated on the right bank of the Sherabad River, a tributary of the Amu Darya, 42 km from the Naushakhar railroad station on the Kagan-Termez line and 59 km from Termez. It has a cotton-ginning plant, an industrial combine, and a ceramics plant. [29–1134–4]

SHERABAD a river in Surkhandar'ia Oblast, Uzbek SSR; a right tributary of the Amu Darya. The Sherabad, also called the Shirabaddar'ia, is known as the Irgaily at its source, the Machaidar'ia in its upper course, and the Karasu in its lower course. The river measures 177 km in length and drains an area of 2,950 sq km before emerging from the mountains. It rises in the Baisuntau Range. The river is fed by snow and rain. The mean flow rate is 7.5 cu m per sec at the city of Sherabad; below this point the water of the river is diverted by a network of canals for irrigation. The irrigation fan of the Sherabad receives supplementary water from the Surkhandar'ia River. [29–1134–3]

SHER ALI. Born 1825; died Feb. 20, 1879, in Mazar-i-Sharif. Afghan emir from 1863.

Sher Ali, one of the sons of Dost Muhammad, implemented measures that furthered Afghanistan's economic and cultural development. Under Sher Ali, the standing army was increased, roads were improved, and the country's first newspaper, *Shams un-Nahar*, was published (1875). Sher Ali worked to effect an independent foreign policy and to counteract the plans of the British colonizers, who undertook an aggressive war against Afghanistan in 1878. [29–1134–2]

SHERARDIZING, a galvanizing process in which steel items are heated in zinc dust at 340°–400°C to produce a diffusion surface layer. The process is carried out in a rotating or rocking container. It was proposed by the British scientist Sherard Cowper-Coles in 1900. [29–1134–5]

SHERBROOKE, a city in Canada, in the province of Quebec. Population, 86,000 (1975). Sherbrooke is a railroad junction. A center for the textile and knitwear industry, it also produces rolling stock and equipment for mining and the pulp and paper industry. Other enterprises specialize in metalworking and the production of electrical-engineering equipment. [29–1134–6]

SHEREGESH, an urban-type settlement in Kemerovo Oblast, RSFSR, under the jurisdiction of the Tashtagol city soviet. Sheregesh is located 27 km northeast of Tashtagol. Iron ore is mined nearby. [29–1136–2]

SHEREMETEV, in Russia from the 15th to early 20th centuries, a family of boyars (after 1706, counts) descended from the younger line of the family of Andrei Kobyla, who is mentioned in historical sources in 1347. The founder of the family was Andrei Konstantinovich Sheremet, a great-grandson of Fedor Andreevich Koshka. In the mid-16th century five of Sheremet's grandsons received the rank of boyar. The Sheremetevs were the wealthiest landowners in Russia. The most famous members of the family were the following:

Ivan Bol'shoi Vasil'evich Sheremetev. Date of birth unknown; died 1577. Boyar from 1550; *voevoda* (military commander).

In 1555, I. V. Sheremetev led the Russian Army in a campaign against the Crimean Khanate and in the battle of Sudbishchi. He was a member of the Selected Council (Izbrannaia Rada), but during the 1560's he fell out of favor with the tsar several times.

Fedor Ivanovich Sheremetev. Date of birth unknown; died Feb. 17, 1650.

F. I. Sheremetev belonged to anti-Godunov circles in the early 17th century. In 1601 he was exiled to a Siberian *voevodstvo* (territory under a military governor), but under the First False Dmitrii he received the rank of boyar. From 1606 to 1609 he led the Russian Army in its suppression of a popular uprising in the Volga Region (Povolzh'e). From 1633 to 1645, under Tsar Mikhail Fedorovich, Sheremetev was a member of the government, and from April 1642 he was the de facto head of the government.

Boris Petrovich Sheremetev. Date of birth unknown; died 1650. State figure in the 1630's and 1640's; boyar from 1646.

Matvei Vasil'evich Sheremetev. Date of birth unknown; died 1657. Russian *voevoda* in the mid-17th century; participant in the Russo-Polish War of 1654–67 and the Russo-Swedish War of 1656–58.

Vasilii Borisovich Sheremetev. Date of birth unknown; died 1682. Russian state and military figure in the mid-17th century.

V. B. Sheremetev headed several *prikazy* (offices). He also directed the operations of Russian troops and Ukrainian detachments in the Ukraine from 1654 to 1656 and again from 1658 to

1660. After surrendering near Chudnov in 1660, he was turned over to the Crimean khan by the Poles; he spent 21 years in captivity.

Boris Petrovich Sheremetev. Born 1652; died 1719.

Petr Borisovich Sheremetev. Born 1713; died 1788. High chamberlain, general of the infantry, adjutant general, senator, and prominent state figure during the reigns of Elizaveta Petrovna and Catherine the Great.

P. B. Sheremetev directed the construction of various palaces and architectural ensembles (*usad'by*), such as Kuskovo and Ostankino. He supported peasant theaters, choruses, and orchestras, and he amassed an extremely valuable art collection.

Nikolai Petrovich Sheremetev. Born 1751; died 1809. High marshal of the court, active privy councillor, and senator.

N. P. Sheremetev established the Home for Vagrants in Moscow. (The building now houses the N. V. Sklifosovskii Moscow City Scientific Research Institute of Emergency Medical Care.)

Dmitrii Nikolaevich Sheremetev. Born 1803; died 1871. Master of the court; philanthropist, director of the Home for Vagrants in Moscow, art collector, and patron of the arts.

Sergei Dmitrievich Sheremetev. Born 1844; died 1918. Member of the Council of State, chairman of the Archeographic Commission, editor of the journal *Starina i novizna*, and author of a series of works in the history of Russia in the 16th and 17th centuries.

Aleksandr Dmitrievich Sheremetev. Born 1859; died 1919. Musician, composer, founder of the Society of Music History, and director of a court choir.

SHEREMETEV, BORIS PETROVICH. Born Apr. 25 (May 5), 1652, in Moscow; died there Feb. 17 (28), 1719; buried in St. Petersburg. Russian military leader and diplomat. General field marshal (1701). Count (1706).

Sheremetev began service in the tsar's court in 1671. Appointed *voevoda* (military governor) of Tambov in 1681, he led operations against the Crimean Tatars. He was named a boyar in 1682. Between 1685 and 1687, Sheremetev helped negotiate and conclude the Eternal Peace of 1686 with the Polish-Lithuanian Commonwealth (Rzeczpospolita) and an alliance treaty with Austria. He assumed command in late 1687 of the troops in Belgorod protecting the southern border and fought in the Crimean campaigns. After Peter I took power in 1689, Sheremetev became one of his associates.

Sheremetev served as an army commander on the Dnieper in operations against the Crimean Tatars in the Azov campaigns of 1695 and 1696. Between 1697 and 1699 he carried out diplomatic missions in Poland, Austria, and Italy and on the island of Malta. During the Northern War of 1700–21, Sheremetev proved himself a capable, although circumspect and extremely conservative, military leader. He commanded a cavalry unit composed of *dvoriane* (nobles) in the battle of Narva in 1700. From 1701 to 1705 he was commander of troops in Livland. He won battles at Erestfehr (1701) and Hummelshof (1702) and took Kopor'e (1703) and Dorpat (1704).

After directing the suppression of the Astrakhan Uprising of 1705–06, Sheremetev returned to a command position in the main body of the army in 1708. In 1709 he commanded the troops in the center of the battle formation at Poltava. His men captured Riga in 1710. In 1711 he commanded the army's main forces in the Prut Campaign. Sheremetev was commander of the southern observation army on the Turkish border in 1712 and 1713 and a corps commander in Pomerania and in Mecklenburg between 1715 and 1717. [29–1136–3]

SHEREMET'EVSKII, an urban-type settlement in Moscow Oblast, RSFSR, under the jurisdiction of the Dolgoprudnyi city soviet. Sheremet'evskii has a railroad station 23 km north of Moscow. A children's sanatorium is located in the settlement. Industry is represented by a brickyard and a factory for the production of theatrical equipment. One of the airports of Moscow, Sheremet'evo, is nearby. [29–1138–1]

SHERESHEVO, an urban-type settlement in Pruzhany Raion, Brest Oblast, Byelorussian SSR. Shereshevo is 32 km from the Oranchitsy railroad station on the Brest–Baranovichi-Polesskie line. The settlement has enterprises for food processing and the manufacture of furniture. [29–1139–2]

SHER-GILL, AMRITA. Born Jan. 30, 1912; died Dec. 5, 1941. Indian artist.

Sher-Gill studied in Paris in 1929. She was influenced by the painting of Ajanta and the works of P. Gauguin. She created poetic genre pictures noted for decorative coloring and musically rhythmic composition, including *The Bride's Toilet*. Sher-Gill laid the foundations of the national school of Indian painting of the 20th century.

SHERGIN, BORIS VIKTOROVICH. Born July 16 (28), 1896, in Arkhangel'sk; died Oct. 31, 1973, in Moscow. Soviet Russian writer and folklorist.

Shergin grew up in a family of seafarers and shipbuilders. He graduated from the Stroganov Industrial Arts School in 1917. His first short stories were published in 1915. Shergin's books include *Near the City of Arkhangel'sk, Near the Ship's Refuge* (1924), *Arkhangel'sk Stories* (1936), *By Rivers of Song* (1939), and *The Ocean Is a Russian Sea* (1959). These works brilliantly reflect the beauty of the Russian North, the pride and bravery of its people, and the richness of the Russian language.

Shergin was awarded the Order of the Red Banner of Labor.

SHERIDAN, RICHARD BRINSLEY. Born Oct. 30, 1751, in Dublin; died July 7, 1816, in London. Anglo-Irish dramatist, theatrical and public figure.

Sheridan was educated in the law. From 1780 to 1812 he was a member of Parliament and the leader of the radical wing of the Whigs. From 1776 to 1809 he was the manager of the Drury Lane Theatre. In his comedy *The Rivals* (1775), Sheridan followed the example of O. Goldsmith in opposing sentimentality and obvious edification. His *The School for Scandal* (staged 1777, published 1780) is a satirical comedy of manners in which Sheridan called in question the Enlightenment thesis of moral reason, which he saw as compromised by bourgeois reality. The traditions of English Restoration comedy, as seen in the plays of W. Congreve and G. Farquhar, were enriched in Sheridan's works by the influence of the novels of H. Fielding and other representatives of the Enlightenment. Sheridan also wrote the comedies *A Trip to Scarborough* (1777) and *The Critic* (1779) and the tragedy *Pizarro* (1799, an adaptation of A. F. F. von Kotzebue's drama *Die Spanier in Peru*).

SHERIF, AZIZ. Born 1904 in Anah, Iraq. Public and political figure of Iraq. A jurist by education and profession.

In 1946, Sherif founded the Party of the People (Hizb al-Shaab), which stood for the true independence and democratization of Iraq's political life; in the same year he established the newspaper *Al-Watan*. The party and the newspaper called for a struggle against British supremacy, and in 1947 both the party and the newspaper were banned. Sherif helped found a peace organization in 1949 and the National Council of Partisans of Peace in 1950. Persecuted by the authorities, Sherif emigrated to Syria in 1954. In 1958, after the Iraqi revolution of the same year, he returned to his homeland and was elected general secretary of the National Council of Partisans of Peace. He became a member of the Bureau of the World Peace Council in 1959. In December 1969, Sherif was appointed minister of justice, and he later became one of the ministers of state; he held the latter post until the end of 1975.

Sherif received the International Lenin Prize for Strengthening Peace Among Nations in 1960, and he was awarded the Order of Friendship of Peoples in 1974. [29–1140–2]

SHERIFF, an executive officer in a county (or sometimes another administrative-territorial unit) in Great Britain, Ireland, and the USA.

The legal status of sheriffs in Great Britain is defined by the norms of common law, by parliamentary statutes (since the 14th century), and, in particular, by the Sheriffs Act of 1877. A sheriff is appointed by a special commission that acts under royal authority and is headed by the lord lieutenant of the county. Sheriffs are chosen from among the landowners of the counties. Poor people, lords, priests, officers in active service, and practicing barristers and solicitors are among those who are not eligible for the office. Sheriffs are invested with administrative and judicial powers, such as the execution of sentences, the holding of elections, the selection of juries, and the supervision of jails.

In the USA, in all states except Rhode Island, a sheriff is elected by the residents of the county. His jurisdiction extends only to rural areas, and he fulfills mainly administrative and police functions. He maintains law and order, supervises jails, makes arrests, and checks the observance of state laws regulating such activities as traffic and the sale of alcohol. [29–1140–3]

SHERIPOV, ASLANBEK DZHEMALDINOVICH. Born 1897 in Groznyi; died Sept. 11, 1919, in the village of Vozdvizhenskoe, Terek Oblast. Participant in the struggle for Soviet power in the Northern Caucasus. Chechen by nationality. Member of the Communist Party from 1919.

Sheripov formed the first soviet in Chechnia. He was a delegate to the Second through Fifth Terek Oblast People's Congresses and a member of the Terek People's Soviet. Sheripov was commander of the Chechen Red Army; from August to November 1918 he helped lead the 100-day defense of Groznyi against the White Guards. After the White Guards seized the Northern Caucasus, he and N. F. Gikalo formed a rebel detachment that attacked the rear of Denikin's forces. Sheripov was killed in a battle with a punitive expedition mounted by Denikin's forces. [29–1140–1]

SHERLOCK HOLMES. A fictional private detective, the hero of short stories and novels by A. Conan Doyle, who chose the surname in honor of the American writer O. W. Holmes. The name "Sherlock" in Russian has acquired the connotation of a common noun. [29–1141–3]

SHERLOVAIA GORA, an urban-type settlement in Borzia Raion, Chita Oblast, RSFSR. Sherlovaia Gora is located on the Chita-Transbaikalia highway, 5.5 km from the Sherlovaia railroad station on the Oloviannaia-Zabaikal'sk line and 23.5 km northwest of Borzia. It has a combine for dressing tin ore. Coal is mined. The settlement has a thermoelectric power plant. [29–1141–2]

SHERMAN, WILLIAM TECUMSEH. Born Feb. 8, 1820, in Lancaster, Ohio; died Feb. 14, 1891, in New York City. US military leader, general of the army (1869).

Sherman graduated from the US Military Academy at West Point in 1840 and was commissioned in the artillery. He served in the US war against Mexico of 1846–48. Sherman retired from the army from 1853 to 1859 and worked as a bank manager and lawyer. In 1859 he was appointed superintendent of a military academy. During the US Civil War (1861–65), Sherman commanded a regiment, a brigade, and a division in the Northern army, achieving the rank of brigadier general in 1861. He took part in the battles of First Bull Run, Vicksburg, and Chattanooga, among others. In March 1864, Sherman was given command of the army that made the successful "march to the sea": starting from Chattanooga, Tenn., the army moved through the state of Georgia, taking Atlanta in September, to the Atlantic coast, taking Savannah in December and defeating the Southern army commanded by General J. E. Johnston. In early 1865, Sherman's army turned north and advanced in the rear of the enemy to join up with the army of General U. S. Grant. After covering more than 1,300 km in a year, Sherman's army joined up with Grant's near Richmond, which led to encirclement of the main Southern forces commanded by General R. Lee and to their surrender in April 1865.

From 1869 to 1883, Sherman was commanding general of the US Army. Sherman's memoirs were published in 1875 and 1972. [29–1141–4]

SHERMAN ANTITRUST ACT, a law adopted in the USA in 1890; named after the initiator of the measure, Senator J. Sherman. It was adopted in response to pressure from an antimonopolistic movement of workers and farmers. The act declared illegal any combination in the form of a trust or otherwise, as well as any agreement aimed at restraint of trade. In practice, however, the act failed to impede the operations of the trusts or even to prevent the formation of new trusts. Of five lawsuits brought against trusts from 1892 to 1896, four were decided in favor of the trusts. At the same time one of the provisions of the act—that providing for legal responsibility for inflicting damage to the property of an organization or individual—was used to persecute trade unions and fight the strike movement. From 1890 to March 1897, the US Supreme Court alone pronounced 12 judgments against workers' unions. [29–1141–6]

SHERMARKE, ABDI RASHID ALI (also Abdulrashid Ali Shermarke). Born Nov. 16, 1919; died Oct. 15, 1969. State and political figure of the Somali Republic.

Shermarke graduated from the School of Politics and Administration and the Higher Institute of Law, Economics, and Social Studies in Mogadishu; he was also a graduate of the law school of the University of Rome. In 1947 he helped found the Somali Youth League, which governed the country from 1960 to 1969. He headed the first national government of Somalia from 1960 to 1964 and became president on June 30, 1967. Shermarke was killed by one of his bodyguards on a trip to northern Somalia. [29–1142–1]

SHERPA, a nationality living in India and eastern Nepal, in the region of Chomolungma (Mount Everest). According to a 1975 estimate, there are approximately 25,000 Sherpa in India and 25,000 in Nepal. Their language belongs to the Tibeto-Burman family. The predominant religion is Buddhism.

The Sherpa are descendants of Tibetans who migrated south of the Great Himalayas in the Middle Ages. Those in Nepal engage in yak raising and the cultivation of potatoes and oats; in the past they were intermediaries in trade between Nepal and Tibet. The Sherpa in India work mainly as merchants or as porters and guides for mountain-climbing expeditions. The Sherpa live in rural communities and are divided into 18 exogamous clans, each of which is known as a *ru*; the small monogamous family is prevalent, but polyandry and, less often, polygyny are still practiced to some extent.

SHERRINGTON, CHARLES SCOTT. Born Nov. 27, 1859 (1857 or 1861 according to some sources), in London; died Mar. 4, 1952, in Eastbourne. English physiologist. Fellow of the Royal Society of London (1893) and corresponding member of the St. Petersburg Academy of Sciences (1915).

Sherrington graduated from Cambridge University in 1885. From 1895 to 1913 he was a professor at the University of Liverpool, and from 1913 to 1935, at Oxford University. Sherrington's research was primarily in the physiology of the central nervous system. Of particular importance were his studies on the laws of spinal reflex action. Sherrington investigated the relationship between the afferent and efferent pathways in the central nervous system, discovered the mechanisms of motor coordination, and formulated the principles of the convergence of sensory impulses at motor neurons, which form a common path. Sherrington determined the function of synapses (a term that he coined) in the interaction of nerve cells, suggested a physiological explanation for the antagonistic relationship existing between muscle groups in executing movements, and described reciprocal innervation. He also advanced a theory on muscle reception and described the interrelations of the cerebral cortex and the motor centers of the spinal cord that regulate the functions of the skeletal muscles. Sherrington's studies provided new data on the correlation of excitation and inhibition and on the nature and disturbances of muscle tonus. In his theoretical generalizations, Sherrington strove to achieve an understanding of the organism as a whole, and he developed the concept of the integrative action of the nervous system. He assigned to the distant receptors and the brain ("ganglion of the distant receptors") a decisive role in the integration and control of all the processes in animals and man.

Sherrington established a world-famous school of neurophysiologists, which included R. Granit, D. Denney-Brown, H. Cushing, R. Magnus, A. Fessard, E. Adrian, J. Eccles, and J. Fulton. He won a Nobel Prize in 1932 (with E. Adrian).

SHER SHAH. Born 1472; died 1545. Ruler of Hindustan (North India) from December 1539 to 1545.

Sher Shah was a member of the Afghan feudal clan Sur in Bihar. Originally named Farid, he became the ruler of Bihar in 1533 under the title "Sher Khan." As a result of victories over Humayun at Chausa in 1539 and at Kanauj in 1540, he seized the possessions of the Great Moguls and subjugated Malwa and a number of the Rajput princely states, thus uniting under his rule most of North India. In December 1539 he assumed the title "Sher Shah."

Sher Shah implemented a series of important reforms that were continued and completed by Akbar. During his reign the jagir system of landownership was organized, in which the holder of a benefice was obligated to maintain a hired cavalry detachment. Sher Shah also initiated land measurement and reorganized the collection of taxes. [29–1153–1]

SHERVUD, LEONID VLADIMIROVICH. Born Apr. 16 (28), 1871, in Moscow; died Aug. 23, 1954, in Leningrad. Soviet sculptor. Honored Artist of the RSFSR (1946). Son of architect V. O. Shervud.

Shervud studied with S. I. Ivanov at the Moscow School of Painting, Sculpture, and Architecture from 1886 to 1891. He also attended the St. Petersburg Academy of Arts from 1893 to 1898. In 1899 and 1900 he studied on a stipend from the academy with A. Rodin and E. A. Bourdelle at the Julien Academy in Paris.

Shervud helped implement the Lenin plan of monument propaganda (for example, the monument to A. N. Radishchev, plaster of paris, 1918, Petrograd). Shervud evolved from genre scenes in an impressionistic style (for example, the gravestone for G. I. Uspenskii, bronze and granite, 1904, Volkovo Cemetery, Leningrad) to works noted for monumental strictness of form (for example, the portrait of P. L. Voikov, plaster of paris, 1927, Russian Museum, Leningrad; *The Sentry*, plaster of paris, 1933).

Shervud was awarded the Order of the Red Banner of Labor and various medals.

SHERVUD, VLADIMIR OSIPOVICH. Born 1833; died July 9 (21), 1897, in Moscow. Russian architect, sculptor, and painter. Academician of the St. Petersburg Academy of Arts (1872).

Shervud studied at the Moscow School of Painting, Sculpture, and Architecture. His most famous works, all in Moscow, are the Historical Museum (1875–81, engineer A. A. Semenov) and a temple monument dedicated to the heroes of Pleven (cast iron, opened 1887), in both of which he employed elements of 16th- and 17th-century Russian architecture, as well as a monument to N. I. Pirogov (bronze and granite, unveiled 1897). Shervud also painted portraits and landscapes.

SHESHIAL'GIS, KAZIS KAZE (Kazys Šešelgis). Born Jan. 9 (22), 1915, in the village of Žeimiai, in what is now Rokiškis Raion, Lithuanian SSR. Soviet architect. Honored Engineer of the Lithuanian SSR (1965). Doctor of architecture (1967).

Sheshial'gis studied in the civil engineering department of the University of Kaunas from 1936 to 1943. He was a professor and head of a subdepartment at the polytechnical institute in Kaunas from 1951 to 1971 and has been head of a subdepartment at the civil engineering institute in Vilinius since 1971. He was chairman of the Kaunas branch of the Architects' Union of the Lithuanian SSR from 1954 to 1959.

Sheshial'gis' works include the master plans for Panevėžys (1947–53) and Kėdainiai (1962, with V. Miliukštis) and the reconstruction project for the old towns in Vilnius (1958, with S. Lasavickas and J. Šeibōkas) and Kaunas (1962, with V. Jurkštas and S. Čerškuté).

SHESHKO, EVGENII FOMICH. Born Mar. 1 (14), 1901, in Chenstokhov (now the city of Częstochowa), Poland; died Jan. 22, 1961, in Moscow. Soviet mining scientist. Doctor of technical sciences (1951). Honored Worker in Science and Technology of the RSFSR (1958).

After graduating from the Moscow Academy of Mines in 1927, Sheshko worked at a scientific research institute of fertilizers. From 1930 to 1961 he worked at the Moscow Mining Institute, where he was the first to organize the training of engineers in the open-pit method of working mineral deposits. He proposed a theory of opening up deposits and developed systems for the open-pit working of mineral deposits.

A recipient of the State Prize of the USSR (1952), Sheshko was awarded the Order of the Red Banner of Labor and various medals.

SHESHKOVSKII, STEPAN IVANOVICH. Born Dec. 21, 1719 (Jan. 1, 1720), in St. Petersburg; died there May 12 (23), 1794. Russian state figure.

Sheshkovskii was the son of a minor civil servant. From 1757 to 1762 he was the secretary of the Secret Chancellery, and in 1762 (officially, in 1767) he became senior secretary of the Secret Office of the Senate. A trusted agent of Empress Catherine the Great, Sheshkovskii carried out investigations for the most important political cases of the second half of the 18th century, including the cases of V. Ia. Mirovich, E. I. Pugachev, A. N. Radishchev, and N. I. Novikov. He personally helped with torture during interrogations. For this reason his contemporaries called Sheshkovskii a whipping Tom (*knutoboi*) and the grand inquisitor of Russia.

SHESHMA, a river in the Tatar ASSR and (in its upper course) in Kuibyshev Oblast; a left tributary of the Kama. The Sheshma is 259 km long and drains an area of 6,040 sq km. It rises on the Bugul'ma-Belebei Elevation and empties into Kama Gulf of the Kuibyshev Reservoir. The river is fed mainly by snow. High water occurs in April. The mean flow rate 86 km from the mouth is 11.1 cu m per sec. The Sheshma freezes over in November or early December, and the ice breaks up in April. The river is used as a water supply source. [29–1170–2]

SHESHONK I (throne name, Hetch-Kheper-Ra), Egyptian pharaoh from 950 B.C. to 929 B.C.; founder of the 22nd (Libyan) Dynasty.

Sheshonk I was a descendant of Libyan princes or sheiks who had settled in Lower and Central Egypt, become completely Egyptianized, and joined the Egyptian aristocracy. Sheshonk invaded the Kingdom of Israel and Judah but was unable to gain a foothold there.

SHESTAKOV, ANDREI VASIL'EVICH. Born Oct. 24 (Nov. 5), 1877, in the village of Solombala, Arkhangel'sk Province; died June 29, 1941, in Moscow. Soviet historian. Corresponding member of the Academy of Sciences of the USSR (1939). Member of the CPSU from 1903.

The son of a worker, Shestakov joined the revolutionary movement in 1898. In December 1905, under the party pseudonym of Nikodim, he helped lead an armed uprising on the Moscow-Kazan railroad line. At that time he was a member of the Moscow committee of the RSDLP. From 1918 to 1921 he carried out party and soviet work in Moscow, Voronezh, and Riazan'.

After graduating from the Institute of the Red Professors in 1924, Shestakov became head of the subdepartment of Soviet history at the Communist University for Workers of the East, at the Second Moscow State University, and at the V. I. Lenin Moscow State Pedagogical Institute. He was one of the organizers and leaders of the Society of Marxist Historians. His principal works dealt mainly with the agrarian history of Russia in the period from 1861 to 1917. Shestakov headed the team of authors that wrote the textbook *A Brief Course in Soviet History* (1937) for the third and fourth grades of secondary school.

SHESTAKOVO, an urban-type settlement in Nizhneilimsk Raion, Irkutsk Oblast, RSFSR. Shestakovo is situated on the shore of the Ust'-Ilimsk Reservoir. It is served by the Sredneilimskaia railroad station on the Taishet-Lena line. Shestakovo has a logging and timber distribution establishment. [29–1154–1]

SHESTALOV, IUVAN NIKOLAEVICH (Ivan Nikolaevich Shestalov). Born June 22, 1937, in the village of Kamratka, Berezovo Raion, Khanty-Mansi National Okrug, Tiumen' Oblast. Soviet Mansi writer. Member of the CPSU since 1967.

Shestalov, the son of a kolkhoznik, graduated from the Tiumen' Pedagogical Institute in 1965. He writes in Mansi and Russian. An expert on the folklore and customs of the Mansi, he has made numerous trips through the Tiumen' north.

Shestalov is the author of collections of lyric and narrative poems, short stories, novellas, and essays, as well as children's books. The main themes of his works are the new life of the formerly deprived peoples of the Far North, the labor of the Soviet people, and his native countryside. Shestalov's works have been translated into many languages of the peoples of the USSR and foreign languages.

SHESTOPER, an ancient Russian weapon used for striking. A type of mace, it is a baton with a head consisting of six metal plates (fins). It was used from the 15th to 17th centuries. The first mention of the weapon in written sources is found in an account from 1502 of a battle between Russians and knights of an order. The *shestoper* also served as a symbol of authority of military leaders. *Shestopery* decorated with silver, gold, and precious stones are preserved in the Armory of the Moscow Kremlin. [29–1166–1]

SHESTOV, LEV (real name Lev Isaakovich Schwarzmann). Born Jan. 31 (Feb. 12), 1866, in Kiev; died Nov. 20, 1938, in Paris. Russian existential philosopher and literary figure.

Shestov graduated from the law school of the University of Kiev in 1889. Between 1895 and 1914 he lived primarily in Switzerland. He moved to Moscow in 1914, to Kiev in 1918, and to Paris in 1920.

Combining Nietzschean and Dostoevskian themes, to which he gave his own distinctive imprint, Shestov anticipated the fundamental ideas of later existentialism. At the turn of the century, as though sensing already the world catastrophes to come, Shestov spoke of the tragic absurdity of human existence and brought forth the image of the doomed "hero" who nevertheless lays claim to his sovereign rights and challenges the entire universe. Shestov undertook a revision of traditional philosophy, demanding that the point of view be shifted from the universe to the subject. He proclaimed the "philosophy of tragedy," which he presented in polemical juxtaposition to the academic style of thinking—the "philosophy of the commonplace" (*Dostoevsky and Nietzsche: The Philosophy of Tragedy*, 1903).

Shestov rebelled against the rule of reason over life experience and against the suppression of the personal and unique by the impersonal and general. But his assertion of the individual's independence from any form of determination, including generally

recognized truths and generally mandatory moral norms, led Shestov to epistemological relativism and immoralism. Although his nonreligious "apotheosis of groundlessness" (1905) was replaced in the early 1910's by an enthusiastic belief in the spirit of Luther's "faith alone" (*sola fide*), Shestov's world view lost neither its absurd element nor its arbitrary character.

Shestov's faith is lacking in meaningful definitions; god, who is unconnected to the concept of the logos, appears as the ideal of omnipotent willfulness "beyond good and evil." On the other hand, hopelessness is now replaced by faith in the divine source of life's foundations in accordance with the spirit of the Old Testament; revelation is proposed by Shestov in contrast to philosophical speculation (*Athens and Jerusalem*, 1951; *Speculation and Revelation*, 1964). In his opposition to reason, Shestov turns to hyperbole when he identifies the cognitive drive with the fall of man—mankind having fallen under the power of "soulless and necessary truths."

As an author, Shestov revealed a temperament that was bound to attract attention to his ideas; a master of philosophical paradox and aphorism, he gained renown in the West with his biting criticism of academic thinking. References to Shestov are found in works by G. Marcel, A. Camus, and D. H. Lawrence.

R. A. GAL'TSEVA [29–1161–1]

SHESTOVITSY KURGANS, three groups of ancient Russian burial mounds dating from the tenth and early 11th centuries, located on the right bank of the Desna, 16 km southwest of the city of Chernigov, near the village of Shestovitsy. About 150 mounds were excavated by P. I. Smolichev (1925–27), Ia. V. Stankevich (1946), and D. I. Blifel'd (1948, 1956–58). The burials, with cremations or inhumations, yielded weapons, horse harnesses, Arabic and Byzantine coins, and Scandinavian fibulae. Members of the military aristocracy were buried in chambers ("timber-frame" tombs and rectangular pits) together with their female slaves and horses. Located nearby are an ancient Russian fortified settlement and a small village with the remains of semisubterranean dwellings. The Shestovitsy Kurgans resemble other military necropolises of the early feudal period in Rus' (Kiev) and Scandinavia (*see* BIRKA).

SHETLAND ISLANDS, an archipelago of more than 100 islands in the northeastern part of the Atlantic Ocean. Area, 1,400 sq km. Population, 18,400 (1974). The Shetland Islands belong to Great Britain. The largest islands are Mainland, Yell, Unst, and Fetlar. The rolling plains and plateaus of the islands, which rise to 450 m, are composed primarily of schists and quartzites, with well-preserved traces of glaciation, such as boulder fields and sheepback rocks. Meadows and peat bogs abound. Bird colonies occur on the islands. The inhabitants engage in fishing and stock raising; various grasses are also grown. There is offshore drilling for petroleum. The principal town is Lerwick. [29–1166–3]

SHETPE, an urban-type settlement and administrative center of Mangistau Raion, Mangyshlak Oblast, Kazakh SSR. Railroad station on the Beineu–Novyi Uzen' line, 108 km northeast of Shevchenko. Enterprises include a plant producing nonmetallic building materials. The city has a people's amateur theater. [29–1166–4]

SHEVALIN, VADIM ALEKSANDROVICH. Born Feb. 21 (Mar. 4), 1888, in Kazan; died July 30, 1941, in Leningrad. Soviet scientist in the field of electric traction.

Shevalin graduated from the St. Petersburg Polytechnical Institute in 1911. He taught at the institute, where he became a professor in 1925, until his death. In 1915 he was sent by the government to the United States; he returned to Russia in 1918. Beginning in 1920, Shevalin was involved in various railroad electrification projects, including preliminary work on the electrification of the Leningrad railroad terminal (1925–34). He was also involved in the creation of the Moscow subway and the electrification of Moscow's suburban railroad lines. His research was primarily devoted to the development of the theory of the planning and design of electric railroads and to the technical and economic problems of electric traction.

SHEVARDINO, a village in what is now Mozhaisk Raion, Moscow Oblast; the scene of a battle between Russian and Napoleonic troops on Aug. 24 (Sept. 5), 1812, on the eve of the battle of Borodino, during the Patriotic War.

Located at Shevardino was a pentagonal redoubt, which initially formed the extreme left-flank fortification of the Russian position; however, after M. I. Kutuzov ordered the left flank to withdraw to the village of Semenovskaia on August 23 (September 4), Shevardino became the forward strongpoint. The redoubt was armed with a 12-gun battery, and its approaches were guarded by eight infantry battalions, three chasseur regiments, and several cavalry regiments, numbering up to 18,000 men, under the command of General A. I. Gorchakov. During the afternoon of August 24 (September 5), the French forces of about 35,000 men, comprising the infantry of Marshal L. Davout, supported by cavalry from General J. Poniatowski's Polish corps, attacked the Russian positions at Shevardino. The Russian forces stubbornly defended the redoubt, and only late in the evening, when ordered by Kutuzov, did they leave the devastated redoubt. The defense of the Shevardino redoubt allowed the Russian command to gain time to complete defensive preparations at the main position. [29–1067–4]

SHEVARNADZE, EDUARD AMVROSIEVICH. Born Jan. 25, 1928, in the village of Mamati, Lanchkhuti Raion, Georgian SSR. Soviet party and state figure. Member of the CPSU since 1948.

The son of a teacher, Shevarnadze graduated from the party school of the Central Committee of the Communist Party of Georgia (CPG) in 1951 and from the department of history at the Kutaisi Pedagogical Institute in 1960. He began performing Komsomol and party work in 1946. He was second secretary of the Central Committee of the Komsomol of Georgia in 1956 and 1957 and first secretary from 1957 to 1961. From 1961 to 1963 he served as first secretary of the Mtskheta raion committee of the CPG, and in 1963 and 1964 he was first secretary of the Pervomaiskii raion (Tbilisi) committee.

Shevarnadze became first deputy minister for the protection of public order in 1964 and minister in 1965. After the administrative reorganization in 1968, he served as minister of internal affairs of the Georgian SSR. In 1972 he became first secretary of the Tbilisi city committee of the CPG, and in September of the same year he became first secretary of the Central Committee of the CPG.

From 1958 to 1962, Shevarnadze was a member of the Central Committee of the All-Union Komsomol, and between 1959 and 1961 he was a candidate member and member of the bureau of the Central Committee. Shevarnadze was a member of the Central Committee of the CPG from 1958 to 1964 and was elected a member again in 1966. In 1972 he was named to the bureau of the Central Committee of the CPG. In 1976, Shevarnadze became a member of the Central Committee of the CPSU. He became a candidate member of the Politburo of the Central Committee of

the CPSU in 1978. He served as a deputy to the ninth convocation of the Supreme Soviet of the USSR.

Shevarnadze has been awarded three Orders of Lenin, the Order of the Red Banner of Labor, and various medals. [29–1067–5]

SHEVCHENKO, FAINA VASIL'EVNA. Born Apr. 5 (17), 1893, in Voronezh; died there May 10, 1971. Soviet Russian actress. People's Artist of the USSR (1948).

In 1909, Shevchenko began her association with the Moscow Art Theater. She studied at the theater's school beginning in 1911 and joined the company in 1914. A talented character actress, she made generous use of the speech and mannerisms encountered in everyday life. She was known for her rich voice, expressive gestures, and satirical wit. Her roles included Vaska in Leonov's *Untilovsk*, Marceline in Beaumarchais's *The Marriage of Figaro*, Dun'ka in Trenev's *Liubov' Iarovaia*, Matrena, Kabanikha, and Glafira Firsovna in A. N. Ostrovskii's *Fiery Heart, The Thunderstorm*, and *The Ultimate Sacrifice*, Vasilisa in Gorky's *The Lower Depths*, Melan'ia in Gorky's *Egor Bulychov and the Others*, and Tabun-Turkovskaia in Leonov's *The Golden Carriage*.

Shevchenko received the State Prize of the USSR in 1943 and 1946. She was awarded the Order of Lenin, two other orders, and several medals. [29–1075–1]

SHEVCHENKO, TARAS GRIGOR'EVICH. Born Feb. 25 (Mar. 9), 1814, in the village of Morintsy, now in Zvenigorodka Raion, Cherkassy Oblast; died Feb. 26 (Mar. 10), 1861, in St. Petersburg. Ukrainian poet, artist, thinker, and revolutionary democrat.

Shevchenko was born a serf; orphaned at an early age, he worked as a shepherd and farm laborer for a priest. At the age of 14 he was employed as a "little cossack," or servant boy, by P. V. Engel'gardt, the lord of the estate who was his master. Shevchenko was taught to read and write by a village *d'iachok* (low-ranking church official). In 1829 he was taken to Vilnius by his master and lived there until early 1831, when he moved with Engel'gardt to St. Petersburg. In 1833 he was apprenticed to "a craft guild master in various forms of painting" named Shiriaev. In the spring of 1838, Shevchenko was bought out of servitude and gained his freedom.

Shevchenko's earliest known works are the ballad *The Mad Woman*, the poems "Dumka" ("To the blue sea the water flows") and "To the Eternal Memory of Kotliarevskii," and the narrative poem *Katerina*. These works have been dated 1837 or 1838. A collection of Shevchenko's poetry entitled *Kobzar'* (The Bard), published in 1840, included several previously unpublished poems—"Songs of Mine," "Perebendia," "Dumka" ("What do my coal-black brows avail me?"), "To Osnov'ianenko," "Ivan Podkova," the ballad *The Poplar*, and the narrative poems *Katerina* and *The Night of Taras*.

As a summing-up of Shevchenko's early work, *Kobzar'* was indicative of the poet's development in the mainstream of romanticism. In the ballads and narrative poems, reality is closely intertwined with the fantastic elements of folk legends and traditions. The plots are based on the unhappiness and tragedy of doomed love. At the same time, a strong realistic strain is already evident in Shevchenko's early work; his heroines' feelings are genuine and sincere, and concrete life circumstances can be discerned behind their suffering. *Katerina*, for example, is a completely realistic narrative poem about the bitter fate, despair, and suicide of a simple peasant girl, deceived by an officer and abandoned by him with her newborn child. In Shevchenko's successive poems, love and the lot of women emerge as increasingly well-defined historical topics. In the narrative poems *The Blind Woman* (1842), *Marina* (1848), and *The Princess* (1847), Shevchenko justifies and sanctifies ruthless revenge against the oppressors' violations of human dignity.

The same movement toward realism can be seen in the treatment of historical subjects. From such early works as *The Night of Taras* (1838) and "Ivan Podkova" (1839), which are imbued with the romance of ancient legends, the poet moved closer to the theme of struggle for national liberation. In his major narrative poem on a historical subject, *The Haidamaks* (1841), Shevchenko depicted the great popular uprising of 1768, known as the Koliivshchina, against the oppressive yoke of the Polish *szlachta*. In addition to being historically accurate, this verse epic is wholly addressed to the poet's contemporaries. By recalling ancestral glories, Shevchenko sought to arouse the oppressed Ukrainian people to the revolutionary struggle for liberation.

In May 1843, Shevchenko journeyed to the Ukraine; he returned to St. Petersburg in February 1844, and in the spring of 1845 he set off once again for the Ukraine, intending to settle in Kiev. What he saw during his travels through the provinces of Kiev, Poltava, Chernigov, and Volyn' (in the capacity of artist for the Archaeographic Commission of Kiev), and particularly his impressions of the hardships endured by the serfs, had a marked effect on Shevchenko and strengthened his revolutionary aspirations. In the course of his travels he wrote protest poems against serfdom, recording them in an album (*Three Years*). He read the poems to friends and allowed them to be copied.

In 1846, Shevchenko joined the secret Society of Cyril and Methodius, in which his position was on the left. In April 1847 he was denounced by a provocateur and arrested; he was then sent to serve as a soldier at the fortress of Orsk, in Orenburg Province, and in 1850 he was transferred to the Novopetrovskoe fortification (site of the modern city of Fort-Shevchenko) on the Mangyshlak Peninsula. Shevchenko's crime, according to his sentence, was that "he wrote poems of the most disgraceful content in the Little Russian [that is, Ukrainian] language." The deportation sentence provided that Shevchenko be placed under "the strictest observation in order to prevent his producing disgraceful compositions of any kind." Confirming the sentence, Nicholas I added his own provision, placing Shevchenko "under the strictest supervision and prohibiting [his] writing and drawing" (quoted from *Taras Shevchenko: Dokumenty i Materialy*, 1963, p. 50).

The narrative poems *The Dream* (1844) and *The Caucasus* (1845) and other verse works for which Shevchenko was persecuted by tsarism marked a new stage in the development of Ukrainian political poetry and satire. In these works Shevchenko raised his own historical and political consciousness to a new level; he angrily stigmatized autocracy, called on all peoples to unite in human brotherhood, and glorified the struggle of the peoples of Russia against colonial oppression. The two narrative poems represented a further step in the development of Shevchenko's realism and revolutionary democratic views. With these and subsequent compositions of Shevchenko's during the 1840's and 1850's, Ukrainian poetry took its rightful place as part of advanced European literature and exercised considerable influence on 19th-century Slavic poetry.

Two poems by Shevchenko that were particularly influential are his "Testament" (1845; "When I die, O let my body"), which openly calls for the overthrow of tsarism and serfdom and envisions the wonderful future in store for the people, and the narrative poem *The Heretic, or Jan Hus* (1845), which is directed against religious obscurantism and political reaction and is permeated with the idea of friendship among peoples.

Shevchenko's deportation lasted from June 1847 to August 1857; he was released after the death of Nicholas I. Exile did not destroy his talent, nor did it break his will or his revolutionary convictions. The poetry inspired by what he called the "enslaved Muse"—that is, the poems written in exile and carefully hidden during searches and arrests—bear the mark of Shevchenko's increasingly revolutionary attitudes; a new power resounds in the cycle of poems *The Tsars* (1848), which proclaims the crowned tyrants' guilt and invokes justice against them. In the cycle *In the Fortress* (1847) the poet pours out his passionate love for the Ukraine and its people—a love sharpened by exile. Elsewhere, Shevchenko expresses his feeling of fraternal love for all oppressed peoples—for example, for the Kazakhs in the poem "The Lord Had an Axe Behind His Door" (1848).

During his exile Shevchenko wrote, in Russian, the realistic novellas *The Princess* (1853), *The Musician* (1854–55), *The Unfortunate Man* (1855), *The Captain's Wife* (1855), *Twins* (1855), and *The Artist* (1856). The novellas *The Servant-Girl* (1844) and *Varnak* (1845) were written before Shevchenko's exile, and *A Pleasant Stroll, Not Without a Moral* (1856–58), after. The author's opposition to serfdom permeates all these works. The central figure in *Varnak, The Musician, The Artist*, and *A Pleasant*

Stroll is that of the educated serf, and his experiences are often autobiographical. The hero's views on art reflect those of the author, who was a confirmed advocate of realism and was close to the "natural school" of Russian literature in both theory and practice.

The road back from exile was long and hard. Shevchenko was stopped on the way, in Novgorod, and forbidden to enter either of the two capitals. Through the efforts of friends, however, he obtained permission to live in St. Petersburg, and he arrived there in the spring of 1858. Here he became associated with the authors writing for the journal *Sovremennik*; those he was especially close to included N. G. Chernyshevskii, N. A. Dobroliubov, N. A. Nekrasov, M. L. Mikhailov, and the Kurochkin brothers. The note of anger in Shevchenko's satire grew sharper, and the poet was once again placed under the strict supervision of the Third Section. During his visit to the Ukraine in the summer of 1859, Shevchenko was arrested near the village of Prokhorovka; he was then forced to leave the Ukraine and return to St. Petersburg.

A new edition of *Kobzar'*—the most complete of the three editions published in his lifetime—appeared in 1860; certain poems, however, such as *The Dream, The Caucasus*, and *The Heretic*, as well as "Testament," were necessarily excluded. Dobroliubov reviewed *Kobzar'* in *Sovremennik*, calling Shevchenko "a true people's poet" (*Sobr. soch.*, vol. 6, 1963, p. 142). A number of the poems not included in *Kobzar'* because of the censorship appeared in the collection *New Poems of Pushkin and Shevchenko*, which friends of Shevchenko's published in Leipzig in 1859.

The works of 1857–61 represent the apex of Shevchenko's poetry; there is now greater wealth and variety in his subjects (social, political, and philosophical), in his attitudes, in the range of colors of his nature poems, in the profound wisdom of his reflections on poetry, as in the triptych made up of "Fortune," "The Muse," and "Fame" (1858), in the rhythm and sophistication of poetic means, and in the skill of artistic imagery. Shevchenko's narrative poems *The Neophytes* (1857), *God's Fool* (1857), and *Mary* (1859), as well as his lyric verse of the 1850's and early 1860's, are among the highest achievements of this period. In *The Neophytes*, revolutionaries and Decembrists are glorified through allegorical images of early Christians; one can easily identify Nicholas I in the figure of Nero, and the nobles and landed gentry in Shevchenko's patricians.

Shevchenko's imitations of psalms and biblical motifs were another means by which he expressed revolutionary democratic ideas, as exemplified by his "Imitation of the 11th Psalm," "Hosea, Chapter XIV," and *Mary*. In his lyric masterpieces "O Blind and Wretched People," "Archimedes and Galileo," "There Is No Joy in Anything," and "Although They Do Not Hit a Man Who Is Down" (all written in 1860), Shevchenko's calls to revolution are issued with the assurance that "punishment will come! for the tsars and tsareviches of this earth." In these and other poems (especially in "Silent Light! Shining Light!"), Shevchenko envisions the future in the light of socialist ideals.

In his poetic writing, Shevchenko was close to the folk tradition; without breaking away from that tradition, his poetry evolved toward increasingly greater originality. The rhythmic intonation of Shevchenko's poetry is based on Ukrainian popular verse, but it is richer in its diversity of forms and rhythms and variety of strophic construction, whether syllabic (with 12- and 11-syllable or 14-syllable strophes) or syllabotonic (with, for example, 28 types of strophes in the poems written in iambic tetrameter alone). Shevchenko's contribution to Ukrainian poetry was unique in that he radically broadened its cultural and intellectual horizons, drawing on the history and contemporary life of various European peoples and incorporating ideas and images from European literature.

Many of Shevchenko's works were put to music by N. V. Lysenko (see his collection *Music to Shevchenko's "Kobzar'"*) and other Ukrainian composers, such as K. G. Stetsenko, Ia. S. Stepovyi, and S. F. Liudkevich, as well as by the Russian composers M. P. Mussorgsky, P. I. Tchaikovsky, and S. V. Rachmaninoff. "Oh Songs, My Songs," "Testament," and the first part of *The Mad Woman* ("The mighty Dnieper roars and groans") were made into folk songs, and "Testament" became one of the songs of the revolutionary movement.

Shevchenko's death was perceived as a great loss for literature and for the liberation movement. His funeral was attended by many literary and public figures, including M. E. Saltykov-Shchedrin, I. S. Turgenev, F. M. Dostoevsky, and N. S. Leskov. N. A. Nekrasov wrote the poem "On Shevchenko's Death," and A. I. Herzen published a moving obituary in *Kolokol* (The Bell).

Shevchenko was also known as an artist. From 1838 to 1845 he studied with K. P. Briullov at the Academy of Arts in St. Petersburg. His early works, such as *Katerina* (1842, T. G. Shevchenko Museum, Kiev) and the series of etchings *Pictures of the Ukraine* (published 1844), were indicative of Shevchenko's orientation toward realism, culminating in the keen accusatory force of the watercolors and drawings done in exile—for example, the series *The Parable of the Prodigal Son* and *Running the Gauntlet* (ink and bister, 1856–57).

After his return from exile, Shevchenko did a great deal of engraving, which he saw as a means of spreading art among the people; in 1860 he was given the title of academician in copper engraving. He produced a series of profound psychological portraits, such as his *Self-portrait* (1840–41, T. G. Shevchenko Museum, Kiev), and affecting landscapes of the Ukraine and Kazakhstan.

Shevchenko was the founder of modern Ukrainian literature as well as a pioneer of critical realism and of the revolutionary democratic current in Ukrainian literature and painting. The best traditions of Ukrainian literature are linked to his creative work. Shevchenko's literary works have been translated into many foreign languages, and their study constitutes a specialized branch of modern literature. There are Shevchenko museums in various cities and villages, including Kiev, Kanev (where Shevchenko is buried), Shevchenko, Morintsy, Leningrad, and Orsk. The University of Kiev and the Institute of Literature of the Academy of Sciences of the Ukrainian SSR are named after Shevchenko, and the Ukrainian republic instituted the Shevchenko Prize. In May 1861, in conformity with the poet's wish, the coffin bearing his remains was taken to the Ukraine and buried on Chernech'ia Gora, which overlooks the Dnieper near Kanev.

M. N. PARKHOMENKO [29–1070–2]

SHEVCHENKO (until 1964, Aktau), a city and the administrative center of Mangyshlak Oblast, Kazakh SSR. Situated on the Mangyshlak Peninsula, with a port (Aktau) on the Caspian Sea; located 13 km from the Mangyshlak railroad station on the Beineu–Novyi Uzen' line. Population, 111,000 (1977).

Shevchenko was founded as a result of the discovery of oil and gas deposits in the area. The city has a meat-packing plant, a milk plant, a poultry farm, and a garment factory. As of 1978, a plant for the production of plastics was under construction. Shevchenko has an atomic power plant, which is being used by an experimental industrial installation for the desalination of seawater. Cultural institutions include a people's dramatic theater and a museum of local lore.

The general plan for the layout and development of Shevchenko was approved in 1967. Notable features of the city plan are the relationship between the city and seacoast and extensive programs for planting greenery and providing amenities in the midst of the desert. The city was planned and built under the direction of the architect A. V. Korotkov, with the assistance of the architects G. M. Vylegzhanin, M. I. Levin, T. N. Safonova, N. I. Simonov, E. B. Fedorov, and S. S. Tseliaritskii and such engineers as E. A. Durgarian and G. P. Smorodin. The State Prize of the USSR was awarded to them in 1977 for this work. A complex of administrative buildings, the House of Soviets, the Abai House of Culture, and the Aktau Hotel are among the notable buildings in Shevchenko. [29–1075–2]

SHEVCHENKO, an urban-type settlement in Donetsk Oblast, Ukrainian SSR, under the jurisdiction of the Krasnoarmeisk city soviet. Shevchenko is located 8 km southwest of Krasnoarmeisk and 3 km from the Chunishino railroad station. Coal is mined in the settlement. [29–1075–3]

SHEVCHENKOVO, an urban-type settlement and administrative center of Shevchenkovo Raion, Kharkov Oblast, Ukrainian SSR. Shevchenkovo is located 80 km southeast of Kharkov. It has a railroad station (Bulatselovka) on the Kharkov–Kupiansk-Uzlovoi line. Enterprises include a combine for the manufacture of bread products. [29–1075–4]

SHEVCHUK, IVAN PAVLOVICH. Born 1892 in the village of Chaplia, in what is now Letichev Raion, Khmel'nitskii Oblast, Ukrainian SSR; died Oct. 30, 1942, on the Northwestern Front. Partisan leader in the Far East during the Civil War of 1918–20. Major general (1940). Member of the CPSU from March 1917.

The son of a poor peasant, Shevchuk fought in World War I; he was awarded four Crosses of St. George and was promoted to ensign. After the October Revolution of 1917 he helped recruit and train Red Guard detachments in Khabarovsk. In the summer of 1918 he led Red Guard detachments on the Ussuri Front against interventionists and White Guards.

In mid-1919, in accordance with a decision of the Fifth Regional Congress of Soviets of the Far East and the Urul'ga Conference of Party and Soviet Workers, Shevchuk formed and headed the Tungus Partisan Detachment. He fought against the Japanese for Khabarovsk in April 1920 and became one of the commanders of the Second Amur Partisan Army in June of the same year. In February 1922, Shevchuk commanded an enveloping column near Volochaevka.

Shevchuk graduated from advanced courses for command personnel and served as a regimental commander. In 1929 he fought in the Soviet-Chinese conflict on the Chinese Eastern Railway. Shevchuk graduated from the M. V. Frunze Military Academy in 1933. He commanded a rifle division in the Great Patriotic War of 1941–45 and died in combat. Shevchuk was awarded the Order of the Red Banner, the Order of the Red Star, and a medal.

S. N. PUCHKOV [29–1075–5]

SHEVELEV, FIRS ALEKSANDROVICH. Born Dec. 1 (14), 1912, in Moscow. Soviet hydraulics scientist. Doctor of technical sciences (1954); professor (1962). Member of the CPSU from 1940.

Shevelev graduated from the Moscow Construction Engineering Institute in 1937. From 1938 to 1941 and from 1946 to 1954 he worked at VODGEO (All-Union Scientific Research Institute of Water Supply, Sewage, Hydrotechnical Construction, and Engineering Hydrogeology). From 1954 to 1957 he worked in the construction department of the Central Committee of the CPSU. Between 1957 and 1964 he worked at the Academy of Construction and Architecture of the USSR. In 1965 he became director of the K. D. Pamfilov Academy of Municipal Services. Shevelev's main works are devoted to engineering hydraulics, mainly the hydraulics of pipe systems.

Shevelev has been awarded eight orders and several medals.

[29–1068–2]

SHEVIAKOV, LEV DMITRIEVICH. Born Jan 2 (14), 1889, in Vetluga, in what is now Gorky Oblast; died July 3, 1963, in Moscow. Soviet mining expert. Academician of the Academy of Sciences of the USSR (1939).

Sheviakov graduated from the Ekaterinoslav (Dnepropetrovsk) Mining Institute in 1912. In 1913 he began teaching at the institute, becoming a professor in 1920. In 1929 he became a professor at the Siberian Technological Institute, and in 1932, a professor at the Sverdlovsk Mining Institute. From 1944 to 1950 he was a professor at the Moscow Mining Institute. Between 1939 and 1963 he worked at the A. A. Skochinskii Mining Institute (known as the Mining Institute of the Academy of Sciences of the USSR until 1959). Sheviakov was chairman of the Commission for the Study of Natural Productive Forces of the Academy of Sciences of the USSR from 1946 to 1949 and served as a member of the State Planning Committee of the USSR from 1947 to 1957.

Sheviakov's main works dealt with the applications of analytic methods, for example, the establishment of quantitative relationships between the mining geological, mining engineering, and economic parameters of working deposits. Sheviakov developed a technique for calculating support pillars. The founder of a scientific school of mine planning, he devised a classification of underground methods of working mines.

Sheviakov received the State Prize of the USSR in 1942. He was awarded two Orders of Lenin, two other orders, and various medals.

SHEVRET, chrome-tanned leather made from sheepskin, with a fine, uniform grain. The structure is flocculent, and the face layer separates easily during use; special processes, such as impregnation with polymers, are used to increase the mechanical strength of the leather. *Shevret* is used as an upper leather and in the manufacture of clothing and accessories. [29–1069–3]

SHEVYREV, IVAN IAKOVLEVICH. Born 1859 in Kharkov; died July 7, 1920. Russian entomologist.

Shevyrev graduated from the University of Kharkov in 1883. He worked at the Institute of Forestry in St. Petersburg from 1887 to 1897 and at the Department of Forestry of the Ministry of Agriculture and State Property from 1898 to 1917. His main works deal with forest entomology, primarily bark beetles (Ipidae) and other arboreal pests. Shevyrev initiated the study of insects in man-made steppe forests. He wrote a number of works on parasitic Hymenoptera and proposed a precise method for studying their larvae. Shevyrev originated the use of plant intoxication for the destruction of pests.

SHEVYREV, PETR IAKOVLEVICH. Born June 23 (July 5), 1863, in Kharkov; died May 8 (20), 1887, in Shlissel'burg Fortress. Russian revolutionary Narodnik (Populist).

The son of a merchant, Shevyrev entered the University of Kharkov in 1883 and later transferred to the University of St. Petersburg. In the winter of 1885–86, he organized an illegal student union known as the League of Zemliachestva (see STUDENT MOVEMENT IN RUSSIA). In late 1886, Shevyrev and A. I. Ul'ianov founded the Terrorist Faction of the People's Will, which plotted to assassinate Emperor Alexander III.

In February 1887, suffering from tuberculosis, Shevyrev left for the Crimea. He was arrested in Yalta on March 7. On April 19, in the Second March 1 trial, he was sentenced to death (*see* PERVOMARTOVTSY). Shevyrev was hanged.

SHEVYREV, STEPAN PETROVICH. Born Oct. 18 (30), 1806, in Saratov; died May 8 (20), 1864, in Paris. Russian literary critic, literary historian, and poet. Academician of the St. Petersburg Academy of Sciences (1847).

Shevyrev became a professor at Moscow University in 1837. He was a member of the Society of Lovers of Wisdom (*see* LIUBOMUDRY), and he took part in the publication of the journal *Moskovskii vestnik*. An opponent of euphonious and smooth but meaningless poetry, he attempted to create a "poetry of thought" in his translations and poems on philosophical and historical themes. In such works as *The History of Poetry* (vol. 1, 1835; vol. 2, 1892, posthumously) and *The Theory of Poetry in the Historical Development of Ancient and Modern Peoples* (parts 1–4, 1836, doctoral dissertation), he treated the development of literature as a reflection of the spiritual experience and history of a people; this approach was praised by A. S. Pushkin (*Poln. sobr. soch.*, vol. 7, 1958, pp. 397–98).

From 1835 to 1837, Shevyrev was the leading critic for *Moskovskii nabliudatel'*. With M. P. Pogodin he headed the journal *Moskvitianin*, which was founded in 1841. In the ideological struggle of the 1840's and 1850's, he supported the official nationality theory formulated by S. S. Uvarov. Shevyrev opposed V. G. Belinskii, the natural school, and the realistic trend in literature.

SHEYBANI, ABU-NASR FATHULLAH-KHAN. Born 1830 in Kashan; died 1891 in Tehran. Persian poet.

Sheybani, a follower of Sufism, befriended the poor and reflected their life in his poems. Themes frequently encountered in his poetry include dissatisfaction with life and criticism of the injustice of the rulers and flaws in the social structure. In his "panegyrics" he denounced the shah's indifference to the plight of the country. Sheybani's works heralded social criticism in Persian literature and furthered the birth of critical realism. His poetic style was simple and laconic, also an innovation for Persian literature. Sheybani's poems are collected in two divans.

SHIASHKOTAN, one of the Kuril Islands, located in the northern part of the chain, between Shiashkotan and Kruzenshtern straits. The island, which belongs to the USSR, has an area of 122 sq km. Shiashkotan is composed of two volcanoes connected by a narrow isthmus with a width of 1 km. In the north is the active volcano Sinarka, which erupted in the 18th century and again in 1846, 1855, and 1872; Sinarka has an elevation of 934 m. In the south is the volcano Kuntomintar, which has an elevation of 828 m and which emits hot gases and vapors. Shiashkotan has oceanic meadows and thickets of dwarf stone pine and prostrate forms of alder. [29–1171–2]

SHIBAEV, ALEKSEI IVANOVICH. Born Feb. 8 (21), 1915, in the village of Maslovka, in what is now Spasskoe Raion, Gorky Oblast. Soviet party and trade union figure. Hero of Socialist Labor (1973). Member of the CPSU since 1940.

The son of a peasant, Shibaev graduated from the University of Gorky in 1940. Between 1940 and 1943 he worked as a design engineer, deputy chief, and chief of a shop at a factory in Gorky. From 1943 to 1947 he was a party organizer of the Central Committee of the ACP(B) at the V. P. Chkalov Plant in Novosibirsk and between 1947 and 1955 he was the director of various factories in Rostov and Saratov oblasts. From 1955 to 1959, Shibaev served as second secretary of the Saratov oblast committee of the CPSU, and in 1959 he became first secretary of the committee. In 1963 and 1964 he was first secretary of the Saratov industrial oblast committee of the CPSU.

In November 1976, Shibaev was named chairman of the All-Union Central Council of Trade Unions. He became a member of the Central Committee of the CPSU in 1961, and he served as a deputy to the sixth through tenth convocations of the Supreme Soviet of the USSR. In December 1977 he became a member of the Presidium of the Supreme Soviet of the USSR.

Shibaev has been awarded four Orders of Lenin, four other orders, and various medals. [29–1171–3]

SHIBANOV, MIKHAIL. Patronymic and date of birth unknown; died after 1789. Russian painter.

Shibanov, the son of serfs, was a "free painter" after 1783. He was a portraitist and the originator of peasant genre painting in Russian art. His pictures, which reveal the strong influence of nature, are painted in a direct manner. They depict peasants in a truly expressive style comparable to portraiture. Notable examples include *Peasant Dinner* (1774) and *Wedding Celebration* (1777), both in the Tret'iakov Gallery.

Shibanov painted portraits of A. G. Spiridov (1772, Tret'iakov Gallery), V. S. Popov (1784–85, Odessa Art Museum), and Catherine II and A. M. Dmitriev-Mamonov (both 1787, Russian Museum, Leningrad). From 1783 to 1786 he painted icons for the Cathedral of St. Catherine in Kherson (now housed in the Kherson Museum of Local Lore).

SHIBANOV, a family of Russian antiquarian booksellers.

Petr Vasil'evich Shibanov. Born circa 1822 in the village of Lava, in Karsun District, Simbirsk Province; died Dec. 22, 1892 (Jan. 3, 1893), in Moscow.

The son of a serf, P. V. Shibanov began selling Russian manuscripts and books in old Russian typeface (*staropechatnye knigi*) in 1840, while in Samara. He became commissioner of the Soci-

ety of Lovers of Ancient Literature in 1877 and the proprietor of a bookstore in Moscow in 1883.

Pavel Petrovich Shibanov. Born 1864 in Samara; died May 1, 1935, in Moscow. Son of P. V. Shibanov.

P. P. Shibanov started out in his father's business and acquired his own bookstore in 1892. The catalogs published by him—*The Antiquarian Book Trade of P. Shibanov* (nos. 1–168, 1885–1916)—are an invaluable source on the history of the Russian book in the 19th and 20th centuries. In 1892, Shibanov published the journal *Bibliograficheskie zapiski*, of which 12 numbers appeared. After the October Revolution of 1917 his store became municipal property, and his collection of books and manuscripts was given to the library of the Rumiantsev Museum, now the Lenin State Library of the USSR.

In November 1918, Shibanov was retained as an expert for the People's Commissariat for Education; he inventoried and oversaw the distribution of nationalized book collections. In 1923 he became head of the antiquarian department of the joint-stock company Mezhdunarodnaia Kniga, under the People's Commissariat of Foreign Trade and the Supreme Council on the National Economy; the company carried on a trade in books in the USSR and abroad. Shibanov helped compile about 300 catalogs of old books.

Shibanov was a member of several bibliographic and bibliophilic societies and wrote on the history of the antiquarian book trade in Russia.

Druz'ia knigi." In the collection *Kniga*, collection 27. Moscow, 1973.

A. V. DOROSHEVICH [29–1172–2]

SHIBLIAK, Mediterranean-type vegetation consisting of drought-resistant thermophile deciduous shrubs and low trees. This type of vegetation developed in the Mediterranean region during the Neogene. Modern *shibliak* has formed mainly in places where drought-resistant forests and open woodlands of the foothills and low mountains have been destroyed by man. The vegetation occurs in the Balkans, the Crimea, Dagestan, Transcaucasia, and the Black Sea Coast of the Caucasus. The floristic composition of *shibliak* varies; the most common trees are oaks (*Quercus pubescens* and Iberian oaks), Christ's thorn, *Carpinus orientalis*, and laburnum. In warmer regions there are admixtures of evergreen plants. [29–1173–6]

SHIDERTY, an urban-type settlement in Ekibastuz Raion, Pavlodar Oblast, Kazakh SSR. Shiderty is situated on the bank of the Shiderty Reservoir, on the Irtysh-Karaganda Canal, on the Pavlodar-Karaganda highway, 50 km west of Ekibastuz. The settlement uses the Chiderty railroad station. A crushing and screening plant that produces stone used in construction is located in Shiderty. [29–1177–3]

SHIDERTY (also Sarapan; in the lower course, Karasu), a river in Karaganda and Pavlodar oblasts, Kazakh SSR. The Shiderty is 506 km long and drains an area of 15,900 sq km. It rises in the central part of the Kazakh Melkosopochnik and empties into Lake Shaganak, which occupies an area of 16.4 sq km; when water levels are high, water from the lake flows into Lake Zhalauly. The river is fed mainly by snow. High water occurs between mid-April and early June. At times the upper and lower courses of the river dry up. The Irtysh-Karaganda Canal passes through the upper and middle courses of the Shiderty. [29–1177–2]

SHIDLOVSKII, ANDREI PETROVICH. Born Nov. 17, 1818, in Voronezh Province; died May 7, 1892, in the village of Karabachkino, in what is now Zhitomir Oblast, Ukrainian SSR. Russian astronomer.

Shidlovskii was a professor of astronomy at the University of Kharkov from 1843 to 1856 and the University of Kiev from 1856 to 1868. He took part in the major arc and angle measurements directed by V. Ia. Struve and in a chronometric expedition to determine the difference in longitude between the Pulkovo and Altona observatories.

REFERENCE

Piaskovskii, D. V. "Razvitie astronomii v Kievskom universitete." In the collection *Istoriko-astronomicheskie issledovaniia*, fasc. 1. Moscow, 1955. [29–1177–5]

SHIDLOVSKII, SERGEI ILLIODOROVICH. Born 1861; died 1922. Russian political figure; large-scale landowner; Octobrist.

Shidlovskii became a member of the administrative board of the Peasant Land Bank in 1900; in 1905 he was made director of the department of agriculture, but he resigned from the post in 1906. Thereafter, he served in a *zemstvo* (local self-government) institution and engaged in agriculture. Shidlovskii was assistant chairman of the Third State Duma and headed the left wing of the Octobrist Party in the Fourth State Duma. From 1915 to 1917 he was chairman of the bureau of the Progressive Bloc.

During the February Revolution, Shidlovskii served on the Provisional Executive Committee of the State Duma, and in the Provisional Government he was a member of the Central Committee. He took part in the Moscow State Conference of 1917 and served in the Preparliament. He was a member of the counterrevolutionary Council of Public Figures in 1917.

Shidlovskii withdrew from active politics in 1918 and emigrated in 1920. [29–1178–1]

SHIDLOVSKII COMMISSION, a government commission formed in accordance with a ukase issued by Nicholas II on Jan. 29, 1905. The commission was established as a result of the events of January 9 (Bloody Sunday) and the ensuing growth of the revolutionary and strike movement. Its purpose was to "clarify without delay the causes of discontent among the workers of St. Petersburg and its suburbs and eliminate such causes in the future."

Senator N. V. Shidlovskii was appointed to head the commission; its members were to be civil servants, factory owners, and deputies chosen from among the workers of St. Petersburg. Election of the deputies was to be a two-step process. First, electors would be chosen at the enterprises; then they, having formed nine production groups, would elect 50 deputies. On February 2 the St. Petersburg committee of the RSDLP adopted a resolution to strive for the selection of electors who supported the Bolsheviks. The electors would present detailed demands to the leaders of the commission setting forth the conditions for their participation in the commission; if the demands were not met, the electors would refuse to take part in the second stage of the elections and would thereby subvert the work of the commission. Candidates were also run by the Mensheviks, by remnants of G. A. Gapon's Assembly of Russian Factory Workers of St. Petersburg, and by the left wing of the Union of Liberation.

At a meeting of the electors on February 16 and 17, a decision was made under the influence of the Bolsheviks to demand that the government make public the sessions of the commission, grant freedom of speech, restore the 11 branches of Gapon's assembly that had been disbanded, and free arrested comrades. On February 18, Shidlovskii rejected the demands as being outside the competence of the commission. In response, the electors of seven of the production groups refused to send deputies to the Shidlovskii Commission and called on the workers to strike.

On February 20, Shidlovskii submitted to Nicholas II a report acknowledging the failure of the commission. On the same day the Shidlovskii Commission was disbanded by a tsarist ukase.

SHIDYAQ, AHMAD FARIS AL-. Born 1804 in Ashkot, Lebanon; died 1887 in Constantinople. Arabic educator and writer of Lebanon.

The son of a Maronite Christian, Shidyaq graduated from a religious school in 1828. From 1834 to 1838, after converting to

Protestantism, he did translations into Arabic for an American missionary publishing house in Malta, including a translation of the New Testament. After visiting the court of the Tunisian bey, he converted to Islam in 1855. In 1857, at the invitation of the Turkish sultan, he moved to Constantinople, where he founded the influential semiofficial newspaper *Al-Jawaib* (1857–84).

In his publicist writings, al-Shidyaq advocated pan-Arabism under the aegis of the Turkish sultan; he sharply criticized Egyptian nationalists. In Constantinople, Shidyaq published his own writings on philology and linguistics and edited more than 20 works of medieval Arabic literature. Perhaps his best-known work, which is similar to an adventure novel, is *Tale of Faryaq* (1855). In this novel Shidyaq described, in a Rabelaisian spirit, his own travels around Europe (Faryaq was a cryptonym of Far-[is Shid]yaq). He also criticized the social relations and mores of Eastern society in the work.

SHIELD. (1) A type of protective armament used to ward off the blows of cold-steel weapons. Shields were worn on the arm, which was passed through straps or rigid bands. The earliest shields were of various shapes and were made of wood, leather, or plaited twigs. Mesopotamians of the third millennium B.C. used wooden shields that were partially covered with copper plates. Bronze shields appeared in the second millennium B.C. in Assyria. The bronze shields of the kings of Urartu were covered with relief work and cuneiform characters.

The round, wooden—less often, iron—shields used in ancient Greece bore warriors' emblems, such as the dolphin or the lion. The Romans used round, iron shields and four-cornered shields made of wood and leather. Shields in early medieval Europe were also round and had umbones. Almond-shaped shields came into wide use in the 11th century; in the mid-13th century they were supplanted by triangular shields.

Symbols—rudimentary coats of arms—appeared on shields in the 12th century. In the second half of the 14th century and in the 15th century, the warriors of northern Rus' used the *paveza*, a rectangular pavis with rounded corners. The field of the pavis was divided into three parts by a trough, which facilitated defensive movements. The Russian cavalry used round shields from the 14th to early 16th centuries. Shields became smaller with improvements in armor and went out of use when firearms were developed.

The shield served as a symbol of military honor and victory. Pagan warriors took oaths on their shields. In 907, in Tsar'grad (Constantinople), Oleg "hung his shield on the gates as a sign of victory." Shields in Rus' were made by special artisans known as *shchitniki* (shield-makers). There was in Novgorod a street called Shchitnaia (Shield), where, apparently, the shield-makers lived.

(2) An armor plate with slots for gun or machine-gun sights. The shield is used to protect the gun crew and the gun's mechanisms from bullets and shrapnel. On some towed weapons, the shield is mounted forward of the sight and sighting devices.

D. A. AVDUSIN [29–1605–5]

SHIELD (geology), the largest positive structure of cratons, contrasted to the platform. Within the shields there are outcrops of strongly metamorphosed Precambrian crystalline rocks (granites, gneisses, and schists), which constitute the basement of the cratons. Shields are irregular, flat uplifts and are usually uplifted segments of the crust. Their outlines show great stability for long periods of time.

The term "shield" was first suggested by E. Suess in 1885 for the extensive outcrops of Precambrian rocks in North America (the Canadian Shield) and Northern Europe (the Baltic Shield). The term "crystalline shield" was proposed by N. S. Shatskii in 1947. [29–1606–2]

SHIELDING (also screening), in electrical engineering and radio engineering, a means of reducing—that is, of suppressing or substantially attenuating—the effect of external stray fields, noise, or pickup. Such phenomena interfere with the operation of, for example, electrical or radio equipment, data transmission equipment, and data-processing equipment.

Shielding is accomplished by means of a grounded metal or metal-plated shield with a high electrical or magnetic conductivity. Either the stray-field or noise source or the equipment or component to be shielded is enclosed in the shield. Depending on the extent of shielding required, either solid shields or screens are used. Solid shields are usually made of sheet steel; screens are woven from copper or steel wire.

In many cases, the metal housing of a device acts as a shield. Complicated or bulky equipment is often installed in a room or chamber that is shielded. [29–1887–1]

SHIELD MINING, a method of mineral extraction in which a mineral is broken up by mechanized means or by drilling and blasting under a special roof shield. The method was proposed in the USSR in 1935 by N. A. Chinakal and others.

When mechanized breaking is employed, shield units are used. A shield unit consists of hydraulic barrier–load-bearing supports (*see* POWERED SUPPORT) and a Loebbe plow, which excavates the mineral and conveys it under the shield to a side chute. Shield units are used in beds with a thickness of 0.7–2.2 m and an angle of dip of more than 45°. They provide for the complete mechanization of operations at the working face.

When coal is broken up by drilling and blasting, flat sectional shields, which are called Chinakal shields in the USSR, are used. Such shields consist of from three to five sections; less often, they are arched and not sectional. A section is a metal frame in which timber flooring is installed in several rows. The flooring is rigidly fastened to the frame, but the sections are flexibly connected. Sectional shields are used in the working of beds with a thickness of 3.6–11 m and an angle of dip of more than 55°. The bed in an excavation area is worked in strips along the dip.

When drilling and blasting is used, a mineral is excavated in two stages. In the first stage, blastholes are drilled and explosives are detonated first in the gallery and then in the pillars that support the shield. In the second stage, the loosened mineral is thrown into the mining excavations driven under the sections and is conveyed to the haulage level, and the shield is advanced 0.8–1.2 m. The cycle of operations is then repeated.

Shield mining is most widely used in the steeply dipping coal seams of the Kuznetsk Coal Basin.

A. P. KILIACHKOV [29–1609–2]

SHIFRIN, NISSON ABRAMOVICH. Born June 16 (28), 1892, in Kiev; died Apr. 3, 1961, in Moscow. Soviet stage designer. People's Artist of the RSFSR (1958). Member of the CPSU from 1942.

Shifrin studied in Kiev, at A. A. Murashko's school of drawing and painting (1912–15), A. A. Ekster's studio (1918–19), and the Ukrainian Academy of Arts (1920–21). He taught in several schools in Moscow, including the Vkhutein (1929–30), the Polygraphic Institute (1931–32), and the A. V. Lunacharskii Institute of Theatrical Arts (1934–36). He became a member of the Society of Easel Painters in 1925.

Shifrin was principal stage designer at the Central Theater of the Soviet Army from 1935 to 1961. Several of his most important designs were for productions of the Moscow Art Theater, including Lavrenev's *The Break* (1950) and Chekhov's *The Seagull* (1960), and of the Malyi Theater, notably Sofronov's *The Moscow Character* (1948). At the Central Theater of the Soviet Army he executed designs for Korneichuk's *The Destruction of the Squadron* (1934), Shakespeare's *The Taming of the Shrew* (1937),

a dramatization of Sholokhov's *Virgin Soil Upturned* (1957), and Salynskii's *The Drummer Girl* (1958).

Shifrin suited his designs to the stage director's conception of each production. He carefully thought out the use of space and integrated painted scenery, including backdrops and borders, into the stage action. He also worked as a painter and illustrated several books, including V. V. Mayakovsky's *Whom Should One Be?* (1929).

Shifrin was awarded the State Prize of the USSR in 1949 and 1951.

SHIGAEV, MAKSIM GRIGOR'EVICH. Born 1726; died Jan. 10 (21), 1775, in Moscow. Iaik Cossack. Comrade-in-arms of E. I. Pugachev. One of the leaders of the Iaik Cossack uprising of 1772.

During the Peasant War (1773–75) led by E. I. Pugachev, Shigaev was Pugachev's closest aide, a member of the "war college," and a judge and commander of troops during the siege of Orenburg. On Apr. 7, 1774, he was taken prisoner at Iletskii Gorodok. Shigaev was sentenced to death on Dec. 31, 1774, and was executed together with Pugachev and the other leaders of the uprising.

SHIGATSE (also Jihk'atse), a city in China, in the Tibetan Autonomous Region. Situated in the valley of the Tsangpo (Brahmaputra) River, at an elevation of more than 3,800 m. Population, approximately 20,000. Shigatse, a highway junction, is the center of a farming region. The city's cottage industries produce pottery and textiles. [29–1176–2]

SHIGELLA, a genus of microorganisms of the family Enterobacteriaceae. It comprises different species of the causative agent of dysentery in monkeys and humans. They are gram-negative, nonmotile, nonspore-forming rods measuring 2–3 micrometers long and 0.6 micrometer wide. Aerobes and facultative anaerobes are distinguished. Shigellae form delicate semitransparent colonies on agar. They are subdivided into different types according to the colicins they secrete. [29–1176–3]

SHIGIR' CULTURE, an archaeological culture of the Mesolithic and early Neolithic periods (fifth and fourth millennia B.C.) widespread in the Central Urals and the Trans-Ural Region; named after the finds from the Shigir' peat bog. Typical implements included bone arrowheads, harpoons, and spears of various shapes and daggers with flint blades. Wooden anthropomorphic figurines—idols—were also found. The chief occupations of the tribes of the Shigir' culture were fishing and hunting. The similarity between the remains of the Shigir' culture and the ancient remains of Estonia (*see* KUNDA) enabled A. Ia. Briusov to hypothesize that the Baltic Region was settled by people from the Urals Region.

SHIGIR' PEAT BOG, a peat bog near the city of Nev'iansk, Sverdlovsk Oblast, RSFSR, with the remains of settlements of the fourth to second millennia B.C. Excavations conducted by P. A. Dmitriev, A. Ia. Briusov, and V. M. Raushenbakh unearthed strata of the developed Neolithic period and the Bronze Age (middle of the third millennium B.C. to the end of the second millennium B.C.; Gorbunovo archaeological culture), as well as Mesolithic and early Neolithic strata. (*See* GORBUNOVO PEAT BOG and SHIGIR' CULTURE.) [29–1176–6]

SHIH, a Chinese verse form. The word *shih* originally denoted poetry in general and later referred only to written poetry. It was associated with a specific poetic genre in the Middle Ages. The classical *shih* consists of five or seven monosyllabic words with a strictly prescribed pattern of musical tones of different pitch, as well as a complex melodic pattern. The rhyme is parallel and consistent throughout the poem. Lines are usually rhymed on the "even" tone, which is more melodious.

A variant of the classical *shih*, the *chüeh-chü* ("stop-short"), is a quatrain with one verse, the penultimate, unrhymed. The appearance of dynamic stress and polysyllabic words in Chinese made the classical *shih* archaic. Chinese free verse, which appeared in the 20th century, is also called *shih*. Song has had a great influence on the modern *shih*.

SHIHAB, a family and dynasty of emirs in Lebanon. The Shihabs, who traced their lineage to the Quraysh tribe of the Hejaz, became the feudal rulers of the region of Anti-Lebanon in the 12th century; from 1697 to 1840 they were the ruling dynasty in the mountainous part of Lebanon. The best known were Bashir I Shihab (ruled 1697–1707), Haidar Shihab (1707–32) and Bashir II Shihab (ruled 1788–1840 or 1789–1840).

Other Lebanese public and state figures from the Shihab family include the historian Haidar Shihab (1760–1835) and General Fuad Shihab (Fouad Chehab), the president of the Lebanese Republic from 1958 to 1964. [29–1242–4]

SHIHCHAISHAN, a burial ground of the Bronze and early Iron ages (fourth century B.C. to first century A.D.), near the village of the same name in Chinning Districts, Yünnan Province, China. Shihchaishan was excavated between 1955 and 1960. The burial inventory included unique articles made of bronze, such as weapons, drums with sculptured images of people and animals, models of dwellings, and implements, as well as Chinese coins and bronze mirrors and seals. Shihchaishan probably belonged to tribes that were known in Chinese written sources under the name of Tien, the ancestors of the contemporary Itsu.

SHIHCHIACHUANG, a city in North China and the capital of Hopeh Province. Population, 1.5 million (1970). Shihchiachuang is a railroad junction and a center of heavy industry—ferrous metallurgy and machine building. The machine-building industry, which includes railroad repair shops, produces engines, mining and power-engineering equipment, steam locomotives, and railroad cars. The city has an electronics industry, and the textile industry is represented by six large cotton mills. Shihchiachuang has glass and cement plants, and the Hopeh Pharmaceuticals Plant is the largest such enterprise in the People's Republic of China. Near the city coal is mined in the Chinghsing coalfield, and iron ore at the Chienp'ing deposit. [29–1243–3]

SHIH CHING ("Book of Odes," "Classic of Poetry"), an anonymous work of Chinese literature written between the 11th and sixth centuries B.C. The *Shih Ching* contains 305 songs, which tradition claims were selected by Confucius. It was burned along with other Confucian books in 213 B.C. and was restored to approximate its original form in the second century B.C. The work is included on the list "Mao-shih"; it received the name *Shih Ching* in the 12th century. The *Shih Ching* consists of four sections: "Kuo feng" (The Morals of Kingdoms), "Hsiao ya" (Little

Odes), "Ta ya" (Big Odes), and "Sung" (Hymns), each of which is actually a separate book with its own themes, emotions, and means of artistic expression, including musical accompaniment.

The songs of "Kuo feng," which has the greatest literary value of the four sections, focus on man and his relation to nature and his surroundings and the emotional and intellectual world of the farmer, livestock breeder, and hunter. Themes of social protest occur more often in the songs of "Kuo feng" than in the other sections. The lyrical works of the section "Hsiao ya" were written mainly by court poets for various celebrations and extol the virtues and military feats of the rulers. The odes of "Ta ya" are considered models of court poetry. The section "Sung" comprises festive and laudatory songs and religious hymns.

The *Shih Ching*, reflecting the varied phenomena of China's spiritual and social life, is an encyclopedia of Chinese antiquity.

SHIH NAI-AN (also Shih Tzu-an). Born 1296 in Tungtu (present-day Yangchou); died 1370 in Hsinghua, Yangchou District. Chinese writer.

Information about Shih Nai-an is scarce and mostly based on legend. It is known that he was the author of a heroic epic based on folk legends and dramas, *The River Backwaters* (*Shui-hu chuan*), which extolled the peasant uprising led by Sung Chiang in the 12th century. The novel was most widely circulated in a 17th-century version by Chin Sheng-t'an, which was translated into Russian and other European languages. The heroes of Chin Sheng-t'an's version break with society and establish a band of freebooters, a kingdom of equality and brotherhood. Versions consisting of 100 and 120 chapters are apparently closer to the original. Many episodes and scenes, written in a lively, colloquial language, were among the favorite themes of street storytellers. The composition and artistic style reproduce with great precision the techniques of oral folk storytelling.

SHIHSANLING (literally, "13 imperial graves"), a necropolis of emperors of the Ming dynasty (15th to 17th centuries), located near Peking. Each of the 13 tombs comprises an underground mausoleum and a surface temple complex. These outstanding examples of palace and temple architecture were partially destroyed after Peking was captured by Manchu troops in 1644, but they were restored and rebuilt in the mid-18th century. In 1956 excavations were undertaken in the Tingling mausoleum (underground palace), the burial site of Emperor Shen-Tsung (1573–1620), which is now a museum.

SHIH SHEN. A Chinese astronomer of the fourth century B.C. Shih Shen was one of the compilers of the oldest surviving star catalog. The catalog provided data on more than 800 stars.
[29–1252–2]

SHIH TA-K'AI. Born 1830; died June 25, 1863. One of the principal leaders of the Taiping rebellion in China.

The son of a prosperous peasant, Shih commanded the advance forces of the Taipings during their march on Nanking in 1853. He headed the Taiping government from November 1856 to October 1857, when he split from the Taiping movement and began operating on his own in the southwestern provinces. During a march into Szechwan, Shih's forces were routed by government troops in June 1863, and Shih was executed. [29–1177–1]

SHIIAN, ANATOLII IVANOVICH. Born Mar. 23 (Apr. 5), 1906, in the village of Borisovka, in what is now Belgorod Oblast. Soviet Ukrainian writer. Member of the CPSU since 1947.

Shiian graduated from the Kiev Institute of Timber Technology in 1929. He was a member of General A. N. Saburov's partisan unit during the Great Patriotic War of 1941–45. Shiian wrote the novella *Slops* (1930) and the novel *Main Line* (1934). He is also the author of the book of sketches *Partisan Country* (1946) and collections of plays, novellas, and short stories. His most important work, the novel *The Thunderstorm* (1936), deals with the life of a prerevolutionary village and the people's struggle for Soviet power; the film *Thunderstorm Over the Fields* (1959) was based on the novel. Shiian has been awarded three orders and various medals.

SHIISM, one of the two main branches of Islam, the other being Sunnism.

In the seventh century the Shiites emerged in the Arabian Caliphate as a faction that supported the claim of Ali and the descendants of Ali and Fatima, the daughter of Muhammad, to the imamate and rule over the caliphate. Although the Shiites were defeated in the struggle for supreme political power, Shiism developed into a distinct branch of Islam by the mid-eighth century. The main dogmas of Shiism, as opposed to Sunnism, were the recognition of the sole right of Ali and his descendants—the Alids—to spiritual and secular leadership over the Muslim world, in other words, to the imamate. The Shiites denied the legitimacy of the first caliphs—Abu Bakr, Omar I (Omar ibn al-Khattab), Othman ibn Affan, and the Umayyad and Abbasid caliphs—and believed that the caliph, as the prophet's representative, should not be elected by the people.

As a result of disputes over the number of Imams, Shiism split into several subdivisions between the seventh and ninth centuries: the Kaisanis, the Zaidis, the Ismailians, and the Imamis, also known as the Twelver, or Ithna Ashariyah, Shiites. The Kaisani sect disappeared in the 11th century; the Zaidi sect is the most moderate. The Imamis, one of the leading sects, recognize twelve Imams, the last of whom—Muhammad al-Mahdi al-Hujjah—is believed to have vanished without a trace in infancy. Known as the hidden Imam, Muhammad is considered to be the messiah, or Mahdi, who will return to earth and establish the rule of the just. In the meantime, he guides Shiite Muslims in all aspects of their lives through the higher clergy, or *mujtahid*, whose authority derives from a mystical communion with the hidden Imam.

The doctrine of the Imamis, in combination with Sufism, provided the ideology for several popular movements in Iran and Middle Asia during the Middle Ages, notably the Serbadar rebellion and the Sayyid movement. The Ismailis broke from the Imamis in the mid-eighth century. A fertile ground for the growth of Shiism was Iran, where it was considerably influenced by Zoroastrianism and Nestorianism.

In many respects, Shiism resembles Sunnism. Shiites recognize an altered version of *sunna*, in which only those traditions of the Hadith that emanate from Ali's supporters are accepted; they also recognize the Koran, although they consider the official Sunni text flawed. At the same time, the Shiites have their own sacred tradition, distinct from that of the Sunnis. The cult of the holy martyrs plays a greater role in Shiism than in Sunnism. The Shiites have accepted the Mutazilite doctrine denying predestina-

tion and affirming man's free will. With the exception of the Zaidis and Kaisanis, who never accepted the doctrine, they recognize the infallibility of the Imams. In contrast to the Sunnites, the Shiites make pilgrimages not only to Mecca and Medina, but to the burial places of the Imams and their relatives: Karbala, al-Kazimiyah, Meshed, and Qom.

Shiism is practiced in various forms by most of the population of Iran and the Yemen Arab Republic and in India, Pakistan, Syria, southern Iraq, and some areas of the USSR, mainly in Azerbaijan.

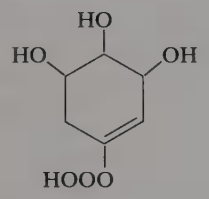
SHIKARPUR, a city in Pakistan, in Sind Province, near the Indus River. Population, 62,500 (1969). Shikarpur has a railroad station. Industry is represented by cotton-ginning, rice-processing, and flour milling enterprises. Handicrafts include the production of silk and cotton fabrics, carpets, pottery, and indigo dyes.
[29–1183–2]

SHIKIMIC ACID, the most important intermediate product of metabolism in microorganisms and higher plants; colorless crystals, with a melting point of 184°C and good solubility in water.



The biochemical role of shikimic acid was elucidated in 1955–58 by the American microbiologist B. Davis while working with mutants of *Bacillus coli*. The formation of the acid is related to carbohydrate metabolism; its closest precursor is 7-phosphate-3-deoxyarabinoheptulose. Shikimic acid takes part in the biosynthesis of aromatic acids, including the amino acids phenylalanine, tyrosine, and tryptophan; phenol compounds, including phenol alkaloids; coumarins; lignin; and flavonoid pigments and other secondary metabolites.

SHIKIN, IOSIF VASIL'EVICH. Born Aug. 26 (Sept. 8), 1906, in the village of Lychevo, in what is now Gavrilov Posad Raion, Ivanovo Oblast; died July 30, 1973, in Moscow. Soviet military and party figure. Colonel general (1945). Member of the CPSU from 1927.

The son of a peasant, Shikin became a worker. He graduated from the N. K. Krupskaia Communist Higher Educational Institution in 1931 and became the secretary of a raion committee of the party. He entered the Red Army in 1939 and graduated from courses for senior political personnel that same year. Shikin was appointed head of the political department of the Military Electrotechnological Academy in November 1939 and deputy chief of the Directorate of Political Propaganda of the Leningrad Military District in August 1940.

During the Great Patriotic War of 1941–45, Shikin was a member of the Military Council of the Northern Front and chief of the political directorates of the Leningrad and Volkhov fronts. He became deputy chief of the Main Political Directorate of the Red Army in July 1942 and was made a member of the Military Council of the High Command of the Soviet Forces in the Far East in August 1945. Shikin served as chief of the Main Political Directorate of the Armed Forces of the USSR from 1946 to 1949 and head of the V. I. Lenin Military Political Academy in 1949 and 1950.

Shikin took a position in the apparatus of the Central Committee of the CPSU in March 1950. He was the Soviet ambassador to Albania in 1961 and 1962. In late 1962 he was appointed first deputy chairman of the Committee of Party and State Control of the Central Committee of the CPSU and of the Council of Ministers of the USSR. Later he became first deputy chairman of the Committee of the People's Control of the USSR.

Shikin was chosen a member of the Central Auditing Commission of the CPSU in 1956. He was a deputy to the second convocation of the Supreme Soviet of the USSR. Shikin was awarded two Orders of Lenin, the Order of the October Revolution, two Orders of the Red Banner, the Order of Suvorov First Class, the Order of the Red Banner of Labor, the Order of the Red Star, and various medals.
[29–1183–4]

SHIKOTAN (also Sikotan), the largest island in the Lesser Chain of the Kuril Islands of the USSR. Shikotan, which has a rugged coast, covers an area of 182 sq km and rises to an elevation of 412 m. Shikotan is composed of volcanic rocks and sandstones of the Upper Cretaceous and Cenozoic. Groves of Sakhalin fir (*Abies sachalinensis*), Kuril larch, and deciduous trees and low-growing bamboo are found on the slopes, and dwarf junipers grow on the crests. Oceanic meadows are found on the coastal terraces. The populated points Malokuril'skoe and Krabozavodskoe are located on the island. Economic activities include fishing and hunting of sea animals.
[29–1184–1]

SHIL'DA, an urban-type settlement in Adamovka Raion, Orenburg Oblast, RSFSR. Shil'da is a railroad junction for lines to Orsk, Cheliabinsk, and Ozernyi.
[29–1196–1]

SHIL'DER, KARL ANDREEVICH. Born Dec. 27, 1785 (Jan. 7, 1786), in the village of Simanovo, in what is now Nevel' Raion, Pskov Oblast; died June 11 (23), 1854, in Călăraşi, Rumania. Russian military engineer. General of the engineers (1852); adjutant general.

Shil'der graduated from a school for column leaders in 1806 and served in the engineer troops as commander of a sapper company and a battalion and as chief of engineers of a corps and of an army. He fought in the battle of Austerlitz (1805), the defense of Bobruisk (1812), the Russo-Turkish War of 1828–29, and the Crimean War of 1853–56. He distinguished himself in action during the siege of Varna in 1828, the sieges of Silistra and Şumla in 1829, and the forcing of the Danube in 1854. Shil'der died of wounds received at Silistra during the Crimean War of 1853–56.

Shil'der developed a new and more effective system of countermining, using horizontal and inclined passages rather than vertical shafts. He also devised antipersonnel mines, stone fougasses, and canister mines. He produced an original design for a suspended rope bridge in 1828 and a "wineskin bridge" of quickly assembled, portable pontoons made of rubberized canvas in 1836. Between 1832 and 1836, Shil'der and P. L. Shilling developed a method of setting off powder charges electrically. Between 1838 and 1848, Shil'der and B. S. Iakobi built electrochemical and electrochemical-contact naval mines. Shil'der provided the designs for the world's first all-metal submarine, built in 1834, and the *Otvazhnost'*, built in 1846; the world's first steamship armed with artillery and rockets, the *Otvazhnost'* was a prototype of the destroyer. Among Shil'der's students were the talented engineers E. I. Totleben and M. M. Boreskov.

[29–1196–2]

SHIL'DER, NIKOLAI GUSTAVOVICH. Born 1828; died Mar. 13 (25), 1898, in St. Petersburg. Russian genre painter.

In the 1850's, Shil'der studied under B. P. Villeval'de at the St. Petersburg Academy of Arts, where he became an academician in 1861. Influenced by P. A. Fedotov, he devoted his creative work to the "little man." Shil'der depicted scenes in a straightforward manner rather lacking in subtlety, for example, *The Temptation* (1856 or 1857, Tret'iakov Gallery, Moscow) and *Forced Marriage* (Russian Museum, Leningrad).

SHIL'DER, NIKOLAI KARLOVICH. Born May 21 (June 2), 1842, in St. Petersburg; died there Apr. 6 (19), 1902. Russian historian. Lieutenant general (1893). Corresponding member of the St. Petersburg Academy of Sciences (1900). Son of K. A. Shil'der.

N. K. Shil'der graduated from the Corps of Pages and the Nikolai Engineering Academy. He took part in the Russo-Turkish War of 1877–78. Shil'der became head of the Nikolai Engineering Academy in 1886 and director of the Public Library in 1899. He was the first to publish a significant number of documents dealing with the political, military, and diplomatic history of Russia. His historical works are rich in factual content. Shil'der defended the view of the monarchy held by the *dvorianstvo* (nobility or gentry).

SHILEIKA, IONAS VINTSO (Jonas Vincas Šileika). Born June 20 (July 2), 1883, in the village of Jadagonej, in what is now Kaunas Raion, Lithuanian SSR; died Oct. 27, 1960, in Kaunas. Soviet painter. People's Artist of the Lithuanian SSR (1958).

Shileika attended the Catholic University of Valparaiso in Chile (1905–06), the Institute of Art in Chicago (1906–10), and the art school of G. Gröber and the Academy of Arts in Munich (1911–13). He worked in the USA from 1915 until 1921 when he returned to Lithuania. He taught at the Kaunas Institute of Applied and Decorative Art from 1944 to 1951 and at other educational institutions. He was known for his generalized, often symbolic landscapes with appealing color schemes, for example, *The Nemanus River at Bruze* (1914, M. K. Čiurlionis Art Museum, Kaunas). He also painted expressive, highly individualized portraits, mostly of Lithuanian cultural figures, such as J. Naialis (1924, M. K. Čiurlionis Art Museum) and Z. Petravičius (1950, Art Museum of the Lithuanian SSR, Vilnius).

SHILEIKO, VOL'DEMAR KAZIMIROVICH. Born Feb. 2 (14), 1891, in St. Petersburg; died Oct. 5, 1930, in Leningrad. Soviet Assyriologist and poet.

Shileiko was a professor at Leningrad State University from 1922 to 1930. He acquainted scholars with many Sumerian, Assyro-Babylonian, Hittite, and other written works from Soviet collections. He also prepared verse translations of several Babylonian works for publication in *Vostok* (1922, books 1, 4).

REFERENCE

SHILIN, AFANASII PETROVICH. Born Sept. 1, 1924, in the village of Petropavlovka, in present-day Novouzensk Raion, Saratov Oblast. Twice Hero of the Soviet Union (Feb. 22, 1944, and Mar. 24, 1945). Lieutenant general (1975). Member of the CPSU from 1944.

Shilin was born into a worker family. He entered the Red Army in 1942 and graduated from the Second Tomsk Artillery School in 1943, the Higher Artillery School for Officers in 1946, the F. E. Dzerzhinskii Artillery Academy in 1952, and the Military Academy of the General Staff in 1966. During the Great Patriotic War (1941–45), Shilin served from 1943 on the Southwestern, Third Ukrainian, and First Byelorussian fronts. He commanded a platoon and was chief of reconnaissance for an artillery battalion in the 132nd Guards Artillery Regiment. He took part in the fighting for the Dnieper and the liberation of the Ukraine, Moldavia, and Poland. After the war, Shilin held important command positions.

Shilin has been awarded the Order of Lenin, the Order of the Red Banner, the Order of the Red Banner of Labor, the Order of the Patriotic War Second Class, and various medals. A bust of Shilin has been erected in the city of Leninsk-Kuznetskii in Kemerovo Oblast. [29–1185–1]

SHILKA, a city (since 1951) and the administrative center of Shilka Raion, Chita Oblast, RSFSR. Shilka is situated in the Shilka River valley, 248 km east of Chita. The city has a station on the Trans-Siberian Railroad. In prerevolutionary Russia, Shilka was a place of political exile, and members of the Petrashevskii circle served sentences of hard labor in the local mines between 1850 and 1856. The city has a butter factory, a confectionary factory, and enterprises serving railroad transportation. [29–1185–5]

SHILKA, a river in Chita Oblast, RSFSR; the left headstream of the Amur. The Shilka is 560 km long and drains an area of 206,000 sq km. It is formed by the confluence of the Onon and Ingoda rivers and flows through a deep valley between the Shilka and Amazar ranges on the north and the Borshchovochnyi Range on the south. It has a rapid current. In places the river divides into separate channels or forms river bars.

The Shilka is fed chiefly by rain. Highwater occurs in July and August, and freshets are common. The mean flow rate 149 km from the river's mouth is 521 cu m per sec. The maximum flow rate on record is 11,400 cu m per sec (July 1958), and the minimum, 0.81 cu m per sec (March 1969). The river freezes over in late October or early November; parts of the upper course freeze completely in some winters. The ice breaks up in late April or the first half of May. The Shilka is navigable. The city of Sretensk is situated on the river. [29–1185–4]

SHILKA, a mountain range in eastern Transbaikalia, in Chita Oblast, RSFSR. Located along the left bank of the Shilka River, the range is approximately 200 km long and reaches an elevation of 1,063 m. It is composed of granites, schists, and sandstones. The range is deeply dissected by the valleys of tributaries of the Shilka River. Larch taiga is found on the slopes. [29–1185–6]

SHILLER, NIKOLAI NIKOLAEVICH. Born Mar. 1 (13), 1848, in Moscow; died Nov. 10 (23), 1910, in St. Petersburg. Russian physicist.

After graduating from Moscow University in 1868, Shiller continued to work there. In 1871 he was sent to Berlin, where he worked under the direction of H. von Helmholtz on the measurement of the dielectric constants ϵ of various substances by a method that he proposed in order to verify Maxwell's relation $\epsilon = n^2$, where n is the refractive index of the medium. In 1876 he became a professor at the University of Kiev. Beginning in 1903, he was director of the Kharkov Technological Institute.

In 1876, Shiller experimentally proved that an electric current always follows a closed path. In 1900 he formulated, as a corollary to the second law of thermodynamics, a principle stating that it is impossible to attain a continuously decreasing or increasing temperature with a closed adiabatic process (a similar formulation was proposed by the German scientist C. Carathéodory in 1909).

SHILLING, PAVEL L'VOVICH. Born Apr. 5 (16), 1786, in Tallinn; died July 25 (Aug. 6), 1837, in St. Petersburg. Russian scientist, electrical engineer, and Orientalist.

After graduating from the First Cadet Corps in 1802, Shilling served on the Russian general staff. Between 1806 and 1812, he served on the staff of the Russian embassy in Munich. He distinguished himself in battle in the Patriotic War of 1812. After the war, Shilling served in the Ministry of Foreign Affairs, where he established the first state lithographic shop in Russia. In 1829 he developed a unique lithographic method for reproducing Chinese texts.

While serving as an official in the Department of Eastern Affairs, Shilling studied the languages and history of various Asian peoples. In 1828 he became a corresponding member of the Imperial Academy of Sciences in the area of Oriental literature and antiquities. Between 1830 and 1832, he took part in a scientific expedition to Eastern Siberia and compiled a valuable collection of Tibetan and Mongolian literary monuments.

In 1812, Shilling took up the study of electrical engineering and designed a mine with an electric fuze. In the same year, the first experimental detonation of the mine was carried out in the Neva River in St. Petersburg. Mines designed by Shilling were used in special subunits of the Russian Army.

Shilling's best known work was concerned with electric telegraphy. In 1832, Shilling invented a key-actuated telegraph, which he used to develop an electromagnetic telegraph system. In his electromagnetic system, a special six-unit code, which he also developed, was used to transmit electric signals over an eight-wire line. Later, in 1835 and 1836, Shilling constructed a system that used a single-needle telegraph and a two-wire line; he also developed an original binary code. In 1835, he demonstrated his telegraphic inventions in Bonn at a congress of the German Society of Naturalists and Physicians. In 1836, in accordance with a commission from the Russian government, Shilling laid an underground telegraph line between rooms located at opposite ends of the Admiralty in St. Petersburg.

While he worked on electric mines and telegraphs, Shilling also developed special insulated electrical cables. In 1837 he drew up a design for a submarine electromagnetic telegraph line between Petergof and Kronstadt. However, his sudden death prevented the implementation of his plans.

SHILLING. (1) A British coin and monetary unit in use until the decimal monetary system was introduced in February 1971; equal to 12 pence, or 1/20 pound sterling. Shillings were minted in silver until 1946 and in a copper-nickel alloy until 1971. They circulated in British colonies and in the countries of the Commonwealth, including Australia, New Zealand, and Ireland, where they constituted 1/20 of the local monetary unit.

(2) The monetary unit of Kenya, Tanzania, and Uganda since 1966 and of Somalia since 1960; equal to 100 cents. According to the rate of exchange set by the State Bank of the USSR in January 1978, 100 Somalian shillings = 11.37 rubles. [29–1192–1]

SHILLINGOVSKII, PAVEL ALEKSANDROVICH. Born Feb. 16 (28), 1881, in Kishinev; died Apr. 5, 1942, in Leningrad. Soviet graphic artist.

Shillingovskii studied at the Odessa Art School from 1895 to 1900 under K. K. Kostandi, G. A. Ladyzhenskii, and A. A. Popov and at the St. Petersburg Academy of Arts from 1901 to 1914 under D. N. Kardovskii and V. V. Mate. He taught at the Academy of Arts in Leningrad from 1921 to 1929 and from 1935 to 1937.

Shillingovskii's etchings and woodcuts, mainly landscapes and portraits, are distinguished for their clarity of line and austerity. They reveal the artist's debt to the heritage of classical engraving. Shillingovskii also worked as a painter and lithographer. His works include the series "Bessarabia" (etching, 1913), "St. Petersburg: Ruins and Resurrection" (woodcut, 1922–23), and "Besieged City" (woodcut, 1941–42), as well as woodcut portraits of T. Zal'kaln (1918), V. I. Lenin (1924), and K. Marx (1933). He also executed illustrations for Homer's *Odyssey* (published 1935).

[29–1192–3]

SHILLING TELEGRAPH, an electromagnetic telegraph that was invented by P. L. Shilling in 1832. In the Shilling telegraph, current pulses—that is, telegraph code units—were formed by opening and closing a battery circuit by means of contact keys. Either an equal-length code or an unequal-length code was used for transmission; both types of code were developed by Shilling. The receiver was a type of moving-magnet magnetometer called a multiplier, that is, a device that contained a magnetized needle and a signal disk, both of which were suspended from a wire near a solenoid. Telegraph signals were indicated by the orientation of the needle in the solenoid field. [29–1192–2]

SHIL'NIKOVSKII, EVSTAFII PAVLOVICH. Born Feb. 14 (26), 1890, in the village of Kuznetsovo, in what is now Vologda Oblast. Soviet artist. Honored Art Worker of the RSFSR (1956).

Shil'nikovskii studied at the St. Petersburg Academy of Arts from 1913 to 1917 under V. V. Mate. He was a leading craftsman of Velikii Ustiug niello work in silver. From 1935 to 1962 he was artistic director of the Severnaia Chern' Artel (later reorganized as a factory) in Velikii Ustiug. His works include spoons with designs on themes from works by A. Pushkin (1937), a service on themes from P. P. Ershov's fairy tale "The Little Humpbacked Horse" (1947), and the box and cup "Moscow" (1956). Articles from these sets, all in niello, are housed in the Russian Museum in Leningrad, the Historical Museum and the Museum of Folk Art of the USSR in Moscow, and other museums of the USSR.

SHILO, NIKOLAI ALEKSEEVICH. Born Mar. 25 (Apr. 7), 1913, in Piatigorsk. Soviet geologist. Academician of the Academy of Sciences of the USSR (1970; corresponding member, 1964). Hero of Socialist Labor (1973). Member of the CPSU from 1941.

After graduating from the Leningrad Institute of Mines in 1937, Shilo worked for various geological institutions in the northeastern part of the USSR. In 1960 he became director of the Northeastern Integrated Scientific Research Institute of the Far East Scientific Center of the Academy of Sciences of the USSR, located in Magadan. He has been chairman of the presidium of the Far East Scientific Center since 1977.

Shilo's main works deal with the study of the geology and geochemistry of mineral deposits, including gold, silver, tin, mercury, tungsten, platinum, and copper. Shilo developed a genetic classification of gold deposits and identified periglacial lithogenesis, revealing the mechanism of rock formation in periglacial zones.

Shilo has been awarded two Orders of Lenin, three other orders, and medals.

SHILOV, DMITRII SAMOILOVICH. Born Feb. 3 (15), 1893, in the settlement of Zubarevo, in what is now Shilka Raion, Chita Oblast; died Nov. 20, 1952, in Moscow. One of the leaders of the struggle for Soviet power in Siberia and the Far East. Member of the CPSU from March 1917.

The son of a peasant, Shilov joined the revolutionary movement in Transbaikalia in 1910. In 1915 he graduated from the Irkutsk Military School and was sent to the front with the rank of ensign. After the February Revolution of 1917, he served as chairman of regimental and brigade committees and was a member of the Soviet of the Caucasian Front. In 1918 he took part in the struggle for Soviet power in Chita, served as a member of the Central Executive Committee of Siberian Soviets, and helped organize the partisan movement. Between 1920 and 1922 he commanded the Eastern Transbaikalia and Amur fronts and served as chairman of the Constituent Assembly and deputy chairman of the Council of Ministers of the Far Eastern Republic. Beginning in 1923, Shilov held a series of positions in Moscow in the apparatus of the People's Commissariat of the Workers' and Peasants' Inspectorate of the RSFSR and in various cultural institutions. In 1938 he became a personal pensioner.

Shilov was awarded the Order of the Red Banner.

SHILOV, EVGENII ALEKSEEVICH. Born July 29 (Aug. 10), 1893, in Serpukhov; died July 22, 1970, in Kiev. Soviet organic chemist. Academician of the Academy of Sciences of the Ukrainian SSR (1951; corresponding member, 1945). Member of the CPSU from 1943.

Shilov graduated from Moscow University in 1917. From 1919 to 1947 he worked at the Polytechnical Institute (now the Institute of Chemical Technology) in Ivanovo, where he became a professor in 1936. From 1947 to 1970, he worked at the Institute of Organic Chemistry of the Academy of Sciences of the Ukrainian SSR in Kiev.

Shilov's main works are devoted to the study of the mechanism of organic heterolytic reactions, such as halogenation. Shilov is one of the founders of the principle according to which the intermediate stage of a heterolytic reaction is the formation of a trimolecular activated complex, in many cases, a six-membered cyclic complex.

Shilov was awarded the Order of Lenin, two other orders, and several medals.

WORKS
"Kinetika i mekhanizm enolizatsii atsetona v prisutstvii aminokislot." *Doklady AN SSSR*, 1952, vol. 84, no. 2, pp. 297–300. (With A. A. Iasnikov.) [29–1194–2]

SHILOV, NIKOLAI ALEKSANDROVICH. Born June 28 (July 10), 1872, in Moscow; died Aug. 17, 1930, in Gagra, Abkhazian ASSR. Soviet physical chemist.

Shilov graduated from Moscow University in 1895 and began working there in 1899. From 1901 to 1904 he worked at W. Ostwald's laboratory. He was a professor at the Moscow Higher Technical School (now the Bauman Moscow Higher Technical School) from 1910 and the Moscow Commercial Institute (now the Plekhanov Institute of the National Economy) from 1911.

Shilov laid down the foundations of the theory of induced reactions and the modern theory of gas sorption. He elucidated the role of oxygen in the adsorption of electrolytes by carbon. During World War I (1914–18), Shilov was one of the organizers of measures to protect the Russian Army from chemical weapons.

SHILOVO, an urban-type settlement and the administrative center of Shilovo Raion, Riazan' Oblast, RSFSR. Shilovo has a landing on the right bank of the Oka River and a railroad station on the Riazan'-Ruzaevka line, 110 km southeast of Riazan'. In addition to a poultry farm, the settlement has food-processing, milk, meat-packing, and industrial building-material combines. There is a people's amateur theater in Shilovo. [29–1195–1]

SHIMANOVSK, a city under oblast jurisdiction and the administrative center of Shimanovsk Raion, Amur Oblast, RSFSR. Shimanovsk is situated on the Bol'shaia Pera River, a right tributary of the Zeia, 251 km north of Blagoveshchensk. The city is served by a railroad station on the Trans-Siberian Railroad. It has construction and prefabricated-housing combines, a plant producing forge and press equipment, and a plant for the repair of road-construction machinery. Other industrial establishments include a ballast plant, a plant for the production of gravel made from *keramzit* (artificial porous filler), a brickyard, a butter factory, and enterprises serving railroad transportation. A complex of enterprises of the construction industry for the Baikal-Amur Main Line was under construction in 1978. [29–1198–4]

SHIMANSKII, IULIAN ALEKSANDROVICH. Born Dec. 5 (17), 1883, in Tashkent; died Apr. 11, 1962, in Leningrad. Soviet specialist in shipbuilding. Academician of the Academy of Sciences of the USSR (1953; corresponding member, 1933).

Shimanskii graduated from the Naval Engineering School in 1905 and the Naval Academy in St. Petersburg in 1910. After working at the Baltiiskii Plant from 1910 to 1912, he lectured at the Naval School in Kronstadt from 1912 to 1916 and at the Naval Academy from 1920 to 1934. He was named a professor in 1938 and was appointed head of the subdepartment of structural mechanics at the Leningrad Shipbuilding Institute in 1945. Beginning in 1925, Shimanskii was also a staff member of a scientific research institute of the shipbuilding industry.

Shimanskii's principal works dealt with the theory and practice of shipbuilding and with the development of underwater vehicles. Shimanskii received the State Prize of the USSR in 1941 and was awarded the Order of Lenin, three other orders, and various medals.

SHIMKEVICH, VLADIMIR MIKHAILOVICH. Born July 28 (Aug. 9), 1858, in Karachevo, Orel Province; died Feb. 23, 1923, in Petrograd. Russian zoologist. Academician of the Russian Academy of Sciences (1920; corresponding member, 1906).

Shimkevich graduated from the University of Moscow in 1881. Beginning in 1889, he was a professor and chairman of the subdepartment of vertebrate zoology at the University of St. Petersburg; in 1921–22 he was the university's rector.

Shimkevich's principal works dealt with the morphology, embryology, and taxonomy of invertebrates. Shimkevich described the germ layers of arthropods, primarily the germ layers of arachnids; he demonstrated the trisegmental structure of Oligomera and Enteropneusta. A number of his works were devoted to the taxonomy and evolution of marine spiders (Pantopoda). Shimkevich advanced broad phylogenetic generalizations about the major paths of evolution in animals, in particular, about the origins of various groups of worms and chordates. He published theoretical articles on evolution, in which he defended and developed Darwin's theory of natural selection. Shimkevich helped popularize biological knowledge. He was an active organizer of science and higher schools and was also interested in problems related to teaching biology in secondary schools. He was the author of text-

books on general biology and comparative anatomy of vertebrates for universities and a textbook of zoology for secondary schools.

SHIMKUS, IONAS (also Jonas Šimkus). Born Aug. 27, 1906, in Riga; died Oct. 28, 1965, in Vilnius. Soviet Lithuanian writer. Member of the CPSU from 1942.

Shimkus joined a group of anti-Fascist writers in the 1930's. In 1940 he became editor of the newspaper *Taribų Lietuvą* (Soviet Lithuania), and from 1954 to 1958 he edited the journal *Pergalė* (Victory). His poetry was first published in 1925. Shimkus was the author of the collections of poems *Behind the Door* (1927) and *Folk Tales of Cement* (1929). In his articles of literary criticism, he supported the principles of socialist realism. His collections *Stories* (1953) and *Tomorrow the Weather Will Be Good* (1962) depicted the life of the Soviet people. Shimkus was chairman of the Writers' Union of Lithuania from 1948 to 1954.

Shimkus was awarded four orders and various medals.

SHIMKUS, VLADAS (also Vladas Šimkus). Born Oct. 15, 1936, in the village of Jučiai, Kelmė Raion. Soviet Lithuanian poet.

Shimkus graduated from the department of history and philosophy of the University of Vilnius in 1961. His works first appeared in print in 1957. In 1960 he published the poetry collection *The Best Second*, followed in 1963 by *Shorelines* and in 1968 by *Iron and Silver*. His verses are simple in form, but their content can be interpreted on many levels. Shimkus' narrative poems *My Cousin's Library* (1966) and *The Old Grand Piano* (1968) contain philosophical reflections on the meaning of life.

SHIMMY. (1) In motor vehicles, an intense vibrational process that occurs in a vehicle's steered wheels and front suspension. Steered wheels that are connected to a motor vehicle's frame or body by an elastic suspension and a steering linkage are components of a complex vibrating system. Such wheels vibrate when a vehicle travels on a bumpy road, when the vehicle's wheels are improperly aligned, or when the vehicle's suspension and steering gear are kinematically mismatched.

Shimmy impairs road safety, increases the rolling resistance at the tires, and intensifies the wear of the parts of the steering gear and suspension. It also increases tire wear.

To reduce the harmful effects of shimmy, independent front suspension is widely used in present-day passenger cars. In other motor vehicles, the kinematic design of the steering gear and suspension may be improved by moving the centers of wheel vibration closer to the drag links and the hinge points of the springs. Other measures to reduce the effects of shimmy include dynamic wheel balancing and stabilization of the direction in which the wheels move when they encounter road irregularities.

(2) In airplanes, a free vibration of the nose wheel of a tricycle landing gear that occurs during taxiing, takeoff runs, and landing runs. The free vibration is manifested as a yawing of the nose wheel. It may result in the collapse of the shock strut or in an airplane crash.

Shimmy is eliminated by means of shimmy dampers. They prevent the occurrence of free vibration but do not prevent the nose wheel from being steered. [29–1202–3]

SHIMORSKOE, an urban-type settlement in Vyksa Raion, Gorky Oblast, RSFSR. Shimorskoe has a landing on the right bank of the Oka River and is located 36 km southwest of the Navashino railroad station on the Murom-Arzamas line. The settlement has a shipyard and an asphalt plant. A sanatorium for patients suffering from tuberculosis of the bones is located in Shimorskoe. [29–1203–2]

SHINA, a people of northern Pakistan. The Shina inhabit the Gilgit River valley and the adjoining mountain regions. According to a 1975 estimate, they number more than 100,000; 9,900 Shina live in India, according to the 1971 census. The Shina speak one of the Dard languages. The official religion is Islam, but ancient animistic beliefs have survived to a large extent. The Shina engage in farming, fruit growing, transhumant livestock raising, hunting, trade, and handicrafts. Many work as porters and guides.

SHINAKAN, a member of the main working population of early medieval Armenia.

The *shinakans* were originally legally free. In Armenian sources of the fourth and fifth centuries, they are contrasted to the *azats* (the privileged class). The *shinakans* had smaller fines to pay for violating church rules than did the *azats*, but unlike the *azats* they were subject to corporal punishment. The *shinakans*' elders had the right to attend the state class assemblies of Armenia, and the *shinakans* paid a tax to the ruler.

During the development of feudal relations, most of the *shinakans* were brought under the yoke of the *nakhararq* (princely families). The term *shinakan*, along with the term *ramik*, became a designation for a serf at various stages of feudal dependence.

SHINGAREV, ANDREI IVANOVICH. Born 1869; died Jan. 7 (20), 1918, in Petrograd. Russian political figure. Member of the Constitutional Democratic Party (Cadets).

Shingarev graduated from the physics and mathematics faculty at Moscow University in 1891 and from the medical faculty in 1894. He became a doctor for a *zemstvo* (body of local self-government) in 1895 and served as head of a *zemstvo* hospital from 1899 to 1903. From 1903 to 1907 he was head of the health department of the Voronezh provincial *zemstvo* board, and from 1905 to 1907 he was the editor of the newspaper *Voronezhskoe slovo*. Shingarev served as a deputy to the Second, Third, and Fourth State Dumas and was deputy chairman of the Cadet faction. He wrote the Cadet agrarian program.

Shingarev was minister of agriculture in the bourgeois Provi-

sional Government in its initial stage (from March to May 1917). In its second stage (May to July) he was minister of finance and head of food supply. After the Cadets left the government on July 2 (15), Shingarev served as the leader of the Cadet faction in the Petrograd municipal duma and as a member of the Preparliament; he was elected to the Constituent Assembly. In November he was arrested for antisoviet activity. Shingarev was killed by anarchist sailors at the Mariinskaia Hospital.

SHINKUBA, BAGRAT VASIL'EVICH. Born Apr. 29 (May 12), 1917, in the village of Chlou, in what is now Ochamchira Raion, Abkhazian ASSR. Soviet Abkhazian writer and state and public figure. People's Poet of Abkhazia (1967). Member of the CPSU from 1946.

Shinkuba graduated from the Sukhumi Pedagogical Institute in 1939. He first published his works in 1935. He is the author of two novels in verse: *My Countrymen* (1950), which is about the postwar life of kolkhozniks, and *Song of the Cliff* (1965; Russian translation, 1967; film version entitled *The White Bashlyk)*, which describes the revolutionary events in Abkhazia from 1905 to 1907. Shinkuba's other works include the novella *Chanta Has Come* (in Russian, 1969) and the historical novel *The Last to Leave* (1974; Russian translation, 1976).

Shinkuba has been a member of the Auditing Commission of the Communist Party of Georgia since 1976. Since 1958 he has been a candidate member of the Central Committee of the Communist Party of Georgia and chairman of the Presidium of the Supreme Soviet of the Abkhazian ASSR. He was a deputy to the fifth convocation of the Supreme Soviet of the USSR. Shinkuba has been awarded the Order of Lenin, three other orders, and several medals.

SHIO-MGVIME (also Shiomgvime), a Georgian monastery on the left bank of the Kura River, 10 km west of Mtskheta in the Georgian SSR. Shio-Mgvime was founded in the sixth century A.D. by the monk and preacher Shio, who originally came from Syria. It is surrounded by many caves (in Georgian, *mgvime*). The monastery's buildings include a domed cruciform church (550's–560's) with a stone altar rail (first quarter of the 11th century), a basilica reconstructed in the 18th century from a 12th-century domed church, a refectory (12th-century, reconstructed 17th century), and a bell tower (18th century). A chapel with wall paintings from the 12th and 13th centuries is near the monastery.

SHIPITSYNO, an urban-type settlement in Kotlas Raion, Arkhangel'sk Oblast, RSFSR. Situated on the left bank of the Severnaia Dvina, Shipitsyno is 6 km from the city of Kotlas. It has a repair and machine shop, a lashing and sorting boom, and a logging and timber distribution establishment. [29–1215–2]

SHIPKA PASS, a pass in Bulgaria, in the Stara Planina (Balkan) Mountains, situated at an elevation of 1,185 m. The highway between the cities of Kazanluk and Gabrovo crosses Shipka Pass. Located near the pass is the Liberty Monument (1928–30; architect A. Donkov, sculptor A. Andreev), commemorating the military cooperation between Russian and Bulgarian soldiers and Bulgaria's liberation from the Turkish yoke in 1877–78. The pass is now a national park.

Shipka Pass was the scene of bitter fighting for its possession during the Russo-Turkish War of 1877–78. On July 7 (19), 1877, after the battles of July 5–6 (17–18), Russian troops took the pass, which afforded the shortest route to Istanbul. The Turkish command, having transferred the army of Suleiman Pasha from Montenegro to the Transbalkan region, decided to launch a counteroffensive with the goal of pushing the Russian troops beyond the Danube. Suleiman's army, comprising 37,500 men, was instructed to take Shipka Pass and link up with the main forces, located in the vicinities of Ruschuk (Ruse), Shumla, and Silistra. Suleiman sent 27,000 men, along with 48 guns, into Shipka Pass against the Russian-Bulgarian detachment of General N. G. Stoletov, which held the pass with 4,800 men (including 2,000 Bulgarians) and 27 guns. On the morning of August 9 (21), the Turkish forces launched heavy frontal attacks from the south and southeast up Mount Saint Nicholas in the southern part of the pass. The Russian-Bulgarian forces commanded by Generals V. F. Derozhinskii and Stoletov, reinforced on August 9 (21) by the arrival of 7,500 reserves and 28 guns, beat back numerous enemy attacks, inflicting heavy losses. On August 10 (22), the Turks regrouped and enveloped the pass in a semicircle from the west, south, and east, then launched an assault from three directions on August 11 (23). Despite extremely difficult conditions—the enemy's great superiority in forces (25,000 men and 34 guns against 7,200 men and 28 guns), a shortage of ammunition, and the intense heat and lack of water—the Russian-Bulgarian forces heroically defended the pass, holding their position despite significant losses (about 1,400 men). On the evening of August 11 (23) and the morning of August 12 (24), reinforcements, comprising about 9,000 men under the command of General M. I. Dragomirov, arrived and swiftly led a counterattack, driving back the enemy, who had approached the pass on the west and east. In the course of bitter fighting that lasted until August 14 (26), the Russian troops tried in vain to capture the height to the west of the pass; they then dug in strongly in Shipka Pass. The Russian losses numbered about 4,000, including more than 500 Bulgarians, while the Turkish losses, according to clearly understated figures, were more than 6,600.

The heroic defense of Shipka Pass disrupted the plans of the Turkish command and prevented the loss of an important strategic position. The Russian troops held Shipka Pass until their offensive in January 1878, driving back new Turkish attacks on September 5 (17) and enduring an exceptionally difficult winter "Shipka camp." [29–1215–3]

SHIPOV, DMITRII NIKOLAEVICH. Born 1851; died 1920. Russian political figure. One of the founders of the Octobrist Party and a leader of the *zemstvo* (local self-government) movement in the late 19th and early 20th centuries.

Shipov was a landowner in Moscow Province. He graduated from the law faculty at the University of St. Petersburg in 1872. He became a *zemstvo* delegate (*glasnyi*) in Volokolamsk District in 1877 and was later a member of the Moscow provincial *zemstvo* assembly. From 1893 to 1904 he was chairman of the Moscow provincial *zemstvo* board. Shipov was chairman of the "private conference of *zemstvo* figures" in November 1904 that called for the introduction of legislative representation of a consultative nature in Russia.

In September 1906, Shipov left the Octobrist Party because of disagreements with A. I. Guchkov and joined the Party of Peaceful Renewal. In 1906 he was named the representative of the Moscow provincial *zemstvo* assembly on the Council of State. Shipov withdrew from public life in 1911. After the October Revolution of 1917 he was the first chairman of the counterrevolutionary National Center. Shipov was arrested by agents of the All-Russian Extraordinary Commission (Cheka) in early 1919 and died in prison. [29–1216–1]

SHIPOV FOREST, a wooded region in Voronezh Oblast, RSFSR. Shipov Forest, situated on the right bank of the Osered' River, has an area of 39,200 hectares (ha). It is the largest insular oak forest on the southeastern border of the forest-steppe, and it is important for water storage and land protection. Unwooded ravines divide the forest into three parts. An area of 35,600 ha is covered by trees, including oak (92 percent), ash (3 percent), and aspen (2 percent); maple, elm, linden, and other species account for 3 percent of the forested area. The oak stands of Shipov Forest produce an abundance of high-quality timber.

In 1709, Peter I had the forest reserved for the use of the shipbuilding industry. In 1908 projects in experimental forestry were begun in the forest. The Central Scientific Research Institute of Forest Genetics and Selection maintains a forest genetics and breeding laboratory in Shipov Forest. [29–1217–1]

SHIPOVNIK, a publishing house that produced books in St. Petersburg (Petrograd) from 1906 to 1918. It was founded by the caricaturist Z. I. Grzhebin and S. Iu. Kopel'man. Its publications were designed by artists of the World of Art. Shipovnik published fiction, notably the works of L. N. Andreev and F. K. Sologub, as well as books by idealist philosophers and articles and papers on modern art. Shipovnik's anthologies of fiction (books 1–26, 1907–17), in which writings of the symbolists predominated, were polemically opposed to Gorky's *Znanie* collections. Beginning in 1910 the Shipovnik anthologies included numerous antirevolutionary works. The *Northern Collections* (books 1–7, 1907–11) acquainted readers with the foreign literature of the time. Collected works by Western European classical authors were published by Shipovnik. [29–1218–1]

SHIPOVO KURGANS, several groups of barrows dating from the first to fourth centuries in the Derkul River basin, west of the city of Ural'sk (Zapadnyi Kazakhstan Oblast), near the station of Shipovo. The Shipovo Kurgans were investigated by P. S. Rykov in 1925. Most of the burials belonged to the Sarmatians, nomads of the first centuries A.D. Buried in one rich barrow was a man in silk clothing, with gold plaques, weapons, and a horse harness. Another rich barrow yielded the burial of a woman, with a glass-encrusted bronze diadem, a pendant edged in gold, earrings, and a mirror. The objects are characteristic of the age of the Great Migration of Peoples in Eastern Europe in the late fourth and fifth centuries and belonged, judging from the funerary ritual, to representatives of the tribal aristocracy of the Alani, descendants of the Sarmatians.

SHIP STURGEON (*Acipenser nudiventris*), a fish of the family Acipenseridae. The body length reaches 2 m, and the weight, 30 kg or more. A migratory fish, the ship sturgeon is distributed in the basins of the Aral, Caspian, and Black seas. It enters rivers to spawn. There are spring and winter forms. Males attain sexual maturity at six to nine years of age, and females, at 12 to 14 years of age. Spawning is in March to May. Fecundity is 200,000 to 1.290 million eggs. The ship sturgeon feeds on mollusks and other aquatic invertebrates, as well as fish. A valuable commercial species, the ship sturgeon is in need of artificial breeding.

SHIPULIN, FEDOR KUZ'MICH. Born Nov. 10 (23), 1913, in the village of Abai, in what is now Gorno-Altai Autonomous Oblast; died Aug. 19, 1972, in the settlement of Saranpaul', Tiumen' Oblast; buried in Moscow. Soviet geologist. Corresponding member of the Academy of Sciences of the USSR (1970). Member of the CPSU from 1946.

Shipulin graduated from the Moscow Geological Prospecting Institute in 1939. From 1939 to 1946 he conducted geological explorations in the Mongolian People's Republic. Between 1946 and 1952 he was head of the geology division of the Far East Branch of the Academy of Sciences of the USSR. From 1952 to 1955 he worked at the Geological Institute of the Academy of Sciences of the USSR. In 1955 he began working at the Institute of Geology of Ore Deposits, Petrography, Mineralogy, and Geochemistry of the Academy of Sciences of the USSR, where he became head of the geochemistry division in 1967.

Shipulin's works dealt with geochemistry, petrography, and the theory of ore deposits. Shipulin established the formational independence of small intrusions, the general regularities underlying the crystallization of silicate melts, and the genetic relationship between concentrations of individual groups of chemical elements and different magmatic centers. He developed the fundamentals of the petrological analysis of magmatic processes at the atomic and molecular levels.

Shipulin was awarded the Order of the Badge of Honor and various medals.

SHIPUNOVO, an urban-type settlement and the administrative center of Shipunovo Raion, Altai Krai, RSFSR. Shipunovo is situated on the left bank of the Alei River, 173 km southwest of Barnaul. It is served by a railroad station on the Barnaul-Semipalatinsk line. Industry is represented by a construction combine. [29–1220–2]

SHIRA, an urban-type settlement and the administrative center of Shira Raion, Khakass Autonomous Oblast, Krasnoiarsk Krai, RSFSR. The settlement is served by a railroad station on the Achinsk-Abakan line. It has a wood-products combine, a canned milk combine, and a grain elevator. [29–1220–4]

SHIRA, a bitter salt lake with no outlet, located in the Khakass Autonomous Oblast, Krasnoiarsk Krai, RSFSR. Situated at an elevation of 352 m in the Minusinsk Basin, Lake Shira covers an area of 32 sq km. The average depth is 11.2 m, and the maximum depth, 21.6 m. The shores are gently sloping, with sandy beaches; the bottom is composed of hydrogen sulfide therapeutic silt. The water level fluctuates within a range of 4.5 m. The lake freezes in November and opens up in late April or May. The Son River empties into Lake Shira. Summers are warm, with a mean July temperature of 18°C, and winters are cold, with a mean January temperature of −19°C. The annual precipitation totals 250 mm.

Located 11 km from the Shira railroad station is a balneological and pelotherapeutic health resort. Therapeutic remedies include the sulfate-chloride sodium-magnesium water of Lake Shira, which is used for drinking (in diluted form) and for baths, and the silty mud of Lake Bol'shoe Utich'e, located 20 km from Lake Shira. Persons with diseases of the organs of the musculoskeletal system, digestive and gynecological disorders, and diseases of the nervous system are treated at the resort, which has a sanatorium and a balneological and mud-bath facility. [29–1220–3]

SHIRAKI STEPPE, an upland in the southeastern part of the interfluve of the Iori and Alazani rivers of the Kura River basin in the eastern part of the Georgian SSR. The steppe has elevations to 865 m. It consists principally of chernozem beard-grass and feather-grass steppes and, in light forests and arid thin forests, secondary beard-grass steppes with cinnamon-colored and mountain cinnamon-colored soils. Livestock is grazed on the steppe in the winter. Grain crops are cultivated. The region has petroleum deposits. [29–1221–2]

SHIRAZ, OVANES TATEVOSOVICH (real surname, Karapetian). Born Apr. 12 (25), 1914, in Aleksandropol', now Leninakan. Soviet Armenian poet.

The son of a peasant, Shiraz studied at the University of Yerevan from 1937 to 1941. He was first published in 1935. He is the author of the lyric verse collections *The Advent of Spring* (1935), *Song of Armenia* (1940), *The Voice of a Poet* (1942), *Book of*

Songs (1942), and *Lyric Poetry* (1946). He also wrote the philosophic narrative poem *Biblical* (1944), which deals with the Great Patriotic War of 1941–45. Shiraz extolled Socialist Armenia in such narrative poems as *Land of Happiness* (1937), *Razdan* (1947), and *The Names of Our Villages* (1950). His poems are characterized by turbulent spontaneity, vividness of imagery, and fidelity to the traditional language of Armenian poetry. Some of Shiraz' works have been translated into other languages of the USSR.

SHIRAZ, a city in southwestern Iran, on the Bushire-Isfahan highway. Administrative center of the *ostan* (province) of Fars. Population, 370,000 (1975). Shiraz produces textiles, sugar, flour, wine, mineral fertilizers, cement, petroleum and attar of roses. The city is famous for its carpets, mosaics, and silver articles. It is the trade center of an agricultural region that produces roses, grapes, tobacco, and sugar beets. A university is located in the city.

Under the Sassanids a settlement stood on the site of Shiraz. A city was founded there by Arabs in the seventh century. From the tenth to mid-11th centuries, Shiraz was a center of the Buyid state. In the 14th century it was seized twice by Tamerlane. In the 14th and 15th centuries the Shiraz school of miniatures was famous. In the second half of the 18th century, under the Zands, the city was the capital of Persia. Shiraz was the birthplace of Saadi and Hafez. The ruins of Persepolis are located 50 km northeast of the city. Architectural monuments include the fortress walls. The Fars Museum, which houses works of Iranian applied art, is located in Shiraz. The Mausoleum of Saadi (1952, architect A. Godard) is nearby.

SHIRE (also Chire), a river in eastern Africa, in Malawi and Mozambique; a left tributary of the Zambezi. The Shire, which originates in Lake Nyasa, is 400 km long and drains an area of 32,000 sq km. As the river descends from the Shire Highlands to the low-lying valley of the Zambezi, it forms rapids and waterfalls, including Murchison Falls. Water levels are highest from November through April. The Shire is navigable below Murchison Falls. There are two hydroelectric power plants on the river—one at Nkula Falls (opened 1966; 24 megawatts) and one at Tedzani Falls (opened 1973; 16 megawatts). [29–1223–6]

SHIRE, the oldest breed of heavy draft horse. The breed was developed in Great Britain by improving small local heavy war horses (the medieval Great Horse) and then crossing them with Belgian heavy draft horses. In the 19th century the breed was exported to many countries in Europe, including Russia, and to North and South America. The Shire horse has a massive trunk, a long hook-nosed head, and a broad chest, back, and croup. The coloration is bay, dark bay, black, gray, or red dun with white markings. The average stallion stands 165–175 cm high at the withers; the circumference of the chest is 210–250 cm, and that of the front cannon bone, 28–30 cm. The load-pulling capacity is 18–20 tons and more.

In the USSR the Shire horse was used to develop the Vladimir heavy draft horse.

SHIRENDYB, BAZARYN. Born May 15, 1912, in Khubsugul Aimak. Mongolian historian; public and state figure of the Mongolian People's Republic. Academician of the Academy of Sciences of the Mongolian People's Republic (1961). Member of the Mongolian People's Revolutionary Party (MPRP) since 1942.

Shirendyb graduated from the Irkutsk Pedagogical Institute in 1941. From 1942 to 1954 he was the rector of the Mongolian State University. He became president of the Academy of Sciences of the Mongolian People's Republic in 1961. He served as secretary of the Central Committee of the MPRP from 1944 to 1948 and as a member of the Politburo of the Central Committee from 1953 to 1957. Shirendyb was first elected a deputy to the Great People's Khural in 1951. From 1954 to 1957 he was first deputy chairman of the Council of Ministers of the Mongolian People's Republic. He became deputy chairman of the Great People's Khural in 1966. Shirendyb is a member of the World Peace Council; he was named a foreign member of the Academy of Sciences of the USSR in 1966.

SHIRIAEV, STEPAN GRIGOR'EVICH (pseudonym, Tekhnik). Born 1856 in the village of Tavolozhka, in what is now Petrovsk Raion, Saratov Oblast; died Aug. 18 (30), 1881, in the Alekseі Ravelin of the Peter and Paul Fortress, St. Petersburg. Russian revolutionary Narodnik (Populist).

Shiriaev, the son of a serf, studied at the Kharkov Veterinary Institute. In 1873 he carried on revolutionary propaganda in Saratov. He lived in London and Paris from 1876 to 1878 and studied electrical engineering under P. N. Iablochkov. In 1878 he joined a Russo-Polish circle of socialist propagandists in Paris that included P. L. Lavrov and T. Uziembło. In 1878 he traveled to Russia as an emissary of the group.

In 1879, Shiriaev became a member of the Narodnik group Liberty or Death and took part in the Lipetsk Congress; he served as a member of the Executive Committee of the People's Will and set up its first workshop for the manufacture of dynamite. On Nov. 19, 1879, Shiriaev, together with S. L. Perovskaia, tried to assassinate Emperor Alexander II near Moscow. Shiriaev was arrested on Dec. 3, 1879, and condemned to death in the Trial of the 16, a sentence that was commuted to life at hard labor.

SHIRIAEVO, an urban-type settlement and the administrative center of Shiriaevo Raion, Odessa Oblast, Ukrainian SSR. Shiriaevo is located 32 km from the Zatish'e railroad station on the Kotovsk-Razdel'naia line. The settlement has a mixed-feed plant and a poultry hatchery. [29–1239–1]

SHIRIAMOV, ALEKSANDR ALEKSANDROVICH. Born Jan. 21, 1883, in Irkutsk; died June 23, 1955, in Moscow. A leader in the struggle to establish Soviet power in Siberia. Member of the CPSU from 1900.

The son of a petty merchant, Shiriamov became a worker in 1898. He took part in the Revolution of 1905–07 in Irkutsk and Omsk, where he was a member of the RSDLP committee: he was arrested numerous times. In 1913 he undertook party work in the coal mines of Transbaikalia. After the February Revolution of

1917, Shiriamov became chairman of the soviet and of the committee of the RSDLP at the Adagan coal mines, chief of the Red Guard, and a member of the Transbaikal oblast committee of the RSDLP. In late 1917 he became commissar of industry in Chita and chairman of the Transbaikal oblast mining council.

Shiriamov began underground party work in the summer of 1918 and helped organize the partisan movement in Siberia. He became chairman of the Siberian oblast committee of the RCP(B) in late 1919. In 1920 he became chairman of the Irkutsk revolutionary military committee, the Irkutsk soviet, and the Omsk provincial committee of the RCP(B) and a member of the party's Far East Bureau. In 1922 and 1923 he was a member of the Siberian Bureau of the Central Committee of the RCP(B) and a member of the Presidium of the Siberian Bureau of the Supreme Council on the National Economy.

In 1923, Shiriamov moved to Moscow to assume a post in the defense industry. In 1925 he became deputy chairman of Glavpolitprosvet (Central Committee of the Republic for Political Education). Shiriamov later engaged in scholarly work and in 1941 became a personal pensioner. [29–1239–2]

SHIRIN, a city (since 1972) under oblast jurisdiction in Syr Darya Oblast, Uzbek SSR. Situated on the left bank of the Syr Darya River, Shirin is 6 km from the Farkhad railroad station on the Khavast-Kokand line. The Farkhad Hydroelectric Power Plant, which produces 126 megawatts of power, is located in Shirin. Construction of the Syr Darya State Regional Electric Power Plant was under way in Shirin in 1978; the first phase of the plant's operation was begun in 1975, with a capacity of 1,200 megawatts. [29–1224–2]

SHIRINGUSHI, an urban-type settlement in Zubova Poliana Raion, Mordovian ASSR. Shiringushi is situated on the right bank of the Vad River, in the Volga basin, 28 km south of the Zubova Poliana railroad station in the Riazan'-Ruzaevka line. The glove shop of the Zubova Poliana Knitwear Factory and a factory producing felted fabrics are located in Shiringushi. [29–1225–2]

SHIRIN-SAI, a burial ground dating from the second to fourth centuries, located on the left bank of the Syr Darya River, on the Shirin-Sai channel, near the city of Begovat, Tashkent Oblast, Uzbek SSR. Shirin-Sai was excavated by V. F. Gaidukevich in 1943. The burials contained clay vessels covered with white and red engobe, glass beads, bronze ornaments, and a Chinese coin dating from the first century. The burial ground belonged to settled land cultivators, the remains of whose settlement (Munchak-Tepe) are located near Shirin-Sai.

SHIRINSKII-SHIKHMATOV, PLATON ALEKSANDROVICH. Born Nov. 18 (29), 1790, in the village of Dernovo, Viaz'ma District, Smolensk Province; died May 5 (17), 1853, in St. Petersburg. Russian state figure. Academician of the St. Petersburg Academy of Sciences (1828). Prince.

Shirinskii-Shikhmatov graduated from the Naval Cadet Corps (Naval Cadet School) in 1807. While serving in the navy, he took part in the war against France from 1812 to 1814. He was made head of a division of the Engineering Department of the Ministry of War in 1820. Shirinskii-Shikhmatov became friends with A. S. Shishkov, who appointed him director of an office of the Ministry of Public Education; he became assistant minister of public education in 1842 and minister in 1850. He tried to deny persons of nonnoble origin access to secondary and higher education, and he persecuted progressive professors and students. Under Shirinskii-Shikhmatov, reaction in the area of education reached its apogee. [29–1226–2]

SHIRKAT, in Afghanistan, Turkey, and Iran, a national joint-stock company. *Shirkats* were organized on a wide scale in various sectors of the economy in the 1920's and 1930's, when the development of national capitalism intensified in the countries mentioned. Supported and protected by the government, the *shirkats* contributed greatly to accelerating the accumulation of national capital. [29–1226–3]

SHIRKOV, DMITRII VASIL'EVICH. Born Mar. 3, 1928, in Moscow. Soviet physicist. Corresponding member of the Academy of Sciences of the USSR (from 1960). Member of the CPSU from 1953.

Shirkov graduated from Moscow State University in 1949. From 1950 to 1960 he worked at the V. A. Steklov Institute of Mathematics of the Academy of Sciences of the USSR and at the Joint Institute for Nuclear Research in Dubna. From 1960 to 1969 he worked at the Institute of Mathematics of the Siberian Division of the Academy of Sciences of the USSR; at the same time, beginning in 1961, he was a professor at the University of Novosibirsk.

Shirkov's main works deal with the theory of elementary particles, the theory of superconductivity, and the theory of neutron transport and moderation. In the theory of elementary particles, he developed the renormalization theory, created the method of the renormalization group, and constructed semiphenomenological schemes for the quantitative description of strong interactions at low energies.

Shirkov received the Lenin Prize in 1958. He has been awarded three orders and various medals.

SHIRMA, GRIGORII ROMANOVICH. Born Jan. 8 (20), 1892, in the village of Shakuny, in what is now Pruzhany Raion, Brest Oblast; died Mar. 23, 1978, in Minsk. Soviet choral conductor, folklorist, and figure in the music world. People's Artist of the USSR (1955); Hero of Socialist Labor (1977). Member of the CPSU since 1959.

Shirma graduated from the Sedlets Teachers' Institute in 1918. He carried out extensive cultural-educational work in Western Byelorussia and was persecuted by the authorities of bourgeois Poland. After the reunification of Western Byelorussia with the Byelorussian SSR, he organized in 1940 the Byelorussian Song and Dance Ensemble (now the State Academic Chorus of the Byelorussian SSR), which he directed until 1970. In 1966 he became chairman of the administrative board of the Composers' Union of Byelorussia. Shirma, who began collecting Byelorussian folk songs in 1910, compiled several folklore collections, including *Byelorussian Folk Songs* (vols. 1–4, 1959–76), and he published two volumes of his choral arrangements of Byelorussian folk songs (1971–73).

Shirma was a deputy to the fourth through ninth convocations of the Supreme Soviet of the Byelorussian SSR. He received the State Prize of the Byelorussian SSR in 1966 and 1974. Shirma was awarded two Orders of Lenin, the Order of the October Revolution, two other orders, and various medals.

SHIROBOKOV, STEPAN PAVLOVICH. Born Dec. 5 (18), 1912, in the village of Malyi Kazess, in what is now Sharkan Raion, Udmurt ASSR. Soviet Udmurt writer. People's Poet of Udmurtia (1963).

Shirobokov graduated from the Izhevsk Teachers' Institute in 1939. He took part in the Great Patriotic War of 1941–45. Shirobokov is the author of collections of poems and narrative poems; the drama *Every Wolf Has Its Own Path* (1956); the comedy *If There Is No Love* (1962); the first Udmurt comedy in verse, *Hey, Beautiful Girls* (1970); the novella *Songs Find the Road* (1967); books for children; literary sketches, and short stories. Shirobokov writes about modern youth and the people of kolkhozes.

Several of his poems have become folk songs. Shirobokov has been awarded two orders and various medals.

SHIROKAIA RECHKA, an urban-type settlement in Sverdlovsk Oblast, RSFSR, under the jurisdiction of the Verkh-Isetsk raion soviet of the City of Sverdlovsk. Shirokaia Rechka is located 7 km southwest of Sverdlovsk. Peat is extracted near the settlement. [29–1227–4]

SHIROKII, an urban-type settlement in Amur Oblast, RSFSR, under the jurisdiction of the Raichikhinsk city soviet. Shirokii has a railroad station (Kholodnyi Kliuch) on a branch line of the Trans-Siberian Railroad, 12 km east of Raichikhinsk. Coal is mined at Shirokii, and the settlement has a branch of the Raichikhinsk Garment Factory. [29–1228–2]

SHIROKII, an urban-type settlement in Susuman Raion, Magadan Oblast, RSFSR. Shirokii is situated on the left bank of the Berelekh River of the Kolyma river basin, 702 km northwest of Magadan. Gold is mined in the vicinity. [29–1228–3]

SHIROKOE, an urban-type settlement and the administrative center of Shirokoe Raion, Dnepropetrovsk Oblast, Ukrainian SSR. Shirokoe is situated on the left bank of the Ingulets River (a tributary of the Dnieper), 12 km from the Ingulets railroad station. The settlement has a brewery, a food products plant, a mixed-feed plant, and a poultry hatchery. [29–1228–5]

SHIROKOVSKII, an urban-type settlement in Perm' Oblast, RSFSR, under the jurisdiction of the Gubakha city soviet. Shirokovskii is situated on the Kos'va River, in the Kama basin, 22 km from the Polovinka railroad station on the Solikamsk-Chusovskaia line. A hydroelectric power plant and a factory producing biochemical preparations are located in the settlement. [29–1228–4]

SHIRPOTREB CHERNAIA, a variety of cherry developed by I. V. Michurin by crossing the Iubileinaia variety of sour cherry with the Pervenets variety of sweet cherry. The cherries are medium-sized, turnip-shaped, dark red, and shiny. The flesh is juicy, sweet, slightly acidic, and pleasant to the taste. The fruits ripen in mid-July but do not drop from the tree immediately. The cherries are eaten fresh or processed into jam, juice, or syrup. The trees have average growing vigor; the elongate spherical crowns are well developed. Fruit formation begins in the second year. The annual fruit yield from one tree is 5–10 kg. The Shirpotreb Chernaia variety is grown in the central zone of the RSFSR. [29–1237–1]

SHIRSHOV, ANATOLII ILLARIONOVICH. Born Aug. 8, 1921, in the village of Kolyvan', in what is now Novosibirsk Oblast. Soviet mathematician. Corresponding member of the Academy of Sciences of the USSR (1964). Member of the CPSU since 1951.

Shirshov graduated from the Voroshilovgrad Pedagogical Institute in 1949. From 1950 to 1960 he was on the staff of Moscow State University, and in 1960 he became associated with the Institute of Mathematics of the Siberian Division of the Academy of Sciences of the USSR. Shirshov's principal works deal with algebra, in particular, the general theory of nonassociative algebras, alternative rings, and Lie algebras. Shirshov has been awarded two orders and various medals.

SHIRSHOV, PETR PETROVICH. Born Dec. 12 (25), 1905, in Ekaterinoslav, now Dnepropetrovsk; died Feb. 17, 1953, in Moscow. Soviet oceanographer, hydrobiologist, and polar explorer; state figure. Academician of the Academy of Sciences of the USSR (1939). Hero of the Soviet Union (1938). Member of the CPSU from 1938.

Shirshov graduated from the Odessa Institute of Public Education in 1929. From 1929 to 1932 he was a research worker at the Botanical Garden of the Academy of Sciences of the USSR, and from 1932 to 1936, at the All-Union Arctic Institute. Shirshov was a member of several arctic expeditions, including the expeditions on the vessels *Sibiriakov* (1932) and *Cheliuskin* (1933–34); he was also a member of the first Soviet drifting station, Severnyi Polius–I (1937–38).

Between 1942 and 1948, Shirshov was first people's commissar and then minister of the Soviet merchant marine. The founder of the Institute of Oceanography of the Academy of Sciences of the USSR, he became the institute's director in 1946. From 1946 to 1950 he also served as chairman of the Pacific Ocean Scientific Committee. He was a deputy to the first and second convocations of the Supreme Soviet of the USSR.

Shirshov's chief works dealt with the plankton of the polar seas. Shirshov disproved the hypothesis of the absence of life in the high latitudes of the Arctic Ocean and discovered a number of regularities in the distribution of warm water from the North Atlantic to the Arctic Basin.

Shirshov was awarded three Orders of Lenin, four other orders, and various medals. A bay on Franz Josef Land and an underwater ridge in the Bering Sea have been named after him, as has the Institute of Oceanography of the Academy of Sciences of the USSR.

SHIRVAN, a historical region in northern Azerbaijan, on the western shore of the Caspian Sea, east of the Kura River. The name "Shirvan" ("Sharvan") came into use during the Sassanid era (226–651) as a designation for part of ancient Caucasian Albania, later known as Aran. Shirvan was occupied by the Arabs in 654 and eventually became a hereditary possession of Arab governors. From 799 to 1538, Shirvan was ruled by a succession of dynasties of *shirvanshahs* (shahs of Shirvan), under whom it encompassed all the territory from the Kura River to the city of Derbent; the capital was at Shemakha.

During the Seljuk conquest, Shirvan was a center of the struggle for Azerbaijani independence. In the mid-15th century it was a center of land cultivation and the production of silk and other fabrics; it also played an important role in trade, exporting such goods as oil and cotton. Relations between Shirvan and Moscow were established in 1465 and 1466, and in 1499 an ambassador from Shirvan conducted negotiations toward a treaty "on friendship and concord." A major cultural center, Shirvan produced such writers as Khaqani and Feleki Shirvani. As the Safavid state became more powerful, Shirvan fell under its sway, becoming a province of the Safavid state in 1538. In 1748 the independent Shirvan Khanate was formed in Shirvan.

Minorskii, V. F. *Istoriia Shirvana i Derbenda X–XI vv.* Moscow, 1963.
Istoriia Azerbaidzhana, vols. 1–2. Baku, 1958–60. [29–1221–4]

SHIRVAN KHANATE, a feudal state in northern Azerbaijan, in the Shemakha region, that existed from 1748 to 1820. The Shirvan Khanate, which was formed in 1748 after the area had been liberated from the yoke of the Iranian Nadir Shah, became one of the largest and richest khanates in northern Azerbaijan. The population engaged chiefly in land cultivation, the production of silk and other fabrics, trade, and handicrafts. The incorporation of the khanate into Russia in 1805 was affirmed by the Treaty of Gulistan in 1813. In 1820 the khan's government was abolished and replaced with a Russian administration. Shirvan Subprovince was formed on the territory of the khanate; in 1840 the subprovince became part of Caspian Oblast, which became Shemakha Province in 1846 and Baku Province in 1849. Today the territory of the Shirvan Khanate is part of the Azerbaijan SSR. [29–1223–2]

SHIRVAN PLAIN (also Shirvan Steppe), part of the plainlike area of the Kura-Araks Lowland in the Azerbaijan SSR. The Shirvan Plain lies along the left bank of the Kura River at elevations of 16–100 m; about half its area is below sea level. Wormwoods, saltworts, and liman meadows are found on sierozem-meadow and sierozem soils. The Upper Shirvan Canal carries water from the Mingechaur Reservoir for irrigation. Livestock are grazed on winter pastureland, and on irrigated land the local population engages in viticulture and the cultivation of cotton and grains. [29–1223–1]

SHIRVANSHAHS' PALACE, an architectural ensemble in Baku, consisting mainly of structures of the 15th century. The palace of the Shirvanshahs is an outstanding monument of medieval Azerbaijani architecture. The two-story palace building itself, architecturally simple, is probably the earliest of the structures. The divan-khan (court of law) has a hall enclosed on five of its eight sides by a gallery with an arcade. Also of note is the rectangular tomb (1435), with its cruciform prayer hall and richly ornamented portal. The other structures are a two-domed mosque with an elegant minaret (1442), the small eight-sided mausoleum of Said Yahya Bakuvi, the Eastern Gate (1585), an *ovdan* (underground reservoir) and a bathhouse.

The palace of the Shirvanshahs, although it comprises structures erected at different times, is artistically integrated by unity of scale and architectural technique. The severe, geometrically precise mass of the buildings is set off by the spare but expressive decorative details. The palace is now a museum.

SHIRVANZADE, ALEKSANDR MINASOVICH (pen name of A. M. Movsisian). Born Apr. 7 (19), 1858, in Shemakha, Azerbaijan; died Aug. 7, 1935, in Kislovodsk; buried in Yerevan. Soviet Armenian writer. People's Writer of Armenia and Azerbaijan (1930).

The son of an artisan, Shirvanzade graduated from a Russian district school in 1873. He lived in Baku until 1883 and changed professions many times. In the early 1880's, Shirvanzade wrote publicist articles about the exploitation of workers in Baku's oil refineries. This was also the theme of his first works of fiction, the short stories "The Fire at the Refineries" and "A Shop Assistant's Diary" (both 1883). In 1883, Shirvanzade moved to Tbilisi and devoted himself to writing fiction. From 1886 to 1891 he worked for the weekly newspaper *Ekho* (*Ardzagank*), in which he published short stories, sketches, and novellas.

Shirvanzade lived in Paris from 1905 to 1910 and in Tbilisi from 1910 until 1919, when he went abroad again. The writer welcomed the October Revolution of 1917 and was delighted with the achievements of Soviet Armenia. In 1926 he returned to his homeland and became one of the creators of Soviet Armenian literature. He spoke at the First Congress of Soviet Writers.

From the beginning of his writing career, Shirvanzade dealt with the lives of various strata of society—merchants, artisans, businessmen, the bourgeois intelligentsia, and performing artists. He depicted the world of the patriarchal provinces in the novel *Honor* (1885) and the novella *The Evil Spirit* (1894, separate edition 1897), pointing out the infiltration of bourgeois mores and narrating the dramatic fates of his heroes with psychological accuracy.

In the novel *Chaos* (1898), his most significant work, Shirvanzade described life in an industrial city and the chaos of the capitalist world. He based the plot on fundamental social problems, mainly the struggle of social classes and groups, the exploitation of workers, and the moral disintegration of the bourgeois family, for whom the craving for money snuffs out all emotions. The heroes of several of his works fall victim to profiteerism and man's inhumanity to man, notably the gifted and idealistic musician in the novella *The Artist* (1903) and the innocent, ingenuous daughter of a "hero of easy profit" in the drama *For the Sake of Honor* (1905).

In his prose and plays, Shirvanzade introduced a number of innovations to Armenian literature. His works' psychological depth, passion, and accurate satirical exposure of the purveyors of social vices have accounted for their popularity over the years. In Soviet Armenia, Shirvanzade published many articles, short stories, and sketches, as well as the political comedy *Kum Morgana* (1926), which caustically ridiculed those who vainly hoped of returning the old order to Russia. He was the author of a screenplay about oil refineries, *The Last Fountain* (1934), and the memoirs *In the Crucible of Life*. His works have been translated into many languages of the world.

G. S. TAMRAZIAN [29–1221–5]

SHISH, a river in Omsk Oblast, RSFSR; a right tributary of the Irtysh. The river measures 378 km in length and drains an area of 5,270 sq km. It rises on the Vasiugan Plain and is fed mainly by snow. The mean flow rate 149 km from the mouth is 14.8 cu m per sec. It freezes in late October or early November, and the ice breaks up in the second half of April or the first half of May. The Shish is used to float timber. [29–1244–1]

SHISHAK, a type of Russian helmet decorated with an upwardly tapering cone with a knob at the point. The *shishak* had earpieces on the sides, a visor and nasal in front, and a camail in back. [29–1244–2]

SHISHAKI, an urban-type settlement and administrative center of Shishaki Raion, Poltava Oblast, Ukrainian SSR. Shishaki is situated on the Psel River, a tributary of the Dnieper. It is 12 km from the Iares'ki railroad station on the Romodan-Poltava line. The settlement has a mixed-feed plant, a brickyard, and a cheese factory. A mineral-water plant is located nearby. [29–1244–3]

SHISHAKLI, ADIB AL-. Born 1909, in Hamah; died Sept. 27, 1964, in Ceres, Brazil. Syrian state figure.

A career army officer, Shishakli carried out a military coup in December 1949 and became chief of the General Staff of the Syrian Army. Between Nov. 29 and Dec. 2, 1951, he staged a coup

d'etat. While president of Syria in 1953 and 1954, Shishakli established a military dictatorship. Overthrown in February 1954, he fled from Syria. He settled in Brazil in 1958. Shishakli was killed by a Druze named Ghazali, who was taking revenge for violence committed against his clan in 1954. [29–1244–5]

SHISHIGIN, FIRS EFIMOVICH. Born Aug. 17 (30), 1908, in the village of Borok-Gorodok, Arkhangel'sk Oblast. Soviet stage director. People's Artist of the USSR (1964). Member of the CPSU since 1940.

Shishigin graduated from the Leningrad Technicum of Theater Arts in 1929. From 1928 to 1933 he worked at the Theater of Classical Miniatures and the Theater of Working Youth (TRAM), and from 1933 to 1946 he was artistic director of theaters in Ussuriisk, Spassk, and Vladivostok. In 1946–47 he was principal stage director of the Stavropol' Theater, and from 1947 to 1950 he worked at the Moscow Theater of Drama and Comedy. Shishigin was principal stage director of the Volgograd Theater from 1950 to 1956 and of the Voronezh Theater from 1956 to 1960. In 1960 he became artistic director and principal stage director of the F. G. Volkov Yaroslavl Theater.

Shishigin, a master of the epic, monumental panorama, has been attracted mainly to heroic and romantic drama and folk tragedy. He has devoted particular attention to detailed mass scenes and to the class-related psychology of his heroes. His best productions include a dramatization of Fadeev's *The Rout* (1933), Kocherga's *The Watchmaker and the Hen* (1935), Simonov's *A Lad From Our Town* (1942), Gorky's *The Old Man* (1946), Chepurin's *Conscience* (1950), Gorky's *The Lower Depths* (1952), *Port Arthur* by Stepanov and Popov (1954), *Virineia* by Seifullina and Pravdukhin (1957), Korablinova's *Aleksei Kol'tsov* (1958), Pogodin's *Third Pathétique* (1959), Gorky's *Children of the Sun* (1962), Nazarov's *The Panfilovites* (1965), Dangulov's *The Ambassador's Diary* (1970), Chepurin's *The Snows* (1971), and Ankilov's *The Soldier's Widow* (1972).

Shishigin received the State Prize of the USSR in 1951 and the State Prize of the RSFSR in 1971. He has been awarded the Order of Lenin, the Order of the Red Banner of Labor, and various medals.

SHISHKIN, BORIS KONSTANTINOVICH. Born Apr. 7 (19), 1886, in Kukarka, now Sovetsk, Kirov Oblast; died Mar. 21, 1963, in Leningrad. Soviet botanist. Corresponding member of the Academy of Sciences of the USSR (from 1943).

Shishkin graduated from the medical faculty of the University of Tomsk in 1911; he taught there from 1913 to 1915. From 1915 to 1918 he was a military doctor, and from 1918 and 1925 he was the director of the botany department of the Museum of the Caucasus. Between 1925 and 1930 he was a professor at the University of Tomsk. In 1930, Shishkin joined the staff of the Botanical Institute of the Academy of Sciences of the USSR, serving as its director between 1938 and 1949. From 1945 to 1958 he was a professor at the University of Leningrad. Between 1946 and 1963 he was the vice-president of the All-Union Botanical Society.

Shishkin's main works deal with the taxonomy of flowering plants (including Caryophyllaceae, Umbelliferae, and Compositae) and botanical geography (Siberia, Transcaucasia). He was the organizer and editor of many collective works, for example, *The Flora of the USSR*, *The Flora of the Byelorussian SSR*, *The Flora of Leningrad Oblast*, and *The Flora of Turkmenia*. A recipient of the State Prize of the USSR in 1952, Shishkin was also awarded the Order of Lenin and two other orders.

SHISHKIN, IVAN IVANOVICH. Born Jan. 13 (25), 1832, in Elabuga, in what is now Tatar ASSR; died Mar. 8 (20), 1898, in St. Petersburg. Russian painter; one of the most outstanding masters of realistic landscape painting.

Shishkin studied at the Moscow School of Painting, Sculpture, and Architecture from 1852 to 1856 under A. N. Mokritskii and at the St. Petersburg Academy of Arts from 1856 to 1865 under S. M. Vorob'ev. From 1862 to 1865 he received a stipend to study at the academies of arts in Munich, Prague, and Düsseldorf. In 1865 he became an academician of the St. Petersburg Academy of Arts where he served as a professor from 1873 and director of the landscape studio in 1894 and 1895. Shishkin was a founding member of the *peredvizhniki* (the Society of Wandering Art Exhibitions).

At the beginning of his career, Shishkin worked in the traditional manner of romantic landscape painting common in the mid-19th century, for example, *View of Valaam Island* (1858, Kiev Museum of Russian Art). In the 1860's he transcended the conventions of color and light effects and turned to what might be considered a more objective representation of Russian forest landscape, which was to be the main theme of his works. Shishkin strove for an accurate rendering of the endless variety of forms in the plant world. He abandoned the descriptive and elaborate style evident in *Forest Felling* (1867, Tret'iakov Gallery, Moscow) and created truly integral images of Russian nature, revealing through composition the majestic beauty of his native land and the unique quality of its forests and fields. Prominent examples include *Rye* (1878) and *Expanses of the Forests* (1884), both of which are housed in the Tret'iakov Gallery.

Continually working on studies from nature, Shishkin perfected the use of chiaroscuro effects and achieved unity of painting style and tonality. In several works he depicted the changing moods of nature, as in *Sunlit Pines* (1886, Tret'iakov Gallery). He revealed typically expressive and poetic features of the Russian land, introducing elements of genre painting in such works as *Morning in a Pine Forest* (1889, bears painted by K. A. Savitskii, Tret'iakov Gallery), and *Oak Grove* (1887, Kiev Museum of Russian Art).

Shishkin's vital, monumental images of his native land reflect the democratic concepts common to the historical paintings, scenes of everyday life, and portraits of the *peredvizhniki*. His best works generalize and glorify the heroic character of Russian nature, for example, *Ship-timber Grove* (1898, Russian Museum, Leningrad).

Studying nature intently, Shishkin devoted a great deal of attention to the graphic arts. His etchings, which are similar to his paintings in content and style, furthered the rebirth of the genre in Russia. His realistic landscapes, which became widely popular, were important in the struggle to establish the national Russian character in the arts, a major trend in the cultural life of the 1870's to 1890's.

SHISHKO, LEONID EMMANUILOVICH (pseudonyms include P. B., P. Batin, and Blagoveshchenskii). Born May 19 (31), 1852, in Podol'sk; died Jan. 20, 1910, in Paris. Russian revolutionary, publicist, and historian.

The son of a forester, Shishko graduated from the Mikhail Artillery School in St. Petersburg in 1871, and in 1871 and the first part of 1872 he studied at the St. Petersburg Technological Institute. In 1872 he joined the Chaikovskii circle in St. Petersburg and began conducting propaganda among the military cadets (*iunkera*) and working people. Shishko took part in the "going to the people" movement and was the author of the pamphlet *Something, Brothers*, which contained a revolutionary proclamation. Shishko was arrested in Moscow on Aug. 14, 1874, and was sentenced at the Trial of the 193 to nine years' hard labor. He escaped from exile in 1890, however, and fled abroad.

Shishko helped establish the Foundation of the Free Russian Press. He joined the Socialist Revolutionaries in 1902 and became a member of the party committee abroad and the editorial board of the newspaper *Revoliutsionnaia Rossiia*. He translated A. Thun's *History of the Revolutionary Movement in Russia*, which was the first work on the subject. Shishko's own writings on the agrarian issue and the history of the social movement in Russia are typical of Narodnik (Populist) historiography.

SHISHKOV, ALEKSANDR SEMENOVICH. Born Mar. 9 (20), 1754; died Apr. 9 (21), 1841, in St. Petersburg. Russian state figure and writer.

Shishkov graduated from the Naval Cadet Corps (Naval Cadet School) in 1771. He later served as an admiral, as secretary of state (*stats-sekretar'*) to Alexander I, as a member of the Council of State, and, from 1824 to 1828, as minister of public education. Shishkov became a member of the Russian Academy in 1796 and was its president from 1813 to 1841; he became an honorary member of the St. Petersburg Academy of Sciences in 1800. He served on the court that tried the Decembrists and was one of the initiators of the censorship statute of 1826.

Shishkov headed the Society of the Lovers of the Russian Word. He opposed sentimentalism and attacked N. M. Karamzin and Karamzin's followers in his book *Treatise on the Old and New Styles of the Russian Language* (1803). Shishkov believed that literature should be oriented toward Old Church Slavonic and toward folklore; he stressed the importance of church books and of *The Tale of Igor's Campaign*. He was the author of an original work on the poetics of Russian folklore entitled *Conversations About Philology* (1811). Shishkov wrote plays, odes, occasional verse, and adaptations of psalms.

Politically, Shishkov was a conservative. A rabid opponent of the influence of the French Revolution and the Enlightenment in Russia, he vigorously attacked arguments for the abolition of serfdom. At the same time, his literary theories contributed to the lofty style of Decembrist political poetry, as seen in the works of F. N. Glinka and W. K. Küchelbecker. Shishkov's linguistic ideas exerted some influence on A. S. Griboedov and I. A. Krylov.

SHISHKOV, ALEKSANDR VASIL'EVICH. Born Nov. 3 (15), 1883, in Moscow; died July 8, 1920, in the village of Dubrovino, in present-day Novosibirsk Oblast. Participant in the revolutionary movement in Russia. Member of the Communist Party from 1904.

Shishkov was born into a worker family. He passed the test as an extramural student to receive the title public school teacher (*narodnyi uchitel'*). During the Revolution of 1905–07, he carried on party work among the railroad workers of Moscow. In 1908, Shishkov became a member of the Moscow Committee of the RSDLP and then worked in Sevastopol' and Nizhny Novgorod (now Gorky). Shishkov was arrested numerous times and exiled in 1914.

In 1917, Shishkov participated in the struggle to establish Soviet power in the city of Tomsk and Tomsk Province. He worked in the People's Commissariat for Internal Affairs of the RSFSR in 1918 and served as chairman of the Vladimir provincial executive committee. In 1919 he became a member of the All-Ukrainian Central Executive Committee and a member of the Revolutionary Tribunal of the Ukrainian SSR; he also served as deputy chairman of the All-Ukrainian Extraordinary Commission, chairman of the Vladimir and Tomsk provincial extraordinary commissions, and head of the military department of the Siberian Revolutionary Committee.

A monument to the memory of Shishkov has been erected in Tomsk (1953; sculptor, G. Shemberg).

SHISHKOV, LEON NIKOLAEVICH. Born Feb. 23 (Mar. 7), 1830, in the village of Speshnevo, in what is now Lipetsk Oblast; died there Dec. 31, 1908 (Jan. 13, 1909). Russian chemist.

Shishkov graduated in 1851 from the Mikhail Artillery School in St. Petersburg, where he later taught. In 1860 he became a professor at the Mikhail Artillery Academy, where in 1861 he established a chemistry laboratory considered exemplary for its time. He retired from teaching in 1865 and moved to the country, where he continued his research. Shishkov's main works were devoted to the chemistry of explosives. Shishkov studied the physicochemistry involved in the combustion of gunpowder. He also studied the composition and structure of fulminic acid and its salts (fulminates). He was the first to synthesize and describe a number of nitro compounds, such as tetranitromethane and trinitromethane (or nitroform).

REFERENCE

SHISHKOV, MATVEI ANDREEVICH. Born 1832 in Moscow; died June 15 (27), 1897, in La Seyne-sur-Mer, near Toulon. Russian stage designer.

Shishkov studied in the Stroganov School and under the stage designer Kh. Shen'ian in Moscow. He first worked under the direction of A. A. Roller in St. Petersburg in 1852. In 1869 he became an academician of the St. Petersburg Academy of Arts, and in 1884 he became a professor.

Shishkov introduced historical authenticity into Russian stage design by using details of everyday life; however, the productions he worked on were often excessively naturalistic and overburdened with props. Shishkov's best designs were for A. K. Tolstoy's *The Death of Ivan the Terrible* (1867, Aleksandrinskii Theater, in collaboration with V. G. Shvarts and G. G. Gagarin) and Tchaikovsky's *Vakula the Smith* (1877, Mariinskii Theater, in collaboration with M. I. Bocharov).

SHISHKOV, VIACHESLAV IAKOVLEVICH. Born Sept. 21 (Oct. 3), 1873, in the city of Bezhetsk, in what is now Kalinin Oblast; died Mar. 6, 1945, in Moscow. Soviet Russian writer.

Shishkov, the son of a merchant, graduated from the Vyshnii Volochek Technical School in 1891. His works first appeared in print in 1908. His sketches and short stories, topical in theme and pervaded with compassion for the people's difficult life, continued the democratic traditions of progressive Russian literature.

In 1916, M. Gorky published Shishkov's novella *The Taiga* in the magazine *Letopis'*. His novel *The Crowd* (1923) and the novellas *Lake Peipus* (1924) and *The Wanderers* (1931) depicted the life and heroic struggle of the young Soviet republic. In the novel *The River Ugrium* (vols. 1–2, 1933), Shishkov dealt with the rise and fall of Russian capitalism and with the working class' struggle against its oppressors and its growing revolutionary consciousness. Shishkov's most significant work was the historical epic *Emel'ian Pugachev* (books 1–3, 1938–45; State Prize of the USSR, 1946), which made a major contribution to the development of the historical genre in Soviet literature. Based on many years of study of historical documents, the epic describes the past from the standpoint of modern historiography. Colorful language, skillfully molded characters, and effective descriptions of nature are typical of Shishkov's style.

Shishkov was awarded the Order of Lenin and the Order of the Badge of Honor.

SHISHKOV, VLADIMIR PETROVICH. Born May 24, 1927, in Odoev, Raion, Tula Oblast. Soviet veterinarian. Academician of the V. I. Lenin All-Union Academy of Agricultural Sciences (1973). Member of the CPSU since 1951.

Shishkov graduated from the Moscow Veterinary Academy in 1951. Beginning in 1956, he worked at the academy, where he became rector in 1967. He has been academician-secretary of the veterinary division of the V. I. Lenin All-Union Academy of Agricultural Sciences since 1973. Shishkov's work has dealt mainly with metabolic diseases of highly productive animals, diseases of young animals, leukosis, developmental physiology, geographic pathology, and veterinary aspects of stock raising.

Shishkov has been awarded the Order of the Red Banner of Labor and several medals. [29–1248–2]

SHISHMANOV, IVAN DMITROV. Born June 22, 1862, in Svishtov; died June 22, 1928, in Oslo, Norway; buried in Sofia. Bulgarian literary scholar, folklorist, and cultural historian. Member of the Bulgarian Literary Society (1902; now the Bulgarian Academy of Sciences).

In 1884, Shishmanov went abroad to study, attending over the years the universities of Jena, Geneva, and Leipzig. He became a professor at the University of Sofia in 1894. From 1903 to 1907 he served as Bulgaria's minister of education. Shishmanov was the first Bulgarian scholar to study literature from the point of view of culture and social history. He did considerable research on writers and cultural figures of the Bulgarian national renaissance of the period 1750 to 1878. His works include writings on Bulgaria's literary ties with Russia and the Ukraine and a series of lectures on comparative Western European literatures in the 18th century.

Shishmanov was the author of the fundamental work *I. Vazov: Memoirs and Documents* (1930). He undertook the publication of the series *Sbornik za narodni umotvoreniia, nauka, i knizhina* (from 1889) and served as its first editor; the series, which was later published under the auspices of the Academy of Sciences, was devoted to the folklore, science, and literature of the Bulgarian people.

Shishmanov's works marked the beginning of Bulgarian folklore studies and ethnography.

SHISHMAREV, GLEB SEMENOVICH. Born 1781; died Oct. 22 (Nov. 3), 1835, in St. Petersburg. Russian navigator; rear admiral.

In the period 1815–18, Shishmarev circumnavigated the globe on the brig *Riurik*, under the command of O. E. Kotsebu (Kotzebue). He conducted hydrographic investigations in the Pacific Ocean. Between 1819 and 1822 he commanded the sloop *Blagonamerennyi*, which, as part of M. N. Vasiliev's expedition to circumnavigate the globe, attempted to find a sea route from the Bering Strait to the Atlantic Ocean along the shores of Siberia or America. A bay (Shishimaref Inlet) in Alaska, a passage near the Marshall Islands, islands in the Kara Sea, and a peak in Antarctica are named after Shishmarev.

SHISHMAREV, VLADIMIR FEDOROVICH. Born Mar. 13 (25), 1875, in St. Petersburg; died Nov. 21, 1957, in Leningrad. Soviet philologist. Academician of the Academy of Sciences of the USSR (1946).

Shishmarev graduated from the University of St. Petersburg in 1897. He pursued graduate study in Romance philology in France and Italy from 1899 to 1903. He became a professor at Petrograd (later Leningrad) University in 1918. Shishmarev organized the First Workers' and Peasants' University in Kostroma and served as the dean of its faculty of humanities in 1918 and 1919. He was the director of the Institute of World Literature from 1944 to 1947 and engaged in scholarly work at the Institute of Linguistics of the Academy of Sciences of the USSR from 1950 to 1957.

Shishmarev, whose principal works dealt with Romance philology, studied the poetry of the later Middle Ages in France, notably in *Guillaume de Machaut: Lyric Poetry* (vols. 1–2, 1909; Prix Saintour of the Académie Française, 1909) and *Lyric Poetry and Lyric Poets of the Later Middle Ages: Essays in the History of the Poetry of France and Provence* (1911). He also studied the French and Italian Renaissance and conducted research on the paleography, textual criticism, and theory and history of music.

In the 1930's, Shishmarev investigated general problems of philology and linguistics in such works as *The Historical Morphology of the French Language* (1952), *Readings in the History of the French Language: Ninth to 15th Centuries* (1955), and *Dictionary of Old French: For Use with "Readings in the History of the French Language"* (1955, with M. A. Borodina and M. V. Gordina). Shishmarev was awarded the Order of Lenin and three other orders.

SHITIKOV, ALEKSEI PAVLOVICH. Born Mar. 1 (14), 1912, in the village of Gorka, in what is now Kologriv Raion, Kostroma Oblast. Soviet state and party figure. Member of the CPSU since 1939.

The son of a peasant, Shitikov graduated from the Gorky Agricultural Institute in 1936 and from the Higher Party School Under the Central Committee of the ACP(B) in 1941. In 1936 he began working as an animal specialist for the raion department of agriculture and became first secretary of the Ardatov raion committee of the Komsomol in Gorky Oblast. Shitikov served in the Soviet Army and fought in the Great Patriotic War of 1941–45. From 1945 to 1948 and again from 1950 to 1952 he held a position in the apparatus of the Khabarovsk Krai Committee of the ACP(B). From 1948 to 1950 he was secretary of the Kamchatka oblast committee of the ACP(B), and from 1952 to 1955 he served as first secretary of the oblast committee of the CPSU in the Jewish Autonomous Oblast. Between 1955 and 1957, Shitikov was secretary and second secretary of the Khabarovsk Krai Committee of the CPSU, and from 1957 to 1970 he served as first secretary of the committee.

In 1970, Shitikov became chairman of the Soviet of the Union, one of the chambers of the Supreme Soviet of the USSR. In 1961 he was elected a member of the Central Committee of the CPSU. Shitikov served as a deputy to the fourth through tenth convocations of the Supreme Soviet of the USSR. He became chairman of the Parliamentary Group of the USSR in 1970 and chairman of the Soviet Committee for European Security and Cooperation in 1971.

Shitikov has been awarded three Orders of Lenin, three other orders, and various medals. [29–1240–2]

SHITKINO, an urban-type settlement in Taishet Raion, Irkutsk Oblast, RSFSR. Shitkino is situated on the left bank of the Biriusa River, in the Enisei basin, 61 km northeast of the Taishet railroad station on the Trans-Siberian Railroad. The Taishet Logging and Timber Distribution Establishment and a combine that manufactures wood products are located in Shitkino. [29–1240–3]

SHITT, PETR GENRIKHOVICH. Born Aug. 1 (13), 1875, in Kitrysh, Bel'tsy District, Bessarabia Province; died Jan. 31, 1950, in Moscow. Soviet specialist in fruit growing. Honored scientist of the RSFSR (1946). Member of the CPSU from 1947.

Shitt graduated from Novorossiia University in Odessa in 1908. In 1920 he became head of the department of fruit growing at the K. A. Timiriazev Moscow Agricultural Academy. He investigated the growth and developmental patterns of fruit plants and studied different varieties. He established the cyclical alternation of the skeletal and overgrowing parts in the crown, the tiered quality of branch arrangement, and the morphological parallelism between fruit and berry plants. Shitt received the State Prize of the USSR in 1950.

SHIVANDA, a balneological health resort in Shilka Raion, Chita Oblast, RSFSR; situated at an elevation of 800 m in the Shivanda River valley, 205 km from Chita and 15 km from the Razmakhnino railroad station. Summers are warm, with an average July temperature of 20°C, and winters are cold, with an average January temperature of −27°C. Shivanda receives 290 mm of precipitation a year. The therapeutic waters used in the resort come from carbonic ferruginous hydrocarbonate calcium-magnesium springs and are used for bathing and drinking. The resort offers treatment for disorders of the cardiovascular system, digestive organs, and respiratory organs; it does not treat tuberculosis, however. Shivanda has a sanatorium. [29–1175–3]

SHIVAZA, IASYR DZHUMAZOVICH (pen name, Shchianma). Born May 5 (18), 1906, in the village of Aleksandrovka, in what is now Moscow Raion, Kirghiz SSR. Soviet Dungan writer. People's Poet of Kirghizia. Member of the CPSU from 1940. Candidate member of the Central Committee of the Kirghiz Communist Party (1958-65).

Shivaza graduated from the G. Tukai Tatar Institute of Education in Tashkent in 1930 and later served in the Great Patriotic War (1941–45). From 1957 to 1964 he was editor of the Dungan-language newspaper *Shyiuedi Chi* (Banner of October), which is circulated in several republics of the USSR.

Shivaza's works, which first appeared in print in 1929, include the poetry collections *Morning Star* (1931), *The Wave of Revolution* (1932), *Selected Verses* (1958), and *Hello, Spring* (1966). He is the author of novellas and the novel *Faithful Friends* (1958). A major theme in Shivaza's works is friendship among peoples.

Shivaza was a secretary of the Kirghiz Writers' Union from 1938 to 1942 and from 1946 to 1954. He has been awarded five orders and several medals.

SHIVELUCH, an active volcano on Kamchatka. Shiveluch has an elevation of 3,283 m and is composed of andesites and basalts. A Pelée-type volcano, it discharges very hot clouds of gas and ash together with lava fragments. Eruptions have occurred in 1790, 1854, 1879–83, 1896–98, 1905, 1927–29, 1944–50, and 1964. Up to an elevation of 750 m, the slopes of Shiveluch are covered with forests and thickets of dwarf stone pine; at higher elevations, meadows and lava-ash surfaces are found. [29–1175–4]

SHKADOV, IVAN NIKOLAEVICH. Born Apr. 19 (May 2), 1913, in the village of Naumovo, in what is now Spas-Demensk Raion, Kaluga Oblast. Soviet military leader; general of the army (1975). Hero of the Soviet Union (Feb. 21, 1978). Member of the CPSU since 1938.

The son of a peasant, Shkadov joined the Red Army in 1935. He graduated from the Kharkov Armored School in 1938, advanced training courses for officers at the Military Academy for Armored and Mechanized Troops in 1953, and the Military Academy of the General Staff in 1959. In 1938, Shkadov commanded a tank platoon in fighting near Lake Khasan.

During the Great Patriotic War, Shkadov was assistant chief of staff of a tank regiment and commander of a tank battalion in 1941 and 1942 and commander of a separate tank regiment and a separate tank brigade between 1942 and 1945. He fought at Moscow and Stalingrad, in the Iaşi-Kishinev Operation, and in the liberation of Rumania, Bulgaria, and Yugoslavia.

After the war, Shkadov continued to serve in command positions. He was named deputy commander of the Carpathian Military District in March 1961. From 1964 to 1967 he headed a group of Soviet military specialists in the Republic of Cuba. Shkadov was appointed commander of the Northern Group of Forces in May 1967, first deputy director of the Military Academy of the General Staff in December 1968, and chief of the Main Director-

ate of Military Educational Institutions of the Ministry of Defense in July 1969. Shkadov became chief of the Main Directorate of Personnel of the Ministry of Defense of the USSR in August 1972.

Shkadov was a deputy to the ninth convocation of the Supreme Soviet of the USSR. He has been awarded the Order of Lenin, the Order of the October Revolution, five Orders of the Red Banner, the Order of Suvorov Third Class, two Orders of the Red Star, and various medals. Shkadov has also received foreign orders and medals. [29–1252–4]

SHKETAN, M. (also Iakov Pavlovich Maiorov). Born Oct. 17 (29), 1898, in what is now the M. Shketan Kolkhoz, Orshanka Raion, Mari ASSR; died there May 16, 1937. Soviet Mari writer.

The son of a peasant, Shketan returned to his native village in 1929 and took part in the construction of a kolkhoz. He was first published in 1923. In such plays as *Hey, Parents!* (1928) and *An Aftertaste of Dregs* (1932), Shketan vividly portrayed the search of the Mari working people for a path to a new life. He also wrote short stories (including humorous stories), literary sketches, and publicist articles. Shketan's principal work was the novel *Erenger* (1933), which depicts the socialist reconstruction of the Mari countryside.

SHKHARA, the highest mountain of the Vodorazdel'nyi Range (also known as the Glavnyi Range) in the Greater Caucasus; situated in the central part of the range. The mountain has an elevation of 5,068 m. It is composed of granites and schists. The Bezengi Glacier is on the northern face of the mountain, and the Shkhara Glacier on the southern face. Soviet mountaineers first climbed Shkhara in 1933. [29–1560–2]

SHKHEL'DA, a massif in the central part of the Greater Caucasus, southeast of Mount Elbrus; located in the basin of the Adylsu River, a right tributary of the Baksan. The massif has five peaks, with elevations ranging from 4,2000 m to 4,322 m. It is composed mainly of granites. The Shkhel'da Glacier, which has a length of approximately 9.8 km, is located on the northern slope. Soviet mountaineers first climbed the massif in 1936. [29–1560–3]

SHKIRIATOV, MATVEI FEDOROVICH. Born Aug. 3 (15), 1883, in the village of Vishniakovo, Tula Province; died Jan. 18, 1954, in Moscow. Soviet party figure. Member of the CPSU from 1906.

The son of a peasant, Shkiriatov was a worker. He carried out party work in Moscow, Rostov-on-Don, and Tula and was arrested several times. In 1915 he was conscripted into the army, where he carried on revolutionary propaganda among the soldiers. After the February Revolution of 1917, Shkiriatov served on the executive committee of the Moscow soviet of soldiers' deputies, the military bureau of the Moscow committee of the RSDLP(B), the executive committee of the Tula soviet, and the Tula revolutionary military committee. From 1918 to 1920 he was secretary of the central committee of the garment workers' union and a member of the Moscow oblast and city committees of the party.

In 1921, Shkiriatov began serving in the apparatus of the Central Committee of the RCP(B); he was named chairman of the Central Commission for Review and Purge of the Party's Ranks. In 1923 he became a member of the Central Control Commission of the party, and from 1927 to 1934 he was a member of the collegium of the People's Commissariat of the Workers' and Peasants' Inspectorate of the USSR. In 1934 he became a member of the Commission of Party Control of the Central Committee of the ACP(B), and from 1935 to 1952 he was deputy chairman of the commission. In 1952 he was named chairman of the body, which was reorganized in the same year and renamed the Committee of Party Control of the Central Committee of the CPSU.

Shkiriatov was a delegate to the Eighth through Nineteenth Party Congresses. He was elected a member of the Central Control Commission at the Eleventh through Sixteenth Congresses and a member of the Central Committee at the Eighteenth and Nineteenth Congresses. In 1952 and 1953 he served on the Presidium of the Central Committee of the CPSU. Shkiriatov was a delegate to the Seventh Congress of the Comintern. He served as a member of the All-Russian Central Executive Committee and the Central Executive Committee of the USSR and as a deputy to the first through third convocations of the Supreme Soviet of the USSR.

Shkiriatov, who was awarded three Orders of Lenin and various medals, is buried on Red Square by the Kremlin wall. [29–1255–2]

SHKLO, an urban-type settlement in Iavorov Raion, L'vov Oblast, Ukrainian SSR. Shklo is 4 km from the Shklo-Starzhiska railroad station. The Iavorov Mining and Chemical Plant and a plant producing *keramzit* (artificial porous filler), a plant manufacturing reinforced-concrete components, and a branch of the L'vovpribor plant are located in the settlement. [29–1256–1]

SHKLOV, a city and the administrative center of Shklov Raion, Mogilev Oblast, Byelorussian SSR. Situated on the Dnieper River, 30 km north of Mogilev, Shklov has a railroad station on the Orsha-Mogilev line. Shklov has a paper mill, a furniture factory, a plant for preprocessing flax, a mixed-feed plant, a building-materials plant, and enterprises of the food-processing industry. [29–1256–2]

SHKLOVSKII, IOSIF SAMUILOVICH. Born June 18 (July 1), 1916, in Glukhov, in what is now Sumy Oblast, Ukrainian SSR. Soviet astrophysicist. Corresponding member of the Academy of Sciences of the USSR (1966).

After graduating from Moscow University in 1938, Shklovskii began working at the Shternberg State Astronomical Institute. In 1968 he began working at the Institute for Space Research of the Academy of Sciences of the USSR. Shklovskii's main works deal with the theory of the solar corona, radio astronomy, and X-ray astronomy. In 1948 he investigated the presence of the 21-cm line in the radiation of neutral interstellar hydrogen. In 1953 he explained the properties of the Crab Nebula in terms of the radiation of relativistic electrons in a magnetic field. In 1965 he proposed a new concept of planetary nebulas, linking them to the end of the evolution of red giants and the birth of white dwarfs. In the 1970's, Shklovskii turned to the study of the nature of galactic and extragalactic X-ray sources.

Shklovskii is a foreign member of the US National Academy of Sciences and a member of the Royal Astronomical Society of Great Britain. Shklovskii received the Lenin Prize in 1960. He has been awarded the Order of the Badge of Honor and various medals.

SHKLOVSKII, VIKTOR BORISOVICH. Born Jan. 12 (24), 1893, in St. Petersburg. Soviet Russian writer, literary scholar, and critic.

The son of a teacher, Shklovskii studied in the philological faculty at the University of St. Petersburg. His first scholarly work on literature was published in 1914. Shklovskii was close to the

futurists and was a member of the Society for the Study of Poetic Language (OPOIAZ). He was a founder and a theorist of the formalist school of literary scholarship (*see* FORMAL METHOD). Shklovskii's most important works from these years were collected in *On the Theory of Prose* (1925).

Shklovskii became aware of the limitations of the formalist school in the 1930's. He began dealing with literature from a broad sociohistorical viewpoint in his article "Monument to a Scholarly Error" (1930). Beginning in the 1930's, Shklovskii investigated the historical relations between literature and the social reality and dominant ideas of the age. His books and articles dealing with this problem include *Artistic Prose: Reflections and Analyses* (1959; 2nd ed., 1961), *Stories About Prose* (vols. 1–2, 1966), and *The Bowstring: On the Dissimilarity of the Similar* (1970).

Shklovskii also wrote memoirs and lyric epistolary books of an autobiographical nature, such as *A Sentimental Journey* (parts 1–2, 1923), *Zoo: Letters Not About Love, or The Third Héloise* (1923), *Hamburg Account* (1928), and *Once Upon a Time* (1962). Much of Shklovskii's work deals with the Russian classics. In particular, he was the author of a series of works on L. N. Tolstoy, beginning with *Material and Style in Leo Tolstoy's Novel "War and Peace"* (1928) and ending with the detailed biography *Leo Tolstoy* (1963; 2nd ed., 1967; both editions part of the series *Zhizn' zamechatel'nykh liudei* [Lives of Outstanding People]). He also wrote works on film theory; literary portraits of S. M. Eisenstein, L. V. Kuleshov, Dziga Vertov, and A. P. Dovzhenko; and screenplays.

Shklovskii was awarded the Order of the Red Banner of Labor.

SHKODËR, a city in Albania, on Lake Scutari. Administrative center of the *rrethi* (district) of Shkodër. Population, more than 60,000 (1975). A landing on Lake Scutari, Shkodër is linked by highway with the cities of Tirana and Durrës and with Titograd, Yugoslavia. Shkodër's industry includes ferrous metallurgy, food processing, and tobacco production as well as the manufacture of cement, wood products, paper, textiles, and leather products. The ruins of the 14th-century citadel of Rozafat are located in Shkodër. [29–1258–2]

SHKOLA I PROIZVODSTVO (School and Industry), a monthly scientific and methodological journal of the Ministry of Education of the USSR. Founded in Moscow in 1957, the journal was published until 1960 under the title *Politekhnicheskoe obuchenie* (Polytechnical Training). *Shkola i proizvodstvo* is intended for teachers at vocational and industrial training schools, workers at interschool industrial training centers and school workshops, teachers of drafting and drawing, workers in public education, and students in pedagogical institutes. Circulation, 134,500 (1978). [29–1263–2]

SHKOLA I ZHIZN' (School and Life), a weekly pedagogical newspaper of a liberal orientation. The newspaper, which was published in St. Petersburg from November 1910 through 1917, was edited by G. A. Fal'bork, a progressive Russian figure in public education. It dealt with such matters as preschool upbringing; elementary, secondary, and higher education; educational work among adults; the activities of teachers' organizations; and congresses on public education. Prominent Russian pedagogues, such as V. P. Vakhterov, K. N. Venttsel', E. A. Zviagintsev, and N. V. Chekhov, contributed to the newspaper. On occasion, special monographs on the upbringing of children were included with the newspaper as supplements. [29–1263–1]

SHKOL'NIKOV, ALEKSEI MIKHAILOVICH. Born Jan. 2 (15), 1914, in the city of Egor'evsk, Moscow Oblast. Soviet state and party figure. Member of the CPSU since 1940.

The son of a peasant, Shkol'nikov graduated from the Podol'sk Industrial Technicum in 1933. In 1937 he completed three correspondence courses at the Industrial Academy, and in 1952 he graduated from the Higher Party School Under the Central Committee of the ACP(B). Beginning in 1933, Shkol'nikov engaged in engineering and technical work in Perm', where he was a senior foreman, shop head, and chief power engineer of a plant. In 1943 he turned to party work. From 1945 to 1947, Shkol'nikov was a commissioner of the Party Control Commission of the Central Committee of the ACP(B) for Vladimir and Voronezh oblasts. From 1947 to 1949 he was second secretary of the Kaluga oblast party committee. He served as first secretary of the Tambov oblast committee of the CPSU from 1952 to 1955, first secretary of the Voronezh oblast committee from 1955 to 1960, and first secretary of the Volgograd oblast committee from 1960 to 1965; in addition, he served as first secretary of the Volgograd oblast rural committee of the CPSU in 1963 and 1964.

Shkol'nikov became first deputy chairman of the Council of Ministers of the USSR in 1965, and in 1974 he became chairman of the Committee of People's Control of the USSR. He was elected a candidate member of the Central Committee of the CPSU in 1952 and a member in 1956. He served as a deputy to the fourth through tenth convocations of the Supreme Soviet of the USSR.

Shkol'nikov has been awarded four Orders of Lenin, the Order of the Red Banner of Labor, and various medals. [29–1269–2]

SHKOTOVO, an urban-type settlement in Shkotovo Raion, Primor'e Krai, RSFSR. Situated on the shore of Ussuri Bay, on the Sea of Japan, Shkotovo has a railroad station on the Uglovaia-Nakhodka line. The settlement has an automotive-repair plant, a cannery, a building-materials combine, a beekeeping sovkhoz, and a sovkhoz for raising vegetables and dairy animals. Coal is mined in the area. [29–1270–1]

SHKURO, ANDREI GRIGOR'EVICH (also A. G. Shkura). Born Jan. 7 (19), 1887; died Jan. 17, 1947. White Guards lieutenant general (1919).

Shkuro was the son of a cossack officer in Kuban' Oblast. He graduated from the Nicholas Cavalry School in 1907 and served in the Kuban' Cossack Host. He served in World War I as commander of a special partisan detachment with the rank of colonel. In the spring of 1918 he formed a counterrevolutionary cossack detachment in the Batalpashinsk region and during May and June raided Stavropol', Essentuki, and Kislovodsk. He later commanded a Kuban' Cossack brigade and a division in Denikin's army; in May 1919 he took command of a cavalry corps. The troops under Shkuro's command were known for their unusual cruelty and lack of discipline, which displeased even the White Guards command. After the White Guards were crushed, Shkuro emigrated and carried on anti-Soviet activities.

In the period 1939–45, Shkuro cooperated with the Nazis and, on their orders, took part in the formation of anti-Soviet cossack units made up of traitors and White émigrés. In 1945, Shkuro was detained by British troops in Austria and was turned over to the Soviet command. Shkuro was executed in conformity with a sentence by the Supreme Court of the USSR. [29–1271–2]

SHLATTER, IVAN ANDREEVICH. Born Feb. 19 (Mar. 1), 1708, in Berlin; died Jan. 23 (Feb. 3), 1768, in St. Petersburg. Russian scientist and state figure.

Shlatter joined the staff of the assay laboratory of the Berg-Kollegiia in 1722. He took a position at the mint in St. Petersburg in 1724 and was appointed director in 1754. From 1760 to 1768, Shlatter was president of the Berg-Kollegiia.

Shlatter improved the methods used in coining and in the smelting of precious metals. He also proposed a refining method in which gold and silver are separated pyrometallurgically and the extracted argentous gold is treated hydrometallurgically. Shlatter's principal works dealt with mining, metallurgy, assaying, and hydraulic and steam power systems. They were used as textbooks at metallurgical schools, the Mining School, and, later, the Cadet School of Mining.

SHLEISNER, OL'GA ALEKSANDROVNA (married name, Natanson). Born circa 1850 in Kursk Province; died Mar. 16 (28), 1881, in St. Petersburg. Russian revolutionary Narodnik (Populist). Wife of M. A. Natanson.

The daughter of a *dvorianin* (nobleman), Shleisner joined the revolutionary movement in 1870 and helped establish the Chaikovskii circle. She helped found Land and Liberty in 1876 and became a member of its governing body, the Grand Council. She was also an organizer of Narodnik settlements in Saratov Province.

In October 1878, Shleisner was imprisoned in the Peter and Paul Fortress. In May 1880 the St. Petersburg Military District Court gave her a sentence of six years' hard labor, which was commuted to exile in Siberia. Since she was terminally ill, she was kept in St. Petersburg and was released in February 1881, with a sponsor taking responsibility for her actions. Shleisner died shortly thereafter.

SHLIAKHETSTVO, a term borrowed from Polish (*szlachectwo*) and used in 18th-century Russia to designate the nobility. The adjectival derivatives are *shliakhetnyi* and *shliakhetskii*. [29–1308–3]

SHLIKHTER, ALEKSANDR GRIGOR'EVICH. Born Aug. 20 (Sept. 1), 1868, in the city of Lubny, in what is now Poltava Oblast; died Dec. 2, 1940, in Kiev. Soviet state and party figure. Academician of the Academy of Sciences of the Ukrainian SSR (1929) and the Academy of Sciences of the Byelorussian SSR (1934). Doctor of economic sciences (1935). Member of the Communist Party from 1891.

The son of a carpenter, Shlikhter joined the revolutionary movement in 1887. Between 1889 and 1891 he studied at the universities of Kharkov and Bern. Over a period beginning in 1891 he carried out work for the Social Democratic Party in the Ukraine, the Urals, and Samara. He was exiled to Vologda Province in 1895. Shlikhter served on committees of the RSDLP in Tula (1901–02), Kiev (1902–04), and Moscow (1907–08). From 1905 to 1907 he helped lead the revolutionary struggle in Kiev, St. Petersburg, and Finland. Shlikhter served as a delegate to the Fifth Congress of the RSDLP. In 1909 he was exiled to Eastern Siberia.

After the February Revolution of 1917, Shlikhter became a member of the executive committee of the Krasnoiarsk soviet and the Central Siberian oblast bureau of the RSDLP. He was a delegate to the Sixth Congress of the RSDLP(B) and a member of the Moscow committee of the RSDLP(B). During the October Days of 1917, he served as commissar for foodstuffs for the Moscow military revolutionary committee, and between 1917 and 1919 he was people's commissar of agriculture, people's commissar for foodstuffs of the RSFSR, and people's commissar for foodstuffs of the Ukraine. In 1920 and 1921, Shlikhter was chairman of the Tambov provincial executive committee. In 1921 he undertook diplomatic work and became a member of the collegium of the People's Commissariat of Foreign Affairs of the USSR and the People's Commissariat for Foreign Trade of the USSR. From 1927 to 1929 he was people's commissar of agriculture of the Ukrainian SSR.

From 1931 to 1938, Shlikhter was vice-president of the Academy of Sciences of the Ukrainian SSR, and from 1930 to 1933 he also served as director of the Ukrainian Institute of Marxism-Leninism. He was also a delegate to the Fourteenth through Seventeenth Congresses of the ACP(B). In 1924, Shlikhter became a member of the Central Committee of the Communist Party of the Ukraine (Bolshevik), and from 1926 to 1937 he was a candidate member of the Politburo of the Central Committee. In 1924 he served as a delegate to the Fifth Congress of the Comintern. He was a member of the All-Russian Central Executive Committee and the Presidium of the Central Executive Committee of the USSR. In 1923, Shlikhter was named a member of the Presidium of the Central Executive Committee of the Ukrainian SSR.

SHLINO (also Shlino Reservoir), a lake on the border between Kalinin and Novgorod oblasts, RSFSR, in the northern Valdai Hills. The lake occupies an area of 34 sq km and has an elevation of 199 m. The Shlina River, which empties into the Vyshnii Volok Reservoir, originates at the lake. The water flow at the head of the Shlina River is regulated by the Shlina Dam. Water from Lake Vel'e (Pola River basin) flows into Lake Shlino via the Vel'e Canal. [29–1290–2]

SHLISSEL'BURG FORTRESS, a fortress on Orekhovoi Island, at the place where the Neva River flows from Lake Ladoga. The fortress was known as Oreshek until 1611 and as Noteborg from 1611 to 1702; it was called Shlissel'burg Fortress from 1702 to 1944, when it was renamed Petrokrepost'.

Shlissel'burg Fortress was erected by the Novgorodians in 1323; a stone wall was built around the structure in 1353. Archaeologists have uncovered the remains of the wall, along with canals and a man-made harbor (15th–16th centuries) within the fortress, into which ships could enter through a special passage in the wall. The fortress, which was rebuilt numerous times, forms an irregular triangle; five of its original seven towers have been preserved. The walls were up to 6.5 m thick. A specially fortified structure, or citadel, stood in the northeast corner of the fortress, which in the early 18th century was strengthened with seven bastions.

After Kronstadt was built in 1703, Shlissel'burg lost its military importance and was converted into a political prison. Initially, the barracks, the citadel, the Old Prison (built 1798), and the casemates in the walls and towers were used as places of imprisonment. In the 18th and early 19th centuries they held members of the royal family, including the Emperor Ivan VI Antonovich; courtiers who had fallen out of favor; *raskol'niki* (schismatics); runaway serfs; and the Enlightenment writers F. V. Krechetov, N. I. Novikov, and V. N. Karazin.

In the period from 1826 to 1870, Shlissel'burg Fortress held 96 prisoners, including the Decembrists A. P. Bariatinskii, I. I. Gorbachevskii, W. K. Küchelbecker, and I. I. Pushchin; the Polish rebels W. Łukasiński and B. Szwarce; and the Russian revolutionaries M. A. Bakunin and N. A. Ishutin. Beginning in 1872, correctional labor companies made up of arrested military personnel were stationed at the fortress, followed by a disciplinary battalion in 1879. Between 1881 and 1884 the New Prison was

built, in which unusually strict conditions prevailed; a gendarme section directly subordinate to the chief of the gendarmes was established.

In the period from 1884 to 1906, the fortress held 69 revolutionaries, including such Narodniki (Populists) of the 1870's as A. V. Dolgushin and I. N. Myshkin; the members of the Polish party Proletariat L. Waryński and L. Janowicz; the People's Will members M. Iu. Ashenbrenner, G. A. Lopatin, N. A. Morozov, V. N. Figner, and M. F. Frolenko; and, beginning in 1902, the Socialist Revolutionaries (SR's) S. V. Balmashev, G. A. Gershuni, and E. S. Sozonov. Fifteen were executed (including members of the Terrorist Faction of the People's Will, notably A. I. Ul'ianov, on May 8, 1887), three committed suicide, 16 died, and eight went insane.

The fortress temporarily ceased to function as a prison on Jan. 8, 1906, during the Revolution of 1905–07. After the defeat of the revolution, however, a central prison with a hard-labor regime was erected, and the Old Prison and the former barracks (the Zoo) were rebuilt; a new, four-story wing for 600 prisoners was added in 1911. By 1912 the central prison could accommodate 1,700 prisoners.

More than 530 political prisoners passed through Shlissel'burg Fortress between 1907 and 1917, including more than 130 Social Democrats, among them G. K. Ordzhonikidze, F. N. Petrov, and M. A. Trilisser; other prisoners included about 150 SR's, 40 anarchists, and 16 members of the Polish Socialist Party, as well as nonparty participants in such rebellions as the soldiers' and sailors' uprisings of 1905–12 and the agrarian disturbances of 1905–07. The political prisoners engaged in self-education. They responded to harsh conditions with collective protests in 1908 and 1912, and they maintained communication with the Social Democratic faction of the Fourth State Duma through the illegal Group to Aid the Political Prisoners of Shlissel'burg.

On Feb. 28 and Mar. 1, 1917, all the prisoners in the fortress were freed by the insurgent workers of the Shlissel'burg Plant. On Jan. 23, 1919, a monument was erected on a spit on the eastern part of the island to honor all who had died within the fortress walls between 1884 and 1906 (sculptor I. Ia. Gintsburg).

The Shlissel'burg Fortress, which was destroyed during the Great Patriotic War of 1941–45, is today being restored as a branch of the State Museum of History of Leningrad.

SHLOMIN, MITROFAN IVANOVICH. Born Nov. 24, 1896, in the village of Iznoskovo, Maloiaroslavets District, Kaluga Province; died Oct. 27 (Nov. 9), 1917, in Moscow. Fought in the struggle to establish Soviet power in Moscow. Member of the Communist Party from the summer of 1917.

The son of a peasant, Shlomin became a worker in Moscow in 1911. In 1917 he was a member of the Dorogomilovo military revolutionary committee and commander of a Red Guard detachment. During the fighting in October, while transporting weapons from the Moscow soviet, Shlomin was captured by military school cadets (*iunkery*) and was killed.

SHLONSKY, ABRAHAM. Born 1900 in the village of Kriukovo, in what is now Kremenchug Raion, Poltava Oblast, Ukrainian SSR; died May 18, 1973, in Tel Aviv. Israeli poet who wrote in Hebrew.

Shlonsky emigrated to Palestine in 1920. From 1928 to 1933 he published collections under the title *Notes*, which were extremely popular among the avant-garde political youth. Themes recurring in his works of the 1930's are the struggle against the desert and praise of the fruitful earth, for example, in *Stumbling Blocks* (1932) and *Poems of Collapse and Appeasement* (1938). Also of note is his poem "Stalingrad" (1943). Shlonsky translated the works of A. S. Pushkin and M. A. Sholokhov into Hebrew.

Shlonsky was a member of the World Peace Council.

SHLUH (also Chleuch), a Berber people inhabiting the western part of the High Atlas and the Anti Atlas in Morocco. The Shluh live in the valleys of the Sous and Tensift rivers along with the Arab population. They number about 2 million (1975, estimate).

The Shluh are subdivided into separate groups, including the Aghbar, Fruga, Glawa, Ksima, Menaba, and Mtuga. They speak a language of the Berber group, and some also speak Arabic. The religion is Islam. The main occupations are mountain farming and transhumant livestock breeding of sheep and goats. [29–1288–2]

SHLYK, ALEKSANDR ARKAD'EVICH. Born Nov. 1, 1928, in Minsk. Soviet plant physiologist and biochemist. Corresponding member of the Academy of Sciences of the USSR (1966). Member of the CPSU since 1948.

Upon graduation from the Byelorussian University in 1950, Shlyk worked in the Institute of Biology of the Byelorussian Academy of Sciences. In 1957 he became head of the academy's Laboratory of Biophysics and Isotopes. Since 1973 Shlyk has been director of the Institute of Photobiology, which evolved from the Laboratory of Biophysics and Isotopes.

Shlyk's research has been directed at the development of the photosynthetic apparatus. He and his colleagues demonstrated the existence of a chlorophyll renewal process and elucidated its main mechanisms. Shlyk showed that chlorophyll b is synthesized from labile chlorophyll-a molecules and studied the metabolism of the precursors of chlorophyll-a molecules in green plants. Shlyk has been awarded the Order of the Red Banner of Labor and a medal.

SHMAKOV, FEDOR IVANOVICH. Born Feb. 16 (Mar. 1), 1917, in Petrograd. Soviet Byelorussian actor. People's Artist of the USSR (1975). Member of the CPSU from 1948.

In 1939, Shmakov graduated from the Leningrad Theatrical Institute and joined the company of the Russian Theater of the Byelorussian SSR in Mogilev. In 1941 he began working at the Byelorussian Second State Theater in Vitebsk (now the Ia. Kolas Byelorussian Drama Theater). Shmakov appeared in the role of V. I. Lenin in Popov's *The Family*, D. Zorin's *The Eternal Source*, Shatrov's *The Sixth of July*, and Pogodin's *The Third Pathétique*. His other major parts have included Akim in Tolstoy's *The Power of Darkness*, Prisypkin in Mayakovsky's *The Bedbug*, Vaskov in Vasil'ev's *And Dawns Are Quiet Here*, and the title role in Vol'skii's *Nesterka*. He has also appeared in motion pictures, notably as Iusalov in *Immortal Song* (1958), Rubin in *Kochubei* (1958), and Andrei Razmetnov in *Virgin Soil Upturned* (1960–61).

Shmakov, a recipient of the State Prize of the Byelorussian SSR in 1968, has been awarded two orders and several medals. [29–1309–1]

SHMAKOV, PAVEL VASIL'EVICH. Born Dec. 15 (27), 1885, in the village of Snovitsy, Vladimir Province. Soviet specialist in television and electronics. Doctor of technical sciences; professor (1937). Honored Worker in Science and Technology of the RSFSR (1948). Hero of Socialist Labor (1966).

Shmakov graduated from Moscow University in 1912. He taught at the Plekhanov Moscow Institute of the National Economy from 1921 to 1930, at the Moscow Higher Technical School from 1924 to 1930, and at the Moscow Power Engineering Institute from 1930 to 1932. He headed a laboratory at the All-Union Scientific Research Institute of Television in Leningrad from 1935 to 1937 and was director of the institute from 1946 to 1948. Shmakov was named head of the subdepartment of television at the Leningrad Electrical Engineering Institute of Communications in 1937.

Shmakov is credited with several inventions, including a television camera tube with image transfer, called the image iconoscope, which he and P. V. Timofeev developed in 1933. Shmakov's principal works are devoted to facsimile and to color and stereoscopic television. Shmakov received the State Prize of the USSR in 1973 and has been awarded two Orders of Lenin, the Order of the Red Banner of Labor, and various medals.

SHMAKOVKA, a balneological health resort in Primor'e Krai, RSFSR, 38 km from the Shmakovka railroad station and 340 km from Vladivostok. Summers are warm, with an average July temperature of 21°C, and winters are cold, with an average January temperature of −22°C; precipitation totals 610 mm annually. Therapeutic waters used in the resort come from carbonic hydrocarbonate calcium-magnesium springs and are used for bathing and drinking. Disorders of the digestive organs and the cardiovascular and nervous systems are treated. Shmakovka has a sanatorium and bathhouses. [29–1309–2]

SHMAL'GAUZEN, IVAN FEDOROVICH. Born Apr. 3 (15), 1849, in St. Petersburg; died Apr. 7 (19), 1894, in Kiev. Russian botanist. Corresponding member of the St. Petersburg Academy of Sciences (1893). Father of I. I. Shmal'gauzen.

I. F. Shmal'gauzen graduated from the University of St. Petersburg in 1871. He was a professor at the University of Kiev from 1879. His main works dealt with paleobotany and floristics. Shmal'gauzen was the author of *Flora of Southwestern Russia* (1886), *Flora of Middle and Southern Russia, the Crimea, and the Northern Caucasus* (vols. 1–2, 1895–97), and a number of monographs devoted to fossil plants of the Devonian, Carboniferous, Permian, Jurassic, and Tertiary periods. These works played a major role in the development of Russian paleobotany.

REFERENCE

Zerov, D. K., and N. O. Shchekina. "Ivan Fedorovych Shmal'hauzen." *Ukrains'kyi botanichnyi zhurnal*, 1957, vol. 14, no. 4. (References.) [29–1310–1]

SHMAL'GAUZEN, IVAN IVANOVICH (also Schmalhauzen). Born Apr. 11 (23), 1884, in Kiev; died Oct. 7, 1963, in Moscow. Soviet biologist, zoologist, and theorist on evolution. Academician of the Academy of Sciences of the USSR (1935) and the Academy of Sciences of the Ukrainian SSR (1922). Honored Scientist of the Ukrainian SSR (1935). Son of I. F. Shmal'gauzen.

Shmal'gauzen graduated from the University of Kiev (1907), where he was a student of A. N. Severtsov. He was a professor at the universities of Voronezh (from 1918) and Kiev (from 1921). From 1939 to 1948 he was a professor at Moscow University, where he was also chairman (1939–48) of the subdepartment of Darwinism that he had organized. Between 1930 and 1941 he was director of the Institute of Zoology and Biology of the Academy of Sciences of the Ukrainian SSR, and between 1936 and 1948, director of the Institute of Evolutionary Morphology of the Academy of Sciences of the USSR (now the A. N. Severtsov Institute of Evolutionary Morphology and Animal Ecology of the Academy of Sciences of the USSR). From 1948 to 1955 he was a senior research worker at the Zoological Institute of the Academy of Sciences of the USSR; from 1955 to 1963 he was head of the institute's embryology laboratory.

Shmal'gauzen's works (descriptive, experimental, and theoretical) dealt primarily with comparative anatomy and embryology; evolutionary morphology; the origin of land vertebrates; growth processes of organisms; phenogenetics; morphogenesis; factors, pathways, and patterns of evolution; and biocybernetics. In the period 1920–30 he formulated a universal law of growth based on quantitative analysis and devised a methodology for determining growth constants that proved to be of great practical value. At the same time, he studied the development of qualitative characters in ontogeny and demonstrated the overall complexity and genotypic dependence of their morphogenetic interrelations. Beginning in the 1930's, Shmal'gauzen devoted himself to general biological problems, which he unswervingly interpreted from the dialectical-materialist standpoint. He supplemented Darwin's materialist theory of evolution by showing the integral nature of the organism in its individual and historical development, by introducing the theory of stabilizing selection (*see* STABILIZING SELECTION), and by investigating the mechanisms of both the evolutionary process and individual development as self-regulating systems. He thus anticipated several concepts of cybernetics on the basis of which he advanced his theory of evolution (1950–60). Shmal'gauzen's research exerted and continues to exert considerable influence on the development of biology.

Shmal'gauzen was awarded the Order of the Red Banner of Labor, the E. Metchnikoff Gold Medal of the Academy of Sciences of the USSR, and the Darwin Medal of the Leopoldina German Academy of Naturalists.

SHMARINOV, DEMENTII ALEKSEEVICH. Born Apr. 29 (May 12), 1907, in Kazan. Soviet graphic artist. Member of the Academy of Arts of the USSR (1953). People's Artist of the USSR (1967).

Shmarinov studied at N. A. Prakhov's studio in Kiev from 1919 to 1922 and under D. N. Kardovskii in Moscow from 1923 to 1928. He was chairman of the administrative board of the Moscow organization of the Artists' Union of the RSFSR from 1959 to 1961, from 1966 to 1968, and in 1972. He became secretary of the administrative board of the Artists' Union of the USSR in 1968.

Shmarinov works chiefly as an illustrator. He gives realistically precise graphic interpretations of literary works and conveys dramatic situations and the psychosocial characteristics of his heroes in a highly convincing manner. His works include illustrations for Dostoevsky's *Crime and Punishment* (charcoal, black watercolor, 1935–36), A. N. Tolstoy's *Peter the Great* (charcoal, black watercolor, 1940–45), and L. N. Tolstoy's *War and Peace* (black watercolor, 1953–55), all of which are housed at the Tret'iakov Gallery in Moscow. He also illustrated Lermontov's *A Hero of Our Time* (1941, Tret'iakov Gallery; Russian Museum, Leningrad) and Pushkin's *The Captain's Daughter* (1974) and *The Queen of Spades* (1976), all in charcoal and black watercolor.

During the Great Patriotic War (1941–45), Shmarinov designed a number of political posters. He also executed a cycle of easel works entitled *We Won't Forget, We Won't Forgive!* (charcoal, black watercolor, 1942, Tret'iakov Gallery). This angry, impassioned series, which was awarded the State Prize of the USSR in 1943, vividly describes the suffering and courage of the Soviet people in their struggle against the enemy. Shmarinov has also produced a number of paintings.

Shmarinov has been awarded the Order of Lenin, two other orders, and several medals.

SHMELEV, IVAN SERGEEVICH. Born Sept. 21 (Oct. 3), 1873, in Moscow; died June 24, 1950, in Paris. Russian writer.

Shmelev was born into a merchant family. He graduated from the law faculty of Moscow University in 1898. His works first appeared in print in 1895. Shmelev's best prerevolutionary prose works showed a profound knowledge of city life and popular language; they employed the narrative technique of oral folktales. The novellas *Collapse* (1907), *Citizen Ukleikin* (1908), and *The Man From the Restaurant* (1911), which was the most significant of the three, were written in the traditional style of critical realism.

Shmelev emigrated in 1922 and later published anti-Soviet stories and books filled with nostalgia for the prerevolutionary past, for example, *The Lord's Summer* (1933).

SHMEL'KOV, PETR MIKHAILOVICH. Born June 12 (24), 1819, in Orenburg; died Oct. 9 (21), 1890, in Moscow. Russian graphic artist and watercolorist.

Shmel'kov, the son of serfs, studied at the Moscow School of Painting, Sculpture, and Architecture under V. S. Dobrovol'skii from about 1842 to 1847. He was influenced by P. A. Fedotov. Many of his works criticized contemporary society in a satirical and humorous vein. They include genre scenes, as well as various drawings and watercolors intended for journals. With an intensity bordering on the grotesque, Shmel'kov depicted everyday situations and social types, anticipating the works of V. G. Perov and the other Moscow artists of the 1860's. Shmel'kov's works are also noteworthy for their well-conceived and expressive design and subtle use of color.

Shmel'kov also depicted scenes from literature and history and produced several lithographs. His best works include the watercolors "At the Pawnshop" (1850's), "In a Restaurant," and "Merchant at the Photographer's" (the last two 1860's, Tret'iakov Gallery, Moscow) and the lithograph series "Sketches of Factory Life" (published 1861).

SHMIDT, ALEKSANDR ALEKSANDROVICH (also Alexander Schmidt). Born May 15 (27), 1831, on the island of Mukhu; died Apr. 10 (22), 1894, in the city of Iur'ev, now Tartu. Russian physiologist.

Shmidt graduated from the University of Dorpat in 1858 and began teaching there in 1862, becoming a professor of physiology in 1869. From 1876 to 1879 he served as dean of the university's medical faculty and from 1885 to 1890, as the university's rector. Shmidt's works dealt mainly with hematology, for example, respiratory functions of the blood and oxidative processes. Shmidt devoted considerable attention to blood coagulation and formulated the enzymatic theory of blood coagulation, investigating the function of leukocytes, cellular proteins, and other substances involved in the process. He isolated thrombin from blood serum.

SHMIDT, ALEKSANDR ALEKSANDROVICH (in Latvian, Aleksandrs Šmidts). Born Mar. 6 (18), 1892, in Zebrene District, in what is now Dobele Raion, Latvian SSR. Soviet biochemist. Academician of the Latvian Academy of Sciences (1946) and corresponding member of the Academy of Medical Sciences of the USSR (1960). Member of the CPSU from 1950.

Shmidt graduated from the Petrograd Military Medical Academy in 1922 and was an assistant there from 1925 to 1935. From 1936 to 1945 he was a professor and chairman of the biochemistry department of the Second Leningrad Medical Institute and, at the same time, served as director of the All-Union Scientific Research Vitamin Institute. From 1945 to 1950 he was a professor at the Latvian University, and from 1950 to 1972, at the Riga Medical Institute. From 1946 to 1952 he served as academician-secretary of the division of agricultural, biological, and medical sciences of the Academy of Sciences of the Latvian SSR. From 1952 to 1954 he was chief of the metabolism and nutrition section of the Institute of Experimental Medicine of the Academy of Sciences of the Latvian SSR. In 1972 he became head of a department in the Riga Medical Institute.

Shmidt has worked mainly on the biochemistry and technology of protein and vitamin concentrates, insulin, and various vitamins, including ascorbic acid, and on the biochemistry of parenteral feeding in humans.

Shmidt received the State Prize of the USSR in 1951. He has been awarded three Orders of Lenin, three other orders, and various medals.

SHMIDT, EVGENII VLADIMIROVICH. Born Dec. 7 (20), 1905, in St. Petersburg. Soviet neuropathologist. Academician of the Academy of Medical Sciences of the USSR (1963). Hero of Socialist Labor (1975).

Shmidt graduated from the medical faculty of Moscow University in 1929 and then worked in E. K. Sepp's clinic. He became deputy director of the Scientific Research Institute of Neurology of the Academy of Medical Sciences of the USSR in 1949 and the institute's director in 1967. His principal works deal primarily with vascular diseases of the nervous system (origin, mechanisms of development, diagnosis, and treatment of cerebrovascular disorders involving the major arteries of the head), neuro-oncology, and neurotraumatology. He founded a school of angioneurologists.

Shmidt is honorary chairman of the All-Union Society of Neuropathologists and Psychiatrists (from 1975). He is an honorary member of medical societies in Bulgaria, Poland, Czechoslovakia, the United States, and France. He received the State Prize of the USSR in 1971. He has been awarded two orders of Lenin, three other orders, and several medals.

SHMIDT, OTTO IUL'EVICH (also Schmidt). Born Sept. 18 (30), 1891, in Mogilev; died Sept. 7, 1956, in Moscow. Soviet mathematician, astronomer, geophysicist, and state and public figure. Academician of the Academy of Sciences of the USSR (1935; corresponding member, 1933) and academician of the Academy of Sciences of the Ukrainian SSR (1934). Hero of the Soviet Union (June 27, 1937). Member of the CPSU from 1918.

Shmidt graduated from the University of Kiev in 1913, where he became a privatdocent in 1916. After the October Revolution of 1917, he was a board member of several people's commissariats, including the People's Commissariat of Food (1918–20) and the People's Commissariat of Finance (1921–22). One of the organizers of higher education and science, he worked in the People's Commissariat of Education, on the State Scientific Council of the Council of People's Commissars, and in the Communist Academy. He was also one of the organizers of publishing; from 1921 to 1924 he was head of the State Publishing House, and from 1924 to 1941, editor in chief of the *Great Soviet Encyclopedia*. From 1923 to 1956, Shmidt was a professor at Moscow State University. During the same period, he was also director of the Arctic Institute (1930–32), head of the Main Northern Sea Route Administration (1932–39), and vice-president of the Academy of Sciences of the USSR (1939–42). In 1937, Shmidt helped found the Institute of Theoretical Geophysics of the Academy of Sciences of the USSR, of which he was director until 1949.

Shmidt's main works in mathematics deal with algebra; his monograph *Abstract Group Theory* (1916; 2nd ed., 1933) exerted a considerable influence on the development of group theory. Shmidt was the founder of the Moscow school of algebra, which he headed for many years.

In the mid-1940's, Shmidt proposed a new cosmogonic hypothesis about the formation of the earth and the planets of the solar system, the development of which he continued with a group of Soviet scientists until his death.

Shmidt was also one of the leading explorers of the Soviet arctic. In 1929–30 he headed expeditions aboard the icebreaker *Georgii Sedov*, which established the first scientific research station on Franz Josef Land, explored the northeastern part of the Kara Sea and the western coast of Severnaia Zemlia, and discovered a number of islands. In 1932 the expedition aboard the icebreaker *Sibiriakov*, headed by Shmidt, completed the first nonstop voyage from Arkhangel'sk to the Pacific Ocean. In 1933–34, Shmidt headed a sailing expedition aboard the *Cheliuskin* along the Northern Sea Route. In 1937 he led an air expedition to establish the drifting station Severnyi Polius-1, and in 1938 he supervised operations to remove station personnel from the iceberg.

Shmidt was a member of the Central Executive Committee of the USSR and a deputy to the first convocation of the Supreme Soviet of the USSR. He was awarded three Orders of Lenin, three other orders, and several medals. A number of natural features are named in honor of Shmidt, including an island in the Kara Sea and a cape on the coast of the Chukchi Sea, as well as a raion in the Chukchi Autonomous Okrug (Magadan Oblast) and the Institute of Earth Physics of the Academy of Sciences of the USSR.

SHMIDT, PETR IUL'EVICH. Born Dec. 23, 1872, in St. Petersburg; died Nov. 25, 1949, in Leningrad. Soviet zoologist.

Shmidt graduated from the University of St. Petersburg in 1895. Between 1906 and 1930 he was a professor at the Agricultural Institute in St. Petersburg (Leningrad). At the same time, he lectured on ichthyology at the university and worked in the Zoological Museum of the Academy of Sciences of the USSR (1914–31). Between 1930 and 1949 he was scientific secretary of the Pacific Ocean Committee of the Academy of Sciences of the USSR.

Shmidt began his ichthyological work, specifically the study of the ichthyofauna of the Pacific Ocean, in 1900. He participated in a number of major expeditions, during which he gathered a rich collection of fish. He was the first to outline the ichthyofauna of Russian territorial waters in the Far East and to propose a number of theories concerning its distribution and origin. He wrote the first major work on the marine mammals of southern Sakhalin and a number of surveys of many groups of fish found in the Pacific Ocean. He also published works on general biology, including *Anabiosis* (1948) and *Fish Migration* (1936). The *Small Biological Encyclopedia* (1924) was published under his guidance.

SHMIDT, PETR PETROVICH. Born Feb. 5 (17), 1867, in Odessa; died Mar. 6 (19), 1906. Russian revolutionary democrat. One of the leaders of the Sevastopol' mutiny of 1905.

Shmidt came from a family of naval officers. His father was a naval officer and a member of the *dvorianstvo* (nobility). Shmidt graduated from the Naval School in St. Petersburg in 1886 and served on the Baltic and in the Pacific. He entered the reserves in 1898 as a lieutenant and sailed on merchant marine vessels.

Recalled to active duty in 1904, Shmidt was named commander of the destroyer No. 253 of the Black Sea Fleet in January 1905. During the first stage of the Revolution of 1905–07, he organized in Sevastopol' the Union of Officer-friends of the People and then helped form the Odessa Mutual Aid Society for Merchant Seamen, one of the first labor organizations in maritime shipping.

On Oct. 20 (Nov. 2), 1905, Shmidt was arrested for speaking at meetings of sailors, workers, and soldiers, for taking part in a political demonstration, and "for an 'insolent' speech about defending, arms in hand, the liberties promised by the Manifesto of October 17" (V. I. Lenin, *Poln. sobr. soch.*, 5th ed., vol. 12, p. 111). The workers elected Shmidt a deputy for life in the Sevastopol' soviet of workers' deputies. They achieved his release from prison on November 3 (16), and he was granted retirement with the rank of captain second class on November 7 (20).

When the Sevastopol' mutiny began, the military organization of the Social Democrats proposed that Shmidt be the military leader of the uprising. Although Shmidt held no firm political views, the organization considered him a sincere revolutionary; he was knowledgeable in military affairs and was respected and liked by the sailors.

Shmidt went aboard the cruiser *Ochakov* on November 14 (27), and the red flag and the pennant of the fleet commander were raised. He was arrested on November 15 (28). After a trial that lasted from Feb. 7 to Feb. 18 (Feb. 20–Mar. 2), 1906, Shmidt was sentenced to death. He and the other leaders of the mutiny were shot on the island of Berezan'.

Shmidt was named an honorary member of the Sevastopol' soviet of working people's deputies in 1926. A museum named in his honor was opened in Ochakov in 1962, and a monument was erected on Berezan' in 1972.

G. V. SAMOLIS [29–1319–1]

SHMIDT, SIGURD OTTOVICH. Born Apr. 15, 1922, in Moscow. Soviet historian. Doctor of historical sciences (1965). Member of the CPSU since 1947. Son of O. Iu. Shmidt.

S. O. Shmidt graduated from the department of history at Moscow University in 1944. He became chairman of the Archaeographic Commission of the Academy of Sciences of the USSR in 1968. He joined the staff of the Moscow Institute for Historian-Archivists in 1949 and became a professor in 1970. Shmidt's principal works deal with historiography, archaeography, archive management, the sociopolitical history of Russian feudalism (particularly that of the 16th century), the history of culture, the study of historical sources, and methods of studying and teaching history.

SHMIDT, VASILII VLADIMIROVICH. Born Dec. 29, 1886, in St. Petersburg; died Aug. 21, 1940. Soviet party and state figure. Member of the Communist Party from 1905.

The son of a worker, Shmidt was a metalworker by trade. After taking part in the Revolution of 1905–07, he emigrated to Germany in 1907 and returned to St. Petersburg in 1911. Between 1912 and 1914 he was secretary of the Union of Metalworkers of Vyborg District, secretary of the St. Petersburg Union of Metalworkers, and a member of the St. Petersburg committee of the RSDLP. He did party work in Ekaterinoslav. Shmidt served as the secretary of the St. Petersburg committee of the RSDLP in 1915 and 1916 and was arrested several times.

After the February Revolution of 1917, Shmidt was the secretary of the St. Petersburg committee of the RSDLP(B) and of the Petrograd Council of Trade Unions. He was a delegate to the Seventh (April) All-Russian Conference and the Sixth Congress of the RSDLP(B). He became a member of the Presidium of the All-Russian Central Council of Trade Unions and people's commissar of labor in 1918 and held both positions until 1928.

Shmidt served as deputy chairman of the Council of People's Commissars of the USSR and of the Council of Labor and Defense from 1928 to 1930. For a brief period he supported the right-wing deviation in the ACP(B). He served as deputy people's commissar of agriculture of the USSR and chief arbitrator of the Council of People's Commissars of the USSR from 1930 to 1932. In 1933, Shmidt took an administrative position in the Far East.

Shmidt was a delegate to the Seventh through Sixteenth Party Congresses. He was elected a member of the Central Committee at the Seventh, Fourteenth, and Fifteenth Congresses and a candidate member at the Eighth, Tenth, Eleventh, Thirteenth, and Sixteenth Congresses. He was a candidate member of the Organizational Bureau of the Central Committee in 1921 and 1922 and from 1926 to 1930. Shmidt also served as a member of the Central Executive Committee of the USSR.

SHMIDT, CAPE, a cape in northeast Asia, on the coast of the Chukchi Sea, at 68°56′N lat and 179°30′W long. In 1932 a polar station was established on the cape, which was named for O. Iu. Shmidt. [29–1321–3]

SHMIDT HYPOTHESIS (Schmidt hypothesis), in astronomy, a cosmogonic hypothesis the main part of which is the assumption that the planets were formed through the accretion of cold solid bodies of different sizes revolving around the sun. The hypothesis was proposed in 1943 by O. Iu. Shmidt (Schmidt) on the basis of a critical study of the history of planetary cosmogony and an analysis of the regularities underlying planetary motions.

Shmidt was the first to explain the causes of the direct axial rotation of planets (that is, rotation in the same direction as the revolution around the sun) and to pave the way for an explanation of the regularity underlying the distances of the planets from the sun. The assumption that the earth and related planets were formed through the accumulation of solid bodies leads to the conclusion that they originally were in a relatively cold state. This conclusion necessitated a reexamination of many concepts of the geophysical, geological, and geochemical history of the earth. Many aspects of the process of the accumulation and further development of the planets have been studied by Shmidt's colleagues and proponents on the basis of his hypothesis.

To explain the distribution of angular momentum between the sun and planets, Shmidt advanced the hypothesis that the swarm of bodies from which the planets accumulated was captured by the sun from interstellar space. However, after the 1950 studies of L. E. Gurevich and A. I. Lebedinskii, who showed that the bodies from which the planets accumulated must have been formed in the vicinity of the sun, the idea of the capture of a cluster was replaced by the hypothesis that the sun trapped part of the gas-dust matter of an interstellar nebula.

The part of the Shmidt hypothesis that pertains to the accumulation of planets from cold solid bodies, which has won broad recognition, is often called Shmidt's theory; in this case, the term "Shmidt hypothesis" is reserved for the assumption that the sun captured matter to construct the planets, an assumption that has yet to be proved and that is rejected by many investigators.

B. IU. LEVIN [29–1320–3]

SHMIDT ISLAND, the northwesternmost island in the Severnaia Zemlia archipelago, in the Kara Sea. Part of Krasnoiarsk Krai, RSFSR, Shmidt Island has an area of 430 sq km and rises to an elevation of 325 m. It is almost entirely covered by glacial ice, with outcrops of rock only at the shore. The island was discovered in 1930 by an expedition led by O. Iu. Shmidt aboard the steamship *Georgii Sedov*. [29–1321–4]

SHMIDT PENINSULA, the northern tip of the island of Sakhalin. Joined to the island by the narrow Okha Isthmus, Shmidt Peninsula is approximately 50 km long. Its principal mountain ranges, the Eastern (Vostochnyi) and Western (Zapadnyi) ranges, have elevations that reach a maximum of 623 m at the Tri Brata Massif. Larch and spruce forests predominate on the peninsula, which was named for the Russian geologist F. B. Shmidt. [29–1322–1]

SHMIDT SUBGLACIAL BASIN, a vast subglacial depression in East Antarctica, located south of 70° S lat., between the Gamburtsev and Golitsyn mountains on the west and the Eastern Plain on the east. Most of the Shmidt Subglacial Basin is below sea level, hidden beneath a thick ice sheet, which is more than 3,000 m thick almost everywhere except the central part, where it exceeds 4,000 m. The basin was discovered by the Soviet antarctic expedition of 1957–59 by means of seismic sounding. Its position and elevations were determined more precisely in 1962, during the Australian expedition's journey from Wilkes Station to Vostok Station. The basin was named in honor of the Russian scientist O. Iu. Shmidt (Schmidt). [29–1321–1]

SHMIT, NIKOLAI PAVLOVICH. Born Dec. 10 (22), 1883, in Moscow; died there Feb. 13 (26), 1907. Participant in the Revolution of 1905–07. Bolshevik and a member of the RSDLP.

The son of the owner of a furniture factory in Presnia, Shmit studied at Moscow University. On May 1, 1905, having assumed ownership of the factory, Shmit reduced the working day from 11½ hours to nine, raised wages, and opened an outpatient clinic and a special general-education school on the premises. In 1905 he gave 20,000 rubles to the Moscow committee of the RSDLP for the purpose of arming the workers. He willed his estate to the Bolshevik Party.

Shmit was arrested on Dec. 17, 1905. His factory was destroyed that month during the suppression of the armed uprising. Shmit was killed in his solitary-confinement cell at Butyrka Prison in the early morning hours of Feb. 13, 1907. His funeral developed into a political demonstration.

SHMUK, ALEKSANDR ALEKSANDROVICH. Born Oct. 28 (Nov. 9), 1886, in Moscow; died there Jan. 22, 1945. Soviet biochemist. Academician of the V. I. Lenin All-Union Academy of Agricultural Sciences (1935).

Shmuk graduated from the Moscow Agricultural Institute (now the K. A. Timiriazev Moscow Agricultural Academy) in 1913. From 1923 to 1937 he worked at the All-Union Institute of Tobacco and Makhorka in Krasnodar, serving as the institute's director from 1924 to 1928. At the same time, he was a professor at the Kuban' Agricultural Institute. In 1937 he became head of a laboratory of the Institute of Genetics of the Academy of Sciences of the USSR. From 1939 to 1945 he was head of a laboratory of the Institute of Biochemistry of the Academy of Sciences of the USSR.

Shmuk's main work dealt with the chemical composition of tobacco, soil chemistry, and various methods of agricultural chemical investigations. Shmuk devised ways of obtaining nicotine and citric and malic acids from raw makhorka (Indian tobacco).

Shmuk received the State Prize of the USSR in 1942. He was awarded the Order of the Red Banner of Labor.

SHMYGA, TAT'IANA IVANOVNA. Born Dec. 31, 1928, in Moscow. Soviet Russian operetta performer. People's Artist of the USSR (1978).

In 1953, Shmyga graduated from the A. V. Lunacharskii State Institute of Theatrical Arts, where she studied voice under D. B. Beliavskaia and acting under I. M. Tumanov. She became a soloist at the Moscow Operetta Theater the same year. Shmyga masterfully combines the skills of a singer, actress, and dancer. Her roles include Violette and Ninon in Kálmán's *The Violet of Montmartre*, Chanita and Gloria Rosetti in Miliutin's *Chanita's Kiss* and *The Circus Show Is Up*, Tonia in Dunaevskii's *White Acacia*, Eliza Doolittle in Loewe's *My Fair Lady*, Verochka in Eshpai's *There's Nobody Happier Than I*, and Liubov' Iarovaia in V. Il'in's *Comrade Liubov'*.

Shmyga has toured abroad. A recipient of the M. I. Glinka State Prize of the RSFSR in 1974, she has been awarded the Order of the Badge of Honor and several medals.

SHMYREV, MINAI FILIPPOVICH. Born Dec. 11 (23), 1891, in the village of Punishcha, Velizh District, Vitebsk Province; died Sept. 3, 1964, in Vitebsk. One of the organizers of the partisan movement in Byelorussia during the Great Patriotic War of 1941–45. Hero of the Soviet Union (Aug. 15, 1944). Member of the CPSU from 1920.

The son of a peasant, Shmyrev was drafted into the army in 1913; he fought in World War I. After joining the Red Army in 1918, he fought against the White Guard troops of generals Krasnov and Iudenich during the Civil War of 1918–20. From 1921 to 1923 he was commander of a detachment charged with controlling banditry in the Vitebsk region.

In 1923, Shmyrev became the head of the agrarian department of a *volost* (small rural district) in Vitebsk Oblast. He remained in the oblast and later worked as chairman of a kolkhoz, director of a paperboard factory, and director of a plant for the initial processing of flax.

Shmyrev organized a partisan detachment of factory workers in 1941. In the following year he commanded the 1st Byelorussian Partisan Brigade in Vitebsk Oblast from April through October and became a member of the Central Staff of the Partisan Movement.

After the war, Shmyrev engaged in soviet work in Vitebsk. He was awarded the Order of Lenin, the Order of the Red Banner, the Order of the Patriotic War First Class, and various medals. A museum devoted to Shmyrev has been opened in Vitebsk. [29–1325–4]

SHNEIDEROV, VLADIMIR ADOL'FOVICH. Born July 15 (28), 1900, in Moscow; died there Jan. 4, 1973. Soviet motion-picture director. People's Artist of the RSFSR (1969). Member of the CPSU from 1926.

Shneiderov began working in the cinema in 1924. He was one of the first Soviet motion-picture directors to make adventure and travelogue films. He took part in a number of expeditions, which he used as the themes of popular science films. These works include *The Great Flight* (1925), which is about the international group flight of six Soviet airplanes from Moscow to Peking; *At the Foothills of Death* (1928), a film about unexplored areas of the Pamirs; and *Two Oceans* (1933), which records a voyage on the icebreaker *Sibiriakov*. Shneiderov also directed the feature films *Dzhul'bars* (1936) and *Gorge of the Alamas* (1937).

In 1963, Shneiderov became artistic director of a professional association for the shooting of travelogues at the Tsentrnauchfil'm Studio. He organized and headed the television series "Travelogue Club" from 1960 to 1973.

Shneiderov was awarded the Order of Lenin. [29–1326–2]

SHNIREL'MAN, LEV GENRIKHOVICH. Born Jan. 2 (15), 1905, in Gomel'; died Sept. 24, 1938, in Moscow. Soviet mathematician. Corresponding member of the Academy of Sciences of the USSR (1933).

Shnirel'man graduated from Moscow University in 1925. From 1934 to 1938 he was a staff member of the Steklov Institute of Mathematics of the Academy of Sciences of the USSR. In a series of papers coauthored by L. A. Liusternik, Shnirel'man developed topological methods of the calculus of variations and, in particular, solved the problem of three geodesics. In number theory he proposed general metric methods and introduced the concept of density of sequence for the natural numbers. Shnirel'man was consequently able to prove that any number can be represented as the sum of a limited number of primes.

SHNUROVAIA KNIGA, in the USSR, a document kept in each brigade of a kolkhoz and each division of a sovkhoz containing the field crop-rotation history. Information on the area of all land assigned to the division or brigade, classification and identification of the land by particular areas, the structure of crop lands, description of the soils, and the chief elements of the system of soil tillage and fertilization are entered in the Shnurovaia Kniga. Entries are certified by the signature of the person responsible for jobs in the particular field and by an agronomist. The Shnurovaia Kniga and the official field crop rotation record make it possible to monitor the use by kolkhozes and sovkhozes of advanced methods of soil tillage and raising agriculture crops. [29–1329–2]

SHOCK, a sudden life-threatening condition resulting from severe injury and characterized by progressive impairment of all the physiological systems of the body. The main characteristic of shock is the failure of capillary circulation in the tissues owing to impairment of cardiac output and arterial and venous tonus, capillary dysfunction, and changes in the rheological properties of blood. Shock can be brought on by an injury, burns, surgery (traumatic shock, burn shock, surgical shock), incompatible blood transfusion (hemolytic shock), anaphylaxis (anaphylactic shock), functional cardiac disorders (cardiogenic shock), ischemia of tissues and organs, and excessive loss of blood. The condition was described in detail by the French surgeon H. F. Ledran (1737) and by the Russian physician N. I. Pirogov (1870), who described the symptoms of the erectile phase (brief transient excitement) and torpid phase (subsequent sharp functional inhibition) of shock. The clinical manifestations of shock vary considerably. Progressively increasing extreme weakness and a progressive drop in blood pressure are the most characteristic.

Many aspects of the mechanisms underlying the development of shock still remain unclear. From the neuroreflex viewpoint, the various dysfunctions are due to numerous pain impulses that produce sharp excitation and subsequent inhibition of the nervous system, including the vital centers of the medulla oblongata. From the hemodynamic viewpoint, the decrease in the volume of circulating blood, which leads to peripheral circulatory insufficiency, is the principal factor. From the toxemic viewpoint, shock is caused by the entry into the blood of biologically active substances of tissue origin that interfere with the local and systemic blood flow. It is reasonable to assume that each of these factors plays a part: the primary abrupt activation of the central nervous system by extreme nerve impulses (or toxic substances) increases the amount of catecholamines released into the blood, causing a redistribution of the volume of circulating blood—spasms of the blood vessels of the skin, muscles, kidneys, and abdominal cavity accompanied by the increased flow of blood through arteriovenous anastomoses with maintenance of the circulation in the heart and brain (centralization of the circulation). This period of shock is clinically manifested by pallor and clamminess of the skin, contraction of the pupils, cold perspiration on the face, decreased urine flow, and moderately rapid breathing. The blood pressure is normal or slightly lowered.

"Centralization" of the circulation under conditions of extremely severe and prolonged injury becomes the principal mechanism of circulatory failure and further aggravation of the patient's condition. The decreased flow of blood to the tissues leads to the accumulation of the products of anaerobic metabolism, biogenic amines, kinins, and other substances. Upon entering the bloodstream, these products, along with other humoral factors, such as increased concentration of some hormones and reduced partial pressure of oxygen, further disrupt the regulatory functions of the nervous system.

The chief factors in the pathogenesis of shock in its late stages are hypoxia, decreased vascular tonus, dysfunction of the tissue microcirculation, and gross derangement of cell metabolism, which results in injury to the cell membranes. The transfer of intravascular fluid to the tissues causes a decrease in the volume of circulating blood. This stage is marked by cyanosis, rapid pulse, lowered blood pressure, and dilatation and slow reaction of the pupils.

The subsequent stage of shock is complicated by congestion in small blood vessels, intravascular agglutination of the erythrocytes, decreased blood flow to the heart, acute cardiac insufficiency, and functional impairment of the vital organs. This stage is clinically manifested by gray cyanosis, thready pulse, abrupt drop in blood pressure, rapid, shallow breathing, dilatation of the pupils, and unconsciousness.

In cases of shock, emergency therapeutic measures are undertaken, chosen according to the cause of the shock, stage of its development, and severity of the patient's condition. Other measures include the administration of pain relievers, keeping the patient warm, the transfusion of blood and blood substitutes, the administration of oxygen, and the injection of hormones, vitamins, and cardiovascular and other agents.

The term "shock" is also applied to persons in an unusual mental state or persons with severe emotional disturbances (mental, or emotional, shock).

SHOCKLEY, WILLIAM BRADFORD. Born Feb. 13, 1910, in London. American physicist.

Shockley graduated from the California Institute of Technology in 1932 and later continued his studies at the Massachusetts Institute of Technology. From 1936 to 1942 and from 1946 to 1954 he worked at the Bell Telephone Laboratories. From 1942 to 1945 he worked in the Department of War. From 1955 to 1958 he was director of the Shockley Semiconductor Laboratory. From 1958 to 1960 he was president of the Shockley Transistor Corporation, and from 1960 to 1963, director of the Shockley Transistor unit of the Clevite Corporation. Beginning in 1958, Shockley taught at Stanford University, where he was a professor from 1963 to 1975.

Shockley's main research has dealt with solid-state physics, including semiconductor physics, ferromagnetism, the plasticity of metals, and the theory of dislocations. In 1948, Shockley discovered the transistor effect, for which he received a Nobel Prize in 1956 (with J. Bardeen and W. Brattain).

SHOGENTSUKOV, ADAM OGURLIEVICH. Born Aug. 31 (Sept. 13), 1916, in the village of Kuchmazukino, in what is now

Baksan Raion, Kabarda-Balkar ASSR. Soviet Kabardin writer. People's Poet of the Kabarda-Balkar ASSR (1969). Member of the CPSU since 1944.

Shogentsukov graduated from the Kabarda-Balkar Pedagogical Institute in 1940. He worked as a schoolteacher and an instructor at a higher educational institution. He served in the Great Patriotic War (1941–45). Shogentsukov's first published works appeared in 1938. His poetry affirms friendship among peoples and reflects the history of the Kabardin people and their struggle for freedom. Focusing on man's complex inner world, Shogentsukov wrote the first Kabardin sonnets. He is the author of the verse collections *We Are Flourishing* (1940), *Songs of the Heart* (1951), *The Restless Heart* (1958), and *Roads of Friendship* (1961). His novella *The Spring of Sofiat* (1956; Russian translation, 1956), which deals with the life of a mountain girl in the Soviet period, has received wide recognition and has been translated into many languages. Shogentsukov has also written the plays *Madina* (staged 1961) and *The Sweethearts* (staged 1966).

Shogentsukov has been chairman of the administrative board of the Writers' Union of the Kabarda-Balkar ASSR from 1951 to 1954, from 1956 to 1958, and from 1970. He has been awarded four orders as well as medals.

SHOGENTSUKOV, ALI ASKHADOVICH. Born Oct. 28, 1900, in the village of Kuchmazukino, in what is now Baksan Raion, Kabarda-Balkar ASSR; died Nov. 29, 1941, in Bobruisk. Soviet Kabardin poet. Honored Art Worker of the Kabarda-Balkar ASSR (1939). Member of the CPSU from 1940.

Shogentsukov attended a teachers college in Istanbul from 1917 to 1919. He then returned to his homeland and took part in the construction of a Soviet society, devoting many years to teaching. He served in the Great Patriotic War (1941–45) and perished in a fascist concentration camp.

Shogentsukov's first published works appeared in 1917. His literary legacy, which includes the first examples of Soviet Kabardin poetry, is a fictional chronicle of the life of the Kabardin people in the prerevolutionary era and under Soviet power. Outstanding are the narrative poem *Madina* (1933), the heroic narrative poem *Past Days of Tembot* (1935), and the novel in verse *Kambot and Liatsa* (1938). Shogentsukov developed traditional poetic forms and provided models of profoundly ideological, realistic poetry. His short stories "A Pood of Flour" and "Under the Old Pear Tree" marked the beginning of Soviet Kabardin prose.

Shogentsukov translated into Kabardin works by A. S. Pushkin, M. Iu. Lermontov, T. G. Shevchenko, M. Gorky, and K. Khetagurov. Works by Shogentsukov have been translated into many languages of the peoples of the USSR.

SHOKAL'SKII, IULII MIKHAILOVICH. Born Oct. 5 (17), 1856, in St. Petersburg; died Mar. 26, 1940, in Leningrad. Soviet oceanographer, geographer, and cartographer. Honorary member of the Academy of Sciences of the USSR (1939; corresponding member, 1923).

After graduating from the Marine Academy, Shokal'skii worked at the Main Geophysical Observatory and Main Hydrographic Administration. From 1910 to 1930 he was a professor at the Naval Academy; beginning in 1925, he was also a professor at Leningrad State University. He served as president of the Geographic Society of the USSR from 1917 to 1931.

Shokal'skii's principal works dealt with meteorology, hydrology, and oceanography. From 1923 to 1927, Shokal'skii led an oceanographic expedition in the Black Sea and studied the Northern Sea Route and ways of developing the route. He headed projects summarizing hypsometric materials and compiled a relief map of Russia. With A. A. Tillo, he developed a cartometric technique and applied it to calculating the surface of the Asiatic part of Russia and the lengths of the most important rivers. Shokal'skii was the compiler and editor of a series of general geographic maps and atlases. Twelve geographic features, including a strait between islands of Severnaia Zemlia, an island at the entrance to Ob' Bay, and an island in the Kara Strait, have been named after Shokal'skii.

SHOKAL'SKII ISLAND (until 1926, Agnessa), an island in the Kara Sea, situated at the entrance to Ob' Bay, Tiumen' Oblast, RSFSR. Shokal'skii Island measures approximately 30 km in length and 20 km in width. It has a flat surface with elevations to 27 m. There is tundra vegetation. The island was named in honor of Iu. M. Shokal'skii. [29–1336–1]

SHOKAL'SKII STRAIT, a strait in the Severnaia Zemlia Archipelago, situated between the islands of Bol'shevik and Oktiabr'skaia Revoliutsiia and connecting the Kara and Laptev seas. The Shokal'skii Strait measures 110 km in length. It ranges from 20 to 50 km in depth and has prevailing depths of 200–250 m. The shores are steep and covered with glaciers, from which icebergs break off. The strait is covered with ice for most of the year. It was named in honor of Iu. M. Shokal'skii. [29–1336–2]

SHOKIN, ALEKSANDR IVANOVICH. Born Oct. 15 (28), 1909, in Moscow. Soviet state and party figure. Twice Hero of Socialist Labor (1975, 1979). Member of the CPSU since 1936.

The son of a worker, Shokin graduated from the N. E. Bauman Moscow Higher Technical School in 1934. Between 1932 and 1938 he worked in the shipbuilding industry as a foreman, shop chief, head engineer, and head of a design project office. Between 1938 and 1943 he was chief engineer in the central boards of the People's Commissariat of the Defense Industry and the People's Commissariat of the Shipbuilding Industry.

Shokin was deputy minister of the communications equipment industry of the USSR from 1949 to 1953. He served as deputy minister of the radio engineering industry of the USSR in 1954 and 1955 and as first deputy minister from 1955 to 1957. From 1958 to 1961 he was first deputy chairman of the State Committee for Radio Electronics of the Council of Ministers of the USSR. He held the ministerial post of chairman of the State Committee for Electronic Technology of the Council of Ministers of the USSR from 1961 to 1963, and in 1963 he assumed the ministerial post of chairman of the State Committee for Electronic Technology of the USSR. In 1965 he was named minister of the electronics industry of the USSR.

Shokin became a candidate member of the Central Committee of the CPSU in 1961 and a member in 1966. He was a deputy to the sixth through tenth convocations of the Supreme Soviet of the USSR. Shokin received the State Prize of the USSR in 1952 and 1953, and he has been awarded six Orders of Lenin, three other orders, and various medals. [29–1336–3]

SHOLAPUR, a city in India, in Madhya Pradesh, in the western part of the Deccan Plateau. Population, 398,000 (1971). Sholapur is a trade and transportation center. Industry includes the production of cotton cloth and vegetable oil, and cottage industries produce articles made of leather, metal, glass, and cloth. [29–1337–4]

SHOLOKHOV, MIKHAIL ALEKSANDROVICH. Born May 11 (24), 1905, in the *khutor* (farmstead) of Kruzhilin of the *stanitsa* (large cossack village) of Veshenskaia, Oblast of the Don Host (now Veshenskii Raion, Rostov Oblast). Soviet Russian writer. Academician of the Academy of Sciences of the USSR (1939). Hero of Socialist Labor (1967). Member of the CPSU from 1932. Member of the Central Committee of the CPSU from 1961.

Sholokhov, who was of peasant birth, fought in the Civil War. His early short stories, first published in newspapers and magazines in 1923, were later collected in *Tales of the Don* and *The Azure Steppe*, both published in 1926. Sholokhov's stories represented a notable contribution to the Soviet literature of the first half of the 1920's; their themes were the Civil War in the Don region, the bitter class struggle, the place of the individual in the great social changes taking place in the villages and rural areas, and the author's dream of a new world of social justice.

In 1925, Sholokhov began writing *The Quiet Don* (books 1–4, 1928–40; State Prize of the USSR, 1941), the novel that brought him world renown. The idea of history's lawlike regularity underlies the novel's intricate structure and plot. Sholokhov depicts the grandeur of the struggle between two worlds—the breakup of established social relations, traditions, and customs and the emergence and establishment of new ones. The novel deals with very important social issues, such as the relationship between the individual and the people's historic destiny, the question of historical necessity and freedom of choice, and the historical circumstances that give rise to tragic conflicts and dramatic outcomes. In *The Quiet Don*, Sholokhov creatively develops the traditions of epic narration of "people's destinies," portraying the broad-scale movement of the masses as part of the historical process. The people are the novel's hero.

Sholokhov's poetic world is the world of high tragedy, with strong and clear-cut characters acting at critical moments in history. The story of the life of Grigorii Melekhov is not merely part of the dramatic history of the Don Cossacks; it also reflects historical processes of enormous social and psychological importance. The figure of Grigorii Melekhov was an innovation in world literature. His personality is revealed through full exposition of his feelings in a variety of circumstances. The wide range of Sholokhov's psychological analysis is a typical aspect of his artistic skill.

Sholokhov's evaluative ability is an important attribute of his skill at psychological analysis. The people's revolutionary struggle, taken as the objective criterion of evaluation, makes it possible to separate Melekhov's historically justified delusions from his guilt. At history's sudden turning points, Grigorii is constantly faced with the need to choose. The social tragedy is carried over into the depths of consciousness; its sources lie in the hero himself—in his social ambivalence and contradictions. Grigorii has rejected the old world, but he neither understands nor trusts the truth of the new reality confirmed in blood, struggle, and suffering, and he is ultimately left behind at the crossroads of history.

The truly great artist is the one who can see reality in all its complexity and conditionality and perceive the stern objective laws by which it is governed. The technique used by Sholokhov in depicting the character and fate of Grigorii Melekhov played a significant part in the development of the method of socialist realism. The revolutionary masses so powerfully portrayed in *The Quiet Don* affirm the optimistic idea of the triumph of life—the victory of the new through trials and suffering—and convey the grandeur of the changes taking place. The heroic spirit that pervades the novel arises from its historical optimism; it arises from the affirmation of the majesty of life and the greatness of the deed.

Virgin Soil Upturned (books 1–2, 1932–60; Lenin Prize 1960) is an epic novel about the year 1930 and the revolutionary changes in village life. The first part of the novel (book 1) is basically constructed as a "case history"; the story of a kolkhoz in Gremiachii, it is a novel with many heroes. One of Sholokhov's aesthetic principles is to rely as much as possible on actual historical situations. This first part of *Virgin Soil Upturned* resounds with the full force of the emotions attendant upon the transformation of society, the abolishment of old forms of ownership, and the difficult birth of new social relations. The novel's heroes, aware that their life's purpose is to serve the great cause of the people, are the agents of and participants in the novel's historical events; the author's well-defined and intensely individualized characterization of three Communists—Davydov, assigned by the party to carry out the collectivization of the countryside, Razmetnov, and Nagul'nov—helps reveal the meaning of these great events.

The second part of the novel (book 2) captivates the reader with its lyrical "poetry of feelings"; the author's voice is now more markedly poetic. Hence the unique manner in which the plot is developed—the external slowness of the action, the many stories told by the heroes about themselves, the protracted conversations, and the more intense focus on relations in which intimate feelings are revealed. One of the most highly valued aspects of Sholokhov's talent is his ability to see and to vividly reproduce both the tragic and the humorous in life. The character of Grandfather Shchukar', for example, is marvelously conceived. The novel abounds with meditations on what constitutes genuine humaneness, on the paths of progress, and on historical necessity.

During the Great Patriotic War, Sholokhov's essays were published in various periodicals and in such collections as *On the Don*, *In the South*, and *The Cossacks*. His short story "The Sciences of Hatred" (1942) was widely read. Chapters from his novel *They Fought for Their Fatherland* were first printed in *Pravda* and *Krasnaia Zvezda* in 1943–44. Sholokhov's goal in this novel (which appeared in a later version in 1969) was to record the people's heroic wartime feats.

The short story "Fate of a Man" (1956–57) was a notable event in socialist art. The tragic story of Andrei Sokolov is shown to be conditioned by and related to the historic trials that the war inflicted on the people, the state, and the individual. This enables the author to present man and war in large-scale and generalized terms, to place them in historical perspective, and to show the incompatibility of the socialist and fascist worlds. The underlying theme of the story is faith in goodness, humanity, and social progress—the affirmation of life and of the great deed.

Sholokhov is one of the great masters of the literature of socialist realism. His novels were the first in the history of world literature to show the working people in all their wealth of types and characters; his protagonists are so fully portrayed in social, moral, and emotional terms that they have joined the ranks of the lasting figures of world literature.

In his novels, Sholokhov combined the poetic heritage of the Russian people with the advances of the realistic novel of the 19th and 20th centuries; he discovered previously unknown links between the spiritual and the material and new connections between man and the world around him. Sholokhov's epic body of work represents man, society, and nature as manifestations of the eternally creative stream of life; it is their unity and interdependence that give Sholokhov's world its uniquely poetic character. His works have been translated into most of the languages of the peoples of the USSR and of the world.

Sholokhov was a deputy to the first through ninth convocations of the Supreme Soviet of the USSR. He has been a member of the board of directors of the Writers' Union of the USSR since 1934 and has been a member of the World Peace Council. He is honorary doctor of philological sciences of the University of Rostov-on-Don and the University of Leipzig and honorary doctor of law of the University of St. Andrews. He was awarded four Orders of Lenin and two other orders, as well as various medals and a foreign order. He won the Nobel Prize for literature in 1965.

SHOLOKHOV-SINIAVSKII, GEORGII FILIPPOVICH (real surname, Sholokhov). Born Oct 29 (Nov. 11), 1901, on the farmstead of Siniavskii, in what is now Neklinovka Raion, Rostov Oblast; died May 1, 1967, in Moscow. Soviet Russian writer. Member of the CPSU from 1938.

Sholokhov-Siniavskii was born into a peasant family. His first published work was the novella *Crime* (1928). His novels *A Bad Fishing Season* (parts 1–3, 1932–37) and *Distant Lights* (books 1–2, 1939–41) and the novella *The Kudimov Family* (1941) tell of the prerevolutionary life of fishermen and railroad workers and their participation in the revolution. The short-story collection *Zmei-Gorynych* (1944) and the novel *The Volgins* (books 1–3, 1947–51) deal with the heroism of the Soviet people during the Great Patriotic War (1941–45). The novel *The Restless Age* (1959) considers the problems that young people face in determining their path in life. Sholokhov-Siniavskii's last work was the autobiographical trilogy *Bitter Honey* (1961–64).

Sholokhov-Siniavskii was awarded the Order of the Red Banner of Labor and several medals.

SHOLOKHOVSKII, an urban-type settlement in Rostov Oblast, RSFSR, under the jurisdiction of the Belaia Kalitva city soviet. Sholokhovskii is situated on the Likhovskoi-Volgograd highway, 8 km from the Grachi railroad station. Coal is mined in the area, and the settlement has an ore-enrichment plant. [29–1343–2]

SHOMAKHOV, AMIRKHAN KAMIZOVICH. Born Sept. 27 (Oct. 10), 1910, in the village of Nizhnii Kurp, in what is now Terek Raion. Soviet Kabardin writer. People's Poet of the Kabarda-Balkar ASSR (1977). Member of the CPSU from 1938.

Shomakhov graduated from the Northern Caucasus Pedagogical Institute in 1933 and from the Higher Party School of the Central Committee of the CPSU in 1955. His works first appeared in print in 1930. Shomakhov is the author of the novella *Kolkhoz Under Fire* (1958), about the events of the war years. His novel *Dawn Over the Terek* (1968; Russian translation, 1972) is about the Civil War and the first years of Soviet power in the republic. The novel *Horsemen on the Peaks* (1970) is about the formation of the working class in Kabarda-Balkaria.

Shomakhov, whose works have been translated into many of the languages of the peoples of the USSR, has been awarded two orders and several medals.

SHOMUTEPE, the remains of an early farming settlement dating from the fifth millennium B.C., in Kazakh Raion, Azerbaijan SSR. Shomutepe was excavated between 1960 and 1963 by I. G. Narimanov. The site covers an area of about 1 hectare. The thickness of the cultural level varies from 1 to 2.5 m. Shomutepe was densely built up with round dwellings (with hearths) and farm buildings made of mud brick. Among the finds were hoes made of antler, querns, stone pestles and grain mortars, flint and obsidian sickle blades, an intact sickle with a wooden base, and the remains of various species of wheat and barley; also found were the bones of domestic animals, such as bulls, swine, sheep, and goats, and the bones of wild animals, such as boar and deer. In addition, various bone objects were found, including awls, perforators, spoons, and female figurines, as well as roughly modeled pottery of simple shapes. Some of the pots were decorated with rounded affixed designs and with incised designs. Shomutepe, along with similar remains in western Azerbaijan and the neighboring regions of Georgia, is characteristic of the most ancient settled farming culture of Transcaucasia.

SHONA, a group of closely related languages, the most important of which are Karanga and Zezuru, of the south-central Bantu languages. According to a 1970 estimate, the Shona languages are spoken in Southern Rhodesia (Zimbabwe) and Mozambique by 1.5 million people.

The Shona languages have five vowels. Consonants include a voiced bilabial implosive and a voiced dental implosive; nasalization, aspiration, and voicing of consonants occur at morpheme boundaries. Nouns are divided into 21 classes that form a system of concordances; in addition to augmentative, diminutive, and locative classes, the Shona languages have two special classes comprising proper names, kinship terms, and the names of totemic animals. The classes are marked by prepositive monosyllables. Verbs are conjugated by means of affixes. There are many ideophones. In the Shona languages, word order is fixed in the pattern subject-predicate-object. Attributes are postpositional; that is, they follow the modified word.

SHOPTYKOL', an urban-type settlement in Baianaul Raion, Pavlodar Oblast, Kazakh SSR. Shoptykol' is situated on the northern margin of the Kazakh Melkosopochnik, 70 km southeast of the Ekibastuz I railroad station on the Tselinograd-Pavlodar line. Coal is mined near the settlement. [29–1352–2]

SHOR, ROZALIIA OSIPOVNA. Born June 11 (23), 1894, in Kaunas; died Mar. 18, 1939, in Moscow. Soviet linguist and literary historian.

Shor graduated from the Second Moscow State University (formerly the Advanced Courses for Women) in 1919. She was a professor at the N. G. Chernyshevskii Institute of Philosophy, Literature, and History from 1934 to 1939. Her principal works dealt with Germanic and Old Indic linguistics, general linguistics, and the history of linguistics. Shor founded the series *Iazykovedy Zapada* (Linguists of the West; 1933–38) and wrote on the history of Western European literature, notably in *Heinrich Heine* (1931, with F. Shiller and A. Lavretskii) and *Dickens* (1931, with A. Lunacharskii). Shor translated works of Old Indic literature, including *Pancatantra: Selected Stories* (1930) and *Twenty-five Tales of the Vetala* (1939).

SHOR, the language of the Shortzy. According to the 1970 census, Shor is spoken by more than 12,000 people in Kemerovo Oblast of the RSFSR, primarily in the northern foothills of the Altai, in the Kuznetskii Alatau, along the Tom' River and its tributaries, and in the border region between the Khakass and Gorno-Altai autonomous oblasts. Shor, which belongs to the Khakass subgroup of the northeastern group of Turkic languages, has two dialects: the Mras, or *z*-dialect, which formed the basis of the literary language used in the 1920's and 1930's, and the Kondoma *y*-dialect, which in turn embraces several subdialects.

In Shor, vowels are distinguished as long or short, as in *ool* ("son") and *ol* ("he," "that one"). Stops and fricatives are unvoiced in initial and final position and voiced or semivoiced in intervocalic position, as in *kap* ("bag") and *kabí* ("his bag"). In the declension system there is an instrumental case with the affixes *-ba/-be*, *-pa/-pe*, and *-ma/-me*, as in *maltabá* ("by means of an axe"). The system of tenses includes a potential future tense with the affix *-kadíg*, a past tense indicating an incompleted action with the affix *-kalak*, and a normal past tense with the affixes *-chang/-cheng*. Adverbial participles have the affixes *-ala/-ele*, as in *turala* ("as soon as he got up").

A writing system based on the Cyrillic alphabet was introduced in 1927; a Latin alphabet was used from 1929 to 1938 when a new Cyrillic alphabet was created. There once existed an alphabet that was devised for a Shor primer published by missionaries in 1885.

SHORAPANI, an urban-type settlement in Zestafoni Raion, Georgian SSR. Shorapani is situated on the Kutaisi-Tbilisi highway. It has a railroad station on the Samtredia-Tbilisi line. The Electroelement Plant and a factory for the production of building materials are located in the settlement. [29–1352–5]

SHORIN, ALEKSANDR FEDOROVICH. Born Nov. 23 (Dec. 5), 1890, in St. Petersburg; died Oct. 21, 1941, in Ul'ianovsk. Soviet inventor in radio engineering, telegraphy, and sound recording.

Shorin entered the St. Petersburg Electrical Engineering Institute in 1911. His studies were interrupted, however, in 1914, when he was drafted into the army. He served at the Tsarskoe Selo radio station, where he began his work in radio engineering. Shorin graduated from the institute in 1919 and took a teaching position there. He was a member of the staff of the Nizhny Novgorod Radio Laboratory from 1919 to 1922, head of the radio division of the Weak-current Plant Trust from 1922 to 1927, and a member of the staff at the Central Laboratory of Wired Communications from 1927 to 1934. In 1934, Shorin was named director of the Institute of Automation and Remote Control (now the Institute of Problems of Control) of the Academy of Sciences of the USSR.

Shorin is credited with a number of inventions. Among them are a start-stop printing telegraph, radio-teleprinter repeaters, loudspeaker systems, and sound-recording equipment. His name is closely associated with the birth and development of sound films in the USSR. Shorin received the State Prize of the USSR in 1941; he was also awarded the Order of Lenin.

SHORIN, VASILII GRIGOR'EVICH. Dates of birth and death unknown. One of the richest Moscow merchants of the 17th century.

Shorin and his assistants conducted business in Moscow, Vologda, Arkhangel'sk, and Velikii Ustiug, in cities in Siberia and the Volga Region (Povolzh'e), and in certain countries of the East. Shorin owned leather-manufacturing enterprises in Nizhny Novgorod. In 1647 and 1648 and in 1658 and 1659 he was head of customs in Arkhangel'sk. Part of a plan he proposed in 1658 for increasing customs revenue was used in the New Commercial Statute of 1667. Shorin's enterprises, shops, and warehouses were looted during the Moscow uprisings of 1648 and 1662, and a convoy of his ships was seized on the Volga in 1669 by S. T. Razin's cossacks. In 1673, part of Shorin's property was sold for arrears, and the remainder was transferred to the state treasury.

[29–1353–1]

SHORIN, VASILII IVANOVICH. Born Dec. 26, 1870 (Jan. 7, 1871), in the city of Kaliazin, in what is now Kalinin Oblast; died 1938. Soviet military leader.

The son of an artisan, Shorin graduated from the Kazan Cadet School in 1892 and from the Officers' Rifle School. He fought in the Russo-Japanese War of 1904–05 and in World War I, in which he commanded a battalion and a regiment. Shorin was promoted to colonel in 1916 and was awarded the Order of St. George Fourth Class and the Weapon of St. George. After the October Revolution of 1917 he was elected a division commander by the soldiers.

In September 1918, Shorin enlisted in the Red Army in Viatka. He was appointed commander of the Eastern Front's Second Army, which he reorganized and which he led in such actions as the Izhevsk-Votkinsk Operation of 1918. After becoming commander of the Northern Group of the Eastern Front in May 1919, he directed the Perm' and Ekaterinburg operations. In late July 1919, Shorin assumed command of the Southern Front's Special Group, which consisted of the Ninth and Tenth armies, later joined by the Eleventh. In September, the Special Group became the Southeastern Front, whose troops fought successfully in a counteroffensive against General Denikin in late 1919.

Shorin was named commander of the Caucasian Front in January 1920. From May 1920 through January 1921, as assistant commander in chief of the armed forces of the republic in Siberia, he directed the suppression of the kulak rebellions and the eradication of Ungern von Sternberg's forces. Shorin was commander of the Turkestan Front from January to November 1922, during the elimination of Enver Pasha's Basmachi bands.

After serving as deputy commander of the Leningrad Military District from 1923 to 1925, Shorin was put on reserve status for reasons of age. He directed the Society for Assistance to Defense, Aviation, and Chemical Construction in Leningrad.

Shorin was awarded the Order of the Red Banner, the Honorary Revolutionary Weapon, and orders of the Bukhara and Khorezm people's republics.

SHORIN TELEGRAPH, one of the first Soviet start-stop printing telegraphs, introduced in 1929 and named for its inventor, A. F. Shorin. The Shorin telegraph transmits with a five-unit equal-length code. When the device is used in a receiving mode, the message texts are automatically printed onto a tape. The Shorin telegraph was replaced in the mid-1930's by more advanced equipment. [29–1354–1]

SHORSU, an urban-type settlement in Uzbekistan Raion, Fergana Oblast, Uzbek SSR. Shorsu is situated in the foothills of the Alai Range, 26 km south of the Iaipan railroad station, on the Kokand-Khavast line. A plant for the production of drainage pipes was under construction in Shorsu in 1978. [29–1355–1]

SHORTANDY, an urban-type settlement and the administrative center of Shortandy Raion, Tselinograd Oblast, Kazakh SSR. Shortandy has a railroad station on the Petropavlovsk-Tselinograd line, 67 km northwest of Tselinograd. A furniture factory, a butter factory, a food-processing combine, and a grain elevator are located in the settlement. [29–1355–3]

SHORTANOV, ASKERBI TAKHIROVICH. Born Oct. 3 (16), 1916, in the village of Anuzorovka, now the village of Lesken II, Urvan' Raion, Kabarda-Balkar ASSR. Soviet Kabardin writer. Honored Art Worker of the Kabarda-Balkar ASSR (1939); Honored Art Worker of the RSFSR (1971). Member of the CPSU since 1941.

Shortanov studied at the State Institute of Theatrical Arts from 1934 to 1936. He was first published in 1939. His main theme is the history of the Kabardins and their life in the Soviet period. Shortanov is the author of the historical novel *The Mountaineers* (1954; Russian translation, 1967); the chronicle-like novel *Betal Kalmykov* (1968; Russian translation under the title *Always in the Saddle*, 1970), which deals with the Civil War hero of that name; and the plays *Aul Batyr* (staged 1939) and *When The Light Breaks* (published 1947; Russian translation, 1950), which deals with life in a kolkhoz village. His play *The Party's Envoy* (published 1961) was staged in 1967.

Shortanov is a well-known folklorist. He has been awarded five orders and various medals. Shortanov's works have been translated into many languages of the USSR.

SHORTHORN, a beef and dual-purpose (beef and dairy) breed of cattle. The Shorthorn was developed in the 18th century in Great Britain by improving local short-horned cattle, by crossing with Dutch and the Galloway breeds, and by selection, first for meat qualities and in the mid-19th century also for dairy qualities.

There are two types of Shorthorn: beef and dual-purpose. The coloring is various shades of red, as well as white and roan. Bulls weigh 850 to 950 kg (up to 1,200 kg), and cows, 500 to 600 kg (up to 750 kg); young reared for meat weigh 400 to 420 kg by one year of age. The yield of dressed meat is 66 to 67 percent. The meat is tender and marbled. The milk yield of dual-purpose cows is 3,500 to 4,000 kg, sometimes reaching 14,000 kg; the fat content of the milk is 3.7 to 3.9 percent. Shorthorn bulls are widely used for commercial crossbreeding with cows of various dairy breeds. Shorthorns were first imported into Russia in the 19th century and were used to develop the Bestuzhev and later the Kurgan breeds.

Shorthorns are raised in the countries of Europe and North and South America (in the USA the Santa Gertrudis breed was developed using Shorthorns) and in Australia and New Zealand; in the USSR, they are raised in Orenburg, Voronezh, Tiumen', and Rostov oblasts and in the Bashkir ASSR.

SHORTT CLOCK (also free-pendulum clock), a highly accurate pendulum clock. The Shortt clock is named after the British inventor W. H. Shortt, who devised it in 1921.

A Shortt clock has two pendulums made of Invar. The first, called the master pendulum, is enclosed in a low-pressure chamber and placed in a constant-temperature cellar. The second, known as the working pendulum, is installed in an ordinary wooden clock case and kept in a convenient place. The working pendulum is connected to the indicating mechanism, which consists of hands, a clockface, and electric contacts. The clock is powered by an 8-volt DC battery.

In the Shortt clock, an impulse is released every second. The master pendulum, which swings freely, receives a mechanical impulse every 30 sec in order to overcome the damping associated with friction. Special electromechanical devices synchronize the oscillations of the working pendulum, which functions as both a drive mechanism and a counter. The length of the working pendulum may be adjusted so that the clock will keep either sidereal time or mean solar time. The mean-square clock rate of a Shortt clock is ±0.002–0.003 sec per day.

Shortt clocks became obsolete in the 1950's because they did not provide the accuracy required in many astronomical investigations.

SHORTZY (also Shortsy; self-designation, *shor*), a nationality living in southern Kemerovo Oblast (Gornaia Shoriia), RSFSR, chiefly in the basin of the Tom' River and its tributaries the Kondoma and Mras-Su. In Russian historical documents of the 17th and 18th centuries the Shortzy are called the Kuznets, Kondoma, or Mras Tatars. According to the 1979 census, the Shortzy number 16,000. They speak Shortzy. Although considered in the past to be Russian Orthodox, they in fact continued to practice shamanism and forms of worship associated with hunting and fishing.

The Shortzy nationality was formed over a protracted period in which Ugrian, Samoyed, Ket-speaking, and Turkic tribes intermingled. In culture and origin the Shortzy are related to the northern Altais and certain ethnic groups of Khakass. Until the early 20th century the Shortzy retained, to a considerable extent, vestiges of clan relations. Before the October Revolution of 1917 they engaged chiefly in hunting and fishing, although some groups practiced primitive land cultivation as well; smithery was important, as were the mining and smelting of iron ore—hence the name Kuznets (Blacksmith) Tatars.

Under Soviet power the life of the Shortzy has changed radically. The majority are employed in agriculture: they engage in land cultivation and stock raising and pursue the traditional economic activities of hunting, fishing, and the gathering of pine nuts. Many Shortzy work in industry, and a sizable intelligentsia has developed.

SHORYGIN, PAVEL POLIEVKTOVICH. Born Apr. 16 (28), 1881, in the village of Gorki, Kovrov District, Vladimir Province; died Apr. 29, 1939, in Moscow. Soviet organic chemist. Academician of the Academy of Sciences of the USSR (1939; corresponding member, 1932).

Shorygin graduated in 1906 from the Moscow Higher Technical School, where he then worked from 1906 to 1910. From 1910 to 1918 he was an engineer at a textile factory in Moscow. Between 1919 and 1925 he was a professor at the Moscow Veterinary Institute and the Moscow Forest Engineering Institute, and between 1925 and 1939 he was a professor at the D. I. Mendeleev Moscow Institute of Chemical Engineering. From 1931 to 1939 he was scientific director of the Moscow Scientific Research Institute of Synthetic Fibers.

Shorygin's main works dealt with the chemistry of organosodium compounds. Shorygin discovered the process of metallization (the direct substitution of sodium or potassium for hydrogen in hydrocarbons and their derivatives [Shorygin reaction]), the decomposition of ethers by the action of metallic sodium, and two new types of intramolecular rearrangements of ethers—carbinolic and phenolic. The research carried out by Shorygin on the chemistry of hydrocarbons, begun in 1924, terminated in the synthesis of many new cellulose ethers and esters and their derivatives. Under Shorygin's guidance, many problems in the manufacture of synthetic fibers and pulp and paper were solved and methods of synthesizing valuable perfumes were developed.

WORKS
Izbr. trudy. Moscow-Leningrad, 1950. (Contains references.) [29–1357–3]

SHOSHA, a river in Kalinin Oblast and Moscow Oblast, RSFSR; a right tributary of the Volga. The Shosha is 163 km long and drains an area of 3,080 sq km. It rises in the Moscow Upland and empties into the Ivan'kovo Reservoir. The Shohsha is fed chiefly by snow; high water occurs in April. The mean flow rate 51 km from the mouth is 8.5 cu m per sec. The Shosha freezes over between November and early January, and the ice breaks up in late March or April. [29–1383–1]

SHOSHONE, a mountain range in the Great Basin region of the USA, in the state of Nevada. The Shoshone Mountains stretch from north to south along the Reese River, which is situated in the closed basin of the Humboldt River. They measure approximately 250 km in length and rise to a maximum elevation of 3,143 m at North Shoshone Peak. The range is composed primarily of metamorphic rocks. Vegetation includes sparse mountain forests of pine and juniper, as well as shrubs. [29–1383–2]

SHOSHONEAN LANGUAGES, the languages of the Shoshoni Indians, who include the Comanche, Ute, and Hopi; the collective name for the languages of the four subgroups of the Uto-Aztecan family spoken in the southwestern USA and Lower California.

The four subgroups of the Shoshonean languages are the Numic languages, the Tübatulabal language, the Takic languages, and the Hopi language. The Numic, or Plateau Shoshonean, languages include Bannock, whose dialects are Snake, Northern Paiute, and Mono; Shoshoni, whose dialects are Comanche, Gosiute, and Koso (Panamint); and Ute, whose dialects are Southern Paiute, Chemehuevi, and Kawaiisu. The Takic, or Southern Californian, languages comprise Serrano, Luiseño, Cupeño, Cahuilla, and the extinct Gabrielino and Juaneño.

The theories of linguists of the early 20th century that the Shoshonean languages form a single group within the Uto-Aztecan family have been controverted by later studies based on the research of such American scholars as B. Whorf and S. Lamb.

SHOSHONI (also Shoshone), a group of North American Indian tribes. The Shoshoni speak the Shoshonean languages, which belong to the Uto-Aztecan language family. They are divided into three groups of tribes: the Pueblo Shoshoni, which are made up of the Hopi; the Plateau Shoshoni, which comprise the Ute, Shoshoni proper, Comanche, Koso, Painte, Bannock, and Mono; and the Southern Californian Shoshoni, which include the Serrano, Gabrielino, Luiseño, and Cahuilla. The various groups were at different stages of cultural development, ranging from primitive gatherers and small-game hunters in California to settled land cultivators (Hopi) and horse-mounted hunters of bison (Comanche and Shoshoni).

Before the arrival of the European colonialists, the Shoshoni proper inhabited Utah, Nevada, and Idaho. They hunted, fished, and gathered wild cereal grains. In the mid-18th century the hunting of bison from horseback became the basis of the economy. In the mid-19th century, the Shoshoni tribes, after stubborn resistance, were settled on reservations in Nevada, Utah, Idaho, and Oregon. According to the 1970 census, the Shoshoni number 14,200, of whom 4,100 live on reservations; the rest live in cities and work as hired laborers. [29–1383–4]

SHOSSE, a road with a hard surface. The term *shosse* was used extensively from the early 19th century to the mid-20th century in place of the term *guzhevaia doroga* (cart road). In the 1950's, the word *shosse* came to be applied to highways with a multilayered surface consisting of granular materials that are compacted and then treated either with organic binders (used in building a blacktop road) or with water (used in building a macadam road). The term *shosse* is preserved in the names of such roads as the Gorky Shosse and the Leningrad Shosse as well as in everyday speech. The more precise term *avtomobil'naia doroga* (highway) is used instead of *shosse* in scientific and industrial literature. [29–1357–4]

SHOSTAKOVICH, DMITRII DMITRIEVICH. Born Sept. 12 (25), 1906, in St. Petersburg; died Aug. 9, 1975, in Moscow. Soviet composer. People's Artist of the USSR (1954); Hero of Socialist Labor (1966); doctor of the arts (1965). Member of the CPSU from 1960.

The son of an engineer, Shostakovich graduated from the Leningrad Conservatory, where he studied piano with L. V. Nikolaev until 1923 and composition with M. O. Shteinberg until 1925. In 1927 he received an honorable mention at the First Chopin International Competition for Pianists in Warsaw. He subsequently gave concerts at which he performed his own compositions. In 1937 he began teaching composition at the Leningrad Conservatory, where he became a professor in 1939; from 1943 to 1948 he taught at the Moscow Conservatory. Among his pupils

were R. S. Bunin, A. D. Gadzhiev, G. G. Galynin, O. A. Evlakhov, K. A. Karaev, G. V. Sviridov, B. I. Tishchenko, K. S. Khachaturian, and B. A. Chaikovskii. He became a secretary of the Composers' Union of the USSR in 1957 and of the Composers' Union of the RSFSR in 1960; from 1960 to 1968 he was first secretary of the Composers' Union of the RSFSR.

Shostakovich, whose work represents a high point in 20th-century music, invariably turned to socially important themes and images and rendered the most important aspects of contemporary life. His music combines epic scope and psychological profundity, the emotional power of a crusading artist and a highly refined, intimate lyricism. Several of Shostakovich's works reflect the global conflicts of the modern age and give expression to the clash between the world of victorious socialism and the world of reaction and oppression. Particularly important to the composer were the themes of war and peace and the struggle against fascism: to images of evil and aggression he counterposed the will and reason of the Soviet people and a faith in the ultimate victory of light over darkness. Shostakovich's works, which affirm the ideals of Soviet humanism, are imbued with a boundless sympathy for man and his sufferings.

Symphonic works distinguished by a sense of high drama occupy a central place in Shostakovich's oeuvre. The varied musical development in these works is marked by sharp conflicts and contrasts and by the free hand with which the composer worked out his themes: Shostakovich often rethought his musical ideas, and the same theme sometimes embodies totally contrasting aspects of life. Shostakovich, an innovator in the tradition of M. P. Mussorgsky (with whom he felt a special affinity), J. S. Bach, Beethoven, and Mahler, created his own profoundly original style. The individuality of his music is strikingly apparent in its tonal structure and harmony. Shostakovich modified the harmonic systems of classical Russian music to create his own harmonic idiom. An oustanding polyphonist, he reinterpreted the fugue and passacaglia, made extensive use of polyphonic devices to develop musical themes, and restructured the symphony and sonata cyclic forms, whose component parts he fashioned anew to suit his own needs. Shostakovich used the interplay of orchestral timbres to great expressive effect. The principles of symphonic composition are evident in his chamber music.

Shostakovich's Symphony No. 1 (1925), like several of the symphonies to follow, gained worldwide recognition. Subsequent compositions, such as the Symphony No. 2 (*October Symphony*, 1927), the Symphony No. 3 (*First of May Symphony*, 1931), and the ballets *The Golden Age* (1930) and *Bolt* (1931), reflect a search for new directions. In certain works, notably the opera *The Nose* (after N. V. Gogol, 1928), Shostakovich showed a predilection for satire, humor, and the grotesque.

In the opera *Katerina Izmailovna* (or *Lady Macbeth of the Mtsensk District*, 1932; new version, 1963), which marks the beginning of the composer's mature period, the tragic vein, so important in all Shostakovich's works, is combined with social satire. The Symphony No. 4 (1936) and Symphony No. 5 (1937) —particularly the latter—established the principles of Shostakovich's mature symphonic style. Of the *Fifth Symphony* the composer wrote: "The subject of my symphony is the development of the individual. It was precisely man, with all his sufferings, that I saw as the focal point of this work" (*Vecherniaia Moskva*, Jan. 25, 1938, p. 3). Other compositions of the 1930's are the Symphony No. 6 (1939), the Concerto No. 1 for Piano and Orchestra (1933), *Twenty-four Preludes for Piano* (1933), the ballet *The Limpid Stream* (1935), and the String Quartet No. 1 (1938).

The Quintet for Piano and Strings (1940; State Prize of the USSR, 1941), a work imbued with a poetic lyricism, is one of Shostakovich's most harmonious compositions. Shostakovich worked on the Symphony No. 7 (*Leningrad Symphony*; State Prize of the USSR, 1942) in the besieged city of Leningrad. The symphony, which depicts the Soviet people's heroic struggle against fascism, became a musical monument of the war years and played an important role in rallying the world against fascism. Images from the Great Patriotic War also appear in the Symphony No. 8 (1943), a work of enormous tragic power, and in the Trio No. 2 for Violin, Cello, and Piano (1944; State Prize of the USSR, 1946), the String Quartet No. 3 (1946), and songs and choruses from this period. Shostakovich returned to the war for subject matter in such late works as the String Quartet No. 8 (1960), dedicated to the victims of war and fascism.

The Symphony No. 10 (1953), which reflects the composer's concern about the fate of the world, is distinguished by its profound psychological insight. The oratorio *Song of the Forests* (words by E. A. Dolmatovskii, 1949; State Prize of the USSR, 1950) depicts socialist labor. The monumental cycle *Twenty-four Preludes and Fugues for Piano* (1951), which communicates a variety of emotions and moods ranging from high tragedy to carefree gaiety, from epic heroism to moving lyricism, adds to the tradition of Bach a distinctly Russian character.

Other notable postwar works are the Symphony No. 9 (1945), the Violin Concerto No. 1 (1948), and the song cycle *From Jewish Folk Poetry* (1948, set to traditional poems). In this period Shostakovich's fondness for historical and revolutionary subjects became evident. His *Ten Narrative Poems for A Cappella Chorus* (set to words by revolutionary poets, 1951; State Prize of the USSR, 1952) is dedicated to the struggle of the proletariat in the early 20th century. Works in a similar vein include the Symphony No. 11 (*1905 Symphony*, 1957; Lenin Prize, 1958) and the Symphony No. 12 (*1917 Symphony*, 1961), dedicated to V. I. Lenin; these compositions are notable for their striking musical idiom and are imbued with the traditional spirit of the revolutionary song. The Russian past also found expression in the symphonic poem for voice and orchestra *The Execution of Stepan Razin* (words by E. A. Evtushenko, 1964; State Prize of the USSR, 1968).

During this period Shostakovich continued to use a broad range of images and varied subject matter. He turned to humor and satire once again in the musical comedy *Moscow, Cheremushki* (1958) and the song cycle *Satires* (1960, words by Sasha Chernyi).

In the 1960's and 1970's, Shostakovich composed vocal instrumental suites to poems by A. A. Blok (1967) and M. I. Tsvetaeva (1973). The vocal work *Suite on Verses by Michelangelo* (1974), summing up several major themes of the composer's work, registered a protest against evil and injustice and affirmed the creative triumph and immortality of the artist. The principles of the vocal-instrumental suite are combined with operatic elements in the symphonies for voice and orchestra: Symphony No. 13 (1962, words by Evtushenko) and Symphony No. 14 (1969, words by Garcia Lorca, G. Apollinaire, W. K. Küchelbecker, and R. Rilke), an enormously profound and emotionally powerful treatment of the theme of life and death, a subject that is central to such works as the Symphony No. 15 (1971) and the late string quartets. The Sonata for Alto and Piano (1975) marks the end of Shostakovich's creative output.

Shostakovich, who composed music for more than 35 motion pictures, including *The Youth of Maksim* (1935), *The Return of Maksim* (1937), *The Vyborg Side* (1939), *The Man With a Gun* (1938), and *Hamlet* (1964), was a pioneer of Soviet motion-picture music. He adapted several of his film scores for concert performance, notably *Golden Mountains* (1931), *The Young Guard* (1948), and *The Gadfly* (1955). Several songs by Shostakovich for motion pictures have achieved great popularity. He wrote music for the stage and prepared new orchestral versions of Mussorgsky's operas *Boris Godunov* (1940) and *Khovanshchina* (1959). His articles include "Thoughts on the Road I Have Traveled" (1956).

The music of Shostakovich, whose compositions are among the classic works of the 20th century, is of tremendous importance for Soviet and international music.

Shostakovich was a deputy to the sixth through ninth convocations of the Supreme Soviet of the USSR. He was a member of the Soviet Peace Committee (1949), the Slavic Committee of the USSR (1942), and the International Peace Committee (1968). He was an honorary member of Sweden's Royal Academy of Music (1954), Italy's Saint Cecilia National Academy (1956), and the Serbian Academy of Sciences and Arts (1965).

Shostakovich was awarded honorary doctorates by Oxford University (1958), Northwestern University in Evanston, Ill. (1973), and France's Académie des Beaux-Arts (1975). He was a corresponding member of the Academy of Arts of the German Democratic Republic (1956) and the Bavarian Academy of Fine Arts (1968), a member of Great Britain's Royal Academy of Music (1958) and the National Academy of Sciences of the USA

(1959) and an honorary professor at Mexico's National Conservatory. He served as president of the USSR-Austria Society (1958). A recipient of the International Peace Prize (1954), Shostakovich was awarded three Orders of Lenin, the Order of the October Revolution, the Order of the Red Banner of Labor, and various medals.

SHOSTAKOVSKII, MIKHAIL FEDOROVICH. Born May 24 (June 6), 1905, in Novoselitsy, in what is now Kirovograd Oblast. Soviet organic chemist. Corresponding member of the Academy of Sciences of the USSR (1960). Member of the CPSU since 1946.

Shostakovskii graduated from the University of Irkutsk in 1929. From 1932 to 1962 he worked at the Institute of Organic Chemistry of the Academy of Sciences of the USSR. From 1957 to 1971 he was director of the Irkutsk Institute of Organic Chemistry of the Siberian Division of the Academy of Sciences of the USSR, and from 1971 to 1973, director of the Institute of Petrochemistry of the Siberian Division of the Academy of Sciences of the USSR. In 1973 he became head of a subdepartment of the All-Union Polytechnical Correspondence Institute.

Shostakovskii's main works deal with the chemistry of vinyl ethers, organosilicon and organostannum compounds, and acetylene and its derivatives. Shostakovskii developed an antiphlogistic coating agent based on polyvinyl butyl ether (vinylene) known as Shostakovskii balsam, a blood substitute based on polyvinylpyrrolidone, and an agent to combat ringworm in animals.

A recipient of the State Prize of the USSR (1949), Shostakovskii has been awarded two orders and several medals.

SHOSTKA, a city (since 1924) under oblast jurisdiction and the administrative center of Shostka Raion, Sumy Oblast, Ukrainian SSR. Situated on the Shostka River, a tributary of the Desna. Railroad station on a branch line of the Khutor-Mikhailovskii–Konotop line. Population, 64,000 (1977).

The Svema Production Association, which makes motion-picture film and recording tape, is located in Shostka. The city also has a furniture factory and plants for the production of chemical reagents and reinforced concrete structures. The food-processing industry is represented by a meat-packing plant, a butter factory, and a brewery. Shostka has a chemical engineering technicum, a museum of local lore, and a museum of military glory.

[29–1361–2]

SHOTEMOR, SHIRINSHO. Born December 1899 in the *kishlak* (hamlet) of Parshnev, in what is now Shugni Raion, Gorno-Badakhshan Autonomous Oblast; died Oct. 27, 1937. Soviet government and party figure. Member of the Communist Party from 1921.

The son of a peasant, Shotemor became a worker in Tashkent in 1919. He took part in the struggle for the establishment of Soviet power in Turkestan. From 1921 to 1924 he was chairman of a revolutionary committee in the Pamirs and an instructor for the Central Committee of the Communist Party (Bolshevik) of Turkestan. From 1925 to 1927 he was people's commissar of the Workers' and Peasants' Inspectorate and the commissioner of the Central Committee of the Communist Party (Bolshevik) of Uzbekistan in the Tadzhik ASSR; he helped lead the struggle against the Basmachi revolt.

Shotemor graduated from the Communist University for Workers of the East in 1929 and served as executive secretary of the Tadzhik oblast committee of the Communist Party (Bolshevik) of Uzbekistan. He was a delegate to the Sixteenth and Seventeenth Party Congresses. From 1930 to 1933 he was second secretary of the Central Committee of the Communist Party (Bolshevik) of Tadzhikistan. In 1933 he was named chairman of the Central Executive Committee of the Tadzhik SSR. Shotemor became a member of the Central Executive Committee of the USSR in 1925.

SHOTMAN, ALEKSANDR VASIL'EVICH. Born Aug. 25 (Sept. 6), 1880, in the village of Aleksandrovskoe, now within the Leningrad city limits; died Oct. 30, 1937. Soviet state and party figure. Member of the Communist Party from 1899.

The son of a worker, Shotman was a lathe operator. During the period from 1899 to 1902 he was a member of the St. Petersburg League of Struggle for the Emancipation of the Working Class, a participant in the Obukhov defense of 1901, and a member of the St. Petersburg committee of the RSDLP. Shotman was a delegate to the Second Congress of the RSDLP in 1903. During the Revolution of 1905–07 he was a member first of the St. Petersburg committee of the party and then of the Odessa committee. In 1911 and 1912 he was a member of the Helsingfors committee of the Social Democratic Party of Finland; in 1913 he took part in the Poronin meeting of the Central Committee of the RSDLP with party officials. Shotman was co-opted into membership in the Central Committee and the Russian Bureau of the Central Committee of the RSDLP. He was arrested in November 1913 and exiled to Siberia.

In 1917, Shotman became a member of the Tomsk committee of the Russian Bureau of the Central Committee of the RSDLP(B) and a member of the executive committee of the local soviet; in June 1917 he became a member of the Petrograd district committee of the party. He was a delegate to the Sixth Congress of the RSDLP(B). Shotman maintained communication between the party's Central Committee and V. I. Lenin, who was in Razliv, and organized Lenin's move to Finland. After October 1917, Shotman served as deputy people's commissar for postal and telegraph services.

From 1918 to 1920, Shotman was a member of the Presidium of the Supreme Council on the National Economy and chairman of the Siberian Council on the National Economy. In 1923 and 1924 he was chairman of the Central Executive Committee of the Karelian ASSR. In 1926, Shotman became a member of the Supreme Council on the National Economy and the Presidium of the All-Russian Central Executive Committee. A delegate to the Thirteenth through Seventeenth Party Congresses, he served as a member of the Central Control Commission from 1924 to 1934. Shotman was a member of the All-Russian Central Executive Committee and the Central Executive Committee of the USSR.

SHOVELER (*Anas clypeata*), a bird of the family Anatidae. The body length is about 50 cm. Males weigh about 700 g; the females weigh less. The tip of the bill is very broad (hence the name). The shoveler, which is a migratory bird, is distributed in the temperate climates of Europe and Asia and in western North America. In the USSR is it more common in the forest-steppe and steppe

zones and can be found in Transcaucasia and Middle Asia in the winter. During the summer, shovelers gather for molting in the delta of the Volga River and on the lakes of the Transurals Region and Kazakhstan. They prefer shallow tranquil bodies of water and quiet stretches of river. Nests are built on dry land. The clutch contains seven to ten eggs, which are incubated from 22 to 23 days. The diet consists of mollusks, crayfish, and insects. The shoveler is a game bird. [29–1229–1]

SHOVI, a balneological and climatic health resort in the Georgian SSR, on the southern slopes of the Vodorazdel'nyi (Glavnyi) Range of the Greater Caucasus. Shovi is situated at an elevation of 1,600 m on the Ossetian Military Road, in the valley of the Chanchakhi River, 147 km from Kutaisi. Summers are moderately warm, with an average July temperature of 16°C, and winters are relatively mild, with an average January temperature of −6°C; precipitation totals 1,103 mm annually. The resort offers climatotherapy; it also has carbonic hydrocarbonate calcium-sodium springs, the waters of which are used for drinking. Treatment is given for nontubercular ailments of the respiratory system and for disorders of the digestive organs and nervous system. The resort has boarding hotels and a polyclinic. [29–1330–2]

SHOVKOPLIAS, IURII IUR'EVICH. Born Jan. 24 (Feb. 6), 1903, in Kharkov; died there Oct. 12, 1978. Soviet Ukrainian writer. Member of the CPSU since 1945.

Shovkoplias graduated from the Kharkov Institute of Public Education in 1927. His early stories deal primarily with young people and the scientific-technical intelligentsia. Shovkoplias' novel *The Engineers* (books 1–2, 1934–37; new supplementary ed. 1967) describes the scope of the technical revolution and depicts the romanticism of the first five-year plans. The heroes of his trilogy of novels *Man Lives Twice* (1962–64) are Soviet medical scientists.

Shovkoplias also wrote for children and young people. His works have been translated into other languages of the USSR and foreign languages. Shovkoplias was awarded the Order of Lenin, two other orders, and various medals.

SHOVKUNENKO, ALEKSEI ALEKSEEVICH. Born Mar. 9 (21), 1884, in Kherson; died Mar. 12, 1974, in Kiev. Soviet painter. People's Artist of the USSR (1944). Member of the Academy of Arts of the USSR (1947).

Shovkunenko studied at the Odessa Art School from 1901 to 1908 under K. K. Kostandi and at the St. Petersburg Academy of Arts from 1909 to 1917. He worked in watercolors. Shovkunenko produced psychologically probing portraits of B. I. Iakovlev (1944), S. A. Kovpak (1945), M. I. Litvinenko-Vol'gemut (1947), and M. G. Lysenko (1947)—all at the Museum of Ukrainian Fine Arts of the Ukrainian SSR in Kiev. His works also include industrial landscapes, for example, the series *The Dneprostroi Construction Project* (1930–32, Museum of Ukrainian Fine Arts) and colorful landscapes of the Ukraine and Moldavia, notably *Spring* (1955, Odessa Art Museum).

Shovkunenko also taught painting, becoming a professor at the Kiev Art Institute in 1935. His pupils included A. M. Lopukhov and V. G. Puzyr'kov. A recipient of the T. G. Shevchenko State Prize of the Ukrainian SSR in 1970, he was also awarded the Order of Lenin, three other orders, and several medals.

SHPAGA, the Russian term for a type of cold-steel weapon used for thrusting and cutting or simply for thrusting. A variety of sword, the *shpaga* has a narrow, straight blade that is a meter or more in length. The blade may be single or double edged, or it may be of polygonal cross section. The handle, or hilt, of the *shpaga* may have varying kinds of knuckle bow and guard. Various types of *shpaga* have been made, one of which is the foil, which is shorter than an ordinary *shpaga* and has a cup-like guard and a blade with a polygonal cross section.

The *shpaga* first appeared in the 16th century, in Western Europe, and became the characteristic weapon of the nobility. Between the 16th and 18th centuries, the *shpaga* was also a military weapon used chiefly by cavalrymen and officers. Gradually supplanted in the 18th century by the broadsword and the saber, the *shpaga* was retained as an honorary, dueling, or full-dress weapon.

The *shpaga* was first used in the Russian Army in the early 18th century. In 1741, however, the *shpaga* used by infantry soldiers was replaced by a small saber (*polusablia*). Later, the *shpaga* used by officers was replaced by a saber. In the 19th century, the *shpaga* became part of the uniform of generals and of cuirassier-regiment officers not in formation; it was also worn as part of the full-dress uniform of civilian officials. These formal uses of the *shpaga* were discontinued in 1917. [29–1384–1]

SHPAGIN, GEORGII SEMENOVICH. Born Apr. 17 (29), 1897, in the village of Kliushnikovo, in what is now Kovrov Raion, Vladimir Oblast; died Feb. 6, 1952, in Moscow. Soviet small-arms designer. Hero of Socialist Labor (1945). Member of the CPSU from 1944.

The son of a peasant, Shpagin entered the army in 1916 and worked in a regimental ordnance repair shop. After World War I he served as a gunsmith in a rifle regiment of the Red Army. Upon being discharged in 1920, Shpagin became a fitter at a machine-gun plant where V. G. Fedorov and V. A. Degtiarev were employed.

Shpagin became involved in new-weapons design in 1922. In 1938, he and Degtiarev designed the large-caliber 12.7-mm DShK machine gun. Shpagin designed the PPSh automatic submachine gun in 1940 and developed the OPSh flare pistol in 1943. His weapons were widely used in the Great Patriotic War of 1941–45.

Shpagin was a deputy to the second convocation of the Supreme Soviet of the USSR. He received the State Prize of the USSR in 1941 and was awarded three Orders of Lenin, two other orders, and various medals.

SHPAK, VLADIMIR STEPANOVICH. Born Feb. 7 (20), 1909, in Pskov. Soviet chemist. Corresponding member of the Academy of Sciences of the USSR (1968). Hero of Socialist Labor (1961). Member of the CPSU from 1939.

Shpak graduated in 1931 from the Lensovet Leningrad Institute of Technology, where he worked from 1932 to 1975, becoming a professor in 1955. Beginning in 1948, he also worked at the Institute of Applied Chemistry, of which he was director from 1952 to 1977.

Shpak's main works deal with commercial organic chemistry. The synthesis and technological development of the manufacture of many nitro compounds, amines, ethers, esters, and other organic compounds, carried out by Shpak, were introduced in industry. Shpak was also involved in organizing the creation of new branches in the chemical industry, such as the manufacture of organofluorine compounds.

Shpak has been awarded two Orders of Lenin, three other orders, and several medals.

SHPAKOVSKII, ALEKSANDR IL'ICH. Born Aug. 20 (Sept. 1), 1823, in Smolensk Province; died June 25 (July 7), 1881, in St. Petersburg. Russian inventor.

Shpakovskii entered the Pavel Cadet Corps in St. Petersburg in 1846 and taught physics there from 1854 to 1870, when he retired. He joined the staff of the Kronstadt Mine Plant in 1878. An injury received in an explosion during a mine test in 1879 left him disabled.

In the 1850's, Shpakovskii was engaged in a number of projects involving photography, including the development of a wet-collodion process. He also built an arc lamp with automatic adjustment of the distance between carbons. In the 1860's, Shpakovskii invented a night signal light that was approved in 1866 for vessels in the Russian Navy and was later adopted by the British Navy. He developed an oil burner for a steam-generating system in 1866 and a feed pump for shipboard steam boilers in 1868. In 1872, Shpakovskii proposed a technique for preparing potassium nitrate from sodium nitrate, and in 1873, a method for pressing peat into briquettes.

SHPANBERG, MARTYN PETROVICH. Date of birth unknown; died 1761. Russian navigator; captain first class.

An immigrant from Denmark, Shpanberg took part in the First Kamchatka Expedition, from 1725 to 1730, aboard the vessel *Sv. Gavriil*. Sailing aboard the *Arkhangel Mikhail* he commanded a detachment of ships in the Second Kamchatka Expedition and, after Bering's death, became the leader of the expedition. An island in the Lesser Kuril Chain, mountains in the Chukchi region and on Sakhalin, a strait in the Kuril Islands, and capes on the island of Hokkaido and in the Anadyr' Gulf are named for Shpanberg.

SHPET, GUSTAV GUSTAVOVICH. Born Mar. 26 (Apr. 7), 1879, in Kiev; died Mar. 23, 1940, in Tomsk Oblast. Russian idealist philosopher. Follower of E. Husserl's phenomenology.

Shpet graduated from the faculty of history and philology of the University of Kiev in 1905, and in 1907 he moved to Moscow. Beginning as a privatdocent at the University of Moscow in 1910, he was a professor there from 1918 to 1923. From 1923 to 1929 he was vice-president of the Russian Academy of Artistic Disciplines (later the State Academy of Artistic Disciplines).

Shpet conceived of a universal understanding (*urazumenie*), meaning the search for the "first causes" and "principles" of existence, which he called "meanings," *eide*, or "ideas." According to Shpet, reality is not simply "given" in experience but "guessed at," and its meaning is disclosed by uncovering the intuitive acts of the human mind. Intuition is interpreted by Shpet in the spirit of the rationalism of R. Descartes, B. Spinoza, and G. von Leibniz: the intuitive "perception of essence" can be fully expressed and communicated by means of logical definitions based on analytical reasoning, even though the mind initially discerns essence, or "meaning," just as directly as it perceives sense data. Mediation is that derivative aspect represented by description, proof, and interpretation. In *The Internal Form of the Word* (1927), Shpet discusses the philosophy of language as the foundation of the philosophy of culture, and he anticipates many of the ideas later developed in hermeneutics—the study of interpretation.

In the 1930's Shpet translated and annotated various works of world literature, primarily by English writers such as Byron and Dickens. His translation of Hegel's *Phenomenology of the Spirit* was published in 1959.

SHPINDLER, IOSIF BERNARDOVICH. Born 1848; died 1919. Russian hydrographer, oceanographer, and meteorologist.

Shpindler graduated from the hydrographic division of the Marine Academy in St. Petersburg in 1874 and that same year became director of publication of the marine bulletin at the Main Physical Observatory. In 1884 he became head of the meteorological section of the Ministry of the Navy. In 1888 he began lecturing at the Marine Academy. Between 1890 and 1897, Shpindler organized oceanographic expeditions to study the Black Sea, the Sea of Azov, the Sea of Marmara, Lake Chudskoe, Kara-Bogaz-Gol, and other bodies of water. In 1891 he became one of the editors of the *Meteorologicheskii vestnik* (Meteorological Herald). Shpindler published many works on oceanography and marine meteorology, among them *Hydrology of the Sea (Oceanography)* (parts 1–2, 1914–15), the first Russian monograph on oceanography. [29–1396–2]

SHPINEL', IOSIF ARONOVICH. Born Sept. 25 (Oct. 7), 1892, in Belaia Tserkov', in what is now Kiev Oblast. Soviet motion-picture designer. Honored Art Worker of the RSFSR (1940).

Shpinel' graduated from the architectural department of the Kiev Art School in 1914 and from the print-making department of the Vkhutemas. He began to work in the theater in 1921 and in the cinema in 1927. He created designs for the films *The Night Coachman* (1929), *Arsenal* (1929), *Ivan* (1932), *Boule de Suif* (1934), *Petersburg Night* (1934), *Parisian Dawns* (1937), *Alexander Nevsky* (1938), *Mashen'ka* (1942), *Ivan the Terrible* (1945, 1958), *The Story of a Real Man* (1948), *Sisters* (1957), *The Year 1918* (1958), *Gloomy Morning* (1959), and *A Year Like a Lifetime* (1965).

Shpinel', a teacher since 1928, joined the faculty of the All-Union State Institute of Cinematography, becoming a professor in 1965. He was awarded the State Prize of the USSR in 1951. [29–1397–1]

SHPITAL'NYI, BORIS GAVRILOVICH. Born July 25 (Aug. 7), 1902, in Rostov-on-Don; died Feb. 6, 1972, in Moscow. Soviet designer of aircraft armament. Hero of Socialist Labor (1940). Professor (1949). Member of the CPSU from 1940.

Shpital'nyi graduated from the M. V. Lomonosov Moscow Institute of Mechanics in 1927. In 1930, he and I. A. Komaritskii developed the ShKAS 7.62-mm rapid-fire machine gun, which was adopted as armament on Soviet aircraft. The rate of fire of the weapon was subsequently doubled, to 3,000 rounds per minute. The ShKAS was the basis for the ShVAK 20-mm cannon, which was designed by Shpital'nyi and S. V. Vladimirov in 1936. The ShVAK was mounted in a number of aircraft, including the Iakovlev, Lavochkin, and Tupolev models, as well as on the T-60 tank.

Shpital'nyi was head and master designer of a special design office from 1934 to 1953. He later took a position as a professor in a subdepartment of the Moscow Engineering Institute of Geodesy, Aerial Photographic Surveying, and Cartography.

Shpital'nyi received the State Prize of the USSR in 1941 and 1942 for his work in the development of new types of aircraft armament; he was also awarded two Orders of Lenin, four other orders, and various medals.

SHPITAL'SKII, EVGENII IVANOVICH. Born Sept. 16 (28), 1879, in Ardagan, Kars Oblast, in what is now Turkey; died Nov. 23, 1931. Soviet physical chemist. Corresponding member of the Academy of Sciences of the USSR (1929).

Shpital'skii graduated from Moscow University in 1904 and subsequently worked there. His main works dealt with catalysis and electrochemistry. Shpital'skii developed a theory of intermediate compounds in homogeneous catalysis and proposed a method for the production of white leads (the Shpital'skii method).

SHPOLA, a city (since 1938) and administrative center of Shpola Raion, Cherkassy Oblast, Ukrainian SSR. Situated on the Shpolka River (southern Bug River basin). Railroad station on the Khristinovka-Tsvetkovo line. Population, 21,000 (1974). Shpola produces sugar, spare parts (a branch of the Mytishchi Machine Plant), confectionary goods, garments, and furniture. [29–1403–2]

SHPOL'SKII, EDUARD VLADIMIROVICH. Born Sept. 11(23), 1892, in Voronezh; died Aug. 21, 1975, in Moscow. Soviet physicist. Doctor of sciences in physics and mathematics (1933); Honored Worker in Science and Technology of the RSFSR (1968).

Shpol'skii graduated from Moscow University. He began his scientific career in 1913 at Shaniavskii University under the supervision of P. P. Lazarev. He was on the staff of the Institute of Physics and Biophysics from 1918 to 1930 and of Moscow State University from 1930 to 1932. In 1932 he became the head of a subdepartment at the V. I. Lenin Moscow State Pedagogical Institute. Shpol'skii was editor in chief of the journal *Uspekhi fizicheskikh nauk* (Advances in Physical Sciences), which he helped found.

Shpol'skii's main works dealt with spectroscopy and with the use of spectroscopic methods in biophysics and biochemistry. Shpol'skii investigated the absorption spectra and emission spectra of complex organic compounds. In 1952 he discovered the Shpol'skii effect.

Shpol'skii received the State Prize of the USSR in 1970. He was awarded the Order of the Red Banner of Labor and various medals.

SHPOL'SKII EFFECT, the appearance of quasi-line spectra of complex organic compounds in specially selected solvents at low temperatures. The Shpol'skii effect was first observed in 1952 by E. V. Shpol'skii and his co-workers L. A. Klimova and A. A. Il'ina.

The solvent used should be chemically neutral with respect to the solute molecules, should not interact with the solute molecules, and should be optically transparent in the spectral region where the solute molecules emit or absorb light. Liquid *n*-paraffin, for example, has such properties. The substance in question is dissolved in the solvent in low concentrations (10^{-5}–10^{-7} g/cm^3). The solution is then cooled to a temperature below the freezing point of the solvent; in the case of *n*-paraffin, the solution is cooled to −196°C or lower. Under such conditions, the molecules in question are isolated from one another and are fixed in the solvent. The electronic-vibrational emission and absorption spectra (*see* MOLECULAR SPECTRA) of the molecules in question consist of series of narrow spectral lines and resemble atomic spectra. Hence, they are referred to as quasi-line spectra. Under ordinary conditions, the spectra of complex organic compounds are continuous overlapping bands.

Quasi-line spectra have a well-developed vibrational structure, making it possible to determine the vibrational frequencies of molecules not only in the ground state but also in excited states. Such spectra have a markedly individual character. They differ for molecules that are similar in structure and even for isomeric molecules. Quasi-line spectra make it possible to investigate the following: the structure of individual complex organic compounds; the physical and chemical properties of free complex organic radicals; photochemical processes for organic compounds; compounds that are important for life, such as chlorophyll and its analogs, the porphyrins; carcinogenic compounds; and individual organic compounds in the earth's crust, in order to study the formation of hydrocarbons in the crust and to develop new methods of prospecting for petroleum and other minerals.

The spectrochemical analysis of mixtures on the basis of the Shpol'skii effect makes possible the simultaneous determination of several individual compounds in a mixture and has an absolute sensitivity of up to 10^{-11} g.

SHRAMKOVKA, an urban-type settlement in Drabov Raion, Cherkassy Oblast, Ukrainian SSR. Shramkovka is located 5 km from the Kononovka railroad station on the Grebenka-Kiev line. Industry includes the production of sugar and consumer goods. [29–1411–1]

SHRAPNEL, originally an artillery shell filled with round shot. Shrapnel is primarily intended to strike live, exposed targets. It was named for an English officer, H. Shrapnel, who in 1803 proposed filling an artillery shell with cast-iron case shot, thereby intensifying the shell's effect. Exploded in the air at a predetermined distance from the target, shrapnel was highly effective and was widely used in World War I.

Shrapnel was replaced in the 1930's by the more powerful fragmentation and high-explosive fragmentation shells. The late 1960's witnessed the introduction of shrapnel-type artillery shells filled with dart-like projectiles, or fléchettes, intended to strike unconcealed enemy personnel. There are up to 8,000 such projectiles in the US 105-mm shell, each fléchette 24 mm long and weighing 0.5 g. Thrown from the shell as a result of centrifugal force and the pressure of the powder gases of the bursting charge, the fléchettes are scattered in a conical pattern. [29–1411–3]

SHREDER, IVAN FEDOROVICH (also J. Schröder). Born Mar. 29 (Apr. 4), 1858, in St. Petersburg; died there Nov. 29, 1918. Russian physical chemist.

Shreder graduated from the St. Petersburg Institute of Mines in 1884 and became a professor there in 1891. His major research was devoted to the study of solutions. In 1890 he theoretically derived the relationship between solubility, the melting point, and the heat of melting of crystalline bodies (*see* SHREDER EQUATION) and experimentally confirmed the relationship.

REFERENCE
Stepanov, N. I. "Ocherk istorii i sovremennogo sostoianiia khimii v Gornom institute." *Izvestiia In-ta fiziko-khimicheskogo analiza*, 1927, vol. 3, issue 2, p. 510. [29–1411–5]

SHREDER, RIKHARD IVANOVICH. Born 1822 in Denmark; died 1903. Russian horticulturist.

Shreder settled in Russia in the late 1840's. From 1862 he was the head gardener and instructor of the Petrovskoe Agricultural Academy (now the K. A. Timiriazev Moscow Agricultural Academy). Shreder founded an extensive dendrological garden, a nursery, and a dwarf-fruit orchard-garden at the academy. He conducted experiments in acclimatizing a number of tree and shrub species. Shreder was the author of the popular and much reprinted work *The Russian Garden, Nursery, and Fruit Orchard* (1877; 10th ed., 1929). [29–1411–6]

SHREDER EQUATION, a mathematical equation relating the solubility of a crystalline body x_T at a temperature T (in °K) to its heat of melting ΔH_m (in cal/mole) and melting point T_m:

$$\ln x_T = \frac{\Delta H_m(T - T_m)}{RTT_m}$$

where R is the gas constant; ΔH_m is taken as constant in the interval T_{m-T}. The rigorous application of the Shreder equation is limited to ideal solutions. By constructing curves for the temperature dependence of the solubility of a solid phase of each of the components of a binary system using the Shreder equation, it is possible to find the eutectic point and to obtain the solubility diagram.

The Shreder equation was derived in 1890 by I. F. Shreder (Schröder). It is also known as the Shreder logarithm and the Shreder–Le Châtelier equation. (H. Le Châtelier previously had obtained an equation for solubility as a function of temperature in differential form and, using this expression, derived an equation similar to the Shreder equation in 1894.)

SHRENK, LEOPOL'D IVANOVICH. Born Apr. 24 (May 6), 1826, on the estate of Khiten', Sumy District, Kharkov Province; died Jan. 8 (20), 1894, in St. Petersburg. Russian ethnographer and naturalist. Academician of the St. Petersburg Academy of Sciences (1863). Director of the Museum of Anthropology and Ethnology in St. Petersburg (1879–94).

From 1854 to 1856, Shrenk led an expedition to the Amur River and the island of Sakhalin, where he studied the Nivkh (Giviak) and other peoples. The expedition's findings were published in a four-volume work in German, from which the material dealing with ethnography was published in Russian as *The Inhabitants of the Amur Region* (vols. 1–3, 1883–1903). Shrenk introduced the term "Paleo-Asiatic" as a designation for the ancient population of Northeast Asia.

WORKS

Reisen und Forschungen im Amur-Lande in den Jahren 1854–1856, vols. 1–4. St. Petersburg, 1859–1900. [29–1416–2]

SHREVEPORT, a city in the southern USA, in the state of Louisiana, on the right bank of the Red River. Population, 195,000 (1975; with suburbs, 350,000). Shreveport is a commercial and transportation center in an area that is rich in oil deposits; cotton is also grown extensively in the region. In 1975, 5,000 people were employed in the extraction industry, and 25,000 in manufacturing. Oil and natural gas are extracted and refined near Shreveport. The city has plants for the manufacture of chemicals, wood products, and food products. [29–1417–1]

SHROPSHIRE, a breed of semifine-wooled short-haired sheep bred for meat and wool. The breed was developed in the first half of the 19th century in Great Britain, in Shropshire and Staffordshire, by crossing dark-headed ewes with Southdown rams.

The animals are hornless. The rams weigh 80 to 120 kg, and the ewes, 70 to 90 kg. The wool is white (the face, ears, and legs are dark brown), of 54th to 56th quality; it measures about 10 cm in length and is characterized by softness and resilience. The maximum wool clip from rams is 4–6 kg, and from ewes 3–4 kg. The breed is characterized by high fertility: 150 to 170 lambs per 100 ewes. The sheep mature early and transmit their meat qualities well to offspring. They are adapted to various natural and climatic conditions.

The Shropshire sheep is raised in Great Britian, the USA, New Zealand, Australia, and other countries; in the USSR it was used to develop the Latvian Dark-head and Estonian Black-headed breeds.

SHTAKENSHNEIDER, ANDREI IVANOVICH. Born Feb. 22 (Mar. 6), 1802, near Gatchina; died Aug. 8 (20), 1865, in Moscow. Russian architect.

Shtakenshneider studied at the St. Petersburg Academy of Arts from 1815 to 1821, becoming an academician in 1834 and a professor in 1844. He built many palaces and private homes, chiefly in St. Petersburg, combining architectural styles of various periods in eclectic fashion. They include the Mariinskii Palace (1839–44, now the Executive Committee of the Leningrad Soviet of Workers' Deputies), the Belosel'skii-Belozerskii Palace (1846–48, now the Kuibyshev District Committee of the CPSU), and the Nicholas Palace (1853–61, now the Palace of Labor).

SHTALBERG, ERNEST EKABOVICH (also Ernest Iakovlevich Shtalberg; in Latvian, Ernsts Štālbergs). Born Aug. 22 (Sept. 3), 1883, in Liepāja; died June 12, 1958, in Riga. Soviet architect. Honored Science Worker of the Latvian SSR (1945). Academician of the Academy of Sciences of the Latvian SSR (1946).

Shtalberg studied under L. N. Benois at the St. Petersburg Academy of Arts, graduating in 1914. He served as rector of the academy from 1919 to 1922. Shtalberg was chairman of the administrative board of the Architects' Union of the Latvian SSR from 1945 to 1951. He taught in the architecture department of the Latvian University in Riga from 1922 to 1950, becoming a professor in 1945. His pupils included A. Reinfelds and M. Staņa.

Shtalberg collaborated with V. A. Shchuko on the Russian pavilion at the International Exhibition in Rome of 1910–11. His other major structures include an apartment house on Lomonosov Street (1930) and a university auditorium (1929–36), both in Riga, and a sanatorium near Cēsis (1936–38). In Riga he also collaborated on monuments to freedom (1931–35, sculptor K. Zāle) and to V. I. Lenin (1947–50, sculptors V. Ia. Bogoliubov and V. I. Ingal).

SHTEIMAN, STANISLAV IVANOVICH. Born Dec. 6 (18), 1887, in the village of Vaikulāni, in what is now Daugavpils Raion, Latvian SSR; died Nov. 26, 1965, in the settlement of Karavaevo, Kostroma Raion, Kostroma Oblast. Soviet zootechnician. Hero of Socialist Labor (1949); Honored Zootechnician of the RSFSR (1951). Member of the CPSU from 1939.

Beginning in 1920, Shteiman worked in the Gorinskoe and Ivanovskoe sovkhozes in Kostroma Province. In 1927 he began working in the Karavaevo Sovkhoz, first as senior zootechnician and then as chief zootechnician. He was one of the persons involved in the efforts to breed Kostroma cattle, for which he was awarded the State Prize of the USSR in 1943. Working with a team of Karavaevo stock breeders, he developed the very valuable pedigree herd that became the nucleus of the Kostroma breed. He devised a method for raising calves in unheated quarters in the winter and in the open in the summer that is currently used in the USSR and abroad. Shteiman was the author of many studies on the improvement of dairy herds.

Shteiman served as a deputy to the second, third, and fourth

convocations of the Supreme Soviet of the USSR. He was awarded six Orders of Lenin, the Order of the Red Banner of Labor, and various medals.

SHTEIN, ALEKSANDR PETROVICH. Born Sept. 15 (28), 1906, in Samarkand. Soviet Russian playwright. Member of the CPSU since 1930.

Shtein, the son of office workers, has worked as a journalist since 1923. His plays, which are mainly devoted to military and revolutionary history, include *The Spring of '21* (1939), which deals with the tragic events of the Kronstadt Anti-Soviet Rebellion in 1921 and the defeat of the counterrevolution, and *The Admiral's Flag* (1950; State Prize of the USSR, 1951), which is about the Russian naval commander F. F. Ushakov. Shtein's best plays are characterized by sharp conflicts and complex psychological characterizations. Openly tendentious, they are notable for their social commentary. They include *Talent* (1936), *The Ocean* (1961), *Between Downpours* (1964), and *Applause* (1967). The plays *A Personal Case* (1954) and *The Hotel Astoria* (1956) focus on the dramatic fates of people and the restoration of Leninist norms in party life. Shtein has also written literary-biographical dramas and screenplays, including *The Court of Honor* (1948; State Prize of the USSR, 1949), *Admiral Ushakov* (1952), *The Ships Storm the Bastions* (1953) and *A Version* (1977), as well as short stories. He has been awarded two orders and several medals.

SHTEINBERG, LEV PETROVICH. Born Sept. 3 (15), 1870, in Ekaterinosiav, now Dnepropetrovsk; died Jan. 16, 1945, in Moscow. Soviet conductor and composer. People's Artist of the USSR (1937).

Shteinberg graduated from the St. Petersburg Conservatory in 1893 and pursued further study of the piano with A. G. Rubenstein. He conducted opera in St. Petersburg and Saratov. In 1914, at the invitation of S. Diaghilev, he took part in the Russian Seasons Abroad in Paris and London. Actively involved in building ■ Soviet musical culture, he was in Kiev from 1917 to 1924 and Kharkov from 1924 to 1926; in both cities he helped organize philharmonic societies and music theaters.

In 1928, Shteinberg became a conductor at the Bolshoi Theater in Moscow. In 1937 and 1938 he was ■ professor at the Moscow Conservatory. Among his compositions are the opera *Ten Days That Shook the World*, the ballet *Mirra*, three symphonies, the cantata *October*, and the symphonic poem *Red Square*.

Shteinberg was awarded the Order of the Red Banner of Labor and various medals. [29–1465–1]

SHTEINBERG, MAKSIMILIAN OSEEVICH (also Maximilian Steinberg). Born June 22 (July 4), 1883, in Vilnius; died Dec. 6, 1946, in Leningrad. Soviet composer. Honored Art Worker of the RSFSR (1934); People's Artist of the Uzbek SSR (1944); doctor of the arts (1943).

In 1908, Shteinberg graduated from the St. Petersburg Conservatory, where he had studied composition under N. A. Rimsky-Korsakov. He composed five symphonies, the ballets *Metamorphoses* (after Ovid, 1913) and *Tyl Ulenspiegel* (after C. de Coster, 1936), symphonic works, and works for voice and orchestra. In several works he drew on the musical folklore of peoples of the USSR, notably in the Symphony No. 4 (*Turksib Symphony*, 1933), based on Kazakh and Kirghiz folk themes, and the Symphony No. 5 (1942), a rhapsody on Uzbek themes. Shteinberg was also known as a conductor.

In 1908, Shteinberg began teaching at the St. Petersburg (later Leningrad) Conservatory, where he became a professor in 1915. He served as dean of the faculty of composition from 1917 to 1931 and head of the division of conducting from 1931 to 1934; in 1939 he was named head of the subdepartment of composition. Among his students were M. Ashrafi, E. G. Brusilovskii, S. A. Chernetskii, Iu. A. Shaporin, D. D. Shostakovich, and V. V. Shcherbachev. He completed Rimsky-Korsakov's *Foundations of Orchestration*.

Shteinberg was awarded the Order of the Red Banner of Labor and a medal.

SHTEINBERG, SERGEI SAMOILOVICH. Born Sept. 26 (Oct. 8), 1872, in Moscow; died Sept. 7, 1940, in Sverdlovsk. Soviet metallurgist. Corresponding member of the Academy of Sciences of the USSR (1939).

Upon graduating from the Freiberg Mining Academy in 1906, Shteinberg worked at metallurgical plants in the Urals until 1925. At the same time, from 1920 to 1925, he was head of the electrometallurgical division of the Uralmet trust in Zlatoust. Between 1925 and 1940 he was a professor at the Urals Polytechnic Institute. From 1927 to 1930 he was head of the Urals section of the Institute of Metals, which he had organized. In 1932 he began working at the Urals Branch of the Academy of Sciences of the USSR, where in 1939 he was named head of the Institute of Metallurgy, Metal Science, and Metal Physics.

Shteinberg's main research dealt with metallurgy and with the heat treatment and alloying of steel. Shteinberg founded a school of metallurgists in the Urals.

Shteinberg was awarded the Order of the Red Banner of Labor.

SHTEINGART, ALEKSANDR MATVEEVICH. Born Apr. 23, 1887, in Odessa; died Feb. 19, 1934, in Moscow. Soviet party figure. Member of the Communist Party from 1913.

The son of a worker, Shteingart became ■ printshop worker in 1901. In the army during World War I, he carried out revolutionary work among soldiers on the Rumanian front. During the October Revolution of 1917, he served as chairman of the revolutionary committee of his corps and chairman of the corps committee of the RSDLP(B). Shteingart fought in the Civil War of 1918–20, and from 1921 to 1925 he was head of the organizational department of the Political Directorate of the Workers' and Peasants' Red Army.

From 1930 to 1932, Shteingart was a member of the collegium of the People's Commissariat of Agriculture of the RSFSR. In 1933 he became deputy director of the Political Administration of Machine Tractor Stations (MTS) of the People's Commissariat of Agriculture of the USSR; while holding that post, he served ■ head of the political sector of MTS and head of the Northern Caucasus Krai Agricultural Administration. In 1934 he became secretary of the Saratov Krai Committee of the ACP(B). In the same year he served as ■ delegate to the Seventeenth Party Congress, at which he was elected a candidate member of the Central Committee of the ACP(B).

Shteingart, who was awarded the Order of the Red Banner, is buried on Red Square by the Kremlin wall. [29–1466–1]

SHTEINGEL', VLADIMIR IVANOVICH. Born Apr. 13 (24), 1783, in the city of Obvinsk, now the village of Verkh-Iaz'va, Krasnovishersk Raion, Perm' Oblast; died Sept. 20 (Oct. 2), 1862, in St. Petersburg. Decembrist; lieutenant colonel; baron.

After graduating from the Naval Cadet School in 1799, Shteingel' served as a naval officer. He fought in the Patriotic War of 1812 as a member of the St. Petersburg volunteer corps, and from 1814 to 1817 he was adjutant to General A. P. Tormasov, the commander in chief of Moscow. An advocate of constitutional monarchy, Shteingel' joined the Northern Society of Decembrists in 1824 and helped prepare the Decembrist uprising in St. Petersburg. Although he was not present in Senate Square on Dec. 14, 1825, he was sentenced to 20 years' hard labor, at the Nerchinsk mines. Shteingel' spent the period 1835 to 1856 in exile in Siberia.

SHTELLER, PAVEL PAVLOVICH. Born Jan. 1 (14), 1910, in St. Petersburg; died Feb. 4, 1977, in Moscow. Soviet architect. Honored Architect of the RSFSR (1971).

In 1936, Shteller graduated from the architecture department of the Academy of Arts in Leningrad, where he studied under N. A. Trotskii. From 1937 to 1945 he worked under the direction of L. V. Rudnev. Shteller collaborated on several noteworthy buildings in Moscow, including the Hotel Sovetskaia (1950; State Prize of the USSR, 1951), the pavilion of the Central Chernozem Regions at the Exhibition of the Achievements of the National Economy of the USSR (1954), the Kremlin Palace of Congresses (1959–61; Lenin Prize, 1962), the Hotel Rossiia (1970), the concert hall in Zariad'e (1974), and the House of the Council of Ministers of the RSFSR (from 1968, with D. N. Chechulin and others). He headed an architectural team working on designs for Novokirovskii Prospect (1968–77), also in Moscow.

Shteller was awarded the Order of the Badge of Honor and several medals. [29–1469–3]

SHTELLING, EDUARD VASIL'EVICH. Born Apr. 28, 1850; died July 2, 1922. Russian geophysicist. Corresponding member of the St. Petersburg Academy of Sciences (1901).

Shtelling joined the staff of the Main Physical Observatory in 1874. In 1885 he was named director of the Irkutsk Magnetic and Meteorological Observatory, which he used as a base in organizing a network of meteorological stations in Siberia. Between 1897 and 1917, Shtelling was assistant director of the Main Physical Observatory and head of its division of climatology.

Shtelling's works dealt with climatology and terrestrial magnetism; he advanced an empirical formula for calculating evaporation from the surface of a water body. [29–1469–4]

SHTEMENKO, SERGEI MATVEEVICH. Born Feb. 7 (20), 1907, in the *stanitsa* (large cossack village) of Uriupinskaia, now the city of Uriupinsk, Volgograd Oblast; died Apr. 23, 1976, in Moscow. Soviet military commander; general of the army (1968). Member of the CPSU from 1930.

The son of a peasant, Shtemenko joined the Red Army in 1926. He graduated from the Sevastopol' Antiaircraft Artillery School in 1930, the Military Academy of Mechanization and Motorization of the Workers' and Peasants' Red Army in 1937, and the Military Academy of the General Staff in 1940. Beginning in 1940, he held high-level posts on the General Staff of the Red Army.

During the Great Patriotic War of 1941–45, Shtemenko was named deputy axis chief of the Operations Directorate of the General Staff in August 1941. Before becoming first deputy chief of the directorate in April 1943, he served as axis chief. In May 1943, Shtemenko was appointed chief of the Operations Directorate of the General Staff. He was assigned by the General Headquarters of the Supreme Command in 1942 to help organize and conduct the operations of the Transcaucasian Front. He carried out similar assignments for the Black Sea and Northern groups of forces and the Separate Primor'e Army in 1943 and for the First, Second, and Third Baltic fronts, the Western Front, the Fourth Ukrainian Front, and the Second Byelorussian Front in 1944.

After the war, Shtemenko served as deputy chief of the General Staff. He was chief of the General Staff and deputy minister of the armed forces of the USSR from November 1948 to June 1952. Beginning in June, he held high-level troop-command positions. Shtemenko was named chief of staff and first deputy commander in chief of the ground forces in July 1962, deputy chief of the General Staff of the Armed forces of the USSR in April 1964, and chief of staff of the Joint Armed Forces of the member countries of the Warsaw Pact in August 1968.

Shtemenko was a candidate member of the Central Committee of the CPSU from 1952 to 1956. He was awarded the Order of Lenin, three Orders of the Red Banner, two Orders of Suvorov First Class, the Order of Kutuzov First Class, the Order of Suvorov Second Class, the Order of the Red Banner of Labor, the Order of the Red Star, the Order for Service to the Motherland in the Armed Forces of the USSR Third Class, and various medals and foreign orders. Shtemenko was the author of *The General Staff in the War Years* (parts 1–2, 1968–73). [29–1470–1]

SHTERENBERG, DAVID PETROVICH. Born July 14 (26), 1881, in Zhitomir; died May 1, 1948, in Moscow. Soviet painter and graphic artist.

From 1907 to 1917, Shterenberg lived in Vienna and in Paris, where he attended the Academy of Arts and the Vitti Academy. He was head of the art department of the People's Commissariat of Education from 1918 to 1920. Shterenberg was one of the organizers and the chairman of the Society of Easel Painters from 1925 to 1930. He taught in the State Free Art Workshops, the Vkhutemas, and the Vkhutein in Moscow between 1920 and 1930.

As an active supporter of Western modernist trends, Shterenberg took a one-sided approach to the tasks of reinterpreting the artistic heritage for the new revolutionary society. His works are distinguished for their strikingly expressive imagery and laconic composition, as well as for the precision of their abstracted forms and flatness of composition. Notable examples include *Anis'ka*, (1926), *The Agitator* (1927), and *The Old* (1927), all at the Tret'iakov Gallery in Moscow, and *Still Life With Lamp* (1920), at the Russian Museum in Leningrad. [29–1471–2]

SHTERN, GRIGORII MIKHAILOVICH. Born July 24 (Aug. 6), 1900, in the village of Smela, now a city in Cherkassy Oblast, Ukrainian SSR; died Oct. 28, 1941. Soviet military leader; colonel general (1940). Hero of the Soviet Union (Aug. 29, 1939). Member of the CPSU from 1919.

The son of a physician, Shtern graduated from a *Gymnasium* in 1918 and enlisted in the Red Army in March 1919. Between August 1919 and December 1920 he engaged in political work in the 46th Rifle Division of the Southern Front as military commissar of a regiment and of a brigade and as a worker in the division's political section. He was military commissar of a regiment, of the headquarters of the 3rd Rifle Division, and of the First Horse Cavalry Corps between 1921 and 1923. Between November 1923 and May 1925, on the Turkestan Front, Shtern took part in the struggle against the Basmachi, serving as military commissar of a cavalry brigade and as commander of special-assignment units of the Khorezm Group of Forces.

Shtern completed advanced courses for higher command personnel at the M. V. Frunze Military Academy in 1926 and graduated from the eastern department of the academy in 1929. Between 1929 and 1936 he carried out particularly important assignments for the people's commissar for military and naval affairs (from 1934, the people's commissar of defense of the USSR). During the National Revolutionary War in Spain, Shtern was the chief military adviser for the republican government from January 1937 to April 1938.

Shtern was appointed chief of staff of the Far Eastern Front in May 1938. In August of that year he directed the combat opera-

tions of the Soviet forces in the Soviet-Japanese conflict at Lake Khasan. From the autumn of 1938 to June 1939, Shtern commanded the First Red Banner Separate Far Eastern Army. He led a frontline group for the coordination of operations of the Soviet and Mongolian forces in the Soviet-Japanese conflict on the Khalkin-Gol River in August 1939 and commanded the Eighth Army during the Soviet-Finnish War of 1939–40. Shtern served as commander of the Far Eastern Front from January to April 1941 and headed the Air Defense Directorate of the People's Commissariat of Defense from April to June of that year.

Shtern was a member of the Central Committee of the ACP(B) from 1939 to 1941. Shtern was awarded two Orders of Lenin, three Orders of the Red Banner, and the Order of the Red Star. [29–1472–1]

SHTERN, LINA SOLOMONOVNA (also Lina Šterna). Born Aug. 14 (26), 1878, in Liepāja, in what is now the Latvian SSR; died Mar. 7, 1968, in Moscow. Soviet physiologist. Academician of the Academy of Sciences of the USSR (1939) and the Academy of Medical Sciences of the USSR (1944). Member of the CPSU from 1938.

After graduating from the University of Geneva in 1903, Shtern taught there, becoming a professor in 1917. In 1925 she moved to the USSR. From 1925 to 1948 she was head of the subdepartment of physiology of the Second Moscow Medical Institute, and from 1929 to 1948 she was also director of the Institute of Physiology of the Academy of Sciences of the USSR. From 1954 to 1968 she was head of the physiology section of the Institute of Biophysics of the Academy of Sciences of the USSR.

Shtern's main works dealt with the chemical and physicochemical bases of the vital functions of humans and animals. Shtern developed the concept of barrier functions and demonstrated the importance of such functions in maintaining the stability of the internal environment (homeostasis). She thoroughly investigated the blood-brain barrier. Her studies on the significance of nonspecific metabolic products (metabolites) in the functioning of the organism played a major role in elucidating the humoral regulation of functions.

Shtern received the State Prize of the USSR in 1943. She was awarded two orders.

SHTERNBERG, LEV IAKOVLEVICH (also Sternberg). Born Apr. 21 (May 3), 1861, in Zhitomir; died Aug. 14, 1927, in Dudergof, now the settlement of Mozhaiskii, Lomonosov Raion, Leningrad Oblast. Soviet ethnographer. Corresponding member of the Academy of Sciences of the USSR (1924).

Shternberg became a professor at Leningrad University in 1918. He was exiled to Sakhalin (1889–97) for participation in various activities of the People's Will. There he studied the ethnography of the Nivkh (Giliak) and found that they had a clan system with a kinship hierarchy and vestiges of group marriage, as noted by Engels (see K. Marx and F. Engels, *Soch.*, 2nd ed., vol. 22, pp. 364–67). Beginning in 1901, he worked in the Museum of Ethnography and Anthropology in Leningrad. Shternberg demonstrated the unity of mankind from the standpoint of evolutionary theory. He regarded ethnography as a science concerned with the culture of primitive peoples and its vestiges. Shternberg made an important contribution to the study of primitive religion (the concepts of supernatural overlords and divine election, outline of the stages of evolution of religions).

SHTERNBERG, PAVEL KARLOVICH. Born Mar. 21 (Apr. 2), 1865, in Orel; died Feb. 1, 1920, in Moscow. Soviet astronomer; revolutionary figure. Member of the Communist Party from 1905.

The son of a small-scale contractor, Shternberg graduated from the physics and mathematics faculty at Moscow University in 1887. He was named a professor there in 1914 and became director of the Moscow Observatory in 1916.

Between 1905 and 1908, Shternberg was a member of a financial commission of the Moscow committee of the RSDLP and served in the committee's military technical office. During the February Revolution of 1917 he was a member of the party's Moscow committee, a member of the Central Headquarters of the Red Guard in the Moscow city soviet, and a member of the Moscow military revolutionary committee. He also directed combat operations in Zamoskvorech'e Raion.

After the October Revolution of 1917, Shternberg became a member of the presidium of the Moscow provincial executive committee and head of the provincial military committee. He served on the collegium of the People's Commissariat for Education in 1918 and headed its department of higher educational institutions. Shternberg was chosen a member of the Revolutionary Military Council of the Second Army in September of that year and a member of the Revolutionary Military Council of the Eastern Front in October 1919.

Shternberg's principal works dealt with gravimetry and photographic astrometry. He was one of the first to use photography in the measurement of binary stars, and he studied the motion of the earth's poles. In 1931, the Institute of Astronomy at Moscow University was named for Shternberg.

SHTERNFEL'D, ARI ABRAMOVICH (also A. A. Sternfeld). Born May 14, 1905, in Sieradz, Poland; died July 5, 1980, in Moscow. Soviet scientist; pioneer in astronautics. Doctor of technical sciences *honoris causa* of the Academy of Sciences of the USSR (1965). Honored Worker in Science and Technology of the RSFSR (1965).

Shternfel'd studied at the University of Kraków in 1923 and 1924. He graduated from the University of Nancy, France, in 1927 and conducted research at the Sorbonne in astronautics from 1928 to 1930. After emigrating to the USSR in 1935, he joined the staff of the Jet Scientific Research Institute.

Shternfel'd's principal works dealt with the calculation of the most energy-efficient flight trajectories for spacecraft. Shternfel'd received the REP-Hirsh International Astronautical Prize in 1934 and, for oustanding achievements in space science, the Galabert Prize in 1963.

SHTEROVKA, an urban-type settlement in Voroshilovgrad Oblast, Ukrainian SSR, under the jurisdiction of the Krasnyi Luch city soviet. Shterovka is situated 7 km from the Petroven'ka railroad station on the Chernukhino-Dolzhanskaia line. The settlement's population works in the city of Krasnyi Luch. [29–1476–3]

SHTIGLITS SCHOOL OF DESIGN (full name, Baron Shtiglits Central School of Design; TsUTR), a school founded in 1876 in St. Petersburg under the patronage of A. L. Shtiglits. Opened with the Primary School of Drawing, Drafting, and Sculpting in 1879, the Shtiglits School merged with the Petrograd Vkhutein (Higher Art and Technical Institute) in 1922. Its purpose was to prepare individuals for teaching drawing and decorative applied art in industrial arts schools. A number of outstanding Russian and Soviet artists studied at the school, including M. G. Manizer, I. N. Pavlov, and A. F. Pakhomov.

In 1945, the Shtiglits School was reorganized into what is now the V. I. Mukhina Leningrad Higher Industrial Arts School.
[29–1478–1]

SHTIURMER, BORIS VLADIMIROVICH. Born 1848; died Aug. 20 (Sept. 2), 1917, in Petrograd. Russian state figure; large-scale *pomeshchik* (landowner).

After graduating from the faculty of law at the University of St. Petersburg, Shtiurmer served in the ministries of justice and the court. In 1894 he was named governor of Novgorod Province, and in 1896 he became governor of Yaroslavl Province. Appointed director of the Department of General Affairs of the Ministry of the Interior in 1902, he became one of V. K. Pleve's closest associates. Shtiurmer was appointed to the Council of State in 1904. On Jan. 20, 1916, with the support of G. E. Rasputin, he was named chairman of the Council of Ministers; from Mar. 3 (16) to July 7 (20), 1916, he also served as minister of the interior, and on July 7 (20) he was appointed minister of foreign affairs.

Shtiurmer fought against the revolutionary movement and bourgeois opposition. On Nov. 10 (23), 1916, he was released from his duties. After the February Revolution of 1917, Shtiurmer was arrested; he died in the Peter and Paul Fortress.
[29–1510–2]

SHTOF, an old unit of liquid measure, equal to 1.2299 liters. The term was also applied to a distinctive type of bottle for strong alcoholic beverages with a capacity of 1 *shtof*. Such bottles were usually of glass and had a squat, cubelike shape. [29–1487–3]

SHTOF, a decorative woven fabric with a combination or other weave, piece-dyed, and with an elaborate, large-figured textural design. Such fabrics, produced primarily from chemical threads, are used for furniture coverings, wall coverings, and curtains.
[29–1487–4]

SHTOGARENKO, ANDREI IAKOVLEVICH. Born Oct. 2 (15), 1902, in the village of Novye Kaidaki, in what is now Dnepropetrovsk Oblast. Soviet composer. People's Artist of the USSR (1972). Member of the CPSU since 1944.

Shtogarenko graduated from the Kharkov Conservatory in 1936. From 1954 to 1968 he served as rector of the Kiev Conservatory, where he became a professor in 1960. In 1968 he became chairman of the administrative board of the Composers' Union of the Ukraine.

Shtogarenko is known primarily for his symphonic and vocal music. He has developed in a variety of ways the subject of the Great Patriotic War of 1941–45, notably in the cantata-symphony *My Ukraine* (State Prize of the USSR, 1946). Among his other compositions are the symphonic suite *In Memory of Lesia Ukrainka* (State Prize of the USSR, 1952) and three symphonies, including the *Kiev Symphony* (T. G. Shevchenko State Prize of the Ukrainian SSR, 1974).

Shtogarenko has been awarded the Order of Lenin, the Order of the October Revolution, and the Order of the Red Banner of Labor.

SHTOKOLOV, BORIS TIMOFEEVICH. Born Mar. 19, 1930, in Kuznetsk. Soviet Russian singer (bass). People's Artist of the USSR (1966).

Shtokolov graduated from the Urals Conservatory in Sverdlovsk in 1954. He apprenticed at the Sverdlovsk Theater of Opera and Ballet from 1951 until 1954, when he became a soloist. In 1959 he became a soloist at the S. M. Kirov Theater of Opera and Ballet in Leningrad.

Shtokolov, a leading Soviet vocalist, possesses a beautiful, expressive voice and portrays his characters vividly and convincingly. His roles have included the Miller in Dargomyzhskii's *The Mermaid*, Susanin and Ruslan in Glinka's *Ivan Susanin* and *Ruslan and Liudmila*, Godunov and Dositheos in Mussorgsky's *Boris Godunov* and *Khovanshchina*, the title role in Rubinstein's *The Demon*, Gremin in Tchaikovsky's *Eugene Onegin*, Mephistopheles in Gounod's *Faust*, Don Basilio in Rossini's *The Barber of Seville*, and Andrei Sokolov in Dzerzhinskii's *The Fate of a Man*. He also performs on the concert stage and has toured abroad.

Shtokolov has been awarded two orders and several medals.
V. I. ZARUBIN [29–1483–2]

SHTORKH, ANDREI KARLOVICH (also Heinrich Friedrich Storch). Born Feb. 18 (Mar. 1), 1766, in Riga; died Nov. 1 (13), 1835, in St. Petersburg. Russian economist, historian, and bibliographer. Academician of the St. Petersburg Academy of Sciences (1804); the academy's vice-president (1830).

Shtorkh studied at the universities of Jena and Heidelberg from 1784 to 1787. After returning to Russia, he taught history and literature at the St. Petersburg Cadet Corps. For 20 years, beginning in 1799, he tutored the children of the imperial family. With F. P. Adelung he compiled *The Systematic Review of Literature in Russia During the Five-year Period 1801–1806* (parts 1–2, 1810–11), which exhaustively surveyed the works printed in Russia in the indicated period and which marked the beginning of Russian book statistics.

Shtorkh wrote a textbook on political economy that gained wide recognition in the early 19th century. In economic theory, he borrowed a number of ideas, such as the theory of wages and profits, from A. Smith; he rejected Smith's theory of labor value, however, siding with T. Malthus on several issues. Although he demonstrated the advantage of free over serf labor, Shtorkh asserted that Russian agriculture could develop successfully under serfdom. Shtorkh was a member of 21 academies and scholarly societies.

SHTORM, GEORGII PETROVICH. Born Sept. 12 (24), 1898, in Rostov-on-Don; died Apr. 27, 1978. Soviet Russian writer and literary historian.

The son of an office worker, Shtorm studied in the department of history and philology at Don University (now the University of Rostov) from 1919 to 1921. He was first published in 1921. Shtorm's *Tale of Bolotnikov* (1930) was praised by M. Gorky. In the 1930's he published the scholarly historical works *The Bishop's Move* (also known as *A Lot of Daily Life*; 1930) and *The Works and Days of Mikhail Lomonosov* (1932). He was the author of a poetic translation of *The Tale of Igor's Campaign* (1934) and of documentary-biographical books dealing with heroes of the Russian Navy, including *F. F. Ushakov* (1947) and *Pages of Naval Glory* (1954). His diligent archival research resulted in *The Hidden Radishchev: The Second Life of "A Journey From St. Petersburg to Moscow"* (1965). Shtorm was awarded the Order of the Red Banner of Labor and various medals.

SHTRAUKH, ENGEL'BERT MADISOVICH (also Engelbert Strauch). Born Jan. 10 (22), 1896, in Helsingfors (Helsinki); died Apr. 21, 1938. Participant in the struggle for Soviet power in Estonia; party figure. Member of the Communist Party from 1912.

The son of a worker, Shtraukh became a metalworker in 1911 in the naval port of the city of Revel (now Tallinn). After the February Revolution of 1917, he was a member of the Revel soviet and chairman of the naval port and Revel committees of the RSDLP(B). During the October Days of 1917, he served as a member of the presidium of the city's revolutionary committee, chairman of its revolutionary tribunal, and commissar for foodstuffs.

In 1918, during the Ice Campaign of the Baltic Fleet, Shtraukh helped organize the transfer of ships from Revel to Helsingfors. Between 1918 and 1921 he served as chairman of the collegium for foodstuffs of Omsk Province, and he took part in the struggle against the forces of A. V. Kolchak and the White Czechs; during the same period he also served as commissar for foodstuffs of Omsk and deputy commissar for foodstuffs of Tomsk Province. In 1921 and 1922, Shtraukh was secretary of the Russian Bureau of the Communist Party of Estonia (in Petrograd) and a member of the Central Committee of the Communist Party of Estonia. From 1922 he served in the People's Commissariat for Foodstuffs of the RSFSR, the Central Control Commission and Workers' and Peasants' Inspectorate of the RSFSR, and the apparatus of the Council of People's Commissars of the RSFSR.

Shtraukh was a delegate to the Fifteenth through Seventeenth Congresses of the ACP(B), and from 1927 to 1934 he served as a member of the Central Control Commission of the ACP(B). In 1921, Shtraukh was a delegate to the Third Congress of the Comintern. [29–1491–2]

SHTRAUKH, MAKSIM MAKSIMOVICH (Maxim Strauch). Born Feb. 11 (24), 1900, in Moscow; died there Jan. 3, 1974. Soviet Russian actor. People's Artist of the USSR (1965).

From 1921 to 1924, Shtraukh appeared with the Workers' Theater of the Proletkul't. He performed from 1929 to 1931 with the Meyerhold Theater, and in 1932 he joined the Moscow Theater of the Revolution (now the Mayakovsky Theater). In the experimental films of S. M. Eisenstein and the plays staged by V. E. Meyerhold, Shtraukh displayed a flair for extravagance and a socially oriented grotesque style. He portrayed satirical characters in plays by Mayakovsky, including Pobedonosikov in *The Bathhouse* and Prisypkin in *The Bedbug*. In a number of roles, however, he revealed a talent as a master of subtle, profoundly human psychological portraits, for example, as Rubinchik in Zarkha's *Street of Joy* and the Chief in Pogodin's *My Friend*. Shtraukh's supreme creative achievement was his deeply realistic portrayal of V. I. Lenin in a number of plays and in films directed by S. I. Iutkevich, including *Man With a Gun* (1938), *Stories of Lenin* (1958), and *Lenin in Poland* (1966). Also among his major cinematic roles were the Sleuth in *Strike* (1925), the Detective in *The Ghost That Doesn't Return* (1930), and Tibo in *Murder on Dante Street* (1956).

Shtraukh was awarded the Lenin Prize in 1959 and the State Prize of the USSR in 1949 and twice in 1951. He was awarded the Order of Lenin, two other orders, and several medals.

SHTROMBERG, ALEKSANDR PAVLOVICH. Born Sept. 5 (17), 1854; died Oct. 10 (22), 1884. Revolutionary and member of the People's Will; naval lieutenant; baron.

Shtromberg graduated from the St. Petersburg Naval School in 1875 and served in the Baltic Sea and the Pacific Ocean. In 1880 he helped organize a revolutionary circle of sailors at Kronstadt, and, together with A. I. Zheliabov, N. N. Kolodkevich, N. M. Rogachev, and N. E. Sukhanov, he directed the Central Military Organization of the People's Will.

In late April 1881, Shtromberg was arrested. Because of insufficient evidence, his sentence was merely exile to Verkholensk. Betrayed by S. P. Degaev in 1883, he was recalled from exile and sentenced to death in the Trial of the 14. Shtromberg and Rogachev were hanged at Shlissel'burg Fortress.

SHTUTSER, the Russian term for a type of firearm with a rifled bore, loaded from the muzzle; a forerunner of the rifle. Such weapons first appeared in Germany in the 16th century, and in the early 17th century a few were used by troops in Poland and Bavaria. By the end of the 17th century all noncommissioned infantry officers in the Prussian and Swedish services were armed with *shtutsery*, and by the end of the 18th century noncommissioned officers in the French armies were also so armed. *Shtutsery* appeared in Russia in the 18th century; they were first manufactured in Tula in 1726. Rifle battalions were established in the Russian army in 1843, and the best marksmen, called *shtutsernye*, were assigned six to a company in infantry regiments. After the rearming of all armies in the second half of the 19th century with breech-loading rifles, the Russian term was reserved for certain types of hunting rifles (*see* GUNS, SPORTING). [29–1506–2]

SHTYK-IUNKER, the lowest junior-officer rank in the Russian artillery. Introduced in 1712 by Peter I, the rank *shtyk-iunker* existed until the late 18th century and corresponded to the 13th class in the Table of Ranks. [29–1509–1]

SHTYKOV, TERENTII FOMICH. Born Feb. 28 (Mar. 13), 1907, in the village of Liubki, in what is now Gorodok Raion, Vitebsk Oblast; died Oct. 25, 1964, in Moscow. Soviet party and military figure; colonel general (1944). Member of the CPSU from 1929.

The son of a peasant, Shtykov graduated from a vocational-technical school in 1927. In 1938 he became second secretary of the Leningrad oblast committee of the ACP(B), and during the Soviet-Finnish War of 1939–40 he served concurrently as a member of the Military Council of the Seventh Army. During the Great Patriotic War of 1941–45, he was a member of the military councils of the Northwestern Front (1941–42), the Leningrad Front (1942–43), the Volkhov Front (1943–44); and the Karelian Front (1944). In April 1945 he became a member of the Military Council of the Primor'e Group of Forces, and from August 1945 to October 1945 he was a member of the Military Council of the First Far Eastern Front.

After the war, Shtykov served from 1945 to 1947 as a member of the Military Council of the Primor'e Military District, and in 1947 and 1948 he was deputy commander for political matters in the military district. He was ambassador extraordinary and plenipotentiary of the USSR to the People's Democratic Republic of Korea from 1948 to 1951. From 1951 to 1959 he engaged in party work in such capacities as the secretary of oblast and krai committees. Shtykov became ambassador extraordinary and plenipotentiary of the USSR to the Hungarian People's Republic in April 1959. In 1961 he was named chairman of the Commission of State Control of the Council of Ministers of the RSFSR, and in February 1963 he became deputy chairman of the Committee of Party and State Control of the Bureau for the RSFSR of the Central Committee of the CPSU and the Council of Ministers of the RSFSR. He was a candidate member of the Central Committee of the ACP(B) from 1939 to 1952 and a member of the Central Committee of the CPSU from 1956 to 1961.

Shtykov served as a deputy to the first, second, fourth, and fifth convocations of the Supreme Soviet of the USSR. Shtykov was awarded three Orders of Lenin, the Order of the Red Banner, the Order of Suvorov First Class, three Orders of Kutuzov First Class, and various medals. [29–1508–3]

SHTYRBUL, KIRILL ANTONOVICH (surname also spelled Shtirbul, Shtirbu). Born Feb. 17 (Mar. 2), 1915, in the village of Brushteny, Rybnitsa Raion. Soviet Moldavian actor. People's Artist of the USSR (1960). Member of the CPSU since 1947.

Shtyrbul graduated from the theatrical school in Odessa in 1937 and joined the First Moldavian Drama Theater in Tiraspol'

(now the Moldavian Pushkin Academic Music and Drama Theater in Kishinev). He was one of the first actors to depict V. I. Lenin on the Moldavian stage, in Pogodin's *The Kremlin Chimes* and *Man With a Gun* and Shatrov's *In the Name of Revolution*. His best roles were Shvandia in Trenev's *Liubov' Iarovaia*, Truffaldino in Goldoni's *The Servant of Two Masters*, the Mayor in Gogol's *The Inspector-General*, and the title roles in Shakespeare's *King Lear* and Brecht's *Schweik in the Second World War*. Shtyrbul's outstanding roles in musicals were Foma in Dunaevskii's *Free Wind* and Susik in Miliutin's *Trembita*.

Shtyrbul, a member of the Central Committee of the Communist Party of Moldavia from 1963 until 1976, was a deputy to the second through fourth convocations of the Supreme Soviet of the Moldavian SSR. In 1970, Shtyrbul won the State Prize of the Moldavian SSR. He has been awarded the Order of Lenin, the Order of the October Revolution, the Order of the Red Banner of Labor, and several medals. [29–1509–2]

SHUAMTA (also Dzveli-Shuamta or Staraia Shuamta; that is, Old Shuamta), a complex of medieval churches located 7 km southwest of Telavi, Georgian SSR. The main structures are a fifth-century basilica and two seventh-century domed churches, including one large structure similar in style to Dzhvari and one smaller church. Located 2 km from Dzveli-Shuamta is Akhali-Shuamta (Novaia Shuamta or New Shuamta), a 16th-century monastery with a domed church of the 16th or 17th century with 16th-century interior paintings. [29–1510–5]

SHUB, ESFIR' IL'INICHNA. Born Mar. 4 (16), 1894, in Moscow; died there Sept. 21, 1959. Soviet director of documentary films. Honored Artist of the RSFSR (1935).

Shub began her career in the cinema in 1922. Along with D. Vertov, she was among the first Soviet artists to introduce social commentary into the visual arts. She created the distinctive genre of the historical-documentary montage film. Her films *The Fall of the Romanov Dynasty* (1927, made from prerevolutionary newsreels), *The Great Path* (1927), and *Nicholas II's Russia and Leo Tolstoy* (1928) were vivid documents of great social impact. Shub later made films using footage from contemporary newsreels, including *Moscow Builds a Metro* (1934), *The Land of the Soviets* (1937), *Spain* (1939), and *The Face of the Enemy* (1941). From 1943 to 1953 she worked at the Central Documentary Film Studio. She was director of the newsreel *News of the Day* and held other positions. Shub was the author of the book *Close-up* (1959).

Shub was awarded the Order of the Badge of Honor and several medals. [29–1511–1]

SHUBARKUDUK, an urban-type settlement and the administrative center of Temir Raion, Aktiubinsk Oblast, Kazakh SSR. Shubarkuduk has a railroad station on the Gur'ev-Orsk line, 179 km southwest of Aktiubinsk. The settlement has enterprises serving railroad transportation. [29–1511–2]

SHUBARSHI, an urban-type settlement in Temir Raion, Aktiubinsk Oblast, Kazakh SSR. Shubarshi is situated on the Temir River (a right tributary of the Emba), 125 km southeast of the Shubarkuduk railroad station on the Gur'ev-Orsk line. Oil is extracted near the settlement. [29–1511–4]

SHUBERT, FEDOR IVANOVICH. Born Oct. 19 (30), 1758, in Helmstadt, Germany; died Oct. 10 (22), 1825, in St. Petersburg. Russian astronomer and geodesist. Member of the St. Petersburg Academy of Sciences from 1789.

Shubert was named head of the observatory of the St. Petersburg Academy of Sciences in 1804. He published a university-level textbook on theoretical astronomy in 1798 and conducted magnetic observations along the route extending from St. Petersburg through Kazan and Tobol'sk to Irkutsk in 1805. Shubert helped found the naval astronomical observatories at Kronstadt and Nikolaev.

Shubert was the author of *A Guide to Astronomical Observations Used in Determining Latitude and Longitude* (1803). In 1813 he began publishing annually *Morskoi mesiatseslov* (Maritime Calendar), which was used by the navy. Shubert was also the author of *Popular Astronomy* (parts 1–3, 1804–10), which explained the universe in accessible language.

SHUBIN, FEDOT IVANOVICH. Born May 17 (28), 1740, in the village of Tiuchkovskaia, in what is now Arkhangel'sk Oblast; died May 12 (24), 1805, in St. Petersburg. Russian sculptor; one of the greatest representatives of enlightened classicism in 18th-century Russian art.

Shubin, the son of a peasant from the White Sea coast, did bone carvings as a child. He arrived in St. Petersburg in 1759, and from 1761 to 1767 he studied at the Academy of Arts there under N. F. Gillet. He received a stipend to study at the Academy of Arts in Paris, where he was a pupil of J. B. Pigalle from 1767 to 1770; he also studied in Rome from 1770 to 1772.

The classical clarity and realistic precision of Shubin's early works, for example, *F. N. Golitsyn* (marble, 1771, Tret'iakov Gallery), reveal the influence of ancient Greek art. In 1773, upon returning to St. Petersburg, Shubin created portraits, preferring to use marble because its soft texture enabled him to achieve many beautiful subtle effects. A master at sculpting the human face, he skillfully utilized the great variety of effects possible with circular carving motions, combining them to create an artistically successful likeness of the subject.

Shubin emphasized imposing dignity and grandeur in his portrait busts, notably *A. M. Golitsyn* (marble, 1775, Tret'iakov Gallery). Creating an impression of inner strength and vigor, he made an unprepossessing face seem inspired, for example, *Z. G. Chernyshev* (1774, Tret'iakov Gallery) and *P. A. Rumiantsev-Zaduniskii* (1778, Russian Museum, Leningrad), both in marble. He was remarkably successful in revealing the complex inner world of his subject in a marble portrait of an unidentified man (mid-1770's, Tret'iakov Gallery).

In the years 1774–75, Shubin executed 58 medallions depicting Russian princes and tsars for the Chesmé Palace (marble, State Armory, Moscow), and in 1789–90 he created the statue *Catherine II, the Legislator* for the Tauride Palace (marble, Russian Museum). In the 1770's and 1780's he also did numerous monumental decorative works in marble, such as the statues and relief works for the Marble Palace (1775–82) and for the Troitskii Cathedral of the Alexander Nevsky Laura (1786–89).

Shubin reached an exceptional degree of precision and truthfulness of characterization in his portraits of the 1790's, such as *G. A. Potemkin-Tavricheskii* (marble, 1791), *E. M. Chulkov*, *M. V. Lomonosov* (gypsum, 1792), and *A. A. Bezborodko* (marble, c. 1798), all of which are housed at the Russian Museum. His bust *Paul I* (marble, 1797 [?], Russian Museum) is a complex work of uncommon psychological depth.

Shubin spent the last years of his life in poverty, largely owing to the hostility of the ruling circles toward his art.

SHUBIN, PAVEL NIKOLAEVICH. Born Mar. 14 (27), 1914, in the village of Chernavsk, Elets District, Orel Province; died Apr. 11, 1951, in Moscow. Soviet Russian poet.

The son of an artisan, Shubin graduated from the A. I. Herzen Leningrad Pedagogical Institute in 1938. He depicted the variegated beauty of the Russian countryside in his poetry collections *Wind in the Face* (1937) and *The Sail* (1940), which contain vivid word paintings. Shubin's best poems—including "Fidelity," "Half an Instant," "The Attack" and "The Driver"—depict the bravery of soldiers and contain reflections on Russia, fidelity, and love. Shubin was awarded two orders and various medals.

SHUBIN, SEMEN PETROVICH. Born July 18 (31), 1908, in Liepāja, in what is now the Latvian SSR; died Nov. 28, 1938. Soviet theoretical physicist; doctor of physical and mathematical sciences (1935).

Shubin graduated from Moscow State University in 1927. He was a member of the staff of the Urals Physicotechnical Institute (now the Institute of Physics of Metals of the Urals Scientific Center of the Academy of Sciences of the USSR, in Sverdlovsk) from 1932 to 1937. In 1935, Shubin was named a professor at the Urals Physicomechanical Institute (later a department of the Urals Polytechnic Institute).

Shubin's principal works dealt with the classical vibration theory, the quantum theory of solids, and quantum theory in general. He and I. E. Tamm formulated a quantum theory of the photoelectric effect in metals in 1931, and Shubin advanced a band theory of liquid metals in 1933. Between 1934 and 1936, Shubin and S. V. Vonsovskii constructed polar and *s-d* exchange models of crystals.

SHUBINKA, a very old Russian variety of cherry. The fruits are small and dark red; the firm flesh is somewhat tart, with a bitter astringent aftertaste. Shubinka cherries ripen in early August but do not fall from the tree immediately. The cherries are usually processed into jam, juice, or wine. The trees grow vigorously and are well foliated; they are winter-hardy and resistant to many diseases. Fruit production first occurs in the seventh or eighth year. The annual fruit yield from one tree is 6–11 kg. The Shubinka variety is grown in the central zone of the RSFSR. [29–1516–1]

SHUBINSKII, SERGEI NIKOLAEVICH. Born June 2 (14), 1834, in Moscow; died May 28 (June 10), 1913, in St. Petersburg. Russian historian and journalist.

A graduate of the Moscow Institute of the Nobility, Shubinskii served in the military from 1854 until 1887, achieving the rank of major general. He was a popularizer of Russian history of the 18th and first half of the 19th centuries. From 1875 to 1879 he edited the journal *Drevniaia i novaia Rossiia* (Ancient and New Russia); in 1880 he founded and became the editor of *Istoricheskii vestnik* (Historical Journal). Shubinskii held conservative, monarchist views.

SHUBNIKOV, ALEKSEI VASIL'EVICH. Born Mar. 17 (29), 1887, in Moscow; died there Apr. 27, 1970. Soviet crystallographer. Academician of the Academy of Sciences of the USSR (1953; corresponding member, 1933). Hero of Socialist Labor (1967).

Shubnikov graduated from Moscow University in 1912. He then worked at the Shaniavskii People's University under G. V. Vul'f. From 1920 to 1925 he was a professor at the Urals Mining Institute. Beginning in 1925, he worked at the Academy of Sciences of the USSR. In 1937 he became head of the crystallography laboratory of the Academy of Sciences of the USSR, and in 1944, director of the Institute of Crystallography, which was founded on his initiative. Beginning in 1953, Shubnikov was a professor and head of a subdepartment at Moscow State University.

Shubnikov's main works dealt with crystal physics, symmetry, the formation and growth of crystals, and applications of crystals. Shubnikov laid the foundations for the generalizations of crystallographic symmetry, thus creating the study of antisymmetry. He developed the symmetry approach in the investigation and description of the properties of single crystals and polycrystals. Shubnikov predicted the existence of and was the first to create piezoelectric textures. One of the first to study crystal growth, he was instrumental in developing modern techniques for growing and processing crystals.

Shubnikov received the State Prize of the USSR in 1947 and 1950. He was awarded two Orders of Lenin, two other orders, and various medals.

Izbr. trudy po kristallografii. Moscow, 1975. [29–1517–3]

SHUBNIKOV, LEV VASIL'EVICH. Born Sept. 29, 1901; died 1945. Soviet physicist. Doctor of sciences in physics and mathematics.

After graduating from the Leningrad Polytechnic Institute in 1926, Shubnikov was sent to the Cryogenic Laboratory in Leiden. In 1930 he joined the staff of the Ukrainian Physicotechnical Institute. In 1931 he was made the director of the USSR's first cryogenic laboratory, which was established at the Ukrainian Physicotechnical Institute. In 1934, Shubnikov became a professor at the University of Kharkov.

Shubnikov's early scientific works dealt with the growth of single crystals of metals and—together with I. V. Obreimov—the plastic deformation and hardening of crystals. In 1930, together with the Dutch scientist W. de Haas, Shubnikov discovered the phenomenon of a periodic change in the resistance of bismuth as a function of a magnetic field at low temperatures. Shubnikov studied the magnetic properties of superconductors and of alloys as well as the temperature dependence of heat capacity at low temperatures. He brought about the transition of a substance from the paramagnetic state to the antiferromagnetic state.

Balabekian, O. I. "Lev Vasil'evich Shubnikov." *Uspekhi fizicheskikh nauk*, 1966, vol. 89, issue 2. (Contains a bibliography.) [29–1517–4]

SHUBNIKOV–DE HAAS EFFECT, an oscillating dependence of the electrical resistivity ρ of single crystals of metals on the reciprocal of the strength of a magnetic field $1/H$. The effect, which is observed at low temperatures, was discovered by L. V. Shubnikov and W. de Haas in 1930 in single crystals of Bi.

The oscillation period is related to the area of extreme sections of the Fermi surface and depends on the direction of the field **H** with respect to the crystallographic axes. The oscillation amplitude decreases exponentially as temperature increases.

The Shubnikov–de Haas effect makes it possible to determine both the shape of the Fermi surface and the electronic energy spectrum. The nature of the Shubnikov–de Haas effect is the same as that of the de Haas–Van Alphen effect. [29–1518–1]

SHU CHING (Book of Historical Legends, Book of History, Book of Documents; also *Shang Shu* [Ancient Writing]), a work of ancient Chinese literature.

The *Shu Ching* contains material on the history of China from the rule of the legendary ruler Yao (third millennium B.C.) to 624 B.C. The oldest parts apparently date to the period between the 14th and 11th centuries B.C. According to tradition, it was compiled by Confucius. In 213 B.C., the *Shu Ching* was burned along with the other Confucian classics, but it was reproduced in the second century B.C., partly from memory (the "new text," which modern scholarship considers authentic) and partly from discovered manuscripts (the "ancient text"). It contains elements of myths, heroic legends, traditional historical tales, and examples of oratory and philosophy. The texts are accompanied by an expanded Confucian commentary. The *Shu Ching* has become part of the Confucian canon and has had a great influence on Chinese culture.

SHUGNI RANGE, a mountain range in the western Pamirs, in the Tadzhik SSR. The Shugni Range is the watershed for the Gunt and Shakhdara rivers. It measures approximately 80 km in length and rises to a maximum elevation of 5,704 m at Skalistyi Peak. Approximately 150 sq km of the range is glaciated. High-mountain steppes and meadows are found on the slopes.
[29–1521–2]

SHUGUROVO, an urban-type settlement in Leninogorsk Raion, Tatar ASSR. Shugurovo is situated on the Lesnaia Sheshma River of the Kama River basin, 28 km north of the Kliavlino railroad station on the Ul'ianovsk-Bugul'ma line. Industry is represented by a brickyard and a factory for the production of petroleum bitumens. A people's amateur theater is located in Shugurovo. [29–1521–5]

SHUIA, a city under oblast jurisdiction and the administrative center of Shuia Raion, Ivanovo Oblast, RSFSR. Landing on the Teza River, a tributary of the Kliaz'ma; railroad station on the Novki-Ivanovo line. Population, 72,000 (1977; 58,000 in 1939).

Shuia is first mentioned in historical documents in the year 1539. In the 16th and 17th centuries it traded with cities along the Volga and was known for the production of sheepskin, leather, linen, and felted fabric and the manufacture of such goods as sleighs and wagons. In the 18th century the textile industry began to develop in the city, and the first factory was built circa 1755. In 1778, Shuia became the capital of a district in Vladimir Vicegerency (from 1796, Vladimir Province). The first cotton mill was built in the city in 1838, and as of 1850 the city had 17 weaving mills with 5,122 workers.

In 1903, F. A. Afanas'ev formed the first Social Democratic circle in Shuia. During the Revolution of 1905–07, M. V. Frunze carried on propaganda among the textile workers of the city. In September 1917 he was elected chairman of the district soviet of workers' and peasants' deputies; under his leadership the workers of Shuia took part in the October Armed Uprising in Moscow. In 1918, Shuia became the capital of a district in Ivanovo-Voznesensk Province, and in 1932 it became the administrative center of a raion in Ivanovo Oblast.

Shuia has three textile mills, an accordion factory, a furniture factory, a felted-fabric factory, a drawn-thread embroidery workshop, a garment factory, and a knitwear factory. The city also has a machine-building plant, a chemical fibers plant, an oil extraction plant, and a plant for the manufacture of rolled metal products. Educational institutions include a pedagogical institute, an industrial technicum, and a medical school. The M. V. Frunze Memorial Museum and a museum of local lore are located in the city.

SHUIA, an urban-type settlement in Onega Raion, Karelian ASSR. Shuia is located 4 km from the Shuiskaia railroad station on the Petrozavodsk-Murmansk line. The settlement has a sovkhoz specializing in meat and dairy farming. [29–1560–1]

SHUIA (also Suoioki), a river in the Karelian ASSR. The Shuia has a length of 194 km and drains an area of 10,100 sq km. It issues from the lake Suoiarvi (area, 58.5 sq km) and flows through several small lakes and the lake Shotozero (area, 74 sq km) before emptying into the lake Logmozero (16 sq km), which is linked with Lake Onega by a channel 0.8 km long. Lakes occupy 10.6 percent of the Shuia's length. The mean flow rate 11 km from the river's mouth is 90.2 cu m per sec. The Shuia freezes over between November and January, and the ice breaks up in April or the first half of May. The river's flow is regulated at the mouth. The Shuia is used for floating timber. [29–1559–3]

SHUIA, a river in Kostroma Oblast, RSFSR; a left tributary of the Nemda River of the Volga River basin. The Shuia originates on the Galich Rise. The river is fed by mixed sources, but mainly by snow. High water occurs in April and May; there are freshets in the summer and autumn. The mean flow rate 25 km from the river's mouth is approximately 11 cu m per sec. The Shuia freezes over in November, and the ice breaks up in April. The river is used for floating timber. [29–1559–4]

SHUIKIN, NIKOLAI IVANOVICH. Born Mar. 18 (30), 1898, in Mstera, in what is now Vladimir Oblast; died Sept. 1, 1968, in Moscow. Soviet organic chemist. Corresponding member of the Academy of Sciences of the USSR (1953). Member of the CPSU from 1942.

A student of N. D. Zelinskii's, Shuikin graduated from Moscow State University in 1927. He joined the staff of the university in 1930 and became a full professor there in 1943. In 1937 he also became a staff member of the Institute of Organic Chemistry of the Academy of Sciences of the USSR. Shuikin's principal works were devoted to the study of the catalytic transformations of various organic compounds, such as hydrocarbons, furan, and furan derivatives. He developed methods for preparing stable and highly active catalysts for the dehydrogenation of six-membered cycloparaffins and certain alkanes.

Shuikin received the State Prize of the USSR in 1946; he was also awarded two orders and various medals. [29–1522–3]

SHUISKII, a family of princes and boyars in Russia from the 15th to 17th centuries; a branch (descended from Alexander Nevsky's son Andrei) of the line of princes of Nizhny Novgorod and Suzdal'.

The founder of the elder Shuiskii line was Prince Iurii, a son of Prince Vasilii Dmitrievich Kirdiapa. Iurii's sons were the princes Vasilii Iur'evich and Fedor Iur'evich, each of whom founded one branch of the elder Shuiskii line. A third branch, the Skopin-Shuiskii family, was founded by Iurii's grandson Prince Vasilii Vasil'evich Blednyi-Shuiskii; the branch came to an end in 1610 with the death of Prince Mikhail Vasil'evich Skopin-Shuiskii.

Among the best-known descendants of Prince Vasilii Iur'evich were Prince Andrei Mikhailovich (date of birth unknown; died 1589), who became a boyar in 1538 and head of the Shuiskii party in 1542, and Prince Andrei Ivanovich (date of birth unknown; died 1589), who became a boyar in 1584 and took part in the palace struggle of the mid-1580's. Other noteworthy descendants included two brothers of Andrei Ivanovich—the Russian tsar Vasilii Ivanovich Shuiskii and Prince Dmitrii Ivanovich, who was named a boyar in 1586. With the death of Prince Ivan Ivanovich in 1638, all lines of the Shuiskii family in Russia came to an end.

The best-known descendants of Prince Fedor Iur'evich in the 16th century were Prince Vasilii Vasil'evich Nemoi-Shuiskii (date of birth unknown; died October 1538), who became a boyar in 1512 and was the de facto ruler of the country for a few months in 1538; Prince Ivan Vasil'evich (date of birth unknown; died May 1542), who became a boyar in 1532 and was the de facto ruler of the country from 1538 to 1540 and again in 1542; and Prince Ivan Petrovich (date of birth unknown; died Nov. 16, 1588), who became a boyar in 1574 and led the Pskov Defense of 1581–82.

The founder of the younger Shuiskii line was Prince Iurii's first cousin Prince Vasilii Semenovich. His first son, Prince Aleksandr Glazatyi, was the progenitor of two branches of the family—the Glazatyi-Shuiskii family, which came to an end in the early 16th century, and the Barbashin-Shuiskii family. Vasilii Semenovich's second son, Prince Ivan Gorbatyi, founded the Gorbatyi-Shuiskii family in the mid-15th century; the family came to an end in 1565.

The best-known members of the Gorbatyi-Shuiskii family were Prince Mikhail Vasil'evich Gorbatyi-Shuiskii (date of birth unknown; died c. 1535), who became a boyar in 1529, and Prince Aleksandr Borisovich Gorbatyi-Shuiskii (date of birth unknown;

died February 1565), who became a boyar in 1544. Prince Aleksandr Borisovich led the Russian troops during the seige of Kazan in 1522 and served as a member of the Selected Council (Izbrannaia Rada). [29–1523–1]

SHUKHMIN, PETR MITROFANOVICH. Born Jan. 13 (25), 1894, in Voronezh; died May 2, 1955, in Moscow. Soviet artist.

Shukhmin studied in V. N. Meshkov's studio in Moscow in 1912 and at the Moscow Academy of Arts from 1912 to 1916 under I. I. Tvorozhnikov, A. V. Makovskii, and D. N. Kardovskii. He was a founding member of the Association of Artists of Revolutionary Russia. He taught at the Academy of Arts from 1934 to 1936 and at the Institute of Applied and Decorative Art in Moscow from 1948 to 1952.

Shukhmin's best paintings were *The Conductor* (1923), *An Order to Advance* (1925), both of which are housed at the Central Museum of the Armed Forces of the USSR, *Landing From the Aurora* (1931, Museum of the Revolution of the USSR, Moscow), and *The Unsubdued* (1948, Russian Museum, Leningrad). The paintings treated the historical-revolutionary theme with true-to-life realism and were characterized by expressive composition and austere colors. Shukhmin also produced portraits and masterful drawings, which were published in the journals *Krasnyi perets* and *Krasnaia Niva* and included in the series Okna Tass (1941–45; State Prize of the USSR, 1942).

SHUKHOV, VLADIMIR GRIGOR'EVICH. Born Aug. 16 (28), 1853, in Graivoron, in what is now Belgorod Oblast; died Feb. 2, 1939, in Moscow. Soviet engineer and scientist. Honorary academician (1929; corresponding member, 1928). Hero of Labor (1932). Member of the All-Russian Central Executive Committee (1927).

Upon his graduation from the Moscow Higher Technical School in 1876, Shukhov was sent to the United States to pursue his studies further. In 1877 and 1878 he headed the design office of the Warsaw Railroad in St. Petersburg. He was named chief engineer of a construction-engineering office in Moscow in 1878. After the October Revolution of 1917, Shukhov worked in Moscow in the construction office of the Parastroi Plant and, later, at the plant itself.

Shukhov's principal works dealt with petroleum engineering, heat engineering, and construction. He was holder or coholder of a number of patents for industrial equipment that refined or used petroleum. In 1891 he patented an industrial apparatus used for the fractional distillation of petroleum by means of high temperatures and pressures. Because the apparatus was the first to involve cracking in the liquid phase, Shukhov is recognized as the inventor of the cracking process. He was also the first to effect industrial flame-front combustion of liquid fuel with an atomizing nozzle, which he invented in 1880. The nozzle made possible the efficient burning of mazut, which up to that time had been a mere waste product. In addition, Shukhov designed a furnace in which the air was heated before it reached the flame front.

Shukhov designed and supervised the construction of Russia's first petroleum pipeline, which in 1878 extended from the Balakhany oil fields to Baku. Later, also in Baku, he built the world's first preheated-mazut pipeline. Shukhov directed the design and construction of Russia's first metal oil tanker and was responsible for the introduction of riveted oil-storage tanks. Shukhov's solution to the problem of optimum storage-tank dimensions has been used in many branches of industry.

Shukhov's scientific and engineering work involved extremely diverse areas of technology. He developed water-tube boilers that became world famous, and he created designs for lightweight, economical roofs. Among the designs were those for suspended, web-frame roofs covering areas of several thousand square meters; arched, metal roofs such as the overhead cover of the platforms at the Kiev Railroad Terminal in Moscow; and web-frame and doubly curved vaults with spans of up to 40 m.

Shukhov's designs have been used for approximately 200 towers both in the USSR and abroad, including the Shabolovka Radio Tower in Moscow. Approximately 500 bridges were designed and built under Shukhov's direction, some spanning rivers, such as the Oka, the Volga, and the Enisei. Shukhov also supervised the design and construction of grain elevators, blast furnaces, floodgates for floating dry docks, and the revolving stage of the Moscow Art Academic Theater. He planned and directed the raising of the leaning minaret of the Ulug Beg Madrasa in Samarkand and took part in the development and production of several types of obstacle-mine systems, mine fuzes, and platforms for heavy guns.

Shukhov received the V. I. Lenin Award in 1929.

SHUKSHIN, VASILII MAKAROVICH. Born July 25, 1929, in the village of Srostki, Biisk Raion, Altai Krai; died Oct. 2, 1974, in the *stanitsa* (large cossack village) of Kletskaia, Volgograd Oblast; buried in Moscow. Soviet Russian writer, motion-picture director, and actor. Honored Art Worker of the RSFSR (1969). Member of the CPSU from 1955.

Shukshin, the son of a peasant, graduated from the directing department of the All-Union State Institute of Cinematography in 1960. His stories first appeared in print in 1959, and in 1963 he published the collection *Country Dwellers*.

The film *There's a Certain Fellow* was made from a screenplay by Shukshin in 1964. The hero, who was typical of Shukshin's early works, attracted the author by his ingenuousness, his rejection of formality in human relationships, and his great vitality. With time, Shukshin's view of his heroes grew more complex. He openly expressed his opinion of ruffians and troublemakers and harshly criticized "phantom people" and demagogues and bureaucrats who skillfully find their place in society. This is particularly true of the short-story collection *There in the Distance* (1968) and the film *An Unfortunate Acquaintance* (*Pechki-lavochki*, 1973).

Shukshin's deep interest in the expansive Russian character was reflected throughout the novel of revolutionary history *The Liubavins* (1965; film version entitled *The End of the Liubavins*, 1972), in the cinematic novel about Stepan Razin *I Have Come to Give You Freedom* (1971), and in several cycles of short stories, for example, *Characters* (1973), which served as the basis of the films *Your Son and Brother* (1966), and *Strange Folks* (1971).

In several of his works, Shukshin dealt with the incompatibility of the human soul with the spiritually empty petit bourgeois mentality. He raised the theme to the height of artistic expression in the film *Red the Rosetree* (1973), which he directed using his own screenplay and playing the leading role himself. Other films he acted in were *Two Fedors*, *I Ask for the Floor*, and *They Fought for the Homeland*.

Shukshin's style as a director is distinguished by the realistic rendering of texture, the use of details of everyday life, and psychological depth. His films combine these qualities with a poetic perception of the Russian countryside and the people who live there in harmony. Shukshin devoted considerable attention to the world's diverse ethnic and sociopsychosocial elements and to cultural and moral differentiation within modern society, a phenomenon that reflects the complex problems encountered in life.

Shukshin received the State Prize of the USSR for his performance as Chernykh in S. Gerasimov's film *By the Lake* (1971). In 1976 he was posthumously awarded the Lenin Prize. He was also a recipient of the Order of the Red Banner of Labor.

SHULAVERI, an early farming settlement dating from the second half of the sixth and the fifth millennium B.C., located 30 km south of Tbilisi. Shulaveri, which was excavated from 1964 to 1966 and in 1970, occupies an area of 1 hectare. The cultural layer is 6 m thick, with nine horizons. Discoveries include round houses and auxiliary structures of raw brick, crude pottery, and implements made of bone (awls, polishers), antler, stone, and obsidian (sickles, end scrapers, adzes). The inhabitants engaged in farming, stock raising, and the tanning of hides. Such settlements as Shulaveri and Shomutepe are typical of the earliest farming culture of Transcaucasia.

SHULEIKIN, MIKHAIL VASIL'EVICH. Born Oct. 21 (Nov. 2), 1884, in Moscow; died there July 17, 1939. Soviet specialist in radio engineering. Academician of the Academy of Sciences of the USSR (1939).

After graduating from the St. Petersburg Polytechnic Institute in 1908, Shuleikin remained there to study radio engineering and to teach. He was employed at the radio-telegraph plant of the Naval Administration from 1913 to 1918, when he entered the Red Army as a brigade engineer. He headed the radio engineering laboratory of a military engineering directorate from 1918 to 1921.

In 1919, Shuleikin was named a professor at the Moscow Higher Technical School, where he founded a radio engineering division. He became a professor at the Institute of the National Economy in 1921 and concurrently taught at other educational institutions. Shuleikin served as chairman of the Society of Radio Engineers from 1919 to 1929 and was appointed head of the radio communications commission of the Academy of Sciences of the USSR in 1938.

Shuleikin was the author of a number of seminal works on radio-wave propagation. He investigated the effects of the upper layers of the atmosphere on radio-wave propagation and derived formulas for calculating the propagation of radio signals along the surface of the earth. He developed a theory of long-wave antennas as well as techniques for their design. Shuleikin published several works on radio engineering and in 1916 pointed out the existence of side bands in amplitude-modulated radio-frequency oscillations.

V. M. RODIONOV [29–1525–1]

SHULEIKIN, VASILII VLADIMIROVICH. Born Jan. 1 (13), 1895, in Moscow; died there Apr. 24, 1979. Soviet geophysicist. Academician of the Academy of Sciences of the USSR (1946; corresponding member, 1929). Member of the CPSU from 1942.

Shuleikin graduated in 1916 from the Moscow Higher Technical School, where he began teaching in 1918 and was a professor from 1923 to 1929. At the same time, from 1920 to 1931, he worked at the Institute of Physics and Biophysics. Shuleikin founded the Black Sea Hydrophysical Station in Katsiveli and was its director from 1929 to 1941. He also founded (1942) the Marine Hydrophysical Laboratory of the Academy of Sciences of the USSR and served as its director. From 1942 to 1945 he worked for the Hydrographic Survey of the Navy, and from 1945 to 1947, at the A. N. Krylov Naval Academy. Beginning in 1943, he was head of the marine physics subdepartment at Moscow State University, which he had organized. From 1947 to 1950 he was director of the Main Administration of the Hydrometeorological Service of the Council of Ministers of the USSR. In 1948 he began working at the Marine Hydrophysical Institute of the Academy of Sciences of the Ukrainian SSR, which he had founded, and served as its director from 1948 to 1957.

Shuleikin's main works deal with the theory of the interaction of the world ocean, the atmosphere, and the continents, the theory of wind-driven waves, ocean currents, and tropical hurricanes. Shuleikin was one of the founders of the Soviet school of marine physics. He wrote the classic monograph *Marine Physics* (4th ed., Moscow, 1968; State Prize of the USSR, 1942).

Shuleikin was awarded two Orders of Lenin, the Order of the October Revolution, three other orders, and various medals.

SHUL'GIN, VASILII VITAL'EVICH. Born Jan. 1 (13), 1878, in Kiev; died Feb. 15, 1976, in Vladimir. Russian political figure; a leader of the nationalists; publicist.

The son of a *dvorianin* (nobleman) of Volyn' Province, Shul'gin graduated from the faculty of law at the University of Kiev in 1900. He contributed to the Russian nationalist newspaper *Kievlianin*, but in 1912 and 1913 he severed ties with the nationalists as a result of the Beilis case. Shul'gin was held under arrest for three months because of articles he had written in defense of M. Beilis.

During the February Revolution of 1917, Shul'gin served on the Provisional Committee of the State Duma. In Pskov on Mar. 2, 1917, he and A. I. Guchkov presented Nicholas II with the Duma's demand that the tsar abdicate. After the October Revolution of 1917, Shul'gin was one of the organizers of the struggle against Soviet power, and he helped create the Volunteer Army. He emigrated after the Civil War ended but made illegal trips to the USSR in 1925 and 1926.

Shul'gin was the author of the books *Days* (1925), *The Year 1920* (1927), and *Three Capitals* (1927). In the 1930's he moved to Yugoslavia, and in 1937 he gave up political activity. In 1944 he was arrested in Yugoslavia and extradited to the USSR, where he was tried and sentenced to imprisonment; in 1956 he was released.

In the early 1960's, Shul'gin wrote two open letters to Russian émigrés in which he called on them to renounce their hostile attitude toward Soviet power.

Pis'ma k russkim emigrantam. Moscow, 1961.

[29–1525–2]

SHULIACHENKO, ALEKSEI ROMANOVICH. Born Mar. 17 (29), 1841, in Ekaterinopol', in what is now Zvenigorod Raion, Cherkassy Oblast; died May 29 (June 11), 1903, in St. Petersburg. Russian chemist.

Shuliachenko graduated from the Nikolai Engineering Academy in St. Petersburg in 1864. He taught first at the Engineering School and then at the Nikolai Engineering Academy, where he became a professor in 1880.

Shuliachenko's research dealt primarily with the theory of the hardening of binders (hydraulic lime and portland cement) and the study of the causes for the breakdown of concrete in port installations and ways of preventing it. Shuliachenko was involved in developing the first technical standards in Russia for cement and the scientific nomenclature of binders. He was the first to propose and provide scientific evidence for the use of mixed (lime-cement) mortars for masonry. Shuliachenko was instrumental in the establishment of the Russian cement industry.

SHULIATIKOV, VLADIMIR MIKHAILOVICH. Born Sept. 30 (Oct. 12), 1872, in Moscow; died there Mar. 26 (Apr. 8), 1912. Participant in the Russian social democratic movement from the 1890's; Bolshevik. Marxist literary critic.

Shuliatikov graduated from Moscow University in 1898. From 1902 to 1905 he was a member of the Moscow and Arkhangel'sk

committees of the RSDLP. He was a member of the literary lecture group of the Moscow committee of the RSDLP during the Revolution of 1905–07 and a member of the Moscow committee and the oblast bureau of the central industrial region in 1908 and 1909.

Shuliatikov took part in the conference of the enlarged editorial board of *Proletarii* in 1909. In his opposition to eclectic and idealist currents in art and literature, he often oversimplified and distorted Marxism. V. I. Lenin criticized Shuliatikov for deriving class ideology in a simplistic way directly from the production practice of the class in question. [29–1529–1]

SHUL'TS, MIKHAIL MIKHAILOVICH. Born July 1, 1919, in Petrograd. Soviet physical chemist. Corresponding member of the Academy of Sciences of the USSR (1972). Member of the CPSU since 1946.

Shul'ts graduated from the chemistry department of Leningrad State University in 1947 and performed research in the department until 1952. In 1952 and 1953 and again from 1959 to 1972, he was head of a laboratory at the university's scientific research institute of chemistry, and from 1953 to 1959 he taught in the chemistry department. In 1965 he became a professor at the I. V. Grebenshchikov Institute of Silicate Chemistry of the Academy of Sciences of the USSR; he was named director of the institute in 1972.

Shul'ts' principal works are devoted to the physical chemistry of glass and the thermodynamics of heterogeneous equilibrium processes. Shul'ts received the State Prize of the USSR in 1973; he has been awarded three orders and various medals. [29–1527–1]

SHUL'ZHENKO, KLAVDIIA IVANOVNA. Born Mar. 11 (24), 1906, in Kharkov. Soviet Russian singer. People's Artist of the USSR (1971).

Shul'zhenko was an actress at the Kharkov Drama Theater under the direction of N. N. Sinel'nikov from 1923 until 1928, when she began to perform on the variety stage (estrada). She was the first performer of many Soviet songs of everyday life, as well as many lyrical songs. Songs that she made famous included "The Blue Kerchief" by Petersburgskii, "Let's Light Up" by Tabachnikov, and "Pick Up the Guitar" by Lepin.

Shul'zhenko has been awarded the Order of Lenin, the Order of the Red Banner of Labor, and several medals.

SHUMAUSKAS, MOTEIUS IUOZOVICH (also Motiejus Šumauskas). Born Nov. 2 (15), 1905, in Kaunas. Soviet state and party figure. Hero of Socialist Labor (1975). Member of the CPSU since 1924.

The son of a worker, Shumauskas became a worker himself in Kaunas in 1922. In 1925 and 1926 he was a member of the Central Committee of the Komsomol of Lithuania, and in 1928 and 1929 he served in the Panevėžys underground raion committee of the Communist Party of Lithuania. In 1930 and 1931, Shumauskas was secretary of the Central Committee of the Komsomol of Lithuania, and in 1930 he became a member of the Central Committee of the Communist Party of Lithuania. In 1931 he was sentenced to six years' hard labor; in 1939 he was sent to a concentration camp.

After the restoration of Soviet power in Lithuania in July 1940, Shumauskas became chairman of the Central Bureau of Trade Unions of the Lithuanian SSR and people's commissar of local industry of the republic. From 1941 to 1946 he served as a deputy chairman of the Council of People's Commissars of the Lithuanian SSR. In 1942, during the Great Patriotic War of 1941–45, he joined the Soviet Army. In 1943 and 1944 he headed an operational headquarters of the Lithuanian partisan movement and of the Central Committee of the Communist Party of Lithuania; during the same period he also served as secretary of the Northern underground oblast committee of the Communist Party of Lithuania, and in July 1944 he became chairman of the Vilnius city executive committee.

From 1944 to 1950, Shumauskas served as chairman of the State Planning Committee of Lithuania, and in 1946 and 1947 he served concurrently as deputy chairman of the Council of Ministers of the Lithuanian SSR. From 1950 to 1953 he was first secretary of the Šiauliai oblast committee. From 1954 to 1956 he served as second secretary of the Central Committee of the Communist Party of Lithuania. In 1953 and 1954, Shumauskas was first deputy chairman of the Council of Ministers of the Lithuanian SSR, and from 1956 to 1967 he was chairman of the council. From 1967 to 1975 he was chairman of the Presidium of the Supreme Soviet of the Lithuanian SSR and deputy chairman of the Presidium of the Supreme Soviet of the USSR.

Shumauskas was a candidate member of the Central Committee of the CPSU from 1956 to 1976. He served as a deputy to the second through ninth convocations of the Supreme Soviet of the USSR. In December 1975 he became a personal pensioner. Shumauskas has been awarded five Orders of Lenin, two other orders, and various medals.

WORKS

V vodovorote bor'by. Moscow, 1975. [29–1537–1]

SHUMAVTSOV, ALEKSEI SEMENOVICH. Born Mar. 27, 1925, in the village of Ol'shanitsa, Diat'kovo Raion, Briansk Oblast; died Nov. 10, 1942, in the city of Liudinovo, Orel Oblast (now Kaluga Oblast). Head of the Liudinovo underground Komsomol group during the Great Patriotic War of 1941–45. Hero of the Soviet Union (Oct. 12, 1957, posthumously). Member of the Komsomol from 1940.

The son of a worker, Shumavtsov entered secondary school in 1932. In October 1941, by decision of the Liudinovo raion committees of the ACP(B) and of the Komsomol, he became one of the organizers of the Komsomol underground. Shumavtsov was arrested by the Gestapo in late October 1942; after being brutally tortured, he and A. M. Liasotskii, another member of the Komsomol group, were shot to death in a forest on the outskirts of the city. A memorial stone was placed at the execution site in 1960. [29–1533–2]

SHUMEN (from 1950 to 1965, Kolarovgrad), a city in northeastern Bulgaria. Capital of Shumen District. Population, 85,000 (1976).

Shumen is a transportation center. Highly developed industries include transportation machine building (the production of trucks and of equipment for ships), nonferrous metallurgy (the manufacture of rolled aluminum products), and food processing (meat packing, canning, the brewing of beer, and the manufacture of tobacco products). The city also has enterprises for the production of furniture and clothing. Shumen was the birthplace of V. Kolarov.

In the 18th and 19th centuries, Shumen was an Ottoman fortress and an important strongpoint on the road linking Silistra (Silistria) and Istanbul. Together with the fortresses of Varna, Silistra, and Ruse (Ruschuk), it formed the strategically important quadrangle of fortresses on which the Ottoman defense of the Danube region in Bulgaria depended during the Russo-Turkish wars of the 18th and 19th centuries. Russian troops unsuccessfully besieged the city in 1810 and 1828. In 1878, Shumen was incorporated into Bulgaria. [29–1537–3]

SHUMEN DISTRICT (formerly Kolarovgrad District), an administrative-territorial unit in northeastern Bulgaria. Area, 3,400 sq km. Population, 254,000 (1976). The capital is the city of Shumen. The district is located on a hilly plain north of the Stara Planina (Balkan Mountains).

The economy of Shumen District is predominantly industrial, with industry being concentrated primarily in the Shumen industrial region (the cities of Shumen, Novi Pazar, and Preslav). The main branches of industry are machine building, nonferrous metallurgy, food processing, and the production of glass, porcelain, and faïence (in the cities of Novi Pazar and Kaspichan). More

than half of the territory of Shumen District is under cultivation. The principal crops are grains, sugar beets (especially for seed), sunflowers, tobacco, and such fruits as grapes. Animal husbandry includes the raising of cattle and sheep. Agricultural production in Shumen District is concentrated at agroindustrial complexes.

E. B. VALEV [29–1538–1]

SHUMERLIA, a city (since 1937) under republic (ASSR) jurisdiction and administrative center of Shumerlia Raion, Chuvash ASSR. Situated on the right bank of the Sura River, on the Gorky-Ul'ianovsk highway. River landing. Railroad station of the Moscow-Kazan line. Population, 35,000 (1974).

Enterprises in Shumerlia include a combine producing vans, a plant for the manufacture of specialized motor vehicles, a chemical plant, a brickyard, a factory producing leather clothing accessories, and a logging and timber distribution establishment. Enterprises of the food industry include a butter factory, a meat-packing plant, a food-processing combine, and a brewery. The city also has a branch of the Rassvet Chuvash Garment Production Association and a workshop specializing in the production of carved wooden articles. Shumerlia has a branch of the Semenov Mechanized Woodworking Technicum, the central school of which is located in Gorky Oblast. [29–1539–1]

SHUMIACHI, an urban-type settlement and the administrative center of Shumiachi Raion, Smolensk Oblast, RSFSR. Shumiachi is located 7 km from the Penetovka railroad station on the Roslavl'-Krichev line. Industry is represented by a flax-processing plant, a butter factory, a vegetable starch and starch syrup plant, and a plant for the production of asphalt cement. The settlement has an art gallery, which is a branch of the Smolensk Oblast Museum of Fine and Applied Art. [29–1548–2]

SHUMIATSKAIA, ELENA IAKOVLEVNA. Born Mar. 16 (29), 1912, in Turukhansk. Soviet master of applied art.

Shumiatskaia attended the Moscow Textile Institute from 1930 to 1934. Her career has been closely linked with the Trekhgornaia Manufaktura Textile Combine, where she began working in 1934. Shumiatskaia has made a thorough study of Russian folk art and has creatively employed traditional motifs in her decorative printed fabrics. [29–1547–4]

SHUMIATSKII, BORIS ZAKHAROVICH. Born Nov. 4 (16), 1886, in Verkhneudinsk (now Ulan-Ude); died July 29, 1938. Soviet and party figure. Member of the Communist Party from 1903.

The son of an artisan, Shumiatskii became a worker in Chita in 1899. Between 1905 and 1907 he helped lead armed uprisings in Krasnoiarsk and Vladivostok. In 1917 he served as deputy chairman of the Krasnoiarsk soviet and representative of the Central Committee of the RSDLP(B) in Siberia. Shumiatskii was a delegate to the Sixth Party Congress, a member of the Bureau of the Military Organization of the Central Committee of the RSDLP(B), and chairman of the Central Executive Committee of Siberian Soviets.

In 1919 and 1920, Shumiatskii served as a deputy chairman of the Siberian Revolutionary Committee and was a member of the Siberian Bureau of the Central Committee of the RCP(B). In 1920 he served on the Far Eastern Bureau of the Central Committee of the RCP(B) and was chairman of the Council of Ministers of the Far Eastern Republic. From Jan. 5, 1921, to Sept. 6, 1922, he was a member of the Revolutionary Military Council of the Fifth Army. From 1923 to 1925 he was the plenipotentiary of the USSR in Iran.

In 1926, Shumiatskii was named a member of the bureau of the Leningrad provincial committee of the ACP(B); he subsequently was appointed rector of the Communist University for Workers of the East and became a member of the Middle Asian Bureau of the Central Committee of the ACP(B). In 1930 he was named chairman of Soiuzkino; in 1933 he became head of the Central Board of the Motion-picture Industry and deputy chairman of the Committee for the Arts under the Council of People's Commissars of the USSR.

Shumiatskii was a delegate to the Sixteenth Congress of the ACP(B) and to the Third Congress of the Comintern.

SHUMIKHA, a city and the administrative center of Shumikha Raion, Kurgan Oblast, RSFSR. Railroad station on the Cheliabinsk-Kurgan line, 133 km west of Kurgan. Population, 21,000 (1974). Shumikha has a machine-building plant, a plant for the repair of bearings, a plant for the manufacture of reinforced concrete products, a brickyard, and a garment factory. It also has two mixed-feed plants, a seed-cleaning plant, a poultry-packing combine, and a butter and milk combine. A museum of local lore is located in the city. [29–1542–1]

SHUMIKHINSKII, an urban-type settlement in Perm' Oblast, RSFSR, under the jurisdiction of the Gremiachinsk city soviet. Shumikhinskii is situated on the right bank of the Us'va River (a tributary of the Chusovaia River), 10 km northeast of the Us'va railroad station on the Solikamsk-Chusovskaia line. Hard coal is mined in the area, and the settlement has a shop of a garment factory that is based in the city of Gubakha. [29–1542–2]

SHUMILINO, an urban-type settlement and the administrative center of Shumilino Raion, Vitebsk Oblast, Byelorussian SSR. Shumilino is served by a railroad station on the Vitebsk-Polotsk line. The settlement has a cheese plant, a winery, a plant for the initial processing of flax, and a peat enterprise. A branch of the Vitebsk Building-Materials Industrial Association is located in Shumilino. [29–1540–3]

SHUMILOV, MIKHAIL STEPANOVICH. Born Nov. 5 (17), 1895, in the village of Verkhtechenskoe, in what is now Shadrinsk Raion, Kurgan Oblast; died June 28, 1975, in Moscow; buried in Volgograd, on Mamaev Kurgan. Soviet military commander; colonel general (1943). Hero of the Soviet Union (Oct. 26, 1943). Member of the CPSU from 1918.

The son of a peasant, Shumilov graduated from the Chuguev Military School in 1916, during World War I, as an ensign. He joined the Red Army in May 1918 and, during the Civil War of 1918–20, advanced from a platoon commander to commander of a rifle regiment. He completed courses for command and political personnel in 1924, Vystrel courses in 1929, and the Advanced Academic Courses at the K. E. Voroshilov Higher Military Academy in 1948.

Shumilov fought in the Soviet-Finnish War of 1939–40 as commander of a rifle corps. In 1941 and 1942, during the Great Patriotic War of 1941–45, he served as commander of a rifle corps and as deputy commander of the Fifty-fifth and Twenty-first armies on the Leningrad and Southwestern fronts. In August 1942, Shumilov was named commander of the Sixty-fourth Army, which fought successfully south of Stalingrad and was reorganized in March 1943 into the Seventh Guards Army. Shumilov served in this capacity between 1942 and 1945 on the Stalingrad, Don, Voronezh, Steppe, and Second Ukrainian fronts.

After the war, Shumilov served as commander of the White Sea Military District in 1948 and 1949 and the Voronezh Military District from 1949 to 1955. He was in retirement from 1956 to 1958, when he became a military consultant to the Group of Inspectors General of the Ministry of Defense.

Shumilov was a deputy to the third and fourth convocations of the Supreme Soviet of the USSR. He was awarded three Orders of Lenin, four Orders of the Red Banner, two Orders of Suvorov First Class, the Order of Kutuzov First Class, the Order of the Red Star, the Order for Service to the Motherland in the Armed Forces of the USSR Third Class, and various medals. Shumilov was also the recipient of foreign orders and medals. [29–1541–1]

SHUMILOV, NIKOLAI VASIL'EVICH. Born 1875 in Zlatoust; died Jan. 19, 1919, in Tashkent. Participant in the revolutionary movement in Russia; one of the Turkestan commissars who were murdered in 1919 (*see* TURKESTAN COMMISSARS). Member of the Communist Party from 1904.

The son of a worker, Shumilov himself was a worker. During the Revolution of 1905–07, he was a member of the Zlatoust committee of the RSDLP, commander of a fighting *druzhina* (armed detachment of workers or other democratic elements), and a member of the Kurgan committee of the RSDLP. In 1913 he was sentenced to permanent exile in Eastern Siberiá.

After the February Revolution of 1917, Shumilov served on the Tashkent party committee, and in September he became a member of the executive committee of the Tashkent soviet. In 1918 he was deputy people's commissar of railroads of the Turkestan Republic, a member of the local revolutionary military committee, and chairman of the Tashkent soviet. Shumilov died during the Tashkent Anti-Soviet Revolt of 1919.

[29–1541–2]

SHUMILOV, PETR PAVLOVICH. Born 1901 in Bobrinets, in what is now Kirovograd Oblast; died Aug. 17, 1942, in Moscow. Soviet specialist in hydromechanics and a founder of the theory of turbodrilling. Member of the CPSU from 1940.

Upon graduating from Moscow State University in 1929, Shumilov joined the staff of the State Research Institute of Petroleum, where he remained until 1934. He organized and directed an experimental turbodrilling office in Baku between 1934 and 1939 and was a member of the People's Commissariat of the Petroleum Industry from 1939 to 1942.

Between 1934 and 1936, Shumilov developed a theory for the use of small multistage, axial-flow turbines in turbodrills. He and R. A. Ioannesian, E. I. Tagiev, and M. T. Gusman invented a multistage turbodrill that operated without the use of reduction gears and a technique for turbodrilling vertical and inclined wells. In 1941, Shumilov began work on the development of a rocket-firing antitank weapon; he died during testing.

Shumilov received the State Prize of the USSR once in 1942 and twice in 1947; he was also awarded the Order of Lenin.

SHUMSHU, an island in the northern part of the Kuril Islands, situated between the Kamchatka Peninsula and Paramushir Island, separating the First and Second Kuril Straits. The maximum elevation is 189 m. The island has thickets of dwarf alder and cedar, as well as oceanic meadows. [29–1546–4]

SHUMSKII, IAKOV DANILOVICH. Year of birth unknown; died 1812. Russian actor.

Shumskii, a close associate of F. G. Volkov, helped organize a theater in Yaroslavl in the 1740's. In 1752 he and the other actors of the theater were summoned to St. Petersburg to perform in the court troupe. In 1756, Shumskii joined the first permanent Russian public theater. Shumskii's simple and straightforward style of acting, in particular his brilliant flair for comedy, was linked with the Russian folk theater. He mainly played humorous servants and young rakes, for example, Vasilii in Lukin's *The Spendthrift by Love Reformed* and Sosie in Molière's *Amphitryon*. He also played humorous old women, creating the role of Eremeevna in Fonvizin's *The Minor* (1782).

Shumskii retired in 1785 and thereafter appeared on the stage only occasionally. He also worked as a teacher and director. In the 1760's he directed performances at the School for the Nobility.

SHUMSKII, IURII VASIL'EVICH (real surname, Shomin). Born Nov. 5 (17), 1887, in Tiraspol'; died June 7, 1954, in Kiev. Soviet Ukrainian actor. People's Artist of the USSR (1944). Member of the CPSU from 1942.

Shumskii took an active part in the revolutionary movement. He appeared with a workers' drama group, and from 1917 to 1920 he headed an amateur Ukrainian theater and studio in Kherson. From 1925 to 1934 he performed with the Ukrainian Derzhdrama (now the Odessa Theater of the October Revolution), and in 1934 he joined the Kiev I. Franko Theater. He played the roles of Shvandia in Trenev's *Liubov' Iarovaia*, Gaidai in Korneichuk's *Destruction of the Squadron*, Khlestakov and the Mayor in Gogol's *The Inspector-General*, the title role in Korneichuk's *Bogdan Khmel'nitskii*, Philip II in Schiller's *Don Carlos*, and the title role in Pushkin's *Boris Godunov*. Shumskii also played Marshal Vasilevskii in the motion pictures *The Third Strike* (1948) and *The Battle of Stalingrad* (1949).

Shumskii, a recipient of the State Prize of the USSR in 1950 and 1951, was awarded the Order of Lenin, two other orders, and several medals. [29–1545–2]

SHUMSKII, SERGEI VASIL'EVICH (real surname, Chesnokov). Born Oct. 7 (19), 1820, in Moscow; died there Feb. 6 (18), 1878. Russian actor.

In 1841, Shumskii graduated from the Moscow Theatrical School, where he was a student of M. S. Shchepkin. He performed with the Malyi Theater from 1841 until 1878, and to gain experience he appeared with the Odessa Theater from 1847 to 1850. At first he appeared mainly in vaudevilles. Being impossible to type-cast, Shumskii played many different roles. He created his best characterizations in the 1850's and 1860's, for example, as Kochkarev and Khlestakov in Gogol's *Marriage* and *The Inspector-General*, Count Liubin in Turgenev's *The Provincial Lady*, Krechinskii in Sukhovo-Kobylin's *Krechinskii's Wedding*, Zhadov and Krutitskii in Ostrovskii's *A Profitable Post* and *Even a Wise Man Stumbles*, Ivan the Terrible in A. K. Tolstoy's *The Death of Ivan the Terrible*, and Scapin in Molière's *The Cheats of Scapin*.

Shumskii was outstanding for his mastery of acting techniques, artistry, sincerity, and simplicity and for the careful thought he devoted to the smallest details. In the late 1860's he taught acting at the Moscow Conservatory, where in 1869 he staged Glinka's opera *A Life for the Tsar* (*Ivan Susanin*).

[29–1545–1]

SHUMSKII, an urban-type settlement in Nizhneudinsk Raion, Irkutsk Oblast, RSFSR. It is situated on the right bank of the Uda River, in the Enisei River basin. Shumskii has a station (Uda II) on the Transsiberian Railroad, 500 km from Irkutsk. Enterprises include a lumber enterprise and a plant for sorting gravel. [29–1546–2]

SHUMSKOE, an urban-type settlement and the administrative center of Shumskoe Raion, Ternopol' Oblast, Ukrainian SSR. Shumskoe is situated on the Viliia River (a tributary of the Goryn'), 32 km from the Lepesovka railroad station on the Shepetovka-Ternopol' line. The settlement has a butter factory and a peat-blocking plant. [29–1546–3]

SHUNKOV, VIKTOR IVANOVICH. Born Apr. 6 (19), 1900, in the city of Kuznetsk, in what is now Kemerovo Oblast; died Nov. 9, 1967, in Moscow. Soviet historian. Corresponding member of the Academy of Sciences of the USSR (1962). Member of the CPSU from 1942.

A student of S. V. Bakhrushin's, Shunkov graduated from the department of social sciences of Moscow University in 1925. From 1936 to 1941 and again from 1946 to 1949 he was on the staff of the Institute of History of the Academy of Sciences of the USSR. He fought in the Great Patriotic War of 1941–45. From

1949 to 1967, Shunkov was director of the V. P. Volgin Fundamental Library of Social Sciences, and from 1955 to 1960 he was editor in chief of the journal *Istoricheskii arkhiv*. In 1959 he became deputy academician-secretary of the Division of History of the Academy of Sciences of the USSR.

Shunkov's most important works dealt with the history of peasant colonization of Siberia, Siberian local lore, archaeography, the study of sources, bibliography, and library science. Shunkov was awarded the Orders of the Great Patriotic War First and Second Class and various medals.

SHUNT, an electrical or magnetic conductor connected in parallel with an electric or magnetic circuit to divert part of the electric current or magnetic flux when it is undesirable or impossible to pass all the current or flux through the circuit. For example, when a shunt is used to extend the measuring range of an ammeter, the current I_x being measured is divided between the shunt and the ammeter in inverse proportion to their respective resistances, R_S and R_A; in this case $I_x = I_A(1 + R_A/R_S) = I_A k_S$, where I_A is the value of the current as determined from the ammeter readings and k_S is the shunting factor. For convenience in making current measurements, the resistance of the shunt is chosen so that k_S is equal to 10, 100, or 1000.

Shunts are manufactured in the form of plates, bands, and wires, primarily of manganin or constantan (for electrical shunts) or of a soft magnetic material (for magnetic shunts). [29–1549–2]

SHUR, IAKOV SHEBSELEVICH. Born Apr. 7 (20), 1908, in the village of Dubrovno, in what is now Vitebsk Oblast. Soviet physicist. Corresponding member of the Academy of Sciences of the USSR (1970). Member of the CPSU since 1940.

Shur graduated from Leningrad State University in 1932. The same year, he joined the staff of the Institute of Physics of Metals of the Urals Scientific Center of the Academy of Sciences of the USSR.

Shur's main works deal with the physics of magnetic effects. Shur discovered thermomagnetic hysteresis. He discovered and studied the anisotropy of the magnetic hysteresis of ferromagnetic crystals. He also discovered magnetoelastic hysteresis and explained the nature of magnetization and hysteresis processes in hard magnetic materials. Shur developed new magnetic and magnetostrictive materials, low-loss high-permeability electrical steels, and magnetic thin films.

Shur received the State Prize of the USSR in 1967. He has been awarded four orders and various medals.

S. V. VONSOVSKII [29–1550–1]

SHURAB, a city (since) 1952 in Isfara Raion, Leninabad Oblast, Tadzhik SSR. Shurab, which is situated in the foothills of the Turkestan Range, is the terminal point of a branch line of the Khavast-Kokand line. Brown coal is mined nearby. Enterprises include a repair plant. [29–1550–2]

SHURABASHAT, the site of a fortified settlement that existed from the fourth century B.C. to the first centuries of the Common Era. Shurabashat, located 8 km northwest of Uzgen, Osh Oblast, Kirghiz SSR, is the center of an oasis in the valley of the Iassy River. It was excavated between 1954 and 1957. The area exceeds 70 hectares. The site is enclosed by an earthen wall and is divided into three parts by inner earthen walls. It has a citadel in the northeast. Remains of pisé structures with hearths and household pits have been discovered, as well as burials in the walls. The principal finds have been modeled ware, tinted or painted red against a light background. Hearthstones, poles for drying hay, bone plates for bows, and beads have also been found.

SHURA-I-ISLAM (Council of Islamists), a counterrevolutionary bourgeois-nationalist organization in Turkestan in 1917 and 1918.

Shura-i-Islam, founded in early March 1917 in Tashkent, was the de facto representative of the Turkestan Committee of the Provisional Government. Headed by the Jadidist leader M. K. Abdurashidkhanov, the organization comprised members of the national bourgeoisie, the bourgeois-nationalist intelligentsia, the feudal aristocracy, and the Muslim clergy. By the end of March 1917, branches of Shura-i-Islam had been formed in nearly every city in Turkestan.

Reflecting the interests of local capitalists and landowners, Shura-i-Islam advocated national and religious autonomy for Turkestan, which it wished to remain part of bourgeois Russia; it stood for the preservation of private ownership, including the private ownership of land. The organization's congress of Apr. 16–23, 1917, which was attended by delegates from 42 branches, adopted a resolution on cultural and political self-government for Turkestan and declared its support for the Provisional Government. At the congress, the Regional Council of the Muslims of Turkestan was elected.

From its inception, Shura-i-Islam was plagued by a struggle for leadership between the Jadidists and the Ulemists, or higher clergy; in June 1917 the Ulemists split from the organization and formed their own group, Shura-i-Ulema (Council of the Clergy). After the October Revolution of 1917, Shura-i-Islam resisted the establishment of Soviet power—its leaders helped organize and direct the counterrevolutionary Kokand Autonomy.

In late 1917 and during the first half of 1918 the Council of People's Commissars of the Turkestan Republic and local soviets disbanded all organizations of Shura-i-Islam for engaging in anti-Soviet activity. The leaders of Shura-i-Islam went underground and, in alliance with Russian White Guards, Ulemists, and foreign imperialists, continued the struggle against Soviet power (*see* BASMACHI REVOLT).

SHURA-I-ULEMA (Council of the Clergy), a counterrevolutionary pan-Islamic organization in Turkestan in 1917 and 1918.

Shura-i-Ulema, which was formed when a split occurred in the organization Shura-i-Islam, comprised the higher Muslim clergy, local feudal lords, and the most reactionary segment of the national bourgeoisie. At its congress of Sept. 17–20, 1917, in Tashkent, the delegates declared their opposition to the soviets and demanded Turkestan's secession from Russia, the unification of all Muslims in a single Muslim state under the aegis of Turkey, and the creation of branches of Shura-i-Ulema in cities throughout Turkestan.

At the third congress of the soviets in the region, which was held in 1917, the Ulemists opposed the establishment of Soviet power in Turkestan; they subsequently helped organize the counterrevolutionary Kokand Autonomy and inspired the Basmachi revolt. In their struggle against Soviet power the Ulemists acted in concert with Russian White Guards and foreign imperialists. [29–1551–1]

SHURUKHIN, PAVEL IVANOVICH. Born Nov. 5 (18), 1912, in the village of Solenyi Erik, in what is now Bykovo Raion, Volgograd Oblast; died Nov. 3, 1956, in Moscow. Twice Hero of the Soviet Union (Oct. 23, 1943, and Mar. 24, 1945). Major general (1953). Member of the CPSU from 1940.

After joining the Red Army in 1931, Shurukhin graduated from the Ordzhonikidze Military School in 1934 and completed courses for rifle-division commanders at the M. V. Frunze Military Academy in 1950. He commanded a battalion of ski troops in the Soviet-Finnish War of 1939–40. During the Great Patriotic War of 1941–45 he commanded a rifle battalion on the Western Front in 1941 and a partisan detachment in Gomel' Oblast in 1941 and 1942. In 1942 and 1943 he led a force made up of partisan detachments in Orel Oblast. From July 1943 until the end of the war, Shurukhin was commander of a rifle regiment on the Voronezh, First Ukrainian, and Second Ukrainian fronts.

Shurukhin was a deputy to the second convocation of the Supreme Soviet of the USSR. He was awarded two Orders of Lenin, two Orders of the Red Banner, two Orders of the Red Star, and various medals. A bust of Shurukhin has been placed in the village of Novonikol'skoe, in Volgograd Oblast. [29–1551–4]

SHURUPPAK (present-day Tall Far'ah), an ancient city in Sumer. According to Sumerian legend, Shuruppak was the native city of Ziusudra, a mythological figure corresponding to the Babylonian Utnapishtim, who survived the great flood on an ark he built upon the command of a god.

By the end of the third millennium B.C., Shuruppak had become an insignificant settlement. Excavations there by a German archaeological expedition in 1902 uncovered an archive of economic and legal documents and teaching materials from around the 26th century B.C., as well as sculputured monuments.

[29–1551–3]

SHUSHA, a city and the administrative center of Shusha Raion, Nagorno-Karabakh Autonomous Oblast, Azerbaijan SSR. Situated in the foothills of the Karabakh Range, on the Evlakh-Goris-Nakhichevan highway, 11 km south of Stepanakert and 37 km southwest of the Agdam railroad station.

Shusha was founded in the mid-18th century as a defensive fortress of the Karabakh Khanate and achieved renown for its heroic defense against the Persian Army in 1795. The city became part of Russia in 1805 and played an important role in Azerbaijani trade. During the Russo-Persian War of 1826–28, the small garrison of Shusha held out heroically for some 40 days against the Persian forces of Abbas-Mirza (*see* RUSSO-PERSIAN WARS OF THE 19TH CENTURY). Shusha became a district capital of Elizavetpol' Province in 1840 and the administrative center of a raion of Nagorno-Karabakh Autonomous Oblast in 1923.

Industry is represented by a production combine, a weaving shop of the Karabakh Silk Combine, and a factory that produces Oriental musical instruments; the city is also known as an ancient carpet-weaving center. An agricultural technicum and pedagogical school are located in Shusha, whose cultural institutions include a museum of the history of Shusha and a memorial house-museum devoted to the composer U. Gadzhibekov. Architecture of the 18th century is represented by two castles and the remains of fortress walls. The city has numerous stone houses of the 18th and 19th centuries that are characterized by the use of decorative painting and *shebeke* (ornamental window grills).

Shusha is a climatic health resort. Summers are warm, with a mean July temperature of 19°C, and winters are mild, with a mean January temperature of −2°C; the annual precipitation is 645 mm. The city has sanatoriums, houses of rest, Pioneer camps, and a tourist center.

REFERENCE

Alizade, A. M., and A. V. Sarkisov. "O nekotorykh arkhitekturnykh pamiatnikakh Shushi." In *Pamiatniki arkhitektury Azerbaidzhana*, [vol]. 2. Baku, 1950. [29–1557–1]

SHUSHENSKOE, an urban-type settlement and the administrative center of Shushenskoe Raion, Krasnoiarsk Krai, RSFSR. Shushenskoe is situated near the confluence of the Bol'shaia Shush' and Enisei rivers, 60 km southeast of the Minusinsk railroad station on the Abakan-Taishet line. Industry is represented by a milk-canning combine, a brewery, a poultry farm, and a souvenir factory. The settlement has a sovkhoz-technicum.

Shushenskoe was founded by Russian cossacks in the first half of the 18th century. In the late 19th and early 20th centuries, it was the administrative center of a *volost* (small rural district) in Minusinsk District, in Enisei Province, and had a population of 1,382. The tsarist regime used Shushenskoe as a place of political exile, and Decembrists, Polish revolutionaries, and Narodniki (Populists) were settled there. V. I. Lenin was in exile in Shushenskoe from May 8, 1897, until Jan. 29, 1900. On May 7, 1898, he was joined by N. K. Krupskaia and her mother, E. V. Krupskaia. While living in the settlement, Lenin wrote more than 30 works.

On Nov. 7, 1930, a historical-revolutionary division of the Minusinsk Museum of Local Lore was opened in Shushenskoe. In 1938 the division was reorganized as an independent entity and was named the V. I. Lenin House-Museum. To mark the centennial of Lenin's birth, the Central Committee of the CPSU and the Council of Ministers of the USSR passed a resolution to reconstruct the settlement, and in 1970 the Memorial Museum-Preserve of the Siberian Exile of V. I. Lenin was opened in Shushenskoe. The museum includes two buildings in which Lenin and Krupskaia lived; 25 peasant *usad'by* (complexes of buildings), some of which contain documentary historical exhibits; and other buildings that have been restored to their former appearance.

The general plan for the reconstruction of Shushenskoe was drafted by the architects L. A. Petrov and K. M. Gubel'man. The plans for the reconstruction of the memorial houses were drawn up by the architects B. V. Gnedovskii (project head) and A. N. Klimanov, and the plans for the complexes of peasant houses were done by the architects M. N. Semenov, L. M. Shuliak, and E. A. Chernikov.

SHUSHERIN, IAKOV EMEL'IANOVICH. Born 1753 in Moscow; died there 1813. Russian actor.

Shusherin joined M. Groti's troupe in 1772 and the Petrovskii Theater in Moscow in 1780; from 1786 to 1793 and from 1800 to 1810 he acted on the imperial stage in St. Petersburg. Originally Shusherin played in comedies and comic operas, for example, as Filimon in Ablesimov's *The Miller—Magician, Swindler, and Matchmaker* (to Sokolovskii's music). In the 1780's he turned to tragic roles displaying a perfect command of the technique of the classical theater. His roles included Khorev and Truvor in Sumarokov's *Khorev* and *Sinav and Truvor* and Iarb in Kniazhnin's *Dido*.

Shusherin revealed his gifts most fully in the years 1793–1800, when he was performing in Moscow. In that period his repertoire included roles in sentimental plays, mainly bourgeois dramas and *comédies larmoyantes*, such as Ksuri and Meinau in Kotzebue's *The Parrot* and *Misanthropy and Repentance* and Count Clarendon in Beaumarchais's *Eugenia*. He also played the title role in Ozerov's *Oedipus in Athens* and Zarutskii in Kriukovskii's *Pozharskii*. Shusherin was one of the first Russian actors to try to turn away from classical acting conventions and to strive for a simple, natural style.

SHUSHUN, a short outer garment for women; a felted-fabric or linen jacket formerly worn in northern and, sometimes, central Russia. The *shushun* narrowed at the waist and sometimes had gathers in the back. The collar, skirts, and sleeves were usually ornamented with braid. In the north the term *shushun* was also applied to a *sarafan* (a type of sleeveless dress) made of red calico or linen, with a collar and sleeves that hung down in the back.

[29–1559–2]

SHUST, IVAN. Year of birth unknown; died December 1670 near the city of Koz'modem'iansk. Participant in the Peasant War of 1670–71 under the leadership of S. T. Razin.

A *posadskii chelovek* (merchant or artisan) from the city of Koz'modem'iansk, Shust led the uprising that broke out in the city in October 1670 upon the approach of a detachment of Razin's troops. He became one of the group of five people elected by the inhabitants of Koz'modem'iansk to govern the city. He established communication with the rebellious peasants of the neighboring villages and detachments of Mari troops. In November 1670 the forces of the tsarist *voevoda* (military commander) Prince D. A. Bariatinskii took Koz'modem'iansk. Shust was taken prisoner and executed with a group of his supporters.

[29–1552–3]

SHUSTER MISSION, an American financial mission in Iran from May 1911 to January 1912. The mission was headed by M. Shuster, an official of the American colonial administration in Cuba from 1899 to 1901 and in the Philippines from 1906 to 1909. Shuster, whom the Iranian Majlis had named financial adviser and treasurer general in June 1911, tried to use his broad powers to draw Iran into the orbit of American imperialism. His activities displeased the imperialist rivals of the USA in Iran. After the tsarist government issued an ultimatum on Nov. 29, 1911, that was supported by Great Britain, Shuster was dismissed; he left for the USA in January 1912.

SHUSTOV, a family of large-scale 17th-century merchants and salt producers descended from court peasants of the village of Dedinovo in Kolomna District.

In the mid-17th century, the *gost'* (privileged merchant) Iakov Shustov traded salt along the Volga and the Oka. The *gosti* Grigorii Fedorovich and Vasilii Fedorovich Shustov established a saltworks between the 1670's and the 1690's on the Lenva River, in Solikamsk District. By September 1696, the Shustovs owned 32 salterns, 16 brine pipes, 13 salt storehouses, several granaries, and more than 110 *dvory* (homesteads) for "working people." The annual output of the Lenva saltworks reached 2 million poods of salt in the 1690's.

The Shustovs used their own ships to deliver salt via the Kama and the Volga to Nizhny Novgorod, where part of their cargo was sold on the local market. The rest of the salt continued, via the Oka, to Kaluga, from which it was shipped for sale in western and southwestern cities.

Between 1695 and 1697, the saltworks on the Lenva were turned over to G. D. Stroganov. Some Shustov *gosti* are known to have lost their capital to the state in the early 18th century.

SHUSTOV, SMARAGD LOGINOVICH. Born 1789; died Apr. 17 (29), 1870, in St. Petersburg. Russian architect.

Shustov graduated from the St. Petersburg Academy of Arts in 1810. Beginning in 1827 he worked for a department of the Board of St. Petersburg Imperial Theaters. He built primarily in St. Petersburg and in its suburbs and nearby districts. Shustov built several buildings in the finest traditions of classicism, including the wooden Kamennoostrovskii Theater (1827; rebuilt 1844 by A. K. Kavos) and the Dolgorukov summer home, now a student dormitory on Kirov Prospect (1831–32).

SHUTOV, STEPAN FEDOROVICH. Born Jan. 17 (30), 1902, on the estate of Dvorets, now the village of Dvorets, in Bobruisk Raion, Mogilev Oblast; died Apr. 17, 1963, in Kiev. Twice Hero of the Soviet Union (Jan. 10, 1944, and Sept. 13, 1944). Colonel (1944). Member of the CPSU from 1924.

The son of a farmhand, Shutov joined the Red Army in 1918. He graduated from the All-Russian Central Executive Committee Combined Military School in 1927, advanced armored courses for command personnel of the Workers' and Peasants' Red Army in 1932 and in 1933, and advanced academic courses for command personnel in 1937 and 1943. Between 1941 and 1944, during the Great Patriotic War, he commanded a tank battalion, a regiment, and a tank brigade. In September 1944 he was appointed deputy commander of a mechanized corps that fought on the Western, Volkhov, Voronezh, First Ukrainian, and Second Ukrainian fronts. Shutov was seriously wounded in 1944, and his left arm was amputated. He retired in 1945.

Shutov was a deputy to the second convocation of the Supreme Soviet of the USSR. He was awarded two Orders of Lenin, two Orders of the Red Banner, and various medals. A bronze bust of Shutov has been placed in the settlement of Glusha in Bobruisk Raion, Mogilev Oblast. [29–1553–2]

SHUTTERS, metal, reinforced-concrete, or wooden beams arranged in sets and designed to close off the opening of a water passage in a hydraulic engineering installation. Beams placed horizontally one on top of the other form a wall, which serves as the movable part of the gate that is usually used during construction or repair of an installation. Shutters may also be used as permanent gates in irrigation, flooding, and drainage systems.

[29–832–3]

SHUTTLE. (1) In weaving, the working element of a loom that interlaces the weft yarns with the warp yarns to weave cloth. It is a streamlined body with a cavity, in which a bobbin for the weft is located. Shuttles may be made of hard wood (hornbeam, boxwood, and acacia), compressed wood, or plastic. In order to increase the durability and smoothness of the external walls, shuttles may be covered with vulcanized fiber 2 mm thick. The ends are clad with steel tips. The design of a shuttle depends on the design and purpose of the loom, the weight-to-length ratio of the weft yarn, and the size of the weft yarn package.

(2) In sewing, the working element of a lockstitch sewing machine, which inserts the bottom thread into the stitch. [29–136–2]

SHUUBIYAH, a cultural and political movement among the non-Arab peoples in the Arabian Caliphate that rejected the Arabs' claims to dominance in the cultural, and sometimes political, life of Islamic countries. The movement, which began in the eighth century, was most active in Iran, where the principal figures were the writer and translator Abu Muhammad Abdallah ibn al-Muqaffa, the historian Hamzah al-Isfahani, and the scholar and encyclopedist al-Biruni. The *shuubiyah* movement was associated with opposition to the political hegemony of the Arabs or with heretical sects, such as the Shiites and Kharijites; it was especially linked with the effort to revive local literary languages, notably Farsi. The poets Bashshar ibn-Burd and Abu Nuwas introduced Farsi expressions and poems into their works. [29–1553–3]

SHUVAEV, DMITRII SAVEL'EVICH. Born Oct. 12 (24), 1854; died 1937. Russian military figure; general of the infantry (1912).

Shuvaev was from a family of respected citizens of Orenburg Province. He graduated from the Alexander Military School in 1872 and the Academy of the General Staff in 1878. He taught at military educational institutions and served in staff positions. Shuvaev was a division commander in 1905 and a corps commander in 1907 and 1908.

In 1909, Shuvaev was appointed chief quartermaster and head of the Main Quartermaster Directorate. He served as chief field quartermaster from December 1915 to March 1916. Shuvaev was minister of war from March 1916 to January 1917, when he was named a member of the Council of State.

After the October Revolution, Shuvaev taught at Red Army military educational institutions, including the school for command personnel, Vystrel. Shuvaev retired in the late 1920's as a personal pensioner. [29–1519–2]

SHUVALOV, IVAN IVANOVICH. Born Nov. 1 (12), 1727, in Moscow; died Nov. 14 (25), 1797, in St. Petersburg. Russian state figure. Adjutant general (1760).

Shuvalov obtained a position at the court in 1742, and in 1749 he became a *kamer-iunker* (lowest title at the tsarist court) and a favorite of Empress Elizaveta Petrovna's. Shuvalov, who influenced the foreign and domestic policy of Russia in the mid-18th century, promoted the development of Russian science and art and acted as a patron for Russian scholars, writers, and artists. He supported many of M. V. Lomonosov's ideas, including the plan to establish Moscow University; after the university opened its doors, he became its first curator. In 1757 the Academy of Arts was established at the initiative of Shuvalov, who served as its president until 1763.

After Catherine II Alekseevna was crowned, Shuvalov fell from favor. From 1763 to 1777, while on leave abroad "for reasons of health," he carried out various diplomatic and other missions for the Russian government. He sent collections of art he gathered in Western Europe to the Academy of Arts and the Hermitage. After his return to Russia, Shuvalov did not play a major role in politics.

SHUVALOV, PAVEL ANDREEVICH. Born Nov. 13 (25), 1830, in St. Petersburg; died Apr. 7 (20), 1908, in Yalta. Russian military figure and diplomat. General of the infantry, adjutant general, member of the Council of State (1896). Count. Brother of Petr Andreevich Shuvalov.

Pavel Andreevich Shuvalov took part in the Crimean War and the Russo-Turkish War of 1877–78. He was chief of staff of the guard troops and the St. Petersburg Military District. From 1885 to 1894 he served as ambassador in Berlin and helped negotiate, in addition to the Reinsurance Treaty of 1887, the trade agreement of 1894, which put an end to the "customs war" between Russia and Germany. Shuvalov became governor-general of Warsaw in 1894 and retired in 1896. [29–1519–4]

SHUVALOV, PAVEL PETROVICH. Born 1847; died 1902. Reactionary Russian political figure. Guards colonel and aide-de-camp. Count.

Shuvalov was a member of the group close to Alexander II that defended the privileges of the upper nobility. A founding leader of the Sviashchennaia Druzhina (Holy Host), Shuvalov carried on negotiations, on behalf of the fictional Zemstvo League, with the People's Will members M. N. Oshanina and L. A. Tikhomirov for purposes of provocation. [29–1519–5]

SHUVALOV, PETR ANDREEVICH. Born June 15 (27), 1827, in St. Petersburg; died there Mar. 10 (22), 1889. Russian statesman and diplomat. Adjutant general; general of the cavalry. Member of the Council of State (1874). Count.

After graduating from the Corps of Pages, Shuvalov served in the guards cavalry. He became an adjutant to the minister of war in 1854 and fought in the defense of Sevastopol'. In 1857 he was appointed chief of police in St. Petersburg. Shuvalov was named director of a general affairs department of the Ministry of Internal Affairs in 1860 and chief of staff of the Corps of Gendarmes and director of the chancery of the Third Section in 1861.

In 1864, Shuvalov became governor-general of Livonia, Estonia, and Courland. He was made chief of the gendarmerie and head of the Third Section in 1866. His almost dictatorial power earned him the nickname "Peter IV." Shuvalov was Emperor Alexander II's closest adviser.

Shuvalov was a member of reactionary circles that advocated serfdom and was an opponent of bourgeois reforms. He served as ambassador in London from 1874 to 1879. On May 30, 1878, he and British foreign secretary Lord Salisbury signed the secret Anglo-Russian agreement that anticipated the principal determinations of the Berlin Congress of 1878.

SHUVALOV, PETR IVANOVICH. Born 1710; died Jan. 4 (15), 1762, in St. Petersburg. Russian state and military figure. General field marshal (1761). Count (1746). First cousin of I. I. Shuvalov.

P. I. Shuvalov took part in the palace coup of Nov. 25, 1741, which resulted in the accession of Empress Elizaveta Petrovna. He directed the domestic policy of Russia in the 1750's and worked out a program of government action that was in the spirit of enlightened absolutism. He was the author of plans for such economic and financial reforms as the abolition of internal customs, the creation of a protectionist foreign-trade policy, the establishment of banks for merchants and for the nobility, the implementation of a general land survey, and the modification of the system of money circulation. Shuvalov was one of the initiators of the sixth legislative commission (1754–66).

Shuvalov took an active part in the reorganization of the army and its administrative system on the eve of the Seven Years' War of 1756–63. After becoming head of an armaments office in 1757, he did a great deal to modernize artillery. He developed the "secret" howitzer and the "unicorn" howitzer, which was used by the Russian Army for more than 100 years. Several artillery plants were built on Shuvalov's initiative.

Shuvalov engaged in trade and manufacturing and in liquor and tobacco tax farming. He held monopolies on fishing and seal hunting in the White and Caspian seas and on foreign trade in timber. Shuvalov was also the owner of several ironworks.

SHUVELIAN, an urban-type settlement in the Azerbaijan SSR, under the jurisdiction of the Azizbekov raion soviet of the city of Baku. The Severnaia State Regional Electric Power Plant and the Baku Aluminum-Rolling Plant are located in Shuvelian. The settlement also has a sovkhoz for flower raising. [29–1520–3]

SHUVYR (also *shyabur*), a Mari folk wind instrument in which the sound is produced by a reed. A type of bagpipe, the *shuvyr* consists of an air reservoir (an animal bladder) and three pipes: one to blow the air and two chanters, which are cradled in a wooden gutter and terminate in a common bell of cow's horn. The chanters have a range of a third and a fifth, respectively. One has two finger holes, and the other four; it is possible to perform two-part melodies. The *shuvyr*, which is tuned to the diatonic scale, produces a loud tone with a shrill, buzzing timbre. Known since antiquity, the instrument was used to accompany folk songs and dance melodies; it is rarely heard today.

SHVANVICH, BORIS NIKOLAEVICH. Born Nov. 14 (26), 1889, in Poltava; died Dec. 5, 1957, in Leningrad, Soviet zoologist.

Shvanvich graduated from St. Petersburg University in 1913. In 1915 he began working at Petrograd University; in 1919 he became an assistant, in 1927 a privatdocent, and in 1931 head of a subdepartment. From 1928 to 1930 he was a professor at the University of Perm'. In the period 1954–57 he was vice-president of the All-Union Entomological Society. He was also chairman of the zoological department of the Leningrad Society of Natural Scientists.

Shvanvich established the existence of dwarf male mollusks. However, his main works dealt with general entomology. Shvanvich related the morphology of insect-wing designs to the theory of protective coloring and ecology. He also studied various aspects of insect taxonomy and silkworm acclimatization as well as insect pollinators, including the honeybee.

Shvanvich was awarded the Order of Lenin and various medals.

SHVARTS, ANTON ISAAKOVICH. Born Jan. 24 (Feb. 5), 1896, in Moscow; died there Feb. 21, 1954. Soviet performer of *estrada* (the variety stage). Honored Artist of the RSFSR (1947). Master of Dramatic Reading.

Shvarts graduated from the University of Petrograd in 1922 and became a lawyer. He performed in drama theaters in Rostov-on-Don and Petrograd. Influenced by A. Ia. Zakushniak, he devoted himself to solo performances of dramatic readings, beginning in 1929. Among his best works were Pushkin's *The Queen of Spades* (1936) and *Ruslan and Liudmila* (1947) and a version of Gogol's *Dead Souls* (1935).

Shvarts helped popularize Soviet poetry, notably the works of V. V. Mayakovsky, S. A. Esenin, N. N. Aseev, E. G. Bagritskii and I. L. Sel'vinskii.

SHVARTS, EVGENII L'VOVICH. Born Oct. 9 (21), 1896, in Kazan; died Jan. 15, 1958, in Leningrad. Soviet Russian writer.

The son of a physician, Shvarts studied at the law faculty of Moscow University from 1914 to 1916. He was first published in 1923; he contributed to the magazines *Ezh* and *Chizh*. A subtle understanding of the psychology of children, a fine sense of humor, and a keen perception of the poetry of childhood are evidenced in his novellas *The Adventures of Shura and Marusia* (1937), *Somebody Else's Girl* (1937), and *The Girl in the First Grade* (1949).

Shvarts displayed an original imagination in his early plays—*Underwood* (staged 1929, published 1930), *The Treasury* (staged 1933, published 1934), and the satirical comedy *The Adventures of Hohenstaufen* (1934). These works contain a number of witty plays on the meaning and sound of words. Shvarts made use of plots from folktales and H. C. Andersen's stories to create living, original characters and his own fictional world in the plays *The Naked King* (1934, published 1960), *Little Red Riding Hood* (1937), *The Snow Queen* (1938), and *The Shadow* (1940). During the war he wrote the antifascist play *The Dragon* (1944, staged 1962, director N. P. Akimov, Leningrad Theater of Comedy), one of the most profound and original works of Soviet satirical drama.

In the postwar years Shvarts focused on the psychology of contemporary life and on details of everyday reality in such plays as *An Ordinary Miracle* (1956) and *A Tale of a Young Couple* (1958). Shvarts wrote the screenplay for such films as *Cinderella* (1947), *The Girl in the First Grade* (1948), and *Don Quixote* (1957, based on the novel by Cervantes).

SHVARTS, ISAAK IZRAILEVICH (party pseudonym, Semen). Born Jan. 6 (18), 1879, in Nikolaev; died Oct. 26, 1951, in Moscow. Russian revolutionary and party figure. Member of the Communist Party from 1899.

The son of a worker, Shvarts in 1892 obtained a job as a worker and became active in Social Democratic circles. He was exiled to Yakutia, from which he fled to Switzerland; he later helped rebuild various Bolshevik organizations, including the Ekaterinoslav committee of the RSDLP in 1905 and the Urals party organization in 1906. In 1911 he attended lectures at the party school in Longjumeau, served as a commissioner of the Organizational Commission Abroad for Convening a Party Conference, and was a member of the Russian Organizational Commission for Preparing the Sixth (Prague) All-Russian Conference of the RSDLP(B), which was held in 1912. Seven times he was arrested and exiled to Eastern Siberia, from which he escaped six times.

After the February Revolution of 1917 he engaged in party work in the Ukraine and served on the bureau of the oblast committee of the RSDLP(B) of the Donbas and the Krivoi Rog region. During the Civil War of 1918–20, he was a leader of the party underground and the partisan movement in the Ukraine. In 1918 he was a delegate to the First Congress of the Communist Party (Bolshevik) of the Ukraine, a member of the Central Committee, and chairman of the All-Ukrainian Extraordinary Commission; he served as a commissioner of the Central Committee of the RCP(B) in the Donbas. Shvarts became chairman of the Central Committee of the Miners' Union in 1921 and a member of the Presidium of the All-Union Central Council of Trade Unions in 1925. In 1930 he undertook administrative work.

Shvarts was a delegate to the Ninth and the Eleventh through Seventeenth Party Congresses. At the Tenth and Twelfth Congresses he was elected a member of the Central Control Commission. He was elected a member of the Central Committee by the Thirteenth through Sixteenth Congresses and a candidate member of the Central Committee of the ACP(B) by the Seventeenth Congress. In 1946 he became a personal pensioner. Shvarts was awarded the Order of the Red Star.

SHVARTS, STANISLAV SEMENOVICH. Born Apr. 1, 1919, in Ekaterinoslav, now Dnepropetrovsk; died May 12, 1976, in Sverdlovsk. Soviet zoologist. Academician of the Academy of Sciences of the USSR (1970; corresponding member, 1966). Member of the CPSU from 1958.

Shvarts graduated from Leningrad State University in 1942. In 1946 he began working at the Urals Branch of the Academy of Sciences of the USSR, and from 1955 to 1976 he was director of the Institute of Plant and Animal Ecology (the original name of the Institute of Biology). In 1952 he organized the laboratory of animal population ecology and became its director.

Shvarts' main works dealt with animal ecology. Shvarts developed a system of morphophysiological indicators for determining the state of animal populations and for predicting their growth; he also introduced new concepts concerning the ecological mechanisms of the evolutionary process in nature and the metabolic regulation of the rate of growth and development in animal populations. He made major contributions to the development of animal population ecology (the concept of the biological distinctiveness of seasonal generations of animals) and the chemical ecology of aquatic animals. Shvarts directed a multifaceted investigation of the nature of the far north.

Shvarts was awarded the Order of Lenin, the Order of the October Revolution, and various medals. He received the A. N. Severtsov Prize of the Academy of Sciences of the USSR.

SHVARTS, VIACHESLAV GRIGOR'EVICH. Born Sept. 22 (Oct. 4), 1838, in Kursk; died there Mar. 29 (Apr. 10), 1869. Russian painter.

Shvarts studied at the St. Petersburg Academy of Arts from 1859 to 1863 under B. P. Villeval'de. He perfected his painting technique in Germany (1861) and France (1863–64, 1867). The founder of the historical genre in Russian painting, he strove to depict historical events realistically, to reveal the life-style and national character of the Russian people of past ages, and to impart deep significance to landscape in the imagery of a picture.

Works by Shvarts include *Ivan the Terrible by the Body of the Son He Has Slain* (1864, Tret'iakov Gallery, Moscow), illustrations for A. K. Tolstoy's novel *Prince Serebrianyi* (pen and ink, 1863–65, Tret'iakov Gallery), and *Scene From the Domestic Life of the Russian Tsars* (1865, Russian Museum, Leningrad).

Shvartsevskii has a chemical combine that produces vitamins and synthetic intermediates. The Bolokhovo Chemical-Mechanical Technicum is located in the settlement. [29–931–2]

SHVARTSMAN, OSHER MARKOVICH. Born Oct. 6 (18), 1889, in the village of Vil'nia, near Zhitomir; died August 1919, in the *stanitsa* (large cossack village) of Palitsa, near Sarny. Soviet Jewish poet.

Shvartsman served in World War I, and in late 1918 he joined the Red Army as a volunteer. He was killed in a skirmish with the White Poles. Shvartsman was first published in 1913. His poetry is characterized by optimism and revolutionary romanticism. His best postrevolutionary poems are "Youth" (1917), "Vision" (1918), "My Brother" (1919), and "The Gray Mother-Night" (1919). Shvartsman's poetry is pervaded by a love for working people and for his native countryside. Considered the first Soviet Jewish poet, he deeply influenced the development of Soviet Jewish poetry. Some of Shvartsman's poems have been translated into Russian, Ukrainian, and other languages.

SHVEDOV, FEDOR NIKOFOROVICH. Born Feb. 14, 1840; died Dec. 12, 1905, in Odessa. Russian physical chemist.

Shvedov graduated from the University of St. Petersburg in 1863. In 1870 he became a professor at Novorossiia University in Odessa, and from 1895 to 1903 he was rector of the university; under his direction the institution was greatly expanded.

Shvedov was one of the founders of the rheology of disperse systems. In 1889, using a rotatory viscometer of his own invention, he became the first to observe the elastic form and anomalous viscosity of colloidal solutions. Shvedov studied the relaxation of stress in colloids and established an equation to express the viscoelastic flow of disperse systems.

SHVEITSER, MIKHAIL ABRAMOVICH (Moisei Abramovich Shveitser). Born Mar. 16, 1920, in Penza. Soviet motion-picture director. People's Artist of the RSFSR (1977).

In 1944, Shveitser graduated from the department of film direction at the All-Union State Institute of Cinematography, where he studied in S. M. Eisenstein's workshop. His first work was *Path of Glory* (1949, in collaboration with B. A. Buneev and A. M. Rybakov).

Shveitser's most significant motion pictures have been film versions of well-known works of classical and Soviet literature. They include *Someone Else's Relatives* (1956, based on V. F. Tendriakov's story "Not to the Yard"), *Resurrection* (1960–62, based on the L. N. Tolstoy novel), *Time, Forward!* (1966, in collaboration with S. A. Mil'kina; based on the novel by V. P. Kataev), *The Golden Calf* (1968, based on the novel by Il'f and Petrov), and *The Flight of Mister McKinley* (1976, based on a screenplay by L. M. Leonov).

Shveitser was awarded the State Prize of the USSR in 1977. [29–997–3]

SHVERNIK, NIKOLAI MIKHAILOVICH. Born May 7 (19), 1888, in St. Petersburg; died Dec. 24, 1970, in Moscow. Soviet state and party figure. Hero of Socialist Labor (1958). Member of the CPSU from 1905.

The son of a worker, Shvernik became a metalworker in 1902. Between 1905 and 1917 he was a member of the St. Petersburg, Nikolaev, Tula, and Samara committees of the RSDLP, and in

1910 and 1911 he served on the administrative board of the union of metalworkers in St. Petersburg. After the February Revolution of 1917 he was chairman of the plant committee of the pipe plant in Samara, and in October 1917 he became chairman of the All-Russian Committee of Artillery Plant Workers. After the October Revolution of 1917, Shvernik became chairman of the Samara soviet. From 1918 to 1920 he was a commissar on the Eastern and Southern fronts and deputy extraordinary commissioner of the Council of Defense for supplying the armies of the Caucasian Front.

From 1921 to 1923, Shvernik engaged in trade union work. From 1923 to 1925 he was a member of the Presidium of the Central Control Commission of the RCP(B) and people's commissar of the Workers' and Peasants' Inspectorate of the RSFSR. In 1925 and 1926 he was secretary of the Leningrad oblast committee and the Northwestern Bureau of the Central Committee of the ACP(B). In 1926 and 1927 he was a secretary of the Central Committee of the ACP(B). Shvernik was secretary of the Ural'sk oblast party committee in 1927 and 1928. In 1929 he served as chairman of the central committee of the metalworkers' trade union, and from 1930 until 1944 he was first secretary of the All-Union Central Committee of Trade Unions (AUCCTU).

Between 1944 and 1946, Shvernik served as first deputy chairman of the Presidium of the Supreme Soviet of the USSR and chairman of the Presidium of the Supreme Soviet of the RSFSR; from 1938 to 1946 he was chairman of the Soviet of Nationalities of the Supreme Soviet of the USSR. During the Great Patriotic War of 1941–45 he also served as chairman of the Extraordinary Commission to Establish and Investigate the Crimes of the German Fascist Aggressors. From 1946 to 1953, Shvernik was chairman of the Presidium of the Supreme Soviet of the USSR, and from 1953 until 1956 he served as chairman of the AUCCTU. From 1956 to 1962 he was chairman of the Party Control Committee of the Central Committee of the CPSU. From 1962 to 1966 he was chairman of the Party Commission of the Central Committee of the CPSU.

Shvernik served as a delegate to the Fourteenth through Twenty-third Party Congresses. Having become a member of the Central Committee in 1925, he served as a member of the Organizational Bureau of the Central Committee in 1926 and 1927 and again from 1930 to 1946; a candidate member of the Politburo of the Central Committee from 1939 to 1952, he was a candidate member of the Presidium of the Central Committee of the CPSU from 1953 to 1957 and a member of the Presidium in 1952 and 1953 and again from 1957 to 1966. From 1927 to 1938, Shvernik was a member of the All-Union Central Executive Committee and from 1935 to 1938 he was a member of the Presidium of the Central Executive Committee of the USSR. He was a deputy to the first through sixth convocations of the Supreme Soviet of the USSR.

Shvernik, who was awarded five Orders of Lenin, is buried on Red Square near the Kremlin wall. [29–999–1]

SHVETSOV, ARKADII DMITRIEVICH. Born Jan. 12 (24), 1892, in the settlement of Nizhnie Sergi, in what is now Sverdlovsk Oblast; died Mar. 19, 1953, in Moscow. Soviet aircraft-engine designer; doctor of technical sciences (1940). Lieutenant general of the engineering and technical service (1948). Hero of Socialist Labor (1942).

After graduating from the Moscow Higher Technical School in 1921, Shvetsov worked in the aviation industry. In 1934 he was made chief designer at an aircraft-engine plant.

In 1926, Shvetsov developed the M-11, the first Soviet lot-produced air-cooled aircraft engine, for use in such aircraft as the Po-2 (U-2), the AIR-6, the UT-2, and the Iak-18. Later, in the 1930's, the M-22, M-25, M-62, and M-63 engines were developed under Shvetsov's supervision to power such fighters as the I-15 and the I-16.

In the 1940's, Shvetsov guided the development of a number of ASh air-cooled radial engines, each more powerful than its predecessor: namely, the ASh-62IR, which was used in the Li-2 and An-2 transports; the ASh-82 and ASh-82FN, which powered the La-5 and La-7 fighter planes, the Tu-2 bomber, and the Il-12 and Il-14 passenger planes; and engines for the Mi-4 helicopter, designed by M. L. Mil'. Shvetsov can be said to have founded a school in the design of air-cooled engines.

Shvetsov was a deputy to the second and third convocations of the Supreme Soviet of the USSR. He received the State Prize of the USSR in 1942, 1943, 1946, and 1948. Shvetsov was awarded five Orders of Lenin, three other orders, and various medals.

SHVETSOV, MIKHAIL SERGEEVICH. Born Oct. 17 (29), 1885, in Moscow; died there July 22, 1975. Soviet geologist. Honored Scientist of the RSFSR (1956).

Shvetsov graduated from Moscow University in 1910. He taught there and at the Moscow Mining Academy from 1918 to 1930. In 1930 he became a professor and head of the subdepartment of sedimentary rocks at the Moscow Geological Prospecting Institute. Shvetsov's main works dealt with the petrography of sedimentary rocks, stratigraphy, and paleontology (belemnites, brachiopods). In 1923, Shvetsov began teaching the first course on the petrography of sedimentary rocks in the USSR at Moscow University. He is the author of the textbook *The Petrography of Sedimentary Rocks* (1934), which has been translated into many languages.

Shvetsov was awarded the Order of Lenin and various medals.

SHVETSOV, PETR FILIMONOVICH. Born Jan. 14 (27), 1910, in the village of Kazanskaia, in what is now Iglino Raion, Bashkir ASSR. Soviet permafrost specialist and hydrogeologist. Corresponding member of the Academy of Sciences of the USSR (1953). Member of the CPSU since 1940.

After graduating from the Moscow Geological Prospecting Institute in 1935, Shvetsov worked in the Main Administration of the Northern Sea Route. In 1941 he began working at the Institute of Geocryology, serving as its director from 1956 to 1958. In 1962 he became head of a laboratory at the All-Union Scientific Research Institute of Hydrogeology and Engineering Geology (VSEGINGEO).

Shvetsov's main works deal with groundwaters and the geothermal conditions of permafrost layers. Shvetsov was scientific director and editor of the collective work *Fundamentals of Geocryology* (1959). He received the State Prize of the USSR in 1952 and has been awarded the Order of the October Revolution, two other orders, and medals.

SHVI. (1) One of the names of an Armenian folk wind instrument, a type of ocarina. The *shvi*, also known as a *pepuk, kavits*, or *blul*, is a clay whistle in the shape of a fantastical bird or an animal with two bodies. It has a whistle head and two finger holes in the lower part of the instrument. The *shvi* is also used as a child's toy.

(2) An Armenian whistle flute, also called a *tutak*. [29–1061–2]

SHVIADAS, IONAS IZIDORJAUS (also Jonas Izidoriaus Švedas). Born Sept. 26 (Oct. 9), 1908, in Liepāja, now in the Latvian SSR; died Oct. 15, 1971, in Vilnius. Soviet composer, choral director, and teacher. People's Artist of the USSR (1954).

In 1929, Shviadas graduated from the Klaipėda School of Mu-

sic, where he had studied trombone and, under S. Šimkus and J. Žilėvičius, composition. From 1930 to 1935 he played in the orchestra of the Kaunas Theater. In 1940 he founded the Lietuva State Song and Dance Ensemble of the Lithuanian SSR, which he headed until 1962. Until 1970 he was the principal conductor at the festivals of song.

Shviadas notated and arranged examples of folk music. Many of his songs and compositions for folk instruments are based on elements of national folklore and have become widely known. Among Shviadas' most important compositions are his cantata in honor of the tenth anniversary of Soviet Lithuania (1949) and the cantata *Flourish, Soviet Lithuania* (1960). With B. Dvarionas he wrote the music for the national anthem of the Lithuanian SSR.

Shviadas began teaching trombone at the Kaunas Conservatory in 1935. In 1945 he became head of the subdepartment of folk instruments at the State Conservatory of the Lithuanian SSR in Vilnius, where he was appointed a professor in 1967. He received the State Prize of the USSR in 1950. Shviadas was awarded the Order of Lenin, the Order of the Red Banner of Labor, and various medals. M. M. Iakovlev [29–1063–2]

SHYIUEDI CHI (Banner of October), a Dungan-language newspaper circulated in several republics of the USSR. *Shyiuedi chi* has been published in Frunze, Kirghiz SSR, since 1957; it appears twice a week. Circulation, more than 4,400 (1977). [29–1561–1]

SHYN (Pravda), a Tuvinian-language newspaper of the Tuva ASSR. *Shyn* was founded Aug. 31, 1925, under the name *Erge cholee bukhii Tuva* (Liberated Tuva), and in September of the same year it was renamed *Tyvanyn arattyn shyny* (Pravda of the Tuvinian *Arat*). Since 1931 it has been called *Shyn*. The newspaper, which was published in Mongolian until 1930, comes out in Kyzyl six times a week. Circulation, 1,700 (1977). *Shyn* was awarded the Order of the Badge of Honor in 1975. [29–1561–2]

ŠIAULIAI (until 1795, Saule; until 1917, Shavli), a city under republic jurisdiction and administrative center of Šiauliai Raion, Lithuanian SSR. A junction of railroad lines to Riga, Vilnius, and Liepāja. Population, 115,000 (Jan. 1, 1977).

Šiauliai has been known since the 15th century. It became a city in 1569. Beginning in 1795, it was part of Russia, and in 1843 it was made a district capital in Kovno Province. It was part of bourgeois Lithuania from 1919 to 1940, when it became part of the Lithuanian SSR and the administrative center of Šiauliai Raion.

In 1236, not far from Šiauliai, Lithuanian troops commanded by Prince Vykintas defeated an army of Teutonic knights at the source of the Dubysa River. During the Great Patriotic War (1941–45), the area around the city was the scene of the Šiauliai offensive operation, in the course of which on July 27, 1944, Šiauliai was liberated from the fascist aggressors.

The principal enterprises are the Vairas motor bicycle plant, a machine-tool plant, an experimental electrical design plant, a television plant, a tire-repair plant, and plants for the production of reinforced-concrete structural elements, construction elements, and leather goods. The city also has meat, milk, bread and macaroni, beer-brewing, and home-building combines and factories for the production of leather clothing accessories and nonwoven fabrics. Located in the city are the Verpstas knitted goods factory, the Rūta confectionery production association, the Elnias leather footwear production association, and the Venta furniture production association. The Rekiva State Regional Electric Power Plant and a peat enterprise are located nearby. Heavily damaged during the Great Patriotic War, the city has been rebuilt according to the old grid plan of 1774–83.

Architectural monuments include the Renaissance Church of Sts. Peter and Paul (1595–1625). The city is being developed according to the 1963 general plan (architect K. Bučas). New residential developments have been built (the Druzhba development; architects A. Rätnikas, P. Marengolcas, E. Raupis, and B. Semashka; 1959), and new developments are under construction (Dainiai; architects A. Kuosa and V. Naujėkas; begun 1975). A pedestrian mall (architect V. Taujanskenė) was built in the center of the city in 1976. Notable public buildings include the Palace of Culture (architects A. Rätnikas and I. Cjuta; 1961–71), the Institute of Water Management Planning (architect A. Kuosa; 1966), the parking building (architect A. Rätnikas; 1966), and the building of the planning institute (architect A. Sprindis; 1974). There are several stone and bronze monuments, including the monument to V. I. Lenin (sculptors A. Toleikis and D. Lukoševičius; architect S. Staponkus; 1970), the Victory Monument (sculptor A. Penkov; architect E. Budreika; 1947), the Komsomol monument (sculptors A. Toleikis and D. Lukoševičius; architect S. Staponkus; 1968), and the monument to F. Žemaitis (sculptor D. Lukoševičius; architect V. Gabrjunas, 1976). Šiauliai has a pedagogical institute, an evening department of the Kaunas Polytechnical Institute, a secondary specialized polytechnic, and secondary music and medical schools. It also has a historical-ethnographic museum and a drama theater.

ŠIAULIAI OPERATION OF 1944, an operation by Soviet forces of the First Baltic Front, commanded by General of the Army I. Kh. Bagramian, conducted between July 5 and Aug. 29, 1944, during the Great Patriotic War of 1941–45.

By July 4, the forces involved in the Byelorussian Operation of 1944 (the Sixth Guards and Forty-third armies) had reached the line extending from Druia, to an area west of Voropaevo, to Lake Naroch' and were then to advance in the direction of Švenčionys and Kaunas, as well as on Panevėžys and Šiauliai. The Thirty-ninth Army, which was supposed to concentrate on the left flank of the front by July 10, was transferred to the front, as were the Second Guards and Fifty-first armies from the General Headquarters reserve, which were to arrive in the front zone only in the latter part of July.

The offensive was launched on July 5 by two rifle corps of the Sixth Guards Army and three rifle corps of the Forty-third Army and by a small force of the I Tank Corps. The fascist German forces comprised two corps operating on adjacent wings of Army Groups North and Center. The Thirty-ninth Army was introduced into combat on July 10, striking toward Kaunas. By July 12, the width of the front of the three advancing armies increased to 200 km. The enemy forces of Army Group North offered stubborn resistance.

In view of the situation, the General Headquarters of the Supreme Command changed the direction of the front's main thrust from Kaunas to Šiauliai. On July 14, the Thirty-ninth Army and its zone of attack were transferred to the Third Byelorussian Front, from which the III Guards Mechanized Corps was transferred to the First Baltic Front. On July 20, the Second Guards and Fifty-first armies were brought into combat along the Šiauliai axis to develop the offensive, and by July 22 they had taken the city of Panevėžys, the communications center of Army Group North. On July 27, the III Guards Mechanized Corps, in cooperation with combined-arms units of the Fifty-first Army, liberated the city of Šiauliai. Units of the right wing of the front, in cooperation with the forces of the Second Baltic Front, liberated the city of Daugavpils. Developing the offensive, the forces of the front captured the strongpoints and road junctions of the cities of Biržai and Bauska on July 30 and Jelgava (Mitava) on July 31. At this time, mobile units of the front took the city of Tukums, reached the coast of the Gulf of Riga near Klapkalns, and cut off the land communications of Army Group North.

In late July and early August, the forces of the front repulsed enemy counterstrikes in the vicinity of Biržai (as many as four infantry divisions and 100 tanks and assault weapons) and Raseiniai (one infantry division and one tank division). Between August 16 and August 29, the Germans launched powerful counterstrikes (as many as seven tank divisions and three infantry divisions with more than 800 tanks and assault weapons) to the west and northwest of Šiauliai. In repulsing the enemy counterstrikes, the ground forces were supported by the Third Air Army. On Au-

gust 20, the enemy's counterstrikes from areas west of Tukums and Sloka and his naval landing operations had succeeded in pushing back the Soviet troops from the coast to the south and restoring the coastal communications lines of the Riga grouping. By August 29, the forces of the front were entrenched on the line Plavinas, Lielupe River, Jelgava, Dobele, Auce, and areas west of Zagare, west of Šiauliai, and east of Raseiniai.

During the Šiauliai Operation, the forces of the First Baltic Front defeated the enemy's Panevėžys-Šiauliai grouping and created conditions for completing the liberation of the Soviet Baltic region from fascist German forces. The operation was characterized by a swift offensive, considerable maneuvering, and successful repulses of strong counterstrikes by enemy tank forces.

M. A. POLUSHKIN [29–1566–1]

ŠIBENIK, a city and port in Yugoslavia; situated on the Adriatic Sea, in Croatia. Population, 32,000 (1975). Šibenik, a center for the production of ferroalloys, is also important for the aluminum industry, including smelting in Lozovac and metal-rolling in Ražina. The metalworking industry uses energy from a hydroelectric power plant on the Krka River and bauxite from local deposits. The city also manufactures textiles and food products, mainly wine and canned fruit and fish. Ships are repaired in the port.

Šibenik, which is laid out in the form of an amphitheater, has an old section with an irregular medieval network of streets. Noteworthy buildings include remains of stone fortifications and Gothic churches, including the Church of St. Barbara (1447–51), as well as palaces with elegant carved ornamentation. Renaissance structures include the Cathedral of St. Jakov (1431–1555; architects included Juraj Dalmatinac and Nikola Firentinac; sculpted heads on the eastern facade by Juraj Dalmatinac), the town hall (1534–42), and the New Church (16th century, interior frescoes by local craftsmen, 17th century). The Church of St. Lovre (17th century) is in the baroque style. Outside the old city there are 20th-century buildings, including new residential areas and the Solaris Hotel (1969). Šibenik is popular with tourists.

SIBERIAN SKETCHBOOK, the first Russian geographic atlas. It summarized the results of geographic discoveries of the 17th century.

In 1695, S. U. Remezov made copies of maps that had been sent to Moscow from Siberia and sketched a number of original maps. In 1696 and 1697, sketch maps of various parts of Siberia were compiled in Tobol'sk, Irkutsk, and other cities. Remezov compiled sketch maps of Western Siberia and an atlas of Siberian rivers. Between 1699 and 1701, Remezov, together with his three sons, compiled the *Siberian Sketchbook*.

The *Siberian Sketchbook* comprised a preface and 23 large maps that encompassed the entire territory of Siberia and were outstanding for the abundance and detail of their information. The maps had no graticule and were oriented with south rather than north on top. Nevertheless, the book was an important achievement of early Russian cartography.

ŠILALĖ, a city and administrative center of Šilalė Raion, Lithuanian SSR; located 30 km northwest of the Tauragė railroad station on the Šiauliai-Sovetsk line. The city has a clothing factory and a butter factory. [29–1184–4]

ŠILFS, JĀNIS (party pseudonym, Jaunzems). Born Sept. 8 (20), 1891, in Riga; died there, June 11, 1921. Figure in the revolutionary movement in Latvia. Member of the Communist Party from 1908.

The son of a worker, Šilfs was himself a worker. He was instrumental in establishing underground printshops, and he helped with the publication of newspapers of the Social Democracy of the Latvian Territory (SDLT). Šilfs was arrested several times for his underground activities. In 1912 he became a member of the Bolshevik organization of the SDLT, and in 1914 he became a member of the Central Committee of the SDLT. He continued to serve on the Central Committee of the party after it was renamed the Social Democracy of Latvia in 1917 and the Communist Party of Latvia (CPL) in 1919.

In August 1917, Šilfs began underground party work in Riga, which was then occupied by German troops. In December 1918 he became a member of the Latvian Military Revolutionary Committee and the Provisional Soviet Government of Latvia. After helping to establish Soviet power in Riga in January 1919, he became a secretary of the government of Soviet Latvia. Šilfs went underground in May 1919; he served as secretary of the Central Committee of the CPL and editor of the newspaper *Cīņa* (Struggle).

Šilfs was arrested by the bourgeois secret police and subsequently shot. [29–1195–5]

SILK, a natural textile fiber of animal origin, produced by ejection from the silk glands (sericteries) of silkworms spinning cocoons. The principal commercial silkworm is the larva of the Asiatic mulberry silkworm moth (*Bombyx mori*), which is raised commercially on special farms. The larvae eject silk in the form of two filaments consisting of a protein substance called fibroin (70–80 percent by weight) surrounded by another protein substance called sericin (20–30 percent), which cements the filaments into what is called the cocoon thread (bave). In addition to fibroin and sericin, the cocoon threads contain waxes and fats (1–1.5 percent) as well as minerals, such as potassium, sodium, and calcium salts (1–1.5 percent). From the cocoon thread the silkworm shapes a solid silk shell—the cocoon—which is the raw material from which silk is obtained.

Silk is noted for its thinness, high hygroscopicity, dyeability, and pleasing, moderate luster. It has good mechanical properties: a tensile strength of the order of 40 kg-force per mm^2 (1 kg-force per $mm^2 = 10^7$ newtons per m^2) and an extension at break of 14–18 percent. When silk is wet the first figure decreases by 10 percent, but the second increases by the same amount. Silk has little resistance to alkalis and breaks down rapidly in a 5-percent solution of NaOH. It is more resistant to the action of mineral acids, and does not dissolve in ordinary organic solvents. Silk exhibits low resistance to the effect of light; after 200 hr of exposure to sunlight it loses half its strength.

When the cocoons are reeled (unwound) a continuous silk thread up to 1,200 m long is obtained. However, the cocoon threads obtained by reeling individual cocoons are too thin to be used in industry; several must be combined to form the raw silk threads used as commercial threads. Unreeled cocoons (defective cocoons and those remaining after the moth emerges) and waste from all the processes of silk production are broken into short segments, and the fibers are processed in silk spinning.

The production of silk requires considerable labor, which makes silk one of the most expensive textile materials. As a result, silk has been replaced by various chemical fibers in the production of a number of fabrics (in particular, linings and industrial fabrics), stockings, and other articles.

World silk production in 1976 totaled 49,000 tons, approximately 10 percent of which was produced in the USSR.

SILK FABRIC, a textile made of natural silk; in the Soviet industry the Russian term *shelkovaia tkan'* is also used to refer to silk-like fabrics made from chemical fibers.

The production of silk fabric from natural silk arose in China approximately 5,000 years ago. The Mediterranean countries began producing silk fabrics only after A.D. 555, when Constantino-

ple first imported silkworm eggs from China. In the Middle Ages the silk trade was one of the principal branches of industry in Venice (13th century), Genoa and Florence (14th century), and Milan (15th century). By the 18th century there was a well-developed silk industry in Western Europe, especially in Italy and France.

In Russia the production of silk began during the reign of Peter I the Great. By 1762 the country had 44 silk-weaving mills. However, the production of silk developed in isolation from the raw material base—80 percent of the raw silk used in 1913 and 1914 was imported.

In the USSR the volume of silk and silklike fabrics produced from natural, artificial, and synthetic fibers totaled 1.6 billion sq m in 1977, comprising approximately 600 different items.

The structure of silk fabric varies greatly because of differences in the yarns used (monofilaments, combination yarns, twisted yarns, textured yarns, fancy yarns, cut yarns, and yarns from various textile fibers) and the variety of weaves. Silk fabrics may be bleached, dyed, printed, yarn-dyed, or mélange; they can be given an embossed or glazed finish. In the finishing process the fabric surface can also be given a relief effect, and it can be impregnated with crease-resistant, shrink-resistant, and water-repellent substances. Silk fabrics are conventionally divided into the following groups according to use: dress, shirt, lining, raincoat, suit and coat, and tie fabrics, fabrics for foundation garments, and haberdashery fabrics. Individual items manufactured include scarves, tablecloths, and bedspreads, as well as industrial fabrics.

Silk dress fabrics (armures) (30–200 g/sq m in weight) vary widely in composition, structure, manufacture, and properties. Natural silk dress fabrics include crepe de chine, crepon, and Georgette crepe. Dress fabrics of acetate and triacetate combination and textured yarns are made in plain, twill, satin, small-figured, and large-figured (Jacquard) weaves. They include printed, yarn-dyed, bleached, and piece-dyed fabrics. Dress fabrics of polyamide combination and textured yarns are made with a plain weave; they may be piece-dyed or printed. Dress fabrics of polyester textured yarns include printed and yarn-dyed fabrics. Dress fabrics of viscose yarns are made in a plain weave with printed designs; those of blended yarns (viscose and synthetic fibers) include yarn-dyed and printed fabrics. Some dress fabrics have a nap.

Silk shirting (70–200 g/sq m in weight) may be made from viscose yarn, blended yarn (67 percent polyester and 33 percent viscose fiber), or a combination of such yarns with viscose and polyamide yarns in a plain small-figured, or combination weave. They include bleached, piece-dyed, printed, yarn-dyed, and mélange fabrics and fabrics with crease-resistant and low-shrinkage finishes. All exhibit moderate hygroscopicity and air permeability; special finishes diminish these properties to some extent.

Silk lining fabrics (60–150 g/sq m in weight) are made from viscose and polyamide yarns and from viscose, acetate, or polyamide warp yarns and cotton or viscose filling yarns. Plain, twill, satin, combination, and large-figured weaves are used, and the fabrics may be bleached, piece-dyed, yarn-dyed, or printed and may have a low-shrinkage finish. The face side of the fabric is smooth. The fabrics have a low coefficient of tangential resistance and high friction resistance and hygroscopicity.

Raincoat fabrics (50–200 g/sq m in weight) are used for raincoats, jackets, and umbrellas. They are of two types: fabrics made from polyamide yarn (in a plain weave; piece-dyed, yarn-dyed, or printed; and impregnated for water repellency or with a film coating) and fabrics made from viscose-polyester or viscose-polyamide yarn (in a plain or twill weave; piece-dyed; and impregnated for water repellency).

Suit and coat fabrics (200–300 g/sq m in weight) are usually made from blended yarns (such as polyester-viscose) in a plain or twill weave. They exhibit good hygroscopicity and moderate water repellency. They are sometimes impregnated to reduce shrinkage and creasing. Women's summer dress coats are made with double-layer fabrics of viscose or polyamide yarn in a large-figured weave with a relief effect on the surface. The fabrics may be piece-dyed or yarn-dyed.

Tie fabrics are made from viscose, triacetate, and polyester yarns in small-figured and large-figured weaves. They may be yarn-dyed or printed.

Fabrics for foundation garments are made in a satin weave from viscose and polyester threads in combination with viscose and blended yarns; they may be bleached, piece-dyed, or printed.

Fabrics for scarves and kerchiefs are made from natural silk, acetate, triacetate, and polyamide yarns in various weaves. They may be piece-dyed, yarn-dyed, or printed.

SILK ROAD, the name of the caravan trade routes that connected China, through Middle Asia, with Southwest Asia and ultimately with Europe from the second century B.C. to the 16th century A.D. The main commodity transported along the Silk Road was Chinese silk.

The route began in the central regions of China and ran through Lanchou to Tunhuang, where it divided. The southern route ran through Khotan, Yarkand, and Balkh to Merv, and the northern route through Turfan, Kashgar, and Samarkand to Merv. The Silk Road then passed through Nisa, Hecatompylus, Ecbatana, and Baghdad and ended at the Mediterranean ports of Tyre and Antioch.

In the first centuries of the existence of the Silk Road, Rome and Parthia struggled for predominance in intermediary trade. In the fifth and sixth centuries, much of the Silk Road was controlled by Iranian and Sogdian merchants; in the seventh century a substantial portion of the route came under the control of Arab merchants. The importance of the Silk Road declined in the 14th century with the development of sea travel. [29–1108–1]

SILK-SCREEN PROCESS, a stenciling technique in which the image is applied with oil paints or watercolors on a mesh made of silk or other strong material stretched over a frame. The sections of the mesh corresponding to the blank areas in the image are covered with an impermeable compound; during the printing process the paint is squeezed with a doctor through the openings in the mesh onto the surface to be imprinted. The silk-screen process, which originated in the mid-20th century, is used for pictorial reproductions, including production art, and in the creation of individual works marked by an enhanced vividness and decorative coloring. [29–1108–2]

SILK SPINNING, the aggregate of production processes used in converting silk waste obtained in sericulture and various branches of the silk industry (such as cocoon reeling and silk throwing) into yarn. Three systems of spinning are used: comb spinning without carding, card and comb spinning, and condenser spinning.

Comb spinning without carding is used to produce yarns up to 2.8 tex. The raw material is sorted, scoured to remove gum and fat, separated, and stapled, after which it is combed on circular carding machines. From three to four machine transfers are usually used, during which the combings from the first machine enter the second and so on. The output from the carding machines is fed to a cross folder, where it is drawn out and formed into sliver, which is wound onto a drum. The sliver is then drawn out and doubled in several transfers on two-stage drawing frames, after which it is fed to roving frames. The roving frames produce spun roving, which is processed into twisted roving on roving machines with spindles. Spinning is accomplished on ring spinning frames.

In card and comb spinning, combings from the last carding machine are processed into yarn. The combings are sorted, separated, and carded on carding machines equipped with roller cards. The sliver is then successively processed on drawing frames, a machine that joins several slivers together, and a combing machine. The combed sliver is processed on drawing, roving, and ring spinning frames into yarn up to 6.7 tex.

Condenser spinning consists in processing the combings obtained by card and comb spinning. The combings are separated, cleaned, oiled, and carded on carding machines. The roving is then processed into yarn on ring spinning frames.

Blends of silk wastes and chemical fibers can also be processed into yarns. (*See also* SPINNING.) V. V. ZHOKHOVSKII [29–1109–1]

SILK THROWING, the aggregate of production processes by means of which raw silk or untwisted chemical filaments are converted to twisted yarns. Twisted silk and chemical yarns are classified according to their use: for weaving, knitwear manufacture, general use (sewing and embroidery), and technical purposes (surgical, insulating, and other types). Twisted silk is classified according to structure into simple, compound, and irregular-twist types.

In silk throwing, skeins of raw silk are soaked in a soap- or oil-based emulsion to soften the sericin, which promotes the best separation of filaments during reeling; it also imparts smoothness and pliability, increases the hygroscopicity of the filaments, and decreases their capacity to take and hold an electric charge. Chemical filaments are not soaked, but are subjected to sizing to give them greater toughness and smoothness and to decrease their tendency to accept and hold an electric charge. After soaking or sizing, the skeins of raw silk or chemical filaments are wrung, straightened, and dried. Before drying, skeins of raw silk are picked apart in order to separate the filaments and remove tangles. After drying, the skeins are unwound on winding machines, which permits control of the continuity of the filament and makes it possible to wind it onto spools or bobbins convenient for subsequent processing. During unwinding, weak and defective sections in the strand are removed.

In order to obtain a thicker yarn, several strands are joined together, usually on double twisters, with simultaneous loose twisting of the strands. This decreases the tendency of the strands to break during subsequent twisting, which is done on multistage or ring twisters. In order to produce twisted yarns of equal weight, that is, to decrease their tendency to ravel, the yarns are steamed in special chambers. After steaming, the twisted yarns are rewound into skeins convenient for subsequent processing.

Twisted silk is usually produced from two to five strands twisted together, with from 50 to 3,000 turns per m.

V. V. ZHOKHOVSKI [29–1108–3]

SILKWORM BREEDING HOUSE, an installation for raising larvae of the silkworm moth. The structure is located near plantings of mulberry, on a dry site removed from roads, dumping grounds, and manure storage areas. The walls are of brick or pisé, the floors are of packed earth, and the ceilings are heated. The premises are equipped with heating units (radiators, furnaces, and the like) and forced-air ventilation. Where egg incubation is not centralized, a section of the installation is partitioned off by the main wall and used for egg incubation. Provision is also made for feed storage. Racks or shelves are erected in tiers of four or five. The temperature is kept at 24°–28°C, and the relative humidity at 65–75 percent. One or two rows of tall trees are planted around the installation for shade.

Breeding houses are built in two sizes to accommodate silkworms hatched from 300 or 750 g of eggs (3 cu m per g of eggs). On some farms the larvae are segregated according to age. Younger silkworms are reared in heated premises; older ones may be raised in less substantial structures, including those with collapsible frameworks covered with a plastic film.

ŠILUTĖ, a city and center of Šilutė Raion, Lithuanian SSR. Situated on the Šyša River, a right tributary of the Nemunas River, 50 km southeast of Klaipėda. Railroad station on the Klaipėda-Pagėgiai line. Industrial enterprises include the Gidroprivod plant, a furniture combine, a logging and timber distribution establishment, a peat-blocking enterprise, a distillery, a cheese plant, and the textile factory of the Drobė Kaunas Production Association. The city also has a sovkhoz technicum and a museum of local lore. [29–1195–4]

SILVERFISH (*Lepisma saccharinum*), a wingless insect of the subclass Apterygota of the order Thysanura. The narrow body reaches 11 mm in length. It has three long caudal bristles and is covered with fine silvery scales after the third molting. Silverfish reach sexual maturity after ten moltings; development from the egg to adult takes about three years. Adults are able to molt as well. Silverfish are thermophile but can be found everywhere. The insects prefer moist and dark places. They are nocturnal. Silverfish inhabit houses, food storehouses, stores, mills, libraries, and other places. They can infest sugar, bread, flour, groats, paper, wallpaper, and leather. [29–530–1]

ŠIMKUS, STASYS. Born Jan. 23 (Feb. 4), 1887, in the village of Motiškiai, near Kaunas; died Oct. 15, 1943, in Kaunas. Lithuanian composer, conductor, and public figure.

In 1908 Šimkus graduated from the Warsaw Institute of Music, where he had studied organ; in 1914 he graduated from the St. Petersburg Conservatory, where he had studied composition with A. K. Liadov, M. O. Shteinberg, and J. Vitol. He pursued advanced study at the Leipzig Conservatory in 1921 and 1922. In 1923, Šimkus founded in Klaipėda a school of music that played a major role in musical education in Lithuania; among his students were J. Švedas and A. Baužinskas.

Šimkus made his most important contribution to the development of a national musical culture by directing choruses and by collecting, arranging, and popularizing folk songs. His own songs for solo voice and for chorus are based on folk music and have become part of the repertoire of many musical ensembles in the republic. Šimkus' most important compositions include the opera *The Village Near the Estate* (1942), the cantata *Farewell to the Homeland* (1916), and the symphonic poem *Nieman* (1930). The Klaipėda School of Music has been named in honor of Šimkus. [29–1201–3]

SIMON, ISTVÁN. Born Sept. 16, 1926, in Bazsi, in the *megye* (county) of Veszprém; died July 7, 1975, in Budapest. Hungarian poet.

Simon graduated from the philology department of the University of Budapest in 1952. From 1964 to 1974 he was editor of the journal *Kortárs*, and in 1974 he became secretary of the Hungarian Writers' Union.

Even Simon's early poetry, including the collection *Ripening Days* (1953; A. József Prize, 1954), was characterized by a harmoniously integrated perception of the world. Civic spirit and a striving for a philosophical interpretation of life are combined in his collections of lyric poetry, for example, *No, It Is Not Enough* (1955; L. Kossuth Prize, 1955), *February Rainbow* (1959), *Grapes and Chestnuts* (1966; A. József Prize, 1967), *In an Endless Circle* (1973), and *An Amazing Burden* (1976). Simon was the author of many essays, the monograph *Hungarian Literature* (1973), and the collection of articles *In the Writer's Study* (1976).

ŞİNASİ, İBRAHİM. Born 1826 in Istanbul; died there Sept. 13, 1871. Turkish writer and publicist. Father of modern Turkish literature. Prominent figure of the Tanzimat period.

Şinasi was educated in France and took part in the Revolution of 1848. He returned to Istanbul in 1853. He published the newspaper *Tercüman-i ahval* there in 1860 and the first secular Turkish newspaper, *Tasvir-i efkâr*, from 1862 to 1865; the latter became a platform for the westernizing ideas of Turkish Enlightenment writers. In his publicist articles Şinasi stressed the importance of political independence and called for the Europeanization of Turkish literature, the introduction of new literary forms, the utilization of folklore, and the purification of the Turkish language.

Şinasi wrote the first Turkish drama, the one-act satirical comedy *The Poet's Marriage* (1860). The first Turkish translations of

J. Racine, A. de Lamartine, and J. de La Fontaine were made by him and published in the collection *Translations* (1859). Şinasi published one of the first collections of Turkish proverbs and sayings in 1863 and a collection of qasidas and ghazals in 1862.

ŞINCAI, GHEORGHE. Born Mar. 11, 1754, in Rîciu, Transylvania; died Nov. 2, 1816, in Şinca, Transylvania. Rumanian historian and educator. Doctor of theology and philosophy.

Şincai studied at educational institutions in such cities as Rome and Vienna. From 1782 to 1794 he was the director of the Uniate primary schools in Transylvania. In his historical works, including *A Chronicle of the Rumanians and Other Peoples* (vols. 1–3, 1853–54), he upheld the concept of the Rumanians' autochthony in the areas they inhabited; he also opposed serfdom. Şincai compiled the textbooks *The History of Nature* and *A Natural Study on the Eradication of Popular Superstitions*, in which he expounded the achievements of science from the standpoint of metaphysical materialism.

SINN FEIN, an Irish political party founded in 1905 that united nationalists from the petite and middle bourgeoisie and the radical intelligentsia. The party advocated the emancipation of Ireland from English colonial supremacy.

In 1919, after the party won 73 of the 105 Irish seats in the British Parliament, the Sinn Feiners met in Dublin and formed an Irish parliament (Dáil), which proceeded to proclaim Ireland's independence. Subsequently independence was achieved through the compromise Anglo-Irish Treaty of 1921. The right-wing leaders of the Sinn Fein concluded the treaty, which led to a split in the Irish national liberation movement and to the civil war of 1922–23. After being defeated in the war, many of the Sinn Feiners, refusing to acknowledge the treaty, went underground.

It was not until the 1950's that the Sinn Feiners reentered the political arena, reconstructing a party that promoted an anti-imperialistic program for the unification of Ireland. In the early 1970's the party split into the official wing, which favors the reunification of Ireland by political means, and the provisional wing, which adheres to methods of armed terrorism. In January 1977 the official wing adopted the name Sinn Fein Workers' Party. [29–1207–2]

SIÓFOK, a city in Hungary, in the *megye* (county) of Somogy, on the south shore of Lake Balaton, at the place where the Sió River flows into the lake. Population, 15,000 (1972). One of the centers of the Balaton resort region, Siófok has a moderate continental climate: summers are warm, with an average July temperature of 22°C; autumns are sunny; and winters are mild, with an average January temperature of −2°C. Precipitation totals about 700 mm annually.

Siófok has a fine-sand beach. There are houses of rest, hotels, and motels in the city. The season in Siófok lasts from April to September. [29–1214–2]

ŠIROKÝ, VILIAM. Born May 31, 1902, in Bratislava; died Oct. 6, 1971, in Prague. Czechoslovak party and state figure. Member of the Communist Party of Czechoslovakia from 1921.

The son of a railroad worker, Široký was a member of the Central Committee of the CPC from 1929 to 1963, and from 1948 to 1963 he was a member of the Presidium of the Central Committee. From 1945 to 1953 he was deputy prime minister of Czechoslovakia, and from 1950 to 1953 he served concurrently as minister of foreign affairs. Široký was prime minister of Czechoslovakia from 1953 to 1963. [29–1228–1]

ŠIRVINTOS, a city and the administrative center of Širvintos Raion, Lithuanian SSR. Širvintos is located 48 km northwest of Vilnius on the Vilnius-Riga highway. The city has a butter factory and a swine-raising complex. [29–1223–5]

ŠIŠIĆ, FERDO. Born Mar. 9, 1869, in Vinkovci; died Jan. 21, 1940, in Zagreb. Croatian historian. Academician of the Yugoslav Academy of Sciences and Arts (1910).

Šišić studied at the universities of Zagreb and Vienna; he received the degree of doctor of philosophy in 1900. From 1906 to 1939 he was a professor of national history at the University of Zagreb. Šišić was a member of the alliance of bourgeois liberal parties known as the Croat-Serbian Coalition, which was established in 1905. He was elected a deputy to the Croatian Diet in 1908 and a delegate to the Hungarian-Croatian Sabor in 1910; in 1911 he withdrew from political life. Šišić wrote many works on the history of Croatia and published various historical sources, including the *Chronicle of Father Dukljanin* in 1928.

ŠIŠKA, KAROL. Born Mar. 19, 1906, in Serenča, Yugoslavia. Czech surgeon. Academician of the Czechoslovak Academy of Sciences (1965). Member of the Communist Party of Czechoslovakia since 1945.

Šiška graduated in 1932 from the medical school of Charles University in Prague. He took part in the Slovak national uprising of 1944. He became chief of the surgery clinic of Komenský University of Bratislava in 1950 and director of the Institute of Experimental Surgery of the Slovak Academy of Sciences in 1955. His work has dealt mainly with experimental and clinical surgery of the heart and lungs and with artificial blood circulation.

Šiška is a foreign member of the Academy of Sciences of the USSR (1971) and the Academy of Medical Sciences of the USSR (1969). He also is an honorary member of the J. Purkinje Society and the Society of Polish Surgeons. Šiška was vice-president (1961–65) and president (1970–74) of the Slovak Academy of Sciences and vice-president (1970–74) of the Czechoslovak Academy of Sciences. He was a member of the central committee of the Communist Party of Slovakia (1958–62) and of the Communist Party of Czechoslovakia (1962–76). Since 1969 he has served as deputy of the Slovak National Council. Šiška has been awarded five orders and several medals. [29–1245–2]

SISKIN (*Spinus spinus*), a bird of the family Fringillidae of the order Passeriformes. The body length is about 12 cm, and the weight, 12 to 14 g. The plumage is yellowish green with dark streaks. Siskins are distributed in Eurasia; in the USSR they are found in the zone of coniferous forests, in the forests of the Crimea and the Caucasus, and the pine forests of Kazakhstan. In the winter they wander in flocks, particularly along river valleys with thickets of hardwood trees. Siskins usually nest in spruces or pines. The clutch contains four or five eggs, which are incubated by the female for 12 days. Sometimes siskins nest twice in one summer. The diet consists of seeds of coniferous and hardwood trees, particularly alders, and aphids and other tiny insects. Siskins are often kept in cages. [29–550–3]

SIVA (also Shiva), one of the principal gods in Hinduism and the principal god in Sivaism. The worship of Siva is based on ancient Indian tribal fertility cults. Along with a number of other great gods of Hinduism, Siva personifies the destructive powers of nature. However, he is not only a punisher of sins but also a bestower of blessings and a defender, not only a destroyer but also a

creator. The creative nature of Siva is symbolized by images of the male genitalia—the lingam, or phallus. In iconography, Siva is portrayed as an ascetic immersed in contemplation, or as a figure in a frightening pose, or as a figure performing a sacred dance. [29–1174–1]

SIVAISM (also Shivaism), one of the two main branches of Hinduism, named for its principal divinity, Siva. Sivaism is rooted in the beliefs of the indigenous pre-Aryan population of India. The emergence of Sivaism as a separate current in Hinduism dates to the first centuries of the Common Era. Vestiges of the oldest fertility cults have survived in Sivaism; religious notions of Shakti—the creative basis of all living things—are associated with Sivaism. Veneration of the symbolic image of the genitalia of the male (the lingam) and of the female (the yoni) is to this day an indispensable part of the cult of Siva.

A major role in Sivaism is played by worship of the mother goddess, whose cult is identified primarily with Siva's female hypostasis—his wife Durga (also called Kali, Devi, and other names). At the same time, Siva is regarded in the Trimurti as the destroyer, and his coterie includes evil spirits that inflict misfortunes on people. Bloody sacrifices, including human ones, survived in Sivaism longer than anywhere else.

A peculiarity of the pantheon in Sivaism is its family character. Siva's spouse Durga is the personification of the female creative principle; Siva's sons are Ganesha, the patron of wisdom and the bestower of a good beginning on any undertaking, and Skanda (Karttikeya), the god of war.

Sivaism has a multitude of sects (Lingayats, Shaktas, Smartas) and is practiced throughout India. The sacred literature of Sivaism consists mainly of Sivaist puranas and agamas written in the early Middle Ages. [29–1175–2]

SIVAJI (also Shivaji). Born Apr. 6, 1627, or Feb. 19, 1630, in the region of Poona; died Apr. 3, 1680, in Rajgarh. Founder of the Maratha state in India in 1674. Leader of the Maratha struggle for independence.

Sivaji was the son of the prominent feudal lord (jagirdar) and military commander Shahji, who served the sovereigns of Ahmadnagar and Bijapur. Between 1646 and 1655 he captured, by conquest, cunning, and bribery, northwestern Maharashtra and part of northern Konkan. During a war with Bijapur (1658–61) he carried out a series of successful raids, but he was defeated in his war with the Great Moguls (1660–65), notwithstanding several triumphs, notably the sacking of the important Mogul port of Surat in 1664.

Under the Treaty of Purandhar of 1665, Sivaji surrendered the greater part of his territory and most of his fortresses, and he acknowledged himself a vassal of the Moguls. He then traveled to the court of Aurangzeb in Agra, where he was taken into custody. In 1666 he escaped; resuming his struggle against the Moguls in 1670, he recovered his fortresses and lands. Sivaji raided Bijapur, Berar, Telingana (Andhra), Khandesh, and Gujarat and again sacked the port of Surat.

In 1674, Sivaji had himself crowned in Rajgarh, with great pomp and ceremony, the supreme ruler of Maharashtra. Between 1675 and 1678 he carried out successful campaigns in Kanara, Mysore, and the Carnatic. At the time of his death, he ruled all western Maharashtra, northern and southern Konkan, western Kanara, a number of regions in Mysore, and part of the Carnatic (the region of Tanjore).

Initially nothing more than a military commander blessed with success in various internecine feudal conflicts, Sivaji came to inspire the Marathas with the dream of achieving independence from the Moguls. His mobile army was built up by recruiting peasants. By compiling a land cadastre, eliminating the intermediate levels of the feudal hierarchy, putting an end to internecine feudal strife, and creating a centralized administration, he substantially eased the burden of feudal exploitation borne by the Marathas.

On the other hand, Sivaji's army ruthlessly plundered the population of the conquered territories, sending on the wealth thus obtained to the treasury. Threatened by raids and pillage, the Mogul governor of the Deccan was compelled to pay Sivaji a *chauth* (one-fourth of tax revenues). Sivaji played a major role in weakening the Mogul state, which fell in the first half of the 18th century. As the liberator of the Marathas from the Mogul yoke, the creator of an independent Maratha state, and a defender of Hinduism, Sivaji is honored as a national hero of the Marathas.

SIX, LES, a name applied in 1920 to a group of innovative French composers. The group included L. Durey, D. Milhaud, A. Honegger, G. Auric, F. Poulenc, and G. Tailleferre. The members, who possessed distinctive creative individualities, were united by a striving for a new simplicity and structural clarity in musical language and by a renunciation of the aesthetics of impressionism. After the 1920's Les Six lost the significance of a distinctive group.

SIX-MEMBER DUMA, the executive body of a municipal duma in Russia from 1785 until 1870. The membership of the body consisted of the *gorodskoi golova* (mayor) of the city and six councilmen, who were chosen from among the members of the general duma for a term of three years. The six-member duma was in charge of the maintenance of public order in marketplaces, the construction and preservation of city buildings and squares, and the collection and expenditure of city revenues. [29–1157–1]

SIXTEENTH ALL-RUSSIAN CONGRESS OF SOVIETS OF WORKERS', PEASANTS', AND RED ARMY DEPUTIES, a congress held from Jan. 15 to Jan. 23, 1935, in Moscow. The congress was attended by 1,748 delegates, 1,293 of whom were voting delegates. Industrial workers made up 39.2 percent of the delegates, peasants, 22.9 percent, and nonindustrial workers, 37.9 percent; 71.3 percent of the delegates were members of the ACP(B), 4.9 percent were Komsomol members, and 23.8 percent were not party affiliated. The delegates represented 48 nationalities.

The agenda of the congress consisted of a number of reports, the election of the All-Russian Central Executive Committee, and the election of the RSFSR's representatives in the Soviet of Nationalities of the Central Executive Committee of the USSR. D. E. Sulimov delivered the report of the government of the RSFSR, N. P. Komarov spoke on the state and development of the communal services system in the RSFSR, and G. N. Kaminskii apprised the congress of achievements and tasks in the area of public health. G. G. Baichurin gave the report of the Central Executive Committee of the Tatar ASSR on soviet, economic, and cultural construction, and A. S. Kiselev discussed amendments to the Constitution of the RSFSR.

The congress approved the activities of the Council of People's Commissars of the RSFSR and noted that the first five-year plan (1929–32) had been fulfilled ahead of schedule. It also pointed out that the first two years—1933 and 1934—of the second five-year plan had been completed successfully. The congress directed the government to promote rapid development of sectors of local industry and industrial cooperation. The completion of collectivization in the RSFSR and the extension of MTS (machine-tractor station) service to all kolkhozes were set as goals in agriculture. A decree was passed on the training of medical personnel and on the improvement of health services in rural areas.

After hearing the report of the Central Executive Committee of the Tatar ASSR, the congress called upon the governments of the RSFSR and the Tatar ASSR to provide for the further economic and cultural development of the Tatar republic. The decree of the All-Russian Central Executive Committee converting the Kara-Kalpak, Mordovian, and Udmurt autonomous oblasts into autonomous soviet socialist republics was ratified. A new All-Russian Central Executive Committee, with 401 members, was elected, and five persons from the RSFSR became members

of the Soviet of Nationalities of the Central Executive Committee of the USSR.

SIXTEENTH CONFERENCE OF THE ALL-UNION COMMUNIST PARTY (BOLSHEVIK), a conference held from Apr. 23 to Apr. 29, 1929, in Moscow. The conference was attended by 254 voting delegates and 679 delegates with observer status. There were several topics on the agenda. A. I. Rykov, G. M. Krzhizhanovskii, and V. V. Kuibyshev reported on the five-year plan for the development of the national economy. M. I. Kalinin spoke on ways of improving agriculture and of lightening the tax burden borne by middle peasants, Ia. A. Iakovlev summarized the results and immediate tasks of the struggle against bureaucracy, and E. M. Iaroslavskii addressed the delegates on the purge and review of members and candidate members of the ACP(B).

The principal business of the conference was the discussion and adoption of the first five-year plan for the development of the national economy of the USSR. The formulation of the plan and the plan's discussion at the conference were carried out in the midst of a struggle with a right-wing deviation in the ACP(B). The leaders of the deviation—N. I. Bukharin, Rykov, and M. P. Tomskii—cast doubt on the plan's feasibility and insisted on the adoption of the "minimal" version. (The first five-year plan was written in two versions—the initial, or "minimal," version and the "optimal" version, which was based on full mobilization of the entire resources and the potential inherent in the Soviet social order. The goals of the optimal version were approximately 20 percent higher than those of the initial version.) The conference rebuffed the right-wing opportunists and ratified the optimal version.

The first five-year plan emerged as a broad program for the economic, social, and cultural transformation of society. Signaling an expanded socialist offensive to be conducted on all fronts, the implementation of the plan was to lead to the construction of the foundations of a socialist economy. It would also expose capitalist elements, which would then be eliminated.

After defining the tasks associated with the organization of large-scale socialist agriculture, the conference outlined measures designed to assist poor-peasant and middle-peasant family farms. The delegates approved a new agricultural-tax law that exempted the farms of poor peasants from taxation, reduced taxes on the farms of middle peasants, and shifted the primary burden of taxation to the kulaks.

The conference devoted special attention to new production methods for linking the city and the countryside. In addition to expanding commodity circulation between industry and agriculture, it was necessary to give production assistance to the rural poor and the middle peasants. This assistance would take the form of the establishment of new machine-equipped sovkhozes and kolkhozes, the development of large-scale contracting of agricultural products, the encouragement of production cooperation among peasant farms, and the creation of a broad network of machine-tractor stations. A crucial factor in the development of the new methods of linkage was the organization of ■ heavy industry that would be capable of reequipping agriculture. The conference censured the right-wing deviationists, who aimed at disrupting collectivization, and branded their views as "a direct shift to the kulak position" (*KPSS v rezoliutsiiakh*, 8th ed., vol. 4, 1970, p. 213). The delegates called on the party to combat the deviationists, who represented a serious threat to its ranks.

In the resolution On the Results and Immediate Tasks of the Struggle Against Bureaucracy, the conference pointed out that the struggle against bureaucratic distortions in the activities of the state administrative apparatus was becoming one of the most important forms of class struggle (*ibid.*, p. 222). The delegates called for an improvement of the review of the performance, selection, and placement of personnel, for ■ reduction in the size and expense of administrative bodies, and for a purge of unsuitable elements. The conference stressed the need to involve the working masses in the management of production, to introduce scientific methods in all sectors of production and administration (especially in planning), and to encourage criticism and self-criticism. After hearing Iaroslavskii's report, the conference adopted a resolution recommending a purge to strengthen party ranks during preparations for the socialist offensive on all fronts.

At the end of the conference, V. M. Molotov delivered a report on the united plenum of the Central Committee and the Central Control Commission of the ACP(B) held in April of that year. A resolution that was passed unanimously by the conference approved the decision of the plenum to censure Bukharin's right-wing opportunist group. The conference also urged the party to support the Central Committee and to struggle against deviations from the Leninist party line, particularly against the right-wing deviation. The conference adopted the appeal "To All Workers and Working Peasants of the Soviet Union," in which it called for an expansion of socialist competition.

SIXTEENTH CONGRESS OF THE ALL-UNION COMMUNIST PARTY (BOLSHEVIK), a congress held from June 26 to July 13, 1930, in Moscow. The congress was attended by 1,268 voting delegates and 891 delegates with observer status. The delegates represented 1,260,874 party members and 711,609 candidate members. The agenda consisted of a number of reports as well as elections to central party institutions. J. V. Stalin delivered the political report of the Central Committee, L. M. Kaganovich, the organizational report of the Central Committee, and M. F. Vladimirskii, the report of the Central Auditing Commission. The report of the Central Control Commission was given by G. K. Ordzhonikidze, and that of the ACP(B) delegation to the Executive Committee of the Communist International, by V. M. Molotov. V. V. Kuibyshev addressed the congress on the fulfillment of the five-year plan for industry, Ia. A. Iakovlev spoke on the kolkhoz movement and on the improvement of agriculture, and N. M. Shvernik outlined the tasks facing trade unions in the period of reconstruction.

The summary report of the Central Committee and the resolution adopted on the issues it covered presented an analysis of the international and domestic situation of the USSR and defined the principal tasks associated with the new stage of the building of socialism. The Soviet Union had entered a period of rapid economic growth and of massive expansion of socialist construction. The capitalist countries were undergoing major political upheavals and an economic crisis that accelerated the development of fascism within some countries and hastened preparations for new imperialist wars. The congress called on the party and the people to affirm a policy of peace throughout the world and to strengthen the defense capability of the USSR in every way possible.

Encouraged by the advances made by the country in industrialization, the congress adopted a domestic-policy line of stepping up socialist construction. Industry had provided 53 percent of the national economy's output in 1929 and 1930, and the socialist sector had accounted for 99.3 percent of large-scale industry in 1930. Although the USSR had surpassed the leading capitalist countries in rate of industrial development in the early years of the five-year plan, it continued to trail them considerably in level of industrial output. The congress directed the Central Committee to ensure a high rate of socialist construction and the fulfillment of the five-year plan in four years.

The progress of socialist construction in rural areas was apparent in the mass kolkhoz movement. By the time the congress had convened, 40–50 percent of the peasant farms in the principal grain-growing regions had been consolidated into kolkhozes, and the kolkhoz peasantry had become a bulwark of Soviet power. The congress approved the change to a policy of total collectivization to eliminate the kulaks as a class.

Although some successes had been achieved in the cultural revolution, the congress declared the revolution's rate of development to be inadequate. It was decided to institute universal compulsory elementary education in the near future and to eliminate illiteracy among the people.

Successful socialist construction was to be achieved by rigid adherence to the party's general line and by a resolute struggle on two fronts, that is, against Trotskyism and against the right-wing deviation in the ACP(B). Declaring the views of the right-wing opposition to be incompatible with membership in the ACP(B), the congress pointed to the need to struggle against deviations on the nationalities question—that is, against great-power chauvinism and local nationalism. The congress approved the political line and practical work of the Central Control Commission–Workers' and Peasants' Inspection and took note of this body's resolute efforts to implement the general line of the party and to purge the party's ranks of alien elements.

Directing attention to the need for continued improvement and cost reduction in the operation of the state administrative apparatus, the congress called for the continuation of the purge of administrative bodies, an intensification of the fight against bureaucracy, and precise execution of party and government decrees. After approving the activities of the ACP(B) delegation in the Executive Committee of the Communist International, the congress acknowledged the considerable service performed by the Comintern in crushing Trotskyism and right-wing opportunism and gave its support to the organizational measures developed by the Comintern to purge Communist parties of right-wing and "left" opportunists.

After discussing the report on fulfillment of the five-year plan for industry and after noting that the party had succeeded in bringing about overfulfillment of plan indexes, the congress increased the original goals of the plan. Particular emphasis was placed on the need for comprehensive expansion of heavy industry, accelerated development of ferrous and nonferrous metallurgy, the introduction of advanced technology, and the production of the new machines and equipment necessary for the modernization of all sectors of the economy. The congress adopted a resolution to establish in the near future the country's second coal and metallurgical base, the Urals-Kuznetsk Combine, in the eastern part of the country. The congress called for accelerated development of the industrial sectors associated with strengthening the defense capability of the USSR and decided that more economic and engineering personnel would be trained in order to help fulfill the five-year plan.

Thoroughly reviewing the kolkhoz movement, the congress denounced distortion of the party line in kolkhoz construction. It demanded that in bringing peasants into cooperatives the Leninist principle of voluntary membership be strictly observed, the degree of preparedness of regions for collectivization be taken into account, and the agricultural artel be considered the basic form of collective farm. Since the five-year plan had been overfulfilled with respect to collectivization, the congress felt it necessary to revise the plan for agricultural development. The principal goal consisted in essentially completing the socialist transformation of the countryside and in strengthening the kolkhozes economically.

The congress stressed the need to enlarge the role of the trade unions in socialist construction. The immediate goals of the trade unions were defined as developing socialist competition and the shock-worker movement, raising the qualifications of the workers, and combating the problems of inertia and bureaucracy. The congress advanced the injunction "Trade unions, focus on production!"

A Central Committee of 71 members and 67 candidate members was elected at the congress, as well as a Central Auditing Commission of 13 members and a Central Control Commission of 187 members.

The Sixteenth Congress of the All-Union Communist Party (Bolshevik) went into history as the congress of the full-scale socialist offensive on all fronts. The congress set the goal of accelerating the creation of the material and technical base for socialism and of eliminating the capitalist elements in the country.

SIXTH CONGRESS OF SOVIETS OF THE USSR, a congress held from Mar. 8 to Mar 17, 1931, in Moscow. The congress was attended by 2,403 delegates, 1,570 of whom were voting delegates. Industrial workers made up 54.4 percent of those in attendance, peasants, 25.6 percent, and nonindustrial workers, 20 percent. Of the delegates, 72.8 percent were ACP(B) members, 2.4 percent were Komsomol members, and 24.8 percent were not party affiliated. The congress represented 66 nationalities.

The agenda of the congress included several reports. V. M. Molotov delivered the report of the government of the USSR, and Ia. A. Iakovlev, the report on sovkhoz development from the People's Commissariat of Agriculture of the USSR, the Grain Trust, and the livestock-sovkhoz trusts. Iakovlev also presented the report on kolkhoz development from the People's Commissariat of Agriculture of the USSR, the All-Union Council of Kolkhozes, and the All-Union Center for Machine-tractor Stations, and A. S. Enukidze addressed the congress on questions pertaining to the Constitution of the USSR.

The congress approved in its entirety the foreign and domestic policy of the Soviet government. It directed the government to continue to adhere unswervingly to a policy of peace and to strengthen relations with other nations. In view of the growing threat of war, however, the congress called upon the government to increase the defense capability of the country in every way possible.

The congress devoted considerable attention to issues of the socialist reorganization of agriculture. The decree On Sovkhoz Development emphasized the importance of the sovkhozes as large, model farms from which the kolkhozes would receive various kinds of assistance. The decree On Kolkhoz Development summarized the results of the mass kolkhoz movement of 1929 and 1930 and called for the elimination of deficiencies in the organization and operation of the kolkhozes. The congress noted that the agricultural artel was the "fundamental structure in the kolkhoz movement in the current stage of development." It also approved the government's decision to eliminate okrugs, or districts, and to establish the raion as the basic unit of operation in the socialist reconstruction of rural areas.

In the election of a new Central Executive Committee, 473 members were voted into the Union Soviet, and 138 members, into the Soviet of Nationalities.

SIXTH CONGRESS OF THE RUSSIAN SOCIAL DEMOCRATIC LABOR PARTY (BOLSHEVIK), a congress held from July 26 to Aug. 3 (Aug. 8–16), 1917, in Petrograd. The congress was attended by 157 voting delegates and 110 delegates with observer status. More than 176,000 of the 240,000 party members were represented at the congress.

The agenda included a number of reports. Ia. M. Sverdlov delivered the report of the Organizational Bureau. The Central Committee's political report was given by J. V. Stalin; its organizational report, by Sverdlov; and its financial report, by I. T. Smilga. In addition to regional reports, the congress heard reports on current problems: N. I. Bukharin spoke on the war and the international situation, and Stalin and V. P. Miliutin apprised the congress of the country's political economic situation. Also on the agenda was the discussion of various issues, among them the revision of the party program, organizational questions, the Constituent Assembly elections, the International (this point was withdrawn at the 15th session), party unification, and the trade union movement. Finally, the agenda included elections and miscellaneous matters.

A number of questions on the agenda were sent to sections for further study (the results of the sections' work were discussed at plenary sessions of congresses). M. M. Kharitonov reported to the congress for the organizational section, N. P. Glebov-Avilov, for the trade union section, and R. S. Zemliachka, for the propaganda and agitation section. The congress heard V. N. Podbel'skii's report from the section that studied revision of the party program, as well as that of B. Z. Shumiatskii from the section that examined the issue of the Constituent Assembly elections. Kharitonov delivered a report for the subsection that reviewed the question of youth organizations, and Smilga read a supplementary report from the subsection. The report on the work of the military section was published in the newspaper *Rabochii i soldat* on August 6 (19).

Meeting after the July Days of 1917, the congress began its sessions in a "semilegal" status; that is, the press reported its convocation but did not reveal its location. Beginning on July 29 (August 11), threatened with the arrest of its delegates, the congress conducted its business illegally. On that day, 21 members and 10 candidate members were elected to the Central Committee of the RSDLP(B). V. I. Lenin directed the work of the congress from the locality of Razliv, where he was in hiding. He sent his theses on the political situation to the congress and maintained constant communication with the body's presidium.

One of the first issues discussed at the congress was whether Lenin should appear in court to answer a summons issued by the Provisional Government for his arrest and to confront the slanderous campaign against the Bolshevik party and its leader. The congress decided unanimously that Lenin should not appear and expressed its protest against the government's harassment of the leader of the proletariat.

The political report noted that the Central Committee was following the path of socialist revolution adopted by the Seventh (April) All-Russian Conference of the RSDLP(B) under the slogan "All power to the soviets!" It was adhering as well to the positions of worker control of production and distribution, confiscation of the lands of the *pomeshchiki* (landowning gentry) and the transfer of those lands to the peasants, and withdrawal from the imperialist war. An account was given of the party tactics during the June and July crises and of the leading role the Bolsheviks were playing in the struggle against counterrevolution. The organizational report of the Central Committee reviewed the principal forms and methods of leadership of local party organizations, the distribution of party forces in the country, and the role of the Central Committee's central organ, the newspaper *Pravda*.

The congress devoted special attention to a review of current problems and to the development of a new political course for the party. The report on the war and the international situation presented a broad picture of foreign political conditions contributing to the development of the revolution. The speaker, however, made fundamental errors in his assessment of the revolution's driving forces and of its prospects. He asserted that the peasants were unified with the bourgeoisie and would not follow the working class. Bukharin did not agree with Lenin's conclusion that a socialist revolution could be victorious in one country alone; rather, he believed that the mission of Russian revolution was to "kindle the flames of world socialist revolution." Looking upon the Russian revolution as merely a "stimulus" to revolution in the West, he denied in essence the possibility of achieving a revolutionary victory in Russia without the aid of proletarian revolutions in Western Europe. The congress rejected Bukharin's erroneous statements and those of E. A. Preobrazhenskii, who supported him.

The congress clearly defined in a resolution the domestic and foreign conditions necessary for the Russian proletariat to carry out its struggle. It was noted that international imperialism was acting in concert with the Russian counterrevolution. The course of development of the revolution and the positions of the classes and parties in the political crises experienced by the country were analyzed, and it was pointed out that compromising with the policies of the Provisional Government and supporting the offensive at the front had inevitably placed the Menshevik and SR (Socialist Revolutionary) parties on the side of counterrevolution. It was also noted that, with the end of dual power, the soviets headed by the Mensheviks and the SR's were no longer agencies of power, for that power was now concentrated in the hands of the counterrevolutionary bourgeoisie.

The report on the political situation revealed the current alignment of class forces and outlined ways to intensify the revolution. Analysis of the preceding period showed that had the soviets decided to take power before the July political crisis there would have been no one to oppose them. Since the counterrevolution had organized and strengthened itself during the July events, however, the soviets could no longer take power peacefully. Following Lenin's instructions, Stalin argued for a temporary retreat from the slogan "All power to the soviets!" At the same time, he emphasized the need to use the soviets as agencies of the revolutionary mobilization of the masses. Recording in a resolution that a painless transition of power to the soviets had become impossible, the congress temporarily withdrew the slogan. The resolution asserted that "the right slogan at the present time can only be the complete abolition of the dictatorship of the counterrevolutionary bourgeoisie" [*Shestoi s"ezd RSDLP(b): Protokoly*, 1958, p. 256]. The congress chose the path of an armed uprising and of preparing the masses for a nationwide crisis and a profound revolutionary upsurge, which together would create the conditions for victory.

The report on the economic situation pointed out that the country was on the brink of disaster as a result of the ruling class's policies, which were detrimental to the people's interests. A resolution emphasized that a socialist revolution was the only way out of economic devastation and the imperialist war and would guarantee preservation of Russia's national independence and self-reliance. The resolution substantiated the party's economic program and defined the prerequisites for renewal of the country's economic life on a socialist foundation.

The congress gave its support to the decisions of the April Conference of the RSDLP(B), including the decision to call a special congress for the purpose of revising the party program. The congress also adopted new party Rules.

In the resolution On Unification of the Party, the congress advanced a "revolutionary class slogan calling for unity of all internationalists who have broken with the Menshevik imperialists" (*ibid.*, p. 269). In addition, the congress approved the admission of the Mezhraiontsy to the party.

On the issue of the trade union movement, the congress urged the trade unions of Russia to take the initiative in reestablishing an international organization of the trade unions that rejected the imperialist war and supported the class struggle. The congress pointed to the need to bolster party influence in the trade unions in order to transform them into fighting organizations of the working class in the struggle for communism.

Methods and techniques for working among the masses and a program to prepare the party for the decisive battles ahead were formulated in the recommendation of the military section, in the resolution On Propaganda, and in the resolutions pertaining to the tasks of the party in the trade union movement, to youth leagues, and to the election campaign for the Constituent Assembly. Special attention was devoted to setting up socialist class organizations of young people—the forerunners of the Lenin Komsomol—and to work among the soldiers and sailors. The great importance of agitation among toiling peasants was also pointed out.

The decisions of the congress were aimed at developing revolutionary initiative and independent action among the popular masses and were permeated with the Leninist idea that an alliance between the working class and the poor peasants would be a deciding factor in the victory of the socialist revolution. These decisions are a model of creative Marxism and of the development of revolutionary strategy and tactics in a concrete historical situation.

The congress demonstrated the readiness of the Bolshevik party to lead the masses in the assault on capitalism and in the struggle to establish a dictatorship of the proletariat. Commissioned by the congress, and on its behalf, the Central Committee of the RSDLP(B) issued a manifesto to "all the working people and to all workers, soldiers, and peasants of Russia." Its concluding lines rang out a powerful appeal: "A new movement is approaching and the hour of death for the old world will come. Prepare for new battles, our fighting comrades! Steadfastly,

courageously, and calmly, not giving in to provocation, collect your strength and form fighting columns! Proletarians and soldiers, gather under the banner of the party! Oppressed villages, gather under our banner!" (*ibid.*, p. 276).

A. M. SOVOKIN [29–1162–3]

SIXTH (PRAGUE) ALL-RUSSIAN CONFERENCE OF THE RUSSIAN SOCIAL DEMOCRATIC LABOR PARTY, a conference held from Jan. 5 (18) to Jan. 17 (30), 1912, in Prague. The conference was attended by voting representatives of more than 20 party organizations from the major centers of the working-class movement in Russia—St. Petersburg, Moscow, Kazan, Saratov, Tbilisi, Baku, Nikolaev, Kiev, Ekaterinoslav (Dnepropetrovsk), Dvinsk (Daugavpils), Vilnius, and the central industrial provinces. Attending with observer status were representatives from the editorial staff of the party's central organ, the newspaper *Sotsial-demokrat*, from the editorial staff of *Rabochaia gazeta*, and from the Foreign Organization Committee of the RSDLP. With the exception of two Mensheviks, the delegates were Bolsheviks. For various reasons, the elected delegates from Rostov-on-Don, Samara (Kuibyshev), Nizhny Novgorod (Gorky), Sormovo, Lugansk (Voroshilovgrad), and the Urals did not attend, nor did the invited leaders of foreign groups and national organizations.

Convened as a general party conference of the RSDLP, the conference functioned as the supreme body of the party and bore the significance of a congress. There were 15 points on the agenda: (1) reports, among which were regional reports, the report of the Russian Organizational Commission for Calling the Conference, and the report of the party's central organ; (2) the role of the conference; (3) the current situation and the tasks facing the party; (4) elections to the Fourth State Duma; (5) the Duma fraction; (6) state insurance for workers; (7) the strike movement in the trade unions [a resolution, On the Nature and Organizational Forms of Party Work, was passed on this point, which had been combined with point (12)]; (8) the "petition campaign"; (9) Liquidationism; (10) the tasks facing the Social Democrats in the struggle against famine; (11) party literature; (12) organizational questions; (13) party work abroad; (14) elections; and (15) miscellaneous matters.

The conference was held under the direction of V. I. Lenin, who represented the editorial staff of *Sotsial-demokrat*. He reported on such topics as the current situation and the party's responsibilities, the role of the conference, and the International Socialist Bureau. The draft resolutions and the resolutions adopted by the conference were written by Lenin. After G. K. Ordzhonikidze's report on the work of the organizational commission, the conference passed a resolution that noted the enormous importance of the commission's work in rebuilding and strengthening party organizations during the preparations for the conference.

A resolution on the regional reports indicated that vigorous work to strengthen illegal party organizations and groups was under way in all areas. It also noted that the need to coordinate illegal work and the work of various legal societies had been widely recognized and was now being met. The conference declared that a new revolutionary upsurge had begun, which indicated that a bourgeois democratic revolution was still forthcoming in Russia. The minimum demands of the RSDLP—the creation of a democratic republic, the introduction of an eight-hour workday, and the confiscation of the lands of the *pomeshchiki* (landowning gentry)—remained the principal watchwords of the party. These demands were to be the planks of the party's campaign platform in the elections to the Fourth State Duma.

After discussing the responsibilities of the Social Democrats in the struggle against famine, the conference stressed the need to explain to the people the connection between the famine and the failure of the agrarian policies of tsarism. It was suggested that the discontent aroused by the famine be taken advantage of to organize political meetings and demonstrations against the autocracy. The conference noted that the bill adopted by the Third State Duma in January 1912 to provide state insurance for the workers made a mockery of the workers' vital interests. The delegates called for broad agitation against the bill among the masses.

Denouncing the Menshevik Liquidators' and Trotskyists' petition campaign for freedom of coalition, the conference resolved to explain to the workers that freedom of coalition could not be achieved without overthrowing the autocracy. It was decided that party building during the revolutionary upsurge should follow a course of strengthening illegal party organizations and forming around them a broad network of legal organizations that would serve as bases for work among the masses.

The most pressing problem was the purge of opportunists from the party. Lenin called for a resolute struggle against those who would destroy the party, namely, the Liquidators and the Trotskyists. In the resolution On Liquidationism and on the Group of Liquidators, the conference declared that such persons had placed themselves outside the party once and for all. This declaration signaled the complete triumph of Lenin's call for a final break with the opportunists. The conference stressed that foreign groups that did not recognize the authority of the Central Committee could not use the name of the RSDLP.

The work of the editorial staffs of *Sotsial-democrat* and *Rabochaia gazeta* was approved. *Rabochaia gazeta* was declared the official organ of the Central Committee, and a decision was made to publish a legal daily newspaper.

International issues were also reviewed. In its resolution On the Chinese Revolution, the conference announced its support of the struggle of the Chinese people and stressed the great significance of that struggle in the liberation of Asia. The conference condemned the predatory policies of British imperialism and Russian tsarism in Persia and expressed complete solidarity with the Social Democratic Party of Finland, which was fighting against the Russian autocracy. A congratulatory message was sent to the German Social Democratic Party on its victory in the Reichstag elections.

A new Central Committee was elected, and Lenin was chosen as its chairman. Among the members elected were F. I. Goloshchekin, G. K. Ordzhonikidze, S. S. Spandarian, and D. M. Shvartsman. Upon being given the right to co-opt members, the Central Committee chose I. S. Belostotskii and J. V. Stalin as new members. A. S. Bubnov, M. I. Kalinin, A. P. Smirnov, E. D. Stasova, and S. G. Shaumian were named as candidates for co-optation in the event that any of the members of the Central Committee were arrested. The Russian Bureau of the Central Committee of the RSDLP was reestablished to direct the practical work of the party in Russia, and V. I. Lenin was chosen as the RSDLP representative in the International Socialist Bureau.

The Sixth Party Conference determined the political line and tactics to be used by the party in the new revolutionary upsurge and consolidated the victory of Bolshevism. The expulsion of the Menshevik Liquidators was a decisive factor in the subsequent development of the RSDLP as a new type of party. The decisions of the conference provided all revolutionary elements in the international social democratic movement an example of uncompromising struggle with and organizational demarcation from opportunism.

SIZING, the application to warp yarns of a thin layer of adhesive material (size) in order to increase the yarns' resistance to abrasion and repeated stretching during weaving. During sizing the individual fibers that form the warp yarn are cemented to one another. Sizes are prepared from chemical materials, such as polyvinyl alcohol or a polyacrylamide, and foodstuffs such as starches; water is used as a solvent.

Sizing is performed on slashers. The warp yarns are unwound from back beams, immersed in the size in a vat, squeezed between rollers, passed to a dryer to remove excess moisture, and finally wound onto the warp beam of a loom. Doubled yarns are not usually sized, nor are yarns made from synthetic fibers or natural silk, which possess adequate smoothness and strength. [29–1300–2]

SIZING, a finishing operation in the production and repair of metal articles, accomplished by squeezing the article to produce smooth surfaces and correct dimensions and to eliminate superficial cracks and gaps between assembled parts.

It also implies surface treatment of cast products of art or of sculpture after drawing them off a mold: smoothing of roughness and joints, final finishing of components.

SJAHRIR, SUTAN. Born Mar. 5, 1909, in Sumatra; died 1966, in Switzerland. Indonesian political figure, right-wing socialist leader.

The son of a feudal lord, Sjahrir received his education in Indonesia and the Netherlands. One of the leaders of the Socialist Party of Indonesia, he served several times as prime minister between 1945 and 1947. In 1948 he headed the group of right-wing socialists that split from the SPI to form the Indonesian Socialist Party (Partai Sosialis Indonesia). Sjahrir was known for his anti-Communist views. He supported the separatist rebellions in Indonesia in the late 1950's. In 1962, Sjahrir was imprisoned, but he was soon freed and permitted to go to Europe. [29–857–4]

SJARIFUDDIN, AMIR. Born 1907 on the island of Sumatra; died Dec. 19, 1948, in the village of Ngaliang, on the island of Java. Figure in the Indonesian national liberation and communist movements.

Sjarifuddin studied in the Netherlands and graduated from the law institute in Batavia (Jakarta). A leader of the national revolutionary party Partindo (founded 1931), he was arrested by the Dutch colonial authorities in 1933 and remained in prison until 1935. He helped found the Gerindo in 1937 and became its chairman, as well as the general secretary of the Indonesian Political Union.

During the Japanese occupation of Indonesia (December 1941 to 1945), Sjarifuddin was a leader of the resistance movement; in 1943 he was arrested and condemned to death, a sentence that was commuted to life imprisonment. Released after Indonesia declared its independence in 1945, he became minister of information in the first government of the Republic of Indonesia, established that year.

During the Indonesian people's difficult struggle against the Dutch colonialists, who from 1945 to 1949 tried to regain control over Indonesia, Sjarifuddin served as minister of defense from late 1945 to January 1948 and head of the government from July 1947 to January 1948. From 1945 to 1948 he held the posts of chairman and vice-chairman of the Socialist Party. After the Socialist Party and the Workers' Party (Labor Party) merged with the Communist Party of Indonesia in 1948, Sjarifuddin was elected to the Politburo of the Central Committee of the CPI. In 1948 he became chairman of the Popular Democratic Front, a bloc of leftist parties and organizations influenced by the CPI. During the Madiun incidents of 1948, Sjarifuddin was captured by punitive forces and shot without a trial.

SJÖBERG, ALF. Born June 21, 1903, in Stockholm. Swedish stage and motion-picture director.

In 1925, Sjöberg graduated from the acting school of the Royal Dramatic Theater in Stockholm. He became an actor with the company in the same year and became a stage director there in 1930. Sjöberg, an innovator in the use of space, scenery, and lighting in the theater, is attracted to epic spectacles with impressive mass scenes as well as to more intimate works. His productions have included Värnlund's *The Holy Family* (1934), a dramatization of Dostoevsky's *Crime and Punishment* (1941), Shakespeare's *Richard III* (1947) and *Romeo and Juliet* (1953), Strindberg's *Miss Julie* (1949) and *Master Olof* (1972), Gogol's *The Inspector-General* (1959), and Brecht's *Schweik in the Second World War* (1963) and *Mother Courage and Her Children* (1965).

Sjöberg's first film, *The Strongest* (1929), continued the romantic traditions of the Swedish silent film. His films of the 1940's include *With Life as the Stakes* (1940), *Home From Babylon* (1941), *The Road to Heaven* (1942), *Torment* (1943), *The Royal Hunt* (1944), and *The Return* (1945). Although these films belong to various genres, they share a common theme: the struggle against fascism and the problem of Sweden's neutrality in World War II. In 1951, Sjöberg made one of the best Swedish films, *Miss Julie*, based on the play by Strindberg. He has also directed the films *Only a Mother* (1949), *Karin Månsdotter* (1954), *The Judge* (1960), and *The Island* (1966). O. V. GARIBOVA [29–1065–1]

SJÖGREN, ANDERS JOHAN (also Andrei Mikhailovich Shegren). Born Apr. 15 (26), 1794, in Iitti, Finland; died Jan. 6 (18), 1855, in St. Petersburg. Russian philosopher and ethnographer, of Swedish origin. Academician of the St. Petersburg Academy of Sciences (1844).

Sjögren graduated from the University of Åbo in 1819. He became director of the Ethnographic Museum of the St. Petersburg Academy of Sciences in 1845. From 1824 to 1829 he made a trip to the northern part of European Russia to study the Finno-Ugric languages and peoples. He also carried out research on the history, archaeology, and toponymy of the Russian north. From 1835 to 1837, Sjögren traveled throughout the Caucasus studying the languages and ethnography of the Ossets, Georgians, and other Caucasian peoples.

Sjögren collected field material in Livonia and Courland from 1846 to 1852. He compiled a grammar and a dictionary of the Livonian language that were published after his death by Academician F. I. Videman. Sjögren also compiled the first grammar of Ossetic—*Ossetic Grammar with a Short Ossetic-Russian and Russian-Ossetic Dictionary* (parts 1–2, 1844).

SJÖSTRÖM, VICTOR DAVID (also known as Victor Seastrom). Born Sept. 20, 1879, in Silbodal; died Jan. 3, 1960, in Stockholm. Swedish motion-picture director and actor.

Sjöström began acting at the Vasa Theater in Stockholm in 1896. He made his debut in motion pictures in 1912, appearing in

The Vampire, and the same year he made the film *The Gardeners*. His early films tended toward melodrama, but *Ingeborg Holm* (1913), *The Strike* (1914), *One of Many* (1914), and *Third Way* (1916) are noteworthy for their treatment of social problems. Sjöström's films are outstanding for their powerful visual images and their portrayal of extraordinary men struggling against social injustice and the forces of nature. Of special interest is their innovative montage. They established Sjöström as the founder of the classical Swedish school of film-making.

Sjöström developed a new style in his films *The Outlaw and His Wife* (1917), *The Girl From Stormytorpet* (1917), *The Sons of Ingmar* (1918), *Karin, Daughter of Ingmar* (1919), and *The Phantom Carriage* (1920), in which he also played the leading roles. He worked in Hollywood from 1923 to 1930, subsequently returning to his homeland. In 1930 he made one of the first Swedish sound films, *The Markurells From Wadköping*.

Sjöström's last work as a director was the historical drama *Under the Red Robe* (1937; released in the USSR as *Under the Cardinal's Robe*). His last role was that of Professor Borg in I. Bergman's *Wild Strawberries* (1957). [29–1166–2]

SKELLEFTEÅ, a city in northern Sweden, in the *län* (county) of Västerbotten. Population, 72,400 (1976). Port on the Skellefteå River near its influx into the Gulf of Bothnia of the Baltic Sea. Industry includes nonferrous metallurgy (copper and lead) and pulp manufacture. A hydroelectric power plant is located in the city. [29–1111–3]

SKELLEFTEÄLVEN, a river in northern Sweden. The Skellefteälven is 410 km long and drains an area of 11,600 sq km. It issues from Lake Ikesjaure near the border of Sweden and Norway and flows from northwest to southeast along the Norrland Plateau. The river passes through a series of lakes, including Hornavan, Uddjaur, and Storavan, and forms rapids and waterfalls. In its lower course it flows through the coastal plain and empties into the Gulf of Bothnia of the Baltic Sea.

The Skellefteälven is fed primarily by snow; the water level is high in summer and low in winter. The mean flow rate is approximately 160 cu m per sec. The river is used for floating timber. A series of hydroelectric power plants is located on the Skellefteälven. The seaport of Skellefteå is situated on the river near its mouth. [29–1111–4]

SKERRY, a rocky island separated by narrow straits and inlets from the intricately dissected coasts of seas and lakes in regions of ancient continental glaciation, such as the Kola Peninsula of the USSR, Finland, Sweden, Norway, and Canada. The islands are composed of crystalline rocks with traces of glacial activity, such as sheepback rocks, and various moraine formations, such as drumlins, eskers, and moraine hills. The islands have an area of several square kilometers and elevations of only a few meters. Many hundreds of skerries occur in certain regions of a sea or lake. [29–1560–5]

SKIEN, a city and port in southern Norway, on the Skien River, near the place where the Skien flows into Bohus Bay of the Skagerrak. Administrative center of the *fylke* (county) of Telemark. Population, 47,000 (1976). Skien has footwear, food-processing, machine-building, and pulp and paper industries. It is the birthplace of the writer H. Ibsen. [29–1178–3]

ŠĶILTERS, GUSTAVS (Gustav Ianovich [Ivanovich] Shkilter). Born Nov. 16 (28), 1874, in Renzen Volost, in what is now Valmiera Raion; died Sept. 24, 1954, in Riga. Latvian sculptor and graphic artist, one of the first representatives of the Latvian school of sculpture of the 20th century.

Šķilters studied under M. A. Chizhov at the Shtiglits Central School of Technical Drawing in St. Petersburg from 1893 to 1899 and perfected his technique at A. Rodin's studio between 1900 and 1905. From 1906 to 1907 he drew political caricatures for St. Petersburg's Latvian-language satirical journal *Svari* (Scale). He taught at the Shtiglits School from 1905 to 1918 and at the Latvian Academy of Arts from 1924 to 1932.

Thorough precision of form is frequently combined with a picturesque treatment of the medium in Šķilters' free-standing figures and easel portraits. His works include portraits in bronze of R. Kaudzīt (1902) and M. Kaudzīt (1912), both housed in the Art Museum of the Latvian SSR in Riga, and one of K. Baumanis (1928, Opera and Ballet Theater of the Latvian SSR, Riga). In 1974 the G. Šķilters Memorial Museum was opened in Riga.

SKINNING MACHINE, a unit for the continuous or batch removal of skins from animal carcasses, used in meat-packing plants as a component of mechanized production lines for cattle slaughter and carcass processing. Depending on the design, the output of series-produced skinning machines ranges from 75 to 150 carcasses per hr for cattle, from 125 to 360 carcasses per hr for smaller stock, and up to 100 carcasses per hr for hogs. [29–1271–3]

ŠKODA, JOSEF. Born Dec. 10, 1805, in Pilsen; died June 13, 1881, in Vienna. Czech doctor of internal medicine.

Škoda moved to Vienna in 1825, and in 1831 he graduated from the medical faculty of the University of Vienna. From 1846 to 1871 he was a professor at the university. Škoda and K. Rokitansky were the leading representatives of the new Vienna school, which emphasized the advantages of observing the patient at his bedside and studying the physical symptoms of disease and the underlying changes in organs. The school played a prominent role in the development of clinical medicine. Škoda developed and substantiated the concepts of percussion and auscultation and helped promote these techniques of physical examination in clinical practice. He also showed the dependence of heart sounds not only on anatomical lesions of the valves but also on the rate of blood flow, and he described several symptoms revealed by auscultation. His activities and research contributed greatly to the development of cardiology, pulmonology, and dermatology. Škoda founded a clinical school (F. von Hebra and others).

ŠKODA WORKS, one of the largest heavy machine-building works in Europe, located in the city of Plzeň (Pilsen), Czechoslovakia; the works originated in a factory that was founded during the 1860's to produce agricultural implements. The works underwent a major expansion before World War II. In the postwar years the production of the Škoda works played a major role in the reconstruction of Czechoslovakia's economy and in the development of economic cooperation between Czechoslovakia and other socialist countries. In 1951 the name of V. I. Lenin was added to the works' name.

During the mid-1970's more than 45,000 industrial and nonindustrial workers were employed by the Škoda Works. The production program of the works encompasses more than 50 branches of machine building. The main products manufactured are steam turbines, turbogenerators, hydroelectric generators, compressors, transformers, rolling mill and foundry equipment, hoisting cranes, large metalworking machine tools, electric locomotives, trolleybuses, and other equipment. About 40 percent of the total production is exported, mainly to the USSR and other socialist countries. During the early 1970's the expanding cooperation of the COMECON member countries in the development of nuclear sources of electric power resulted in the works' undertaking the production of equipment for nuclear power plants.

SKÖVDE, a city in Sweden, in the *län* (county) of Skaraborg, between Lakes Vänern and Vättern. Population, 45,400 (1976). Skövde has an engine-building industry (a plant of the Volvo firm) and a clothing industry. Uranium is mined near Skövde at the Ramstad Mine. [29–1068–1]

ŠKRÉTA, KAREL (full name, Karel Škréta Šotnovský ze Závořic). Born 1610 in Prague; buried there Aug. 1, 1674. Czech painter; one of the most outstanding representatives of Bohemian baroque.

Because his family was involved in the Reformation, Škréta was forced to flee from Bohemia to Freiburg, Saxony, in 1628. He studied painting in Italy and in 1638 returned to Prague. He produced religious and mythological works of masterly technique, often incorporating genre motifs, as well as highly expressive portraits, drawings, and illustrations.

ŠKROUP, FRANTIŠEK JÁN. Born June 3, 1801, in Osice, near Pardubice; died Feb. 7, 1862, in Rotterdam. Czech composer, conductor, and singer.

Škroup studied music and law simultaneously. Under the influence of the Buditeli, he organized in Prague the first national Czech opera circle, which in 1823 began staging performances in Czech of German and Italian classical operas at the Estates Theater. He became second conductor at the theater in 1827 and was chief conductor from 1837 to 1857; he was the first to stage the operas of such composers as R. Wagner and G. Verdi in Prague. In 1860 he became conductor with a German opera company in Rotterdam.

Škroup composed nine operas, including *The Dráteník* (1826), the first national opera with a Czech libretto. Among his other works are an overture, string quartets, a piano trio, music for the theater, and songs, notably the popular song "Where is My Home?" (from the music to J. Tyl's play *Fidlovačka*, 1834), which became the first (Czech) part of the national anthem of the Czechoslovak Republic in 1918.

SKULL (also cranium), the skeleton of the head of vertebrates, including man. A distinction is made between the axial cranium and the visceral cranium. The axial, or cerebral, cranium is the anterior continuation of the axial skeleton of the trunk that grows around the brain, olfactory organs, and inner ear. The visceral, or facial, cranium is the skeleton of the anterior part of the intestine (pharynx), which originally consisted of branchial, or visceral, arches separating gills.

In animals. The cranial changes that evolved in organisms were caused by progressive development of the brain and sense organs, replacement of gill respiration by pulmonary respiration, and change in feeding habits resulting from the emergence of organisms onto land from water. The cerebral cranium consists of a brain case, nasal capsules (surrounding the olfactory organs), and auditory capsules (enclosing the inner ear). The brain case is divided into anterior (prechordal) and posterior (chordal) portions. The former embraces the orbital and nasal regions of the skull, and the latter embraces the occipital and aural portions. The anterior portion develops from trabecular cartilages and orbital cartilages situated above them. In embryos the posterior portion develops around the fore end of the chord from the parachordal cartilages and auditory capsules. The parachordal cartilages correspond to the fused neural arches of the most anterior vertebrae, hence the "vertebral" origin of the posterior portion. Both portions remain independent in crossopterygians but grow together in the embryos of other vertebrates. The anterior portion usually contains only the forebrain (the cerebral hemispheres), with the posterior portion containing the greater part of the brain. In the adult cranium the boundary between the portions passes through the hypophysis and the opening by which the trigeminal nerve emerges from the cranium. The nasal capsules fuse with the anterior portion. Crossopterygians and terrestrial vertebrates have, in addition to nostrils, internal nares (choanae) that open into the anterior part of the oral cavity.

Platybasic and tropibasic types of brain case structure are distinguished according to the structure of the orbital portion. In a platybasic skull the prechordal portion has a wide base, and the brain extends into the orbital region. This type of cranium characterizes cyclostomes, sharks, lungfishes, recent amphibians, and mammals. All other vertebrates have a tropibasic skull, whose anterior portion has a narrow base and whose cerebral hemispheres are situated behind the orbital region.

The visceral cranium serves as a support for the anterior part of the digestive tract. It consists of metamerically arranged cartilaginous arches that encircle the initial portion of the digestive tract like hoops. The anterior visceral arches are transformed into jaws in all vertebrates except the most primitive organisms—the Agnatha. The cartilaginous base of the upper jaw, the palatoquadrate cartilage, was formed by the fusion of the upper portions of the two anterior arches, the premaxillary and the maxillary proper. The cartilaginous base of the lower jaw—Meckel's cartilage—corresponds to the lower portion of the second visceral, or maxillary, arch. The upper portion of the third visceral arch, or hyoid arch, was transformed in fish into an appendage that usually attaches the jaws to the axial cranium. In most fish the maxillary arch is joined to the axial cranium only by an appendage (hyostylic). The palatoquadrate cartilage in chimeras, lungfishes, and terrestrial vertebrates is directly joined to the axial cranium without an appendage (autostylic). In extinct shelled and primitive bony fishes and some sharks the maxillary arch is joined to the axial cranium both directly and by means of an appendage (amphistylic).

In terrestrial vertebrates, the appendage is transformed into an auditory ossicle that conducts sounds from the tympanic membrane to the inner ear; the posterior visceral arches (gill arches proper) are transformed into the hyoid bone and laryngeal cartilages. Mammals have additional auditory ossicles, the incus and the malleus, which arose from detached posterior elements of the palatoquadrate and Meckel's cartilages—the quadrate and articular bones.

In higher fishes and terrestrial vertebrates, the embryonic cartilaginous cranium more or less ossifies and becomes invested with dermal bones formed in the deep layers of the skin. On the outside the dermal bones form the calvaria, which is made up of nasal, frontal, parietal, squamous, and other bones. Originally the calvaria had openings only for the eyes and nostrils (anapsid skull), but most terrestrial vertebrates now have openings behind the orbits—temporal windows separated by the temporal, or zygomatic, arches. The function of the upper jaws was transferred to the premaxillary and maxillary dermal bones. The palatal and pterygoid dermal bones of the palatoquadrate cartilage form the palatal surface of the bony cranium. In some reptiles and mammals these bones form a secondary palate, which separates the choanal region from the main part of the oral cavity.

L. P. TATARINOV

In man. The human cerebral cranium is made up of six flat curved bones: the unpaired frontal and temporal bones, the paired parietal and temporal bones, and the sphenoid and ethmoid bones (situated at the base of the skull and possessing air spaces). The bones are connected by sutures. The upper part of the skull is called the skullcap, and the lower part is the base. The latter is divided from within into three fossae: anterior, middle, and posterior. The posterior cranial fossa contains the cerebellum. Nerves and blood vessels pass through the base of the skull by way of numerous canals and openings. The ear is housed in the temporal bone.

The shape and size of the skull vary: the circumference ranges from 52 to 64 cm, the length from 15 to 18 cm, and the width from 12 to 15 cm. Three basic shapes have been determined according to the cranial index. The shape of the skull changes with growth. An infant is born with incompletely developed bones, between which are remnants of the membranous cranium in the form of fontanelles and wide sutures.

The facial cranium consists of 14 comparatively small bones and the hyoid bone. The largest of these bones are the upper and lower jaws, which bound part of the oral cavity. The bones of the facial cranium as a whole determine the shape of the face. The lacrimal, zygomatic, and maxillary bones contribute to the formation of the orbit. The nasal, palatine, maxillary, vomer, and inferior turbinate bones form the nasal cavity, which communicates with the frontal, maxillary, and sphenoidal air sinuses. Other important topographical formations of the cranium include the infratemporal and pterygoid fossae, through which blood vessels and nerves pass. V. V. KUPRIANOV

Anthropological significance. Study of variations in the size and shape of the cranium and of the cranium's individual constituent bones is important in all branches of anthropology. Certain cranial indexes can be determined by measurement (craniometry) or from descriptive characteristics (cranioscopy). Human morphology investigates normal sex- and age-related cranial variations in different population groups and explains the relationship between such variations and types of body build, hormonal status, social and environmental living conditions, and heredity. It has been found that men have larger skulls and cranial bones than women; male skulls are also marked by more expressed bone configuration (superciliary arch, the lines of attachment of muscles to the temporal, occipital, and lower jaw bones). Important age-related variations are changes in the correlation of the cerebral and facial portions; changes in the development, succession, and structure of teeth; and changes in the overgrowth of sutures.

Particularly important is the study of cranial transformations in the course of anthropogenesis, during which the skull gradually lost its "simian" features and acquired the structure characteristic of modern man. The cerebral portion of the skull enlarged, thereby dominating the maxillary portion. The highly developed supraorbital ridges in fossil man diminished and converted into superciliary arches, and the longitudinal crest of the cranium disappeared. The skullcap enlarged markedly: its frontal portion became wider and higher, and the occiput became round and lost the ridge and other bone growths (pronounced in ancient people) that served as sites of attachment of powerful neck muscles. The rearrangement of the cerebral portion was closely related to the enlargement and complication of the structure of the brain in the course of anthropogenesis.

The size of the brain averages 500–600 cc in the extinct higher primate *Australopithecus*, 1,000 cc in the oldest human beings (Archantropinae), 1,350 in ancient peoples (*Palaeoanthropus*), and 1,500 cc in modern man. These evolutionary changes in the calvaria, particularly the increased size of the fornix and the development of a high and almost straight forehead, were caused by active enlargement of the frontal and parietotemporal regions of the brain, where the specific cortical zones associated with man's work and speech are located.

In the course of anthropogenesis, the facial portion of the skull became less protrusive, and paired nasal bones whose lower part protrudes beyond the vertical plane of the face developed. The mandibular teeth were arranged in a horseshoe fashion rather than in the form of a U, as in anthropoid apes. The mental protuberance lacking in apes and some fossil humans developed in front, and the shape of the upper jaw and hard palate changed.

The structural characteristics of the cerebral and, to a greater extent, facial portions of the skull are used in raciology to identify racial types in modern and, especially, ancient populations. The vertical profile of the face, the degree of flatness of the upper and middle parts of the face, the shape of the nostrils and orbital cavities, and the protrusion of the nasal bones are among the features of the major races. Characteristics of the cerebral portion of the skull, for example, the cephalic and cerebral indexes, are used to distinguish smaller units of anthropological classification within major races. Craniological data are an important historical source for study of the formation of ethnic communities (nations, nationalities). The data are particularly useful in the study of peoples lacking a written history. The results of anthropometry of ancient peoples in a given region, together with archeological, historical, linguistic, ethnographic, and anthropological data on modern peoples, are used to explain the ethnogeny of large and small groups of people in the USSR.

Pathology. Diseases of the skull include osteomyelitis, tumors, and congenital cerebral hernias. Injuries to the skull may be limited to soft tissues of the head but frequently affect the cranial bones and the brain. The term "craniocerebral trauma" is applied to the most important combined or isolated closed (with the skin intact) and open (with a wound) injuries to the skull and brain. The extent of bone damage varies with the force of the traumatic agent: depression or fracture of one or more bones at the base of the skull. Brain trauma is manifested by contusion, compression, or concussion.

A closed craniocerebral injury is associated with brief or prolonged unconsciousness, headache, nausea, and vertigo. If severe, there may also be mental, respiratory, and circulatory disorders combined with a variety of neurological symptoms. Such disorders are not pronounced in brain concussion. With cerebral hermorrhaging, there are signs of compression (two-stage loss of consciousness with a "lucid" interval, state of inhibition, prolonged headaches). If the base of the skull is fractured, signs of irritation of the meninges appear against a background of severe general brain symptoms. Treatment may be conservative or surgical. Conservative treatment is possible in cases not associated with compression of the brain. Bed rest and pain relievers are prescribed for skull fractures with no signs of brain injury and for mild brain concussions and contusions. More severe cases call for spinal taps and drugs that reduce intracranial pressure. Surgery is required for skull fractures with bone depression, brain compression by an intracranial hematoma, and increasing brain edema. Surgery involving opening of the cranial cavity is performed under local or general anesthesia.

Open craniocerebral trauma occurs less often than closed trauma in peacetime. It may be nonpenetrating (without injury to the dura mater) or penetrating (with injury to the dura mater). The clinical signs of general cerebral disorders are less pronounced than in closed trauma, but there is a much greater danger of infection or development of meningitis, encephalitis, or other complications. Treatment is only by surgery (surgical treatment of a wound, trephination, and plastic surgery for large defects in bone).

The sequelae of craniocerebral trauma may be diseases of the brain, including arachnoencephalitis, psychological disorders (for example, twilight state), and, in the long term, asthenia, encephalopathy, traumatic epilepsy, and mental deficiency.

SLAG, FURNACE, furnace residues resulting from the combustion of solid fuel in the fireboxes of steam boilers as well as ash particles that have caked or fused into sinter. [29–1273–1]

SLAG, METALLURGICAL, a melt (after solidifying, a rocklike or glasslike substance) usually covering the surface of molten metal in metallurgical processes, as the smelting of raw material,

the processing of molten intermediates, and the refining of metals. Slags are alloys of oxides of various compositions. The major components of slags are the acidic oxide SiO_2 and the basic oxides CaO, FeO, and MgO, as well as the neutral Al_2O_3 and (less often) ZnO. Slags are classified as acidic or basic depending on the predominant oxides. They play an important role in the physicochemical processes of metallurgical production: they remove undesirable impurities in metals and protect metals from the harmful effects of the gaseous medium in the furnace (that is, from oxidation and gas saturation). Slags are formed from waste rock of ores (or ore materials), fluxes, combustion ash, oxidation products of processed materials, and the lining of smelting units. In steel smelting, slags are sometimes prepared in special furnaces (synthetic slags) and then used to process steel upon its removal from the furnace or converter to the ladle. Previously prepared slags are used in the electroslag remelting of metals.

In ferrous metallurgy, slags are usually by-products. They are secondary raw materials for the production of building materials (such as slag sitalls) and lime and phosphorus fertilizers; they are also used as a recycle in metallurgy. Blast-furnace slag is used to prepare granulated slag (used in the production of cement and slag blocks), pumice (a lightweight aggregate in concrete), gravel, rock castings, and slag wool. Steel-smelting slag is used in the production of gravel for road construction; in sintering blast furnaces and cupola furnaces it is used to extract the manganese, iron, and calcium oxide present in the slag. Ferroalloy slags are processed into ground limestone, gravel, and slag sand for construction as well as a powder used in foundry production; a portion of such slags is used in the production of alloys. Special slags used in the production of ferroalloys are produced by the integrated processing of ores and pig iron. Oxidation is an efficient method of transferring vanadium, manganese, niobium, and other metals from naturally alloyed pig iron into slag; the slag is then used for the production of such metals or their alloys.

In nonferrous metallurgy, a distinction is made between reduction slags and waste slags. Reduction slags contain a higher content of valuable metals and are formed as a by-product in metal production or refining. For example, converter slags are a by-product of nickel and copper production, and anode slime is a by-product of copper refining. Reduction slag may be the major product of a production process in which an extracted metal is concentrated, for example, titanium and vanadium slag. Slag yields are extremely high in nonferrous metallurgy. Up to 100–120 tons of slag is produced per ton of metal in the processing of poor ores. Thus, even a small amount of the nonferrous metal in the slag leads to significant losses. Metals may be extracted from reduction slags by recycling the slags to one of the primary production stages or by subjecting them to special processing, such as fuming, electrosmelting with the addition of a reducing agent and a sulfidizer, and flotation. Metal oxides not suitable for extraction in metallurgical processing are concentrated in waste slags, as are various admixtures and small amounts of valuable metals, the extraction of which is not economically feasible at the present level of technology. Waste slags are used partially for the production of slag wool and other building materials.

The complete and integrated use of slags ensures a waste-free production process and less pollution of the environment.

SLAG CAR, a ladle of cast steel mounted on a railroad car for transporting molten metallurgical slag. In order to pour the slag off, the slag car is tipped in the required direction by means of an electric drive. The most common slag cars for blast-furnace and steel-smelting plants in the USSR have capacities of 11 and 16 cu m. [29–1273–6]

SLAG CEMENT, the common name for various cements produced by crushing pellets of blast-furnace slags together with activator additives (lime, construction-grade gypsum, and anhydrite) or by mixing the components after they have been ground separately. A distinction is made between lime-slag cement, with a content of 10–30 percent lime (by weight) and up to 5 percent gypsum, and sulfate-slag cement, with 15–20 percent gypsum or anhydrite and up to 5 percent portland cement or up to 2 percent lime. Slag cement is used in the production of mortars and concretes intended primarily for underground and underwater structures. Lime-slag cement is most suitable for the production of autoclave materials and articles. [29–1273–7]

SLAG CONCRETE, a lightweight concrete, in which the aggregate consists of metallurgical or furnace slag that has been crushed, dispersed, and purified of contaminants. It is used in the erection of cast-in-place wall structures (mainly building walls, ceilings, and floors) and in the prefabricated manufacture of concrete, stone, blocks, and panels. [29–1273–2]

SLAG INCLUSION, a defect in metal intermediate and finished products made primarily by rolling or forging. Slag inclusions are elongated accumulations of nonmetallic inclusions, from several millimeters to several centimeters in length; they usually form in the metal during pouring. They are arranged in the direction of the predominant flow of the metal upon deformation (mainly, on the surface of the metal or in the adjacent layers). Slag inclusions are removed mechanically, for example, by chiseling, flame treatment, and other methods. [29–1273–4]

SLAG POT, a metal ladle for collecting molten slag flowing from the taphole of a steel-smelting furnace during smelting. It is positioned under the furnace on a car that moves along a special trestle. [29–1273–5]

SLAG REMOVAL, the removal from steam boiler fireboxes of residues resulting from the combustion of solid fuels.

A distinction is made between fireboxes in which the slag is removed in thin streams in the molten state into a vat with water and fireboxes in which solid slag drops from the firebox hopper into a bin, from which it is periodically removed through a gate. Usually the slag is subsequently transported together with the fly ash (*see* ASH REMOVAL) collected by gas-purification devices. In older boilers the slag and ash were removed by cars. In modern electric power plants slag is ordinarily removed by a hydraulic system. The slag is transferred to a slag-washing shaft and then (in the case of coarse slag) to a grinder, from which it passes through a grate and metal catchers into dredger pumps or to hydraulic ejector pumps, which transfer the slurry (a mixture of slag and ash with water) to an ash dump. The two materials are often removed individually—the slag by a hydraulic system, and the ash by a pneumatic system. The vacuum removal of ash and slag is used in small boilers.

SLAG RESISTANCE, the capacity of refractory materials to resist the destructive action of molten slags. Slag resistance is determined by the loss in volume or weight of a refractory material upon the action of a slag and, in part, by the depth of penetration of the slag into the refractory material. Both static methods (dissolving of a refractory material in a fixed amount of slag) and dynamic methods (the action of a moving and removable slag) are used to determine slag resistance; a combination of the two methods may also be used. Slag resistance depends on the chemical nature of the slag and the refractory material as well as the density and structural features of the refractory material.

Praktikum po tekhnologii keramiki i ogneuporov. Moscow, 1972. [29–1275–2]

SLAG SITALLS, devitrified glass produced by the controlled, catalyzed crystallization of glass made from metallurgical, furnace, and other slags or from mineral and synthetic raw materials. Nu-

cleation and growth of crystals of the major crystalline phases on the nuclei occur simultaneously throughout the glass during heat treatment. Slag sitalls consist of tiny crystals with lengths from fractions of a micrometer to several micrometers in combination with residual vitreous glass (less than 40 percent by volume). They have high chemical resistance and resistance to wear. Slag sitalls were first synthesized in 1959 as a result of joint investigations by the Avtosteklo Factory in Konstantinovka, Donetsk Oblast, and the Mendeleev Moscow Institute of Chemical Engineering.

Slag sitalls are produced as continuous ribbons and pressed plates. They are white or gray and may be coated with colored ceramic dyes. Articles made of slag sitalls are used in construction, the chemical industry, and mining to protect structures and equipment from corrosion and abrasive wear. Slag sitalls are also used for floor coverings and exterior and interior wall facings.

K. T. BONDAREV [29–1274–2]

SLAG WOOL, a material for thermal insulation, a type of mineral wool manufactured from melts of metallurgical slags by converting them into glasslike fibers. It is used mainly in the form of finished sheets, mats, and shells made with a synthetic binder.

[29–1273–3]

SLIP, a thick, paste-like mass composed of a mixture of finely ground silicate raw materials and water. It is used in the manufacture of shaped refractory blocks, porcelain and faïence wares, ceramic tiles, and the like. M. P. SMIRNOV [29–1289–1]

SLIT TRENCH, a short trench dug 1.5–2 m deep and designed to provide shelter during a nuclear explosion, an artillery bombardment, an air raid, or a tank attack. A slit trench may adjoin a fire trench and may be open at the top or have a splinter-proof covering made of wood and sod. [29–1589–2]

SLOOP. (1) A three-masted, square-rigged sailing vessel of the 18th and 19th centuries that was also called a sloop of war. Smaller than a corvette and larger than a brig, the sloop had an open battery and was designed for reconnaissance, patrol, or dispatch service.

(2) The Russian term for a quiet-running vessel used by some modern foreign navies as an escort for transport convoys.

(3) The name of the most widely used rig on small- and medium-sized single-masted sporting yachts. In addition to its Bermuda or gaff mainsail, the sloop rig also includes a staysail or a jib, or both. [29–1305–4]

SLOT ANTENNA, an antenna in which apertures, or slots, for the radiation or reception of radio waves are cut in the conducting surface. A slot antenna may be a metallic wave guide, a rigid coaxial line, a cavity resonator, or a flat metal sheet.

In a slot antenna, radiation results from the excitation of the slots. In wave guides, resonators, and coaxial lines, the slots are excited by an internal electromagnetic field; in flat sheets, they are excited by means of a radio-frequency cable connected directly to the slot edges. In the general case, the calculation of a slot antenna's field is a complex diffraction problem. However, the problem may be simplified considerably by introducing a fictitious "magnetic" current that flows along a slot and representing a slot radiator as a magnetic antenna (*see* RADIO WAVES, RADIATION AND RECEPTION OF). Thus, for example, when the vectors **E** and **H** are replaced by the vectors **H** and $-\mathbf{E}$, respectively, the field due to a slot cut in a flat sheet is identical to the field of a sheetlike dipole, which is the complement of the slot. This method of designing slot antennas, which is called the duality principle, was first proposed by A. A. Pistol'kors in the early 1940's.

Slot antennas are distinguished by a relatively simple design. Such an antenna may not contain protruding components. The lack of protruding components is an important advantage of slot antennas in a number of cases, for example, when they are mounted in aircraft.

The most widely used metric-wave or decimetric-wave slot antennas are omnidirectional slot antennas, which are based on cavity resonators. In terms of the shape of the slots, such antennas are analogs of various flat wire antennas. The main difficulty in designing such an antenna is the matching of a high-impedance slot and a relatively low-impedance cable. The input impedance of a slot may be as high as 10^3 ohms (Ω), while the characteristic impedance of a cable is usually 50–75Ω.

For centimeter waves, directional slotted-guide antennas (see Figure 18 in ANTENNA) are mainly used. Such an antenna is matched with a wave guide by using a large number of radiators and by choosing the lengths and arrangement of the slots. An important advantage of slotted-guide antennas is the possibility of beam steering, or scanning, by varying the phase velocity of the wave in the wave guide. As early as the 1940's, slot antennas were developed in which scanning was carried out by varying the distance between the narrow walls of a rectangular wave guide or by inserting a longitudinal plate into the wave guide. In the 1950's and the 1960's, frequency-scanning methods were implemented, including methods for the frequency scanning of slotted-guide phased arrays.

A promising trend in the evolution of slot-antenna technology is the development of designs based on printed circuits and strip transmission lines.

SLOTTED CARD, a variation of the edge-punched card, in which the perforations are slots instead of edge notches. The slots connect two or more holes punched in the card. Unlike edge-punched cards, slotted cards have all perforations cut in one direction, either vertically or horizontally across the card. Slotted cards are intended for manual sorting of data files. The absence of edge notches reduces wear on the edges of the cards and increases the cards' service life (compared with edge-punched cards). [29–1584–1]

SLUICE, in ore dressing, an inclined, rectangular trough, usually with a rough bottom of napped fabric covered with a pattern of wood planks, corrugated rubber, or the like, designed for gravity concentration of minerals. As the pulp passes through the sluice, the particles separate into layers according to their density and grain size; the heavier minerals settle to the bottom and are held by the friction created by the roughness and the bottom pattern. The vortices that form promote selective concentration. After the material has accumulated, the sluice is rinsed out by washing the concentrate into a separate receptacle with a powerful stream of water.

A distinction is made between fixed and band-type sluices. Fixed hydraulic sluices are designed to process large amounts of material. They are made of from six to eight consecutively laid boards several meters long with a slope of 0.03–0.06. They can extract 70–80 percent of the tin from ore concentrates containing 15–30 percent SnO_2; the extraction of gold is 40–60 percent. Other sluicing devices, cradles, and trommels are used for processing crude concentrates.

Band-type sluices consist of a continuous rubberized band, the upper part of which moves against the stream of pulp. The lighter fraction is unloaded in the lower section, and the heavier fraction is washed from the upper section of the band by a sprinkler. A band-type sluice 3 m long and 1.5 m wide has a productivity of 5 cu m/hr and can extract 92–95 percent of the gold in an ore.

Automatic multideck movable sluices have been in use since the 1970's. The type used in the USSR has five decks arranged in parallel above one another in tiers. The feed is stopped automatically every 4 min, the decks are tipped to an angle of 45°, and a petcock is opened for 1 min for rinsing. The use of vibration in sluices increases productivity.

L. A. BARSKII [29–1304–1]

SLUICE, REGULATOR, a hydraulic engineering installation on irrigation, flooding, and water supply canals, designed to change the water discharge regime by means of gates.

Regulator sluices are classified according to their location: head sluices, for regulating the feed of water to the canal from the source or from a larger, trunk canal; retaining sluices, for maintaining the water level in a canal when discharge rates are low; flushing sluices, for washing away sediment that has been deposited in front of a structure in the canal; distributors, distributing the water at points where the canal branches; and overflow (spillway) sluices, for directing unused water into a drainage network.

Open regulator sluices are installed where fluctuations in water level are small; where fluctuations are greater, the sluices may be equipped with a diaphragm (retaining wall) and bottom gate underneath, or tunnel sluices may be set in the body of a dam and equipped with the same kind of gate. Regulator sluices are made primarily of reinforced concrete, often precast. [29–1305–3]

SMALTITE (also smaltine), a zonal mineral variety of the skutterudite group of the arsenide class. The chemical composition of smaltite is $(Co, Ni, Fe)As_{3\pm x}$, where x is about 0.1. The Co and Ni substitute for one another without restriction; the Fe content does not exceed 40 atomic percent of the sum of the cations. Isomorphic zonal mixtures in which Co predominates are classified as smaltite, as distinct from mixtures in which nickel predominates, which are called chloanthite.

Smaltite crystallizes in the isometric system, forming cubic or octahedral crystals. It is usually found in the form of solid granular masses. Collomorphic phenocrysts are also common. Smaltite has a tin-white or steel-gray color and a metallic luster. The hardness of individual zones is 5.5–6 on Mohs' scale; the density is 6,400–6,800 kg/m^3.

Smaltite forms during medium-temperature hydrothermal processes in association with other arsenides of cobalt, nickel, and iron and sometimes with uranium, silver, and bismuth minerals. It oxidizes readily at the earth's surface, becoming coated with crimson to pink erythrite. It is one of the most common minerals in ores of hydrothermal cobalt deposits. Smaltite is a valuable raw material of cobalt; sometimes, silver, bismuth, uranium, and gold are obtained from the same ores.

ŠMERAL, BOHUMÍR. Born Oct. 25, 1880, in Třebíč; died May 8, 1941, in Moscow. Figure in the Czechoslovak and international working-class and communist movements.

Šmeral was the son of a teacher. A lawyer by education, he received the degree of doctor of law in 1904. In 1897 he joined the Social Democratic Labor Party of Czechoslovakia, and from 1906 to 1918 he edited its central organ, the newspaper *Právo lidu*. In 1909, Šmeral was elected to the Central Executive Committee of the SDLPC; he was a member of the Presidium of the Central Executive Committee from 1911 to 1917 and chairman from 1914 to 1917. Šmeral was a Social Democratic deputy to the Austrian Reichsrat from 1911 to 1918. He was one of the organizers of the October general political strike of 1918 in the Czech lands, and in 1919 he became a leader of the group known as the Marxist Left, the revolutionary wing of the SDLPC.

In 1920, Šmeral visited Soviet Russia and met V. I. Lenin. When he returned to Prague he published the book *The Truth About Soviet Russia* (1920), in which he stressed the international significance of the October Revolution of 1917. In May 1921, Šmeral helped found the Communist Party of Czechoslovakia, and from 1921 to 1929 he served on its Central Committee; in 1936 he was again elected to the Central Committee. He was a CPC deputy to the National Assembly of Czechoslovakia from 1920 to 1929, and a senator in the National Assembly from 1935 to 1938.

From 1922 to 1935, Šmeral served on the Executive Committee of the Communist International and was a member of the Executive Committee's Presidium. In 1935 he became a member of the International Control Commission of the Comintern. In 1938 he moved to Moscow in accordance with a decision by the Central Committee of the CPC. In Moscow, Šmeral worked for the Comintern and served on the governing central board of the CPC.

WORKS
Historické práce, 1908–1940. Prague, 1961. [29–1314–1]

ŠMIDKE, KAROL. Born Jan. 21, 1897, in Vitkovicé; died Dec. 15, 1952, in Bratislava. Czechoslovak party and state figure. Hero of the Czechoslovak Socialist Republic (1964, posthumously). Member of the Communist Party of Czechoslovakia from 1921.

Šmidke was a CPC deputy to the National Assembly from 1935 to 1938. He emigrated to the USSR in August 1939, five months after the occupation of Czechoslovakia by fascist Germany in March 1939. In 1943, Šmidke was sent by the leaders of the CPC to carry out party work in Slovakia. He served on the Central Committee of the Communist Party of Slovakia (CPS) and the Slovak National Council (SNC). During the Slovak National Uprising of 1944 he was chief of staff of the partisan detachments and chairman of the SNC. In 1944 and 1945, Šmidke was chairman of the CPS, and in 1945 and 1946 he was deputy chairman of the SNC and chairman of the Board of Commissioners, an agency of state power in liberated Slovakia. He was chairman of the SNC from 1948 to 1950, and in 1949 he became a member of the Central Committee of the CPC.

Šmidke was awarded the Order of Lenin posthumously in 1969. [29–1315–1]

SMOKE POT, a device for releasing smoke. A smoke pot consists of a cylindrical metal container with openings in its upper end. An igniter is inserted in the center hole, and the smoke that forms when the mixture in the pot burns escapes through the remaining holes. [29–920–3]

SNEEZEWORT (*Achillea ptarmica*, or *Ptarmica vulgaris*), a perennial herbaceous plant of the family Compositae. The stems are solitary and range from 20 to 125 cm in height. The biserrate and sessile leaves are entire, linear, or linear-lanceolate; they measure 1–8.5 cm in length and 1–6 mm in diameter. The hemispherical heads are about 20 mm wide and in a common corymbose inflorescence. The six to ten white marginal flowers are pistillate and ligulate; there are three curved denticles on the top. The off-white middle flowers are bisexual and tubular. Sneezewort grows in meadows, along bodies of water, and amid shrubbery in Europe, Asia Minor, and the European USSR. It occurs as an alien species in Western Siberia. The powdered dry herb causes sneezing. Varieties with double heads (with a predominance of ligulate flowers) are raised as ornamentals. [29–661–6]

SNORKEL, a special device that enables a submarine to run underwater on diesel power and to recharge its storage batteries without surfacing. Consisting of a pair of tubes approximately 10 m in length and 30–40 cm in diameter, the snorkel can be extended slightly above the surface when the vessel is submerged. One tube of the snorkel is used to provide fresh air, and the other, to remove exhaust gases. Special valves on the snorkel prevent water from entering the engines when the sea is running. [29–1329–1]

SOIL SLITTING, a method of tilling the soil by cutting slits across the slope. The slits are usually 40–60 cm deep and set 100–150 cm apart. The purpose of soil slitting is to regulate overland flow and improve the soil's capacity to retain snowmelt and cloudburst water. Five-bottom plow frames with slit cutters attached in place of the first and fifth bottoms are used for soil slitting.

REFERENCE
Zemledelie, 2nd ed. Moscow, 1972. [29–1583–1]

SOIL SMOOTHING, leveling the surface of a field and partially loosening the topsoil. Soil smoothing is done by floats and drags. The soil is smoothed out in the spring as soon as the tops of the crests formed in fall plowing dry out. The procedure is done somewhat earlier than or at the same time as harrowing. Soil smoothing is effective on soils that are not inclined to become mucky. The small-clump layer formed on the surface prevents the evaporation of moisture. To avoid crusting of topsoil, smoothing is not done on heavy clay and salinized soils. [29–1283–3]

SOLENODONTIDAE, a family of mammals of the order Insectivora. The body length is 28–32 cm, and the tail length, 17–25 cm. The weight reaches 1 kg. The facial part of the head is considerably elongated, and the nostrils open to the sides. There is a deep fissure on the second lower incisor. The feet are relatively large. The body is covered with short reddish brown or blackish fur. The tail is bare. The family comprises one genus, *Solenodon*, which has two species: the almique (*S. cubanus*), distributed in Cuba, and the agouta (*S. paradoxus*), distributed in Haiti. Both the almique and the agouta are terrestrial nocturnal animals, inhabiting forests and shrub thickets. Natural depressions and cracks serve as shelters. The diet includes animals and plants. The almique and agouta breed once a year, giving birth to three offspring. Both are rare and are included in the *Red Data Book* of the International Union for Conservation of Nature and Natural Resources. [29–1584–3]

SOLID SPHERICAL HARMONIC. A solid spherical harmonic of degree n is a homogeneous function u_n in the rectangular coordinates x, y, and z that satisfies Laplace's equation:

$$\frac{\partial^2 u_n}{\partial x^2} + \frac{\partial^2 u_n}{\partial y^2} + \frac{\partial^2 u_n}{\partial z^2} = 0$$

There are $2n + 1$ linearly independent homogeneous polynomials in x, y, and z of integral positive degree n that are solid spherical harmonics. Their linear combination represents the general form of such a polynomial of degree n. For example, the general forms of homogeneous polynomials of degree 0, 1, and 2 that are solid spherical harmonics are represented by

$$u_0 = a$$
$$u_1 = ax + by + cz$$
$$u_2 = a(x^2 - z^2) + b(y^2 - z^2) + cxy + dyz + ezx$$

where a, b, c, d, and e are arbitrary constants.

If the spherical coordinates r, θ, and ϕ are introduced instead of the rectangular coordinates x, y, and z, then solid spherical harmonics may be expressed in terms of the spherical surface harmonics $Y_n(\theta, \phi)$ according to the formula

$$u_n = r^n Y_n(\theta, \phi)$$

To every solid spherical harmonic u_n of degree n there corresponds a solid spherical harmonic $r^{-2n-1}u_n$ of degree $-n - 1$.

Solid spherical harmonics are used in finding the general solution of Laplace's equation and in solving problems of mathematical physics for regions bounded by spherical surfaces. [29–867–7]

SOMLAY, ARTHUR. Born Feb. 28, 1883, in Budapest; died there Nov. 10, 1951. Hungarian actor. People's Artist of the People's Republic of Hungary (1950).

Somlay graduated from the Vígszínház studio in 1900 and worked in many theaters in Budapest. His roles included the title roles in Shakespeare's *Hamlet* and *King Lear*, Egor Bulychov in Gorky's *Egor Bulychov and Others*, Tiborc and bán Petur in Katona's *Bánk Bán*, and Judge Sári in Móricz' *Judge Sári*. Somlay joined the National Theater in Budapest in 1946; in 1948 he became chairman of the Union of Hungarian Actors. Somlay received the Kossuth Prize in 1948 and 1951. [29–1344–3]

SOMOGY, a *megye* (district) in southwestern Hungary, in the basin of the Drava River and Lake Balaton. Area, 6,100 sq km. Population, 362,000 (1975). The administrative center of Somogy is the city of Kaposvár. Somogy is an agricultural and industrial region. A total of 41.7 percent of the gainfully employed population is engaged in agriculture, and 29.5 percent is engaged in industry and construction (1970 census). The chief crops are wheat, maize, rye, sugar beets, sunflowers, tobacco, fodder crops, and potatoes. Orchards and vineyards are cultivated, and cattle, hogs, and poultry are raised. Enterprises of the food-processing industry produce flour, butter, and sugar. Flax and hemp are also processed. Somogy manufactures machinery, crafted wooden articles, textiles, and construction materials. Natural gas is extracted near Kaposvár and in the Drava River Valley. The southern shore of Lake Balaton is a health resort.

V. V. BODRIN [29–1344–4]

SOMOGYI, JÓZSEF. Born June 9, 1916, in Félszerfalva. Hungarian sculptor. People's Artist of the Hungarian People's Republic (1970).

Somogyi graduated from the Academy of Arts in Budapest in 1941. His monumental works, such as *Mother and Child* (aluminum, 1967, Budapest), consist of dynamic figures freely positioned in space. These works are executed in a romantic spirit and are marked by expressiveness of gestures. Somogyi has also produced freestanding sculpture, including very small works.

Somogyi received the Kossuth Prize in 1954 and the Munkácsy Prize in 1956. [29–1345–1]

ŠOPOV, ACO. Born Dec. 20, 1923, in Štip. Macedonian poet, translator, and state and public figure. Member of the Macedonian Academy of Sciences and Arts (1967); corresponding member of the Serbian Academy of Sciences and Arts (1968).

Šopov served in the National Liberation War of 1941–45 in Yugoslavia. He graduated from the philosophy department of the University in Skopje and the Higher Political School in Belgrade. He was president of the Translators' Union and the Writers' Union of the Socialist Republic of Macedonia in the 1950's and 1960's, and of the Writers' Union of Yugoslavia from 1965 to 1969. From 1970 to 1977 he was a diplomat.

Šopov began his literary career during the partisan years; his first published work was *Verses* (1944). In 1950 he published *In the Grammos Mountains* and *With Our Own Hands*, which both dealt with the antifascist and nationalist struggle and the building of a new Macedonia. The collections of lyric poems *Verses on Suffering and Joy* (1952), *Imagination* (1963), and *The Birth of the Word* (1966) deal with "eternal" themes, poetic creativity, and moral self-awareness. Another of his collections is *Song of the Black Woman* (1976).

Šopov experiments with versification and the lexicon. His works are distinguished by the freshness of their poetic language and by their melodic harmony. Šopov also translates from Russian and other European languages.

Šopov was awarded the Prize of the Antifascist *veche* of the National Liberation of Yugoslavia in 1970.

SOPRON, a city in Hungary. Situated on the Ikva River (Danube basin), in the *megye* (county) of Győr-Sopron. Population, 53,000 (1976). Sopron is a railroad junction. Its industrial enterprises manufacture textiles, garments, metal products, wine, and beer. The city has a polytechnic institute.

The city's noteworthy Gothic structures include a Benedictine church (13th–first quarter of the 14th century, reconstructed c. 1490) and a convent with its famous Chapter Hall (first half of the 14th century) and the churches of St. Mihály (13th–15th centu-

ries) and St. György (14th century, reconstructed in the baroque style 1682–1781). The city tower (completed 1681) and various Gothic, Renaissance, and baroque houses are also of interest. The Liszt Ferenc Museum houses archaeological remains and works of the fine arts, folk art, and applied arts.

SOUND EFFECTS, noises and sounds arranged in some definite tempo and rhythm and used in the production of theatrical performances, motion pictures, and radio and television programs.

Sound effects are achieved with special equipment. When combined with other means of expression, such as music, scenery, and lighting, sound effects help to reveal the content of a production and to create the necessary mood, tempo, and rhythm of a performance or a motion picture. Sound effects can be especially important in radio, where sound in all its diversity is the principal means of expression. Sound effects may be realistic, fantastic, arbitrary and abstract or comically absurd, depending on the style and treatment of the performance. [29–1542–6]

SOUNDING BALLOON, a rubber, usually hydrogen-filled balloon carrying a meteorograph and released in free flight to measure atmospheric parameters. The balloon bursts when it reaches a certain altitude, and the meteorograph descends to earth by parachute with a tape recording that is subsequently processed. With the introduction of radiosondes, the use of sounding balloons was virtually discontinued. [29–856–5]

SOUND-LEVEL METER, a device for measuring loudness (of noise) objectively. A sound-level meter consists of a nondirectional microphone, an amplifier, corrective filters, a detector, and an indicating meter.

The overall circuit design is such that the meter's characteristics approximate the properties of the human ear. The sensitivity of the ear is a function of the frequency of a sound, and this function varies with the intensity of the noise (or sound) being measured. Therefore, there are three sets of filters in a sound-level meter that provide the necessary contour of the frequency response at three loudness levels. Scale A conforms to the response for a low loudness level of ~40 phons (it is used in the range 20 to 55 phons); scale B, for a medium loudness level of ~70 phons (55 to 85 phons); and scale C, for a high loudness level, 85 to 140 phons. The response at the high loudness level is uniform over a frequency band of 30 to 8,000 hertz.

Scale A is also used to measure the loudness level in decibels with the notation A, that is, dB(A), at any loudness level. The value of a sound level in dB(A) is used when rating loudness in industry, dwellings, and transportation facilities. The filters are switched manually according to the loudness level of the sound (or noise) being measured. The rectified signal from the square-law detector is averaged over a time interval corresponding to the time constant of the ear—approximately 50 to 60 milliseconds (the time interval in which two separate acoustic signals are perceived as a unified signal by the ear because of its time lag). The scale on the output meter is calibrated in decibels relative to a root-mean-square sound-pressure level of 2×10^{-5} Pa on one of the three aforementioned scales—A, B, or C.

A modern sound-level meter is a compact, portable instrument powered by self-contained dry batteries. The microphone, electronic circuitry, and indicating meter should be extremely stable with respect to variations in the temperature, humidity, and barometric pressure, as well as invariant with respect to time.

[29–1543–2]

SOUTH AMERICAN TORTOISE (*Geochelone denticulata*), a reptile of the family Testudinidae (land tortoises). The shell is elongated and flat and measures up to 55–60 cm in length; the carapace is dark brown with yellow spots. The shell of the young is more convex and more brightly colored. The head and the long fat legs are blackish. The South American tortoise is widely distributed in the tropical forests of South America east of the Andes and in the Lesser Antilles. It feeds on fruits and greenstuffs. The eggs, which number four to 12, are buried in a pile of fallen leaves. The meat and eggs of the tortoise are used for food. [29–794–2]

SOVIET CHINCHILLA, a breed of rabbits raised for meat and fur. The breed was developed at animal-breeding sovkhozes in Moscow, Saratov, Perm', Novosibirsk, and other oblasts by crossing the Chinchilla breed (a breed raised in the USA, Great Britain, Denmark, the Federal Republic of Germany, the German Democratic Republic, and other countries) with the White Giant breed. The breed was confirmed in 1957. Adult rabbits weigh about 5 kg; three-month-old individuals weigh 2.5 kg. A litter contains seven or eight young. The silvery gray-blue pelt resembles that of the chinchilla, a South American rodent. The pelt is darkest on the breast, back, sides, and croup; the neck, abdomen, lower part of the tail, and inside of the legs are almost white. There is a characteristic light gray wedge with a dark base on the back of the head. The Soviet Chinchilla is raised in various zones of the USSR. [29–1208–1]

SOYINKA, WOLE. Born July 13, 1934, in Abeokuta. Nigerian writer and playwright.

In the satiric plays *The Lion and the Jewel* (1963) and *A Dance of the Forests* (1963), Soyinka employed the grotesque to show the clash between the traditional and the modern in Africa, urging his people to reflect seriously on their past. He is the author of the picaresque comedy *The Trials of Brother Jero* (1964), the antiwar parable *Madmen and Specialists* (1971), and the novel *The Interpreters* (1965; Russian translation, 1970), in which he exposed corruption in the bureaucracy of Nigeria and criticized extreme forms of African nationalism. Soyinka's poems are pervaded with themes of disenchantment with the reality of modern-day Nigeria.

S. P. KARTUZOV [29–1333–3]

SPACE-TIME INTERVAL, in the theory of relativity, a quantity that characterizes the relation between the spatial distance and the time interval that separate two events. From the mathematical standpoint it is the "distance" between two events in four-dimensional space-time.

In the special theory of relativity the square of the space-time interval s_{AB} between two events A and B is

$$s_{AB}^2 = c^2(\Delta t)^2 - (\Delta r)^2$$

where Δt and Δr are, respectively, the time interval and spatial distance between the events and c is the speed of light in a vacuum. The space-time interval between events remains unchanged when one inertial frame of reference is replaced by another; that is, the interval is invariant with respect to Lorentz transformations. By contrast, the quantities of Δr and Δt depend on the choice of frame of reference.

If $s_{AB}^2 > 0$, the interval is said to be timelike. In this case there

exists a frame of reference in which the events occur at a single point in space ($\triangle r = 0$), and $s_{AB} = c\triangle t$—that is, the space-time interval is equal to the product of the time interval between the events in this frame and the speed of light.

If $s^2_{AB} < 0$, the interval is said to be spacelike. In this case there exists a frame of reference in which the events occur simultaneously ($\triangle t = 0$), and the distance between them is $\triangle r = is_{AB}$, where $i = \sqrt{-1}$.

When $s_{AB} = 0$, the interval is called a null-interval. In this case the relation $\triangle r = c\triangle t$ always holds; that is, the events in any frame of reference can be connected by a light signal (*see* RELATIVITY, THEORY OF).

In the general theory of relativity, which considers curved space-time in the presence of gravitation, the space-time interval described above may be used only for infinitesimally distant events (*see* GRAVITATION). I. D. NOVIKOV [29–362–2]

ŠPÁLA, VÁCLAV. Born Aug. 24, 1885, in Žlunice; died May 13, 1946, in Prague. Czech painter.

Špála studied in 1902 at the School of Industrial Arts and from 1903 to 1908 at the Academy of Arts in Prague. Špála's work has features in common with fauvism, but the basic characteristics of his paintings, particularly his still lifes, is the stylization and development of the traditions of Czech folk art. [29–1386–1]

SPANISH FLY (*Lytta vesicatoria*), a beetle of the family Meloidae (*see* MELOIDAE). The body length is 12–20 mm. The coloration is golden green. The Spanish fly is distributed in Europe and Asia. It flies on hot days in May through July; it emits a sharp, unpleasant odor. It eats the leaves of trees and shrubs, and in large numbers causes considerable damage. It deposits its eggs in the ground; the hatched larvae crawl onto flowers, from where wild bees transport them on their bodies to their own nests. The larvae eat the bees' eggs and the honey in the honeycomb cells, then leave the nests and metamorphose into pseudopupae, which winter in the ground.

The hemolymph and sexual organs of Spanish flies contain a toxic substance called cantharidin. Dried Spanish flies were used to prepare vesicatory plasters. [29–1389–5]

SPANN, OTHMAR. Born Oct. 1, 1878, in Vienna; died July 8, 1950, in Neustift, Burgenland. Austrian idealist philosopher who developed the concept of wholeness; sociologist and economist.

Spann was a professor at the university in Brünn (Brno) from 1909 to 1919 and at the University of Vienna from 1919 to 1938. Following in the philosophical tradition of Plato, medieval realism, and German classical idealism, Spann tried to construct a philosophical-sociological system of "neoromantic universalism." One of its basic positions was that the whole in its essence precedes the parts; the parts are an expression, a mediation, of the whole; the whole, divided into pieces, conditions the existence of the parts. For Spann, wholeness is the original reality, in which causality does not function. The causal understanding of objects, as Spann proposes, is only possible based on the false assumption that the parts exist before the whole. Spann rejected atomism and materialism, claiming that they were intrinsically mechanistic. In his understanding of the essence of life, Spann was close to the vitalist views of H. Driesch.

Spann gave the central place among social institutions to the state, claiming that it had always existed and merely changed its form. Spann advocated the ideal of a social structure based on arbitrary distinctions and an extremely strict hierarchy, whose features largely reproduce those of the Hindu caste system and the medieval guilds.

SPECIAL-ASSIGNMENTS UNIT, a type of military party detachment in party cells at industrial plants as well as in raion, city, district, and provincial party committees. In accordance with a decree issued by the Central Committee of the RCP(B) on Apr. 17, 1919, the special-assignments units were set up to perform such tasks as aiding bodies of Soviet power in the struggle against counterrevolution and guarding especially important facilities.

The leadership of the units consisted of an organizer responsible to the Central Committee of the RCP(B) as well as organizers at the local committee levels. Initially, the units were formed from among party members and candidates for party membership; later, leading Komsomol members were also admitted. The units first appeared in Petrograd and Moscow and were later organized in the central provinces of the RSFSR. By September 1919, units had been formed in 33 provinces. The special-assignments units of the Southern, Western, and Southwestern fronts fought in frontline operations.

In November 1919, the Central Committee adopted a decision to incorporate the special-assignments units into the universal military training system. The units, however, would maintain their organizational independence and would continue to be available to local party organizations. On Mar. 24, 1921, in a decree based on a decision of the Tenth Congress of the RCP(B), the Central Committee designated the special-assignments units a part of the militia units of the Red Army. The members of the special units were divided into regular-army and militia, or replaceable, personnel.

In September 1921 the national command staff and headquarters of the special-assignments units were set up. A. K. Aleksandrov was named commander of the units, and V. A. Kangelari, chief of staff. The Council of Special-assignments Units was established under the control of the Central Committee to provide the units with political leadership. The council's membership included V. V. Kuibyshev, secretary of the Central Committee, and I. S. Unshlikht, deputy chairman of the All-Russian Extraordinary Commission. The commissar of the staff of the Workers' and Peasants' Red Army and the commander of the special-assignments units were the other members of the council. Command staffs and headquarters were also organized at provincial and district levels, and councils of special-assignments units were established in the provincial and district party committees.

The regular-army personnel of the special-assignments units numbered 39,673 in December 1921, and the replaceable personnel, 323,372. Special-assignments personnel comprised infantry, cavalry, artillery, and armored units.

As a result of improvements in the country's domestic and foreign affairs and an increase in the strength of the Red Army, the special-assignments units were deactivated in 1924 and 1925 by a decision of the Central Committee of the RCP(B).

SPECIAL RULING, in Soviet procedural law, a special decision rendered by a court as a body on the basis of a complete investigation of the circumstances of a case.

In criminal procedure, if there are grounds for issuing a special ruling, the ruling is rendered at the same time as the verdict. The special ruling may address the possibility of eliminating the causes and conditions that facilitated the commission of a crime, or it may direct the attention of the appropriate officials to violations permitted in the conduct of the inquiry or preliminary investigation or to the incorrect conduct of individual citizens at their place of work, at home, or in public places. The special ruling is sent to the head of the appropriate institution, enterprise, or organization or to some other person, such as the official responsible for the conduct of the inquiry or preliminary investigation. When necessary, a copy of the special ruling may be sent to a comrades' court.

In civil procedure, a special ruling is rendered by a court if, while hearing a civil case, it discovers a violation of legality or of the rules of socialist life by individual officials or citizens. A special ruling may also be given if the court finds considerable shortcomings in the work of a state institution, enterprise, collective farm, or other cooperative or public organization. If the court discovers indications of a crime in the actions of a party or other

person, it reports this fact to the procurator or initiates a criminal case.

The decision of whether or not to make public a special ruling is left to the discretion of the court. The procurator has the right to file a protest against a special ruling. A special ruling involving the initiation of a criminal case may be appealed by persons taking part in the case.

A special ruling may also be rendered by a court considering a case on appeal or supervisory review.

Officials who have received a copy of a special ruling are obligated to inform the court within one month of the appropriate measures that have been taken. [29–81–1]

SPECIMEN, a sample, usually metal, that may be studied macroscopically (in macrosections) or microscopically (in microsections). Preparation of a specimen entails grinding the flat surface of a sample and, if microsections are to be examined, polishing the surface. The surface is then etched with chemical reagents or heated in a gaseous atmosphere or in a vacuum. Selective etching and evaporation occur as a result of the differences in the physicochemical properties both of the grains of different phases as well as of the different grain-boundary regions. This leads to the formation of a macrorelief, which is visible to the unaided eye, or a microrelief, which must be examined with a microscope. [29–1294–2]

SPECTRAL LINES, WIDTH OF. Spectral lines in optical spectra of atoms, molecules, and other quantum systems are characterized by a range of frequencies ν or a range of wavelengths $\lambda = c/\nu$, where c is the speed of light. Such a frequency or wavelength range is called the width of spectral lines.

A certain range $\Delta\nu_{ki}$ of frequencies near the frequency ν_{ki} of a radiative transition between discrete energy levels $\mathcal{E}_k$ and $\mathcal{E}_i$ corresponds to every such transition; the transition frequency $\nu_{ki} = (\mathcal{E}_k - \mathcal{E}_i)/h = (\mathcal{E}_k - \mathcal{E}_i)/2\pi\hbar$, where $h = 2\pi\hbar$ is Planck's constant. The value of $\Delta\nu_{ki}$ gives the width of a spectral line, that is, the extent to which a given spectral line is nonmonochromatic. A spectral-line profile $\phi(\nu)$—that is, the frequency dependence of the intensity of emission or absorption—usually has a maximum at or near the transition frequency ν_{ki} (see Figure 1). The frequency range between points where the intensity falls to half the maximum intensity is taken as the width of a spectral line. Hence, the width of a spectral line is often referred to as the half-width of a spectral line. If the Doppler effect is not taken into account, the width $\Delta\nu_{ki}$ of a spectral line is given by the sum of the widths of the energy levels $\mathcal{E}_k$ and $\mathcal{E}_i$: $\Delta\nu_{ki} = (\Delta\mathcal{E}_k - \Delta\mathcal{E}_i)/h \approx (1/\tau_k + 1/\tau_i)/2\pi$. In other words, the shorter the lifetimes τ_k and τ_i at the energy levels, the greater the value of $\Delta\nu_{ki}$.

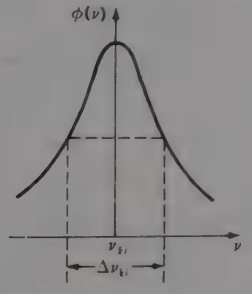

Figure 1. A symmetrical spectral-line profile. The maximum emission intensity $\phi(\nu)$ corresponds to the frequency ν_{ki}; the width of the spectral line ($\Delta\nu_{ki}$) is equal to the frequency range between the points where the intensity falls to half the maximum intensity.

The natural width of a spectral line is given by the expression $(\Delta\nu_{ki})_{nat} = (A_k + A_i)/2\pi$, where A_k and A_i are the total probabilities of spontaneous transitions from the levels $\mathcal{E}_k$ and $\mathcal{E}_i$ to all lower-lying levels. The natural width is very small.

For atoms and molecules, the width of spectral lines is governed mainly by the broadening of the energy levels of the atoms or molecules during interactions with surrounding particles and by the broadening of the spectral lines as a result of the Doppler effect. In a gas or a plasma, the energy levels of the particles are broadened during collisions. Depending on the type of broadening, a symmetrical or an asymmetrical spectral-line profile is produced. Figure 1 shows a symmetrical profile, which is characteristic of radiation broadening.

SPEE, MAXIMILIAN VON. Born June 22, 1861, in Copenhagen; died Dec. 8, 1914, near the Falkland Islands. German vice admiral. Count.

Spee entered the navy in 1878. In 1912 he became the commander of a cruiser squadron in the Pacific Ocean. After the outbreak of World War I, Spee took his squadron to the waters of South America. On Nov. 1, 1914, he defeated a British cruiser squadron in a battle at Coronel off the Chilean coast. On Dec. 8, 1914, Spee was defeated by a strong British squadron off the Falkland Islands. Spee went down with his flagship, the cruiser *Scharnhorst.* [29–1390–5]

SPEISS, an intermediate product or by-product in nonferrous metallurgy, an alloy of arsenides and antimonides of iron, cobalt, nickel, copper, or other metals formed in the melting of raw materials with a high arsenic content. Cobalt speiss is formed in the melting of arsenic-cobalt raw materials. To extract the cobalt, this speiss is roasted to remove arsenic and sulfur, and the oxides produced are subjected to further metallurgical treatment or are sulfatized by sintering with concentrated sulfuric acid and converted by hydrometallurgical treatment.

In the production of lead, speiss is formed in the shaft melting of charges with a high arsenic content and in the melting of copper drosses. As a consequence of its low solubility and relatively high density (8–8.5 g/cm$_3$), speiss is found in a separate layer between the molton lead and the matte.

Speiss is a good collector of lead, silver, and gold; because significant amounts of these metals are lost when using the alloy, the formation of speiss in lead production is undesirable. Speiss is usually treated together with matte in converters with the partial distillation of arsenic and antimony and production of low-quality black copper.

SPEMANN, HANS. Born June 27, 1869, in Stuttgart; died Sept. 12, 1941, in Freiburg, Baden. German embryologist.

Spemann studied medicine, physics, and botany at the universities in Heidelberg, Munich, and Würzburg. He was a professor at the universities of Rostock (1908–14) and Freiburg (1919–37). From 1914 to 1919 he was director of the Kaiser Wilhelm Institute of Biology in Berlin.

Spemann's main studies were devoted to the experimental embryology of amphibians. Spemann developed microsurgical techniques for use on the embryos of amphibians and designed several microinstruments, including glass needles, hair loops, and micropipettes. He discovered the relationship between the development of one part of an embryo and that of another, specifically, the relationship between the development of the crystalline lens and the optic cup and between the central nervous system and the chorda and mesoderm. These studies laid the foundation for Spemann's theory of organizers of development, that is, those parts of the embryo that differentiate before other parts and then act on the development of the latter, thereby determining the direction of their differentiation (*see* INDUCTION and ORGANIZER). The research of Spemann and his school contributed greatly to our knowledge of the relations between the various parts of the developing embryo and the processes of determination.

Spemann received a Nobel Prize in 1935.

SPENGLER, OSWALD. Born May 29, 1880, in Blankenburg in the Hartz Mountains; died May 8, 1936, in Munich. German idealist philosopher, representative of the philosophy of life.

Spengler became famous after the sensational success of his principal work, *The Decline of the West* (*Der Untergang des Abendlandes*, vols. 1–2, 1918–22; Russian translation, vol. 1, 1923). During the 1920's he was a publicist of conservative-nationalist views and was close to fascism; in 1933, however, he rejected a proposal to collaborate with the Nazis. Hitler's regime boycotted Spengler, but this did not prevent the ideologists of Nazism from widely utilizing Spengler's ideas, converting them into weapons for their own demagogical purposes.

The philosophy of F. Nietzsche was a decisive influence on Spengler. Spengler proceeds from the concept of organic life, subjected to unlimited expansion. Culture is treated as an organism that, in the first place, possesses the most rigid, thoroughgoing unity, and, in the second place, is individuated from other, similar organisms. This means that there is not, nor can there be, any single culture for all mankind; the idea of unilinear progress is subjected to ridicule.

Spengler enumerates eight cultures: the Egyptian, Indian, Babylonian, Chinese, Apollonian (Greco-Roman), Magian (Byzantine-Arabic), Faustian (Western European), and Mayan; the birth of a Russo-Siberian culture is awaited. Each cultural organism, according to Spengler, has its limits predetermined (approximately 1,000 years), depending on its internal life cycle. In dying, a culture is reborn as a civilization. Civilization as opposed to culture is, on the one hand, the equivalent of the Spenglerian concepts of dead extension, a soulless "intellect," while, on the other hand, it stands within the context deriving from Nietzsche's concept of mass society. The transition from culture to civilization is a transition from creativity to barrenness, from emergence to ossification, from heroic deeds to mechanical work; Greco-Roman culture passed into civilization in the period of Hellenism, and Western culture became the civilization of the 19th century. With the onset of civilization, artistic and literary creative work becomes, as it were, unnecessary; hence Spengler proposes that we abandon cultural pretenses and give ourselves over to naked technicism.

While acknowledging the senselessness of imperialistic politicking, Spengler calls for it to be accepted as the "lot" of present and future generations. Spengler's expository style makes use of well-developed metaphors, but the metaphoric assimilation of words frequently subverts the logic of the concepts.

SPEYER, a city in the Federal Republic of Germany, on the Rhine, in the *Land* (state) of Rhineland-Palatinate. Population, 44,700 (1975). In addition to a food-processing industry, which produces beer and wine, Speyer has aircraft-construction, electrical-engineering, wood-products, textile, and chemical industries.

Speyer was founded in the fourth century B.C. as a Celtic settlement and later became a Roman town. It became an episcopal see in the eighth century and a free imperial city in the 13th century. In the 16th century the city was the site of several diets, including the Diet of Speyer of 1529. Speyer belonged to France from 1797 to 1814, when it passed to Bavaria; in 1949 it became part of the Federal Republic of Germany.

The visual character of the city, which has partly retained its medieval layout, is largely defined by baroque structures. Architectural landmarks include the Romanesque Speyer Cathedral (begun 1030; additions and restoration work in the 11th, 12th, 18th, and 19th centuries), the baroque Trinity Church (1701–17), the city hall (1712–26), the warehouse (1748), and burghers' houses of the 18th century. The Palatine Historical Museum is located in Speyer.

SPEYER, DIET OF (1529), an imperial assembly of the Holy Roman Empire held from March 15 to April 22 in the city of Speyer. The diet adopted measures to halt the spread of the Reformation in Germany. In repealing the decrees of the Diet of Speyer of 1526, the diet proclaimed that the princes and the imperial cities had the right to determine the dominant religion in their holdings, prohibited the further secularization of church property, and affirmed the Edict of Worms of 1521. Some members of the diet were supporters of the Reformation (five princes, including the elector of Saxony and the landgrave of Hesse, and 14 imperial cities); they constituted the so-called Protestation—a protest against the decisions of the majority (hence the Protestants). [29–1391–2]

SPHAERIIDAE, a family of small hemispherical beetles measuring 0.6–1.0 mm in length. The hind wings have a fringe of long hairs, and the elytra are not reduced. The beetles live along shores in sand and flotsam. One species occurs in the USSR. The family has not been widely studied. [29–866–1]

SPHAERITIDAE, a family of beetles closely related to the family Histeridae. There is one genus, with three species. *Sphaerites glabratus* is distributed in Northern Europe and Siberia. The greenish black oval body is 4.5–5.5 mm long. The beetles usually live in rotting wood; they can be found in the fermenting sap of trees. The family has not been studied extensively. [29–866–1]

SPHAERIUM (also Sphaeriidae), a genus of bivalve mollusks. (Some classifications treat the mollusks as a group of genera, a subfamily, or a family.) The oval or spherical shell is 1–3 cm long; there is a beak in the center of the mantle. The mollusks are viviparous, with the newly born young acting the same as adults.

The Sphaerium are distributed mainly in northern temperate regions. There are some species in the tropics (East Africa), and some in southern temperate regions (South America and Australia). The mollusks inhabit freshwaters, burrowing to a shallow depth in the silty or sandy bottom. [29–866–3]

SPHERE, the geometric solid generated by revolving a circle about its diameter. A sphere is the locus of points in space at a distance not greater than a specified distance R from a fixed point. The fixed point is called the center of the sphere, and R is known as the sphere's radius. The volume of a sphere is $V = 4\pi R^3/3$. The surface of a sphere is also called a sphere; its area is $S = 4\pi R^2$. [29–853–1]

SPHERE GAP, a device for closing or opening an electric circuit. A sphere gap consists of two spherical electrodes separated by a gas-filled insulating interval. Sphere gaps are used as control gaps as well as devices for measuring high impulse voltages; in the latter case, the magnitude of the voltage is computed according to the distance between the spheres when a discharge occurs. [29–867–2]

SPHERICAL SECTOR (or sector of a sphere), the geometric solid generated by the rotation of a sector of a circle about one of the radii bounding the sector (Figure 1,a) or about a diameter that does not intersect the arc bounding the sector (Figure 1,b).

Figure 1

The volume of both types of spherical sector is $V = 2\pi R^2 h/3$. The area of the surface of the first type of spherical sector is $S_1 = \pi R(2h + a)$; the corresponding area for the second type of spherical sector is $S_2 = \pi R(2h + a + b)$. Here, R is the radius; h is the length of the projection, onto the axis of rotation, of the chord joining the endpoints of the arc; and a and b are the distances of the endpoints from the axis. [29–867–5]

SPHERICAL SEGMENT OF ONE BASE, a part of a sphere cut off by a plane (see Figure 1). The volume of such a solid is V

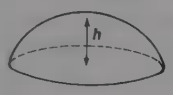

Figure 1

$= \pi h^2(3R - h)/3$, and the area of the solid's curved surface, which is called a zone of one base, is $S = 2\pi Rh$; here, R is the radius of the sphere, and h is the altitude of the segment. [29–867–4]

SPHERICAL SEGMENT OF TWO BASES, a part of a sphere bounded by two parallel planes intersecting the sphere (see Figure 1). The volume of such a solid is $V = \pi h(3a^2 + 3b^2 + h^2)/6$,

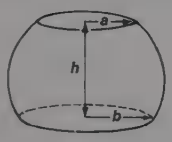

Figure 1

and the area of the solid's curved surface, which is called a zone, is $S = 2\pi Rh$; here, R is the radius of the sphere, h is the distance between the planes of the bases, and a and b are the radii of the bases. [29–867–6]

SPIEGEL, DER, an illustrated weekly magazine published in the Federal Republic of Germany. It was founded in 1947 in Hanover and has been published in Hamburg since 1952. One of the most influential weeklies in the Federal Republic of Germany, the magazine is oriented toward the liberal circles of the bourgeoisie and the intelligentsia. Circulation, 1.1 million (1977). [29–1394–1]

SPIELHAGEN, FRIEDRICH VON. Born Feb. 24, 1829, in Magdeburg; died Feb. 25, 1911, in Berlin. German writer.

Spielhagen studied first at the law faculty of the University of Berlin and then at the philosophy faculties of the universities of Bonn and Greifswald. His most famous novel, *In Formation* (1866; Russian translation under the title *One Not a Soldier in the Field*, 1867–68), shows that an exceptional personality cannot successfully transform society without the support of the masses. Spielhagen's works are noted for their veracity of portrayal, their wealth of ideas, and their declamatory spirit. After 1870 his novels became predominantly sentimental, moralizing, and melodramatic; some of them, however, such as *Storm Flood* (1876), have marked denunciatory elements.

Spielhagen's topical political novels were popular in Russia during the second half of the 19th century, especially among the Narodniki (Populists).

SPIELMANN, a wandering actor and musician in medieval Germany and Austria. The *Spielmann*, who was similar to the French jongleur and the Russian *skoromokh* (itinerant performer), was at once a poet, actor, singer, acrobat, and dancer. In addition to heroic folk narratives, he performed tales and *Schwänke* (satiric folktales) of his own invention, appearing at fairs, folk festivals, and court celebrations. The art of the *Spielmann* was often anticlerical and antifeudal. [29–1395–2]

SPIN, in aviation, a special, critical flight regime of an airplane or glider. In a spin, the aircraft descends in a steep spiral of small radius, simultaneously turning relative to all three of its axes, and enters autorotation.

Spins are classified as tailspins and inverted (outside) spins, depending on the pattern; as steep (50°–90°), banked (30°–50°), and flat (< 30°) spins, depending on the inclination of the longitudinal axis of the aircraft to the horizon; and as stable and oscillating spins, depending on the nature of the occurrence. The descent and entry of an aircraft into a spin occurs when the aircraft achieves a supercritical angle of attack (above the stalling angle). Antispin parachutes and rockets are used in flight testing to provide for escape from a stable spin that has already developed.

The first deliberate entry of an airplane into a spin was achieved by the Russian military aviator K. K. Artseulov in 1916. The problem of spins was studied in 1918 and 1919 by the British scientist H. Glauert. The theoretical basis of spins was elaborated by the Soviet scientist V. S. Pyshnov, and subsequent experimental studies were carried out by A. N. Zhuravchenko.

S. IA. MAKAROV [29–1484–4]

SPINACIA (spinach), a genus of herbaceous annual or biennial plants of the family Chenopodiaceae. There are three species in Europe, Asia, and North America. The garden spinach (*S. oleraceae*) is cultivated in regions having a temperate climate. In the USSR it is raised in southern parts of the European portion, in the Caucasus, and in Middle Asia.

The spinach plant is 25–50 cm tall. At the beginning of vegetation, it yields a rosette of leaves, which are used as food at this stage. The plant later produces a flowering stalk. The leaves are triangularly hastate or elongate-oval and range from smooth to crimped. Male plants have less foliage and form the stalk earlier than female plants. The male flowers are gathered into panicled inflorescences, and the female ones are located in the leaf axils. Spinach is a relatively cold-resistant early-ripening plant. The seeds sprout at 4°C. They are sown in open ground at the rate of 30–50 kg per hectare (ha). Sowing may be repeated several times a summer. The yield is 150–300 quintals per ha. To make maximum use of the planting area in greenhouses and hotbeds, spinach is planted in the interrows of crops that grow slowly during the beginning of the vegetative period. Spinach leaves are rich in proteins and carbohydrates; they also contain vitamin C, B-complex vitamins, carotene, and salts of iron and phosphorus. Spinach is used widely in cooking, canning, and the production of juice.

SPINDLE, the operating shaft of a metal-cutting machine tool. Either the tool (milling cutter, drill, grinding wheel, or the like) or the workpiece being machined may be attached to the spindle. Great demands are placed on a spindle with respect to rotational precision, which significantly affects the accuracy of machining. Thus, spindles are mounted on precision rolling-contact bearings or plain bearings; the spindles of internal grinding machines that exhibit particularly high rotation speeds (up to 100,000 rpm) are mounted on gas-lubricated plain bearings. The spindle may use a gear or belt drive, or it may be driven directly by a built-in electric motor or compressed-air turbine. [29–1396–1]

SPINED LOACH (*Cobitis taenia*), a fish of the family Cobitidae. The body is elongate and laterally compressed; there are large dark spots along the sides. Under the eye is a bipartite spine; there are six antennae around the mouth. The body length reaches 11.5 cm. The spined loach is distributed in rivers and lakes of Europe (up to 60° N lat.) and Asia. It prefers sluggish and stagnant waters with a silty-sandy bottom for burrowing. The fish feeds on small benthic crustaceans and the larvae of Chironomidae. Sexual maturity is attained in the second or third year. Spawning occurs from May through July; the roe, which number no more than 300, are deposited in batches and are benthic. The spined loach has no commercial importance; it is good bait for catching predatory fishes.

SPINELS, a group of minerals of the class of multiple oxides with the general formula AB_2O_4 or $A(A, B)O_4$, where A is Mg, Zn, Mn, Fe^{2+}, Co, or Ni and B is Al, Fe^{3+}, Cr, Mn, Ti^{4+}, or V^{3+}.

Spinels are systems of solid solutions, with extensively developed isomorphism of the A and B cations. They are classified according to the predominant B cation as aluminum spinels, ferrospinels, chrome spinellids, titanium spinels, and vanadium spinels. Aluminum spinels include spinel, $MgAl_2O_4$; hercynite, $FeAl_2O_4$; galaxite, $(Mn, Fe)Al_2O_4$; and gahnite, $ZnFe_2O_4$. Ferrospinels include magnesioferrite, $MgAl_2O_4$; magnetite (*see* MAGNETITE); jacobsite, $MnFe_2O_4$; franklinite, $ZnFe_2O_4$; and trevorite (*see* TREVORITE). Titanium spinels include ulvospinel (*see* ULVOSPINEL) and the magnesium analog of ulvospinel, $MgTiO_4$. Vanadium spinels include coulsonite, FeV_2O_4. (*See also* CHROME SPINELLIDS.) There is nearly complete substitution among the minerals within each isomorphic series, and there is limited substitution among the members of different series.

Spinels crystallize in the isometric system, forming primarily octahedral crystals. In the unit cell of a spinel structure, 32 anions of oxygen form a closest cubic packing, with 64 tetrahedral vacancies (eight occupied by cations) and 32 octahedral vacancies (16 occupied by cations). Spinels are grouped according to the distribution of cations in the occupied tetrahedral and octahedral positions of the structure into normal spinels (eight tetrahedrons occupied by A^{2+} cations and 16 octahedrons by B^{3+} cations), inverse (eight tetrahedrons occupied by B^{3+} and 16 octahedrons occupied by eight B^{3+} and eight A^{2+} cations, with both statistical and ordered distribution of $B^{3+}A^{2+}$ cations in the octahedral vacancies being possible), and intermediate spinels. Spinel, gahnite, hercynite, and galaxite are among the spinels with normal structure, while magnetite, jacobsite, and ulvospinel are among those with inverse structure. A large number of minerals with the intermediate type of structure are known. The structures of certain sulfides with the composition RX_2S_4, where R^{2+} is Co, Ni, Fe, or Cu and X^{3+} is Co, Ni, or Cr, are classified with the structural type of spinels. Maghemite, $\gamma - Fe_2O_3$, has an abnormal spinel structure.

All the spinel minerals are characterized by considerable hardness (5–8 on Mohs' scale) and by chemical and thermal stability. Spinels are the primary carriers of the magnetic properties of rocks. Their density, reflective capacity, hardness, size of the unit cell, and magnetic and electrical properties depend significantly on the composition and nature of distribution of the cations and vary noticeably within each group. Spinels are typically formed at high temperatures. They are resistant to weathering and last well in placers. Many spinels are important ores of chromium, iron, manganese, titanium, and zinc. They are used in the production of ceramics, refractory materials, and heat-resistant paints.

Many synthetic spinels are known that contain, in addition to the cations typical of natural spinels, ions of lithium, indium, calcium, cadmium, copper, tungsten, gallium, silver, antimony, niobium, and germanium. Being variations of ferrites (ferrospinels), synthetic spinels are the basis of many magnetic materials and are used extensively in instrument-making, radio engineering, and the ceramics industry.

SPIRE, a vertical, sharply pointed structure surmounting a building, having the shape of a cone tapering upward. Spires are often capped with a flag or a sculpted or carved figure, such as the ship on the Admiralty spire in Leningrad. [29–1394–5]

SPITSBERGEN (ancient Russian name, Grumant; ancient Scandinavian and present Norwegian name, Svalbard), an archipelago in the Arctic Ocean, including also Bear Island and a number of small islands. Norwegian possession. Area, about 62,000 sq km. Population, 3,400 (1976).

The largest islands are Vestspitsbergen (West Spitsbergen), North East Island, Edge Island, and Barents Island. The shores are cut by fjords, primarily in the west and north. Mountain ranges alternate with plateaus and broad valleys. The highest point is Mount Newton (1,712 m), on Vestspitsbergen. Most of Spitsbergen is included in the Caledonian folding of Europe. Spitsbergen is composed of a thick (more than 10 km) sedimentary stratum of the Hecla Hoek series (Riphean quartzites, slates, dolomites, and limestones and Cambrian and Ordovician dolomites and limestones) with intrusions of Caledonian granite overlain by Devonian lagoon red sediments (up to 8 km thick). The eastern part of the archipelago (North East Island) is partially included within the hypothetical ancient platform called Barentsia, whose mantle is composed of Carboniferous and Cretaceous sand and shale strata up to 3 km thick as well as traps. There is a depression on Vestspitsbergen filled with Tertiary terrigenous strata containing seams of high-quality coal (reserves of about 8 billion tons). Coal is mined at Barentsburg and the Pyramid mine by Soviet enterprises and near Longyearbyen by a Norwegian joint-stock company.

Ice sheets and outlet and mountain glaciers, with a total area of 35,100 sq km, occupy more than one-half of Spitsbergen. The arctic marine climate is mitigated by the influence of the warm West Spitsbergen Current, a northeastern continuation of the North Atlantic Drift, which is most strongly manifested in the western part of Spitsbergen. On the coast the mean temperature in March, the coldest month in most of Spitsbergen, ranges from −13°C in the west to −21°C in the east; corresponding figures for July are 4°–5°C and 1°–2°C. Up to 400 mm of precipitation, almost exclusively in the form of snow, falls annually in the southeast, about 150 mm in the northeast, and 800–1,200 mm on the glaciers. Permanently frozen rocks are widespread. Mosses and lichens predominate, although there are about 150 species of higher plants. Dwarf willows and birches occur. Mammals include the polar bear, the reindeer, and the musk ox (brought in from Greenland), as well as sea mammals, such as the walrus, the ringed seal, the harp seal, and the beluga. The coastal waters are covered with ice most of the year. V. A. MARKIN and K. A. KLITIN

Spitsbergen was visited by the Pomory in the 11th and 12th centuries, a fact known in Western Europe as early as the 15th century. Spitsbergen was rediscovered in 1596–97 by the expedition of the Dutch navigator W. Barents. It long remained unclaimed. Between the 18th and early 20th centuries numerous Russian scientists visited the archipelago. The first Norwegian winter settlement was established on Spitsbergen in 1822.

The international legal status of Spitsbergen is defined by the multilateral Treaty of Paris of Feb. 9, 1920, signed by the United States, Great Britain and its dominions, France, Italy, Denmark, Norway, Sweden, Japan, the Netherlands, and other countries. The USSR became a de facto participant in the treaty in 1924 and formally joined it in 1935. By 1977, 40 states had signed the treaty. The treaty established Norwegian sovereignty over the Spitsbergen archipelago, including Bear Island, stipulating that it be demilitarized and neutral. It obliges Norway not to establish or permit the establishment of naval bases on Spitsbergen and not to build any fortifications. It stipulates that Spitsbergen should never be used for military purposes. The ships and citizens of the signatory states are accorded equal rights to fishing and hunting and to engage in navigation, industry, mining (the mining statute is a constituent part of the treaty), and commercial affairs on Spitsbergen and in surrounding territorial waters. The USSR has a consulate in the archipelago. A. N. TALALAEV

SPITTELER, CARL (pen name, Felix Tandem). Born Apr. 24, 1845, in Liestal; died Dec. 29, 1924, in Luzern. Swiss writer. Wrote in German.

Spitteler studied law and theology at the universities of Basel, Zürich, and Heidelberg. From 1871 to 1879 he lived in Russia. In *Prometheus and Epimetheus* (1880–81; verse version *Prometheus the Sufferer*, 1924), an epic written in rhythmic prose, Spitteler used metaphors that paralleled the conflicts and contradictions of his epoch. His chief work, the epic poem *Olympic Spring* (1900–05; revised ed., 1910), is also characterized by an allegorical modernization of classical myth. His novel *Imago* (1906) has as its central concern the intensification in bourgeois society of the conflict between the artist and the burgher. Spitteler received a Nobel Prize in 1919.

SPITZ, a group of breeds of house pet dogs. Spitzes are descended from the ancient Peat dog. It is believed that the modern spitz originated in southern Germany. All spitzes have a short, pointed muzzle, small, erect triangular ears, and a tail curled tightly over the back. The coat is fluffy, straight, and long, especially on the neck, where it forms a ruff, and on the top of the chest, on the tail, and on the back of the legs. Owing to a thick undercoat, the fur does not cling to the body. The dogs tolerate cold well.

The largest spitz breed is the German wolf spitz, which stands at least 45 cm high at the shoulder. Its coloration is various shades of gray. Somewhat smaller is the German great spitz, which stands at least 40 cm high at the shoulder. The most common color is pure white; other colors include black with a light bluish undercoat and dark brown without spots. The miniature spitz, distinguished by its delicacy, stands no more than 28 cm high at the shoulder. The coloration is white, black, brown, orange, or various shades of gray. White spitzes have dark eyes, eyelids, lips, and nose tips.

Spitzes have a lively temperament, are affectionate, and are capable of being taught varied and complex circus tricks. Wolf spitzes and great spitzes are also used as watchdogs in apartments and orchards. Spitzes are found almost everywhere in the world.

SPITZER, LEO. Born Feb. 7, 1887, in Vienna; died Sept. 16, 1960, in Forte dei Marmi, Italy. Austrian philologist.

Spitzer studied at the universities of Vienna, Paris, Rome, and Leipzig. He became a professor at the universities of Bonn in 1922, Marburg in 1925, and Cologne in 1930. In 1933 he emigrated from fascist Germany and took up a post at the University of Istanbul, and from 1936 to 1956 was a professor at the Johns Hopkins University in Baltimore. Spitzer was influenced by the aesthetic idealism of K. Fossler. His principal works dealt with the literary stylistics of Romance languages, particularly French and Spanish; he also did research in various areas of Romance linguistics. Spitzer was the editor of *Hugo Schuchardt: Breviary* (1922).

SPITZWEG, CARL. Born Feb. 4, 1808, in Munich; died there Sept. 23, 1885. German painter and graphic artist; one of the greatest representatives of the Biedermeier style.

A self-taught artist, Spitzweg painted scenes from the lives of city dwellers and idyllic landscapes. He is most famous for his small genre paintings, such as *The Widower* (New Pinakothek, Munich), *Serenade* (Schackgallerie, Munich), and *The Hypochondriac* (Schackgallerie, Munich). These subtly poetic works by Spitzweg are distinguished by warm humor; drawing on characteristic human types and details from everyday life, they are noted for their expressive use of color.

SPLINE-GRINDING MACHINE, a metal-cutting machine tool designed to grind splined articles. External splines (on shafts) are ground to the minor diameter and bearing sides; internal splines (on sleeves) are ground to the major diameter and bearing sides. The machining may be done by a single profiled or flat abrasive disk or by a set of several disks. The most efficient method is to grind the entire spline space with a single specially shaped disk. [29–1301–5]

SPLINE-HOBBING MACHINE, a metal-cutting machine tool for spline manufacture. Straight-sided and involute splines are generated on shafts with a hob. The hob rotates and simultaneously performs a feed motion, moving along the axis of the workpiece; the workpiece also rotates at a speed that depends on the number of splines being generated. In a similar manner, automatic milling machines with circular grooving cutters are used to machine slots on screwheads. [29–1301–4]

SPLINT, a device for immobilizing injured parts of the body. A splint is applied to a fracture, sprain, or areas with extensive injury to soft tissues; it is also applied in cases of inflammatory diseases of the limbs, in cases of burns, and after surgery on bones, blood vessels, and nerves in the extremities. A distinction is made between transport and therapeutic splints.

Transport splints are applied as a first-aid remedy before the victim is transported to a medical facility. The purpose is to immobilize the injured part and prevent the development of traumatic shock or increased bleeding when bone fragments are moved. Standard transport splints are made of wood, of wire (several types measuring 75 to 100 cm in length and 6 to 10 cm in width are available), which easily conforms to the contour of the limb regardless of the site of the injury, or of plastic. There are also pneumatic and vacuum types. If standard splints are not available, immobilization during transport can be achieved by improvising splints from available materials, such as a board, a ski, ■ piece of plywood, or a stick. In applying a transport splint it is important that the two segments adjoining the injured one also be immobilized. For example, in the case of a shin fracture, the splint is secured to the foot, crus, and thigh by bandages; in the case of a shoulder fracture, it is applied to the forearm, shoulder, and chest. The splint should be padded with soft material to prevent ulceration.

Therapeutic splints are used for extended immobilization, for the length of time required for a fracture to heal. For example, metal splints are used in skeletal traction. In stomatology, splints made of wire or quick-hardening plastic, special appliances, or arches are used to immobilize the parts in fractures of the upper or lower jaw and after osteoplastic surgery of the jaw.

V. F. Pozhariskii [29–1209–1]

SPOHR, LUDWIG (also Louis Spohr). Born Apr. 5, 1784, in Braunschweig; died Oct. 22, 1859, in Kassel. German composer, violinist, conductor, and teacher.

The son of a doctor, Spohr studied violin under F. Eck, with whom he made a trip to Russia. He held the post of *kapellmeister* in Braunschweig and Gotha and was a concertmaster in Vienna from 1812 to 1816; he also appeared on occasion in London and Paris. In 1822, Spohr was appointed *kapellmeister* to the court at Kassel. His European concert tours as a violinist and conductor were enormously successful.

As a violinist, Spohr was noted for his full, singing tone and impeccable technique. The founder of the 19th-century German school of violin playing, he educated several generations of violinists, including F. David, A. Kömpel, and L. Saint-Luban; he was the author of *Violin School* (1831). Spohr, who played a major role in the development of conducting into an independent performing art, was among the first to use the baton. As a composer, he was a representative of the romantic trend in German music.

Spohr composed ten operas, with plots taken, for the most part, from historical or fantastic subjects; the most popular were *Faust* (stage 1816 in Prague under the direction of C. M. von Weber), *Jessonda* (1823), *The Alchemist* (1830), and the *Crusaders* (1845). Among his other works are nine symphonies, 15 violin concerti, and 34 string quartets. Spohr's *Autobiography* (vols. 1–2, 1860–61) provides a broad survey of the musical life of the first half of the 19th century.

SPOTTED REDSHANK (*Tringa erythropus*), a bird of the family Charadriidae of the order Charadriiformes. The body is about 30 cm long. The breeding plumage is slate black with white speckles, and the legs are reddish brown. The spotted redshank is found in the northern part of the forest zone, in the forest-tundra, and sometimes in the shrub tundra of Europe and Asia. In the USSR it is distributed from the Kola Peninsula east to the lower courses of the Kolyma and Anadyr' rivers. It is a migratory bird, wintering in Africa and southern Asia. Nests are built along the grassy shores of shallow lakes. The clutch contains four eggs, which are usually incubated by the male. The bird feeds primarily on aquatic insects and other invertebrates; sometimes small fish and tadpoles are eaten. [29–1577–2]

SPRANGER, EDUARD. Born June 27, 1882, in Grosslichterfelde, near Berlin; died Sept. 17, 1963, in Tübingen. German idealist philosopher, psychologist, and educator.

Spranger was a professor at the universities of Leipzig (from 1911), Berlin (1920–46), and Tübingen (from 1946). In 1944 he was arrested and confined in the military prison at Moabit. Spranger's philosophical ideas reveal the influence of W. Dilthey and the philosophy of life, as well as H. Rickert's teachings on values. Spranger's chief philosophical work is *Types of Men* (1914), in which he develops a typological analysis of personality; it is this "structural" psychology that Spranger, in the spirit of neo-Kantian differentiation of the sciences of the spirit and the sciences of nature, opposes to the "psychology of elements" of natural science. According to Spranger, the psychology of the sciences of the spirit, or "understanding" psychology, should examine the spiritual process as a whole, with all its semantic links—that is, as included in a specific cultural "content." Spranger considered comprehension of individual spiritual structure to be the only way to know any spiritual forms. Calling for liberation from sociological illusions—the reduction of science, art, morality, and religion to social forces—Spranger acknowledged the unbreakable link between the social form and the cultural content; however, he gave the deciding role not to the forms of social relations, but to the individual human and objective cultural content that develops in these forms and that determines their value.

Spranger also wrote about the theory and history of pedagogy (including works on W. von Humboldt, J. H. Pestalozzi, and F. Froebel), as well as a work entitled *The Psychology of Youth* (1924; Russian translation in the anthology *The Pedagogy of Youth*, 1931).

SPRATTUS, a genus of small marine fish of the family Clupeidae. Sprats measure up to 13–18 cm in length and weigh up to 10–12 g. Sexual maturity is reached at one to two years of age; the life-span is five to six years. Sprats feed on tiny zooplankton. The USSR has one species, *Sprattus sprattus*, which is found in the North and Baltic seas. The subspecies *S. sprattus phalericus*, which is smaller, inhabits the Mediterranean and Black Seas; these serve as food for predatory birds and dolphins. Sprats are also found near Australia, around New Zealand, and on the Patagonian Shelf.

The term "sprats" is sometimes used for many kinds of canned fish. Canned sprats were initially prepared only from the Baltic sprat, a subspecies of *S. sprattus*. Later, the tiulka, Baltic herring, herring fry, and other small fish came to be canned as sprats.

SPREE, a river in the German Democratic Republic and West Berlin, a left tributary of the Havel River of the Elbe River basin. The Spree is 398 km long and drains an area of 10,100 sq km. It rises in the western Sudetes, in the northern foothills of the Lusatian Mountains, and flows through the Central European Plain. High water is in the spring, and there is a low-water period in the summer. The river's flow is strictly regulated by dams and lakes. The mean flow rate is approximately 40 cu m per sec; the river does not freeze over every year. The Spree, parts of which are canalized, forms part of a waterway that links the Oder with the Elbe. The city of Berlin is situated on the river. [29–1408–3]

SPREMBERG, a city in the German Democratic Republic, in the *Bezirk* (district) of Cottbus, on the Spree River. Population, 22,500 (1975). Spremberg produces textiles, plastics, and iron alloys. A 450-megawatt thermal power plant is located in the city. [29–1409–1]

SPRENGER, ALOYS. Born Sept. 3, 1813, in Nassereith; died Dec. 19, 1893, in Heidelberg. Austrian Orientalist and physician.

Sprenger studied medicine and Oriental languages in Vienna. After working on Arabic manuscripts, he defended a dissertation on the history of Arab medicine in Leiden in 1840. From 1843 to 1854, Sprenger worked for the British East India Company in India.

Sprenger taught Oriental languages at the University of Bern from 1858 to 1881; in 1881 he began teaching in Heidelberg. His chief work is a biography of Muhammad. Sprenger was especially interested in the influence of Islamic culture on the culture of the European Middle Ages.

SPRINGER (full name, Axel Springer Verlag A.G.), a newspaper concern in the Federal Republic of Germany (FRG). The firm was established in Hamburg by A. Springer in 1947 and be-

came a joint-stock company in 1970. Springer publishes several dailies, notably *Die Welt*, *Hamburger Abendblatt*, and *Bildzeitung*, with a circulation of more than 40 percent of the total for all dailies in the FRG. It also publishes Sunday newspapers and magazines.

Springer publications regularly print propaganda against the USSR and other socialist countries and against the communist movement and democratic forces within the FRG. [29–1409–4]

SPUR. (1) In birds, a horny spine situated on a protuberance of the bones of the posterior or anterior legs. The spur serves as a defensive or offensive weapon. In Phasianidae the spur is located on the dorsal side of the metatarsal bone; it occurs most often in males. The tooth-billed pigeon, the spurred lapwing, and jacanas have a single spur, whereas screamers have two spurs on the bend of the wings. Spur-winged geese have sharp spurs on the metatarsal bones and on the wing folds.

(2) In cloacal mammals, spurs are found on the hind limbs, near the tarsus. They are well developed in males; females have only a rudiment of a spur. Inside the spur there is a duct of a poisonous gland, which is weakly expressed in females. The sharp back claws on the inside digits of the hind legs of the clawed frog are also referred to as spurs. [29–1407–2]

SPUR, a small, curved piece of metal that has a spike or a small wheel and that is secured to a horseman's shoe at the heel. Spurs are used to control the horse. Spurs were first used by the Celts, with the earliest archaeological finds dating from the fifth century B.C. Spurs were mentioned by Greek authors as early as the fourth century B.C. Although such gear was not worn in the ancient East, medieval Eastern peoples did use in its place a point on the rear of the stirrup.

Spurs were first worn in what is now the USSR in the first and second centuries A.D., among tribes of the Lipitsa and Przeworsk cultures, in what is now the Western Ukraine. Spurs came to be widely used in ancient Rus'. In the Middle Ages, spurs were an attribute of knighthood. The present-day spur is a small, curved implement with a small wheel, or rowel, attached to the fork at the end of the spur's neck. [29–1407–1]

SPUR, CALCANEAL, a thornlike bony excrescence on the lower surface of the calcaneal bones where the foot ligaments or Achilles tendon are attached; a type of osteophyte. Calcaneal spurs occur most frequently as a result of metabolic disorders or overtaxation of the foot ligaments in flatfootedness. Although a spur can cause severe pain, it is not visible externally. Detection is by means of a foot X ray. Treatment includes physical therapy, the use of special orthopedic inner soles and shoes, and—in cases of persistent severe pain—roentgenotherapy and surgery. [29–1407–4]

SPUR-WINGED GOOSE (*Plectropterus gambensis*), a bird of the order Anseriformes. The male measures about 1 meter in length and weighs up to 8 kg; the female is somewhat smaller. On the fold of the wing is a blunt, horny spur (hence the name). The plumage is white with black; there is a violet-green iridescence on the back and wings. The naked outgrowth on the forehead and bill is red. The spur-winged goose is distributed in Africa, south of the Sahara. It keeps to riverbanks and large swamps. It nests in reed thickets, on termite nests, among stones, or in the burrows of aardvarks. The clutch contains seven to 12 white eggs. The spur-winged goose is a game bird. [29–1408–1]

SQUALL, a sudden, brief increase in wind force that is accompanied by changes in wind direction. Wind velocity in a squall often exceeds 20–30 m/sec. A squall lasts several minutes, sometimes with a succession of gusts. Squalls may occur with the approach of storm clouds or clouds preceding atmospheric cold fronts and are often attended by showers, hail, or thunderstorms. Violent squalls can cause great destruction. [29–1253–4]

SQUAMATA, a subclass or order of Reptilia. The Squamata include three orders or suborders: Sauria (lizards), Amphisbaenidae, and Serpentes (snakes). The characteristic feature is the movable joint between the quadrate bone of the upper jaw and the skull. The upper body is covered with horny scales, plates, and squamae. [29–530–2]

SRI KSETRA, a state of the Pyu people of Burma that existed until the 830's. Sri Ksetra, which is first mentioned in Chinese sources of the fourth century A.D., occupied most of the Irrawaddy River valley and in the south bordered the Mon cities; its first capital was the city of Tarekitara, or Sri Ksetra. The state reached its peak under the Vikrama dynasty, which ruled in the seventh and eighth centuries. Sri Ksetra maintained extensive commercial and cultural relations with India and China. The dominant religion was Buddhism.

In the eighth century, Sri Ksetra became a dependency of the state of Nan Chao, and its capital was moved north to the city of Khalin. In 832, according to the Chinese chronicles of the T'ang Dynasty, the troops of Nan Chao overran and leveled the Pyu capital; the surviving Pyu became slaves. The Pyu, a people of the Tibeto-Burmese group, subsequently were assimilated by the Burmese; they are last mentioned between the 11th and 13th centuries as one of the peoples inhabiting the Pagan state.

Sri Ksetra considerably influenced the development of later Burmese states (particularly the Pagan state), primarily in the area of Buddhist ideology and culture.

SRI LANKA (Ceylon until 1972), Republic of Sri Lanka, a state on the island of the same name in the Indian Ocean, lying off the southeastern coast of the Hindustan Peninsula. Member of the British Commonwealth of Nations. Area, 65,600 sq km. Population, 13.7 million (1976). The capital is the city of Colombo. For administrative purposes the country is divided into nine provinces, which in turn are subdivided into 22 districts.

Constitution and government

Sri Lanka is a republic. The present constitution was adopted on May 22, 1972 (amendments were adopted in 1977). The head of state is the president, elected for a term of six years. He is also the chief executive and the commander in chief of the armed forces. He has the right to dissolve the parliament. He appoints the prime minister and other ministers and determines their functions. The highest legislative body, a unicameral parliament, is the National State Assembly, whose members are elected for a term of six years. All citizens over 18 years of age have the right to vote. The government—the Council of Ministers—is headed by the prime minister.

Each district is administered by a government official, appointed by the president from among the members of parliament. Town, urban, and municipal councils and village committees constitute the local bodies of authority.

The judiciary comprises the Supreme Court, which also exercises appellate jurisdiction, district and magistrates' courts (for criminal cases), and rural courts, which exercise jurisdiction with respect to petty crimes and civil disputes. The judges are appointed by the Council of Ministers, while the members of the Supreme Court are appointed by the president.

Natural features

The island's coasts are primarily low-lying, with numerous lagoons. Rimmed by coral reefs, they are weakly indented, with isolated ingression-type gulfs.

Terrain. More than 80 percent of Sri Lanka is occupied by lowland plains, dotted with isolated rocky inselbergs. Located in the central and southern parts is a steed highland, with flattened surfaces and steep fault scarps; the upper stratum is formed by table surfaces and steep summits, including Mount Pidurutalagala, which rises to an elevation of 2,524 m, and Adam's Peak.

Geological structure and mineral resources. Sri Lanka occupies part of the Hindustan Shield of the Indian Plate, the foundation of which is composed of gneisses, granite gneisses, charnockites,

amphibolites, schists, quartzites, and marbles with intrusions of Upper Proterozoic granites (from approximately 1 billion years ago) and dikes of dolorites and pegmatites. Carbonatites also occur. Rocks of the foundation outcrop to the surface on nine-tenths of the territory of Sri Lanka; in the north the foundation is overlain by a mantle of Jurassic and Miocene sedimentary rocks, including sandstones, siltstones, argillites, limestones, sands, and clays. Coastal marine Quaternary deposits (pebbles, gravel, sand, and clay) are widespread on the Indian Ocean coast. Laterites are developed in the crystalline rocks.

The principal minerals are graphite (with total reserves of 20 million tons), precious and semiprecious stones (sapphire, ruby, aquamarine, topaz, moonstone, chrysoberyl, coastal-marine black sands containing ilmenite and rutile (2 million tons in the form of TiO_2), zircon, and monazite. Other important minerals are kaolinite and other clays, as well as limestones, feldspars, and quartz sands.

Climate. The climate is the monsoon type; in the north and east it is subequatorial, and in the south and west, equatorial. The temperature is 26°–30°C on the plains, dropping to 15°–20°C in the mountains; it changes little in the course of the year. The greatest amount of precipitation (as much as 5,000 mm annually) falls on the southwestern slopes of the highland, primarily during the summer monsoon); in the foothills the annual precipitation reaches 2,000 mm. On the northeastern slopes of the highland and on the adjacent plains most of the precipitation, which amounts to 1,000–2,000 mm annually, falls during the winter monsoon; there is a dry season lasting eight to nine months. The least amount of precipitation, amounting to less than 1,000 mm a year, occurs on the northwestern and southwestern coasts. During the spring and autumn, many areas experience abundant convective afternoon showers.

Rivers and lakes. The river network is dense. Short, copious rivers, the largest of which is the Mahaweli Ganga, rise in the central highland and radiate out in all directions, forming waterfalls in the mountains. They are used for irrigation, primarily in the north and east; numerous reservoirs have been constructed.

Soil and flora. The soils are red earths and lateritic; there are bands of alluvial soils in the river valleys and on the coasts. Natural vegetation covers about three-fourths of the island. On the southwestern slopes of the mountains and in some parts of the foothills, humid equatorial forests have been preserved; with individual trees reaching 80 m in height, they are characterized by an enormous diversity of species. Trees include palms and dipterocarps; forests have dense undergrowth and abundant mosses. The plains in the island's northern and eastern parts and the adjacent highland slopes are covered with secondary deciduous forests, with trees of 9–12 m. The plateaus are occupied by savanna-type wasteland, consisting of high, coarse grasses and individual trees; elfin woodland occurs at elevations above 2,000 m. Thickets of prickly shrubs grow along the northwestern and southeastern shores; mangrove forests and coconut palms grow in certain areas near the coasts.

Fauna. The fauna is of the Indo-Malaysian type, with some Madagascar species, for example, lemurs. Mammals include elephants, leopards, lynx, five species of monkeys, deer, wild boars, and civets. There are numerous birds (parrots, peacocks, flamingos, storks), lizards, snakes, and crocodiles. There are also many types of insects, including butterflies, ants, termites, and malarial mosquitoes.

Preserves. The flora and fauna are preserved in botanical gardens (the largest is Peradeniya, near the city of Kandy), national parks (Gal Oya, Yala, Vilpatthu), and preserves (Rittigalla, Wasgomuva, Hakgala).

Iu. K. Efremov (physical geographical characteristics) and R. E. Tkacheva (geological structure and minerals)

Population

Seventy percent of the population are Sinhalese, and 20 percent, Tamils. The Sinhalese, who number 9.8 million (1975; here and below the population figures are estimated), inhabit the western, central, and southern parts of the country; they speak Sinhalese. The Tamils, who number 2.6 million, comprise two separate groups: the Sri Lankan Tamils, who live in the northern and eastern parts of the country, and the Indian Tamils, who live in the central part; they speak Tamil. Minority ethnic groups of mixed origin include the Ceylon Moors (854,000), the Burghers of Ceylon (44,000), and Malays (42,000). The Veddas are the descendants of the oldest population.

Sinhalese is the official language. About 67 percent of the population (Sinhalese) are Buddhists, more than 17.5 percent (Tamils) are Hindus, 7 percent (Moors and Malays) are Muslims, and another 7 percent (the Burghers, some Tamils, and others) are Christians, primarily Catholics.

The natural population increase (2.2 percent annually in the period 1970–74) is due to a high birthrate and a significant decline in the death rate. At the end of the 19th and beginning of the 20th centuries, a major role in the population increase was played by emigration from India, for the most part, of Tamil agricultural workers. In 1965 a state policy of controlling the birthrate was announced. In 1971, 51.3 percent of the population were males. A large proportion of the population is young; 43 percent are under the age of 15.

In 1971, 40.6 percent of the economically active population were engaged in agriculture; these were, for the most part, peasants and plantation workers. The average population density is more than 200 persons per sq km. In 1971 the urban population constituted 22.4 percent of the total.

The most important cities are Colombo (607,000; 1976), Jaffna, Kandy, Galle, and Moratuwa.

Historical survey

Rise of early state formations (to the eighth century A.D.). The area now occupied by Sri Lanka was settled during the Paleolithic period. The most ancient inhabitants were hunting tribes, probably the ancestors of the modern Veddas. The island underwent several waves of migration, primarily from India. According to written sources, the first Indian settlers, under the leadership of Prince Vijaya, came to the island in the fifth century B.C., bringing with them the culture of growing rice. The indigenous population intermixed with the new arrivals, thus giving rise to the Sinhalese ethnic group, centered in the north and southeast. Sinhalese settlements were self-sufficient village communities.

The first major state formation arose under Devanampiya Tissa in the third century B.C., a period of history called the Anuradhapura period, after the name of the state's capital. Agriculture attained considerable development (there was intensive construction of irrigation networks), as did handicraft production and trade. Close state and cultural contacts with India facilitated the penetration of Buddhism. The Buddhist clergy played an important role in economic and cultural life. In the fifth century, internecine strife led to the disintegration of the state, which enabled the Tamil conquerors, orginally from southern India, to seize considerable parts of the island. In the sixth century Anuradhapura once again became the capital of the state. In the sixth and seventh centuries, the struggle for the throne continued between the Sinhalese and Tamil rulers.

Development of feudal relations (eighth to late 18th centuries). In the eighth century, a Sinhalese dynasty became firmly entrenched in Anuradhapura. Large landholdings were concentrated in the hands of the chief of state. Feudal relations began developing. From the eighth through 13th centuries Polonnaruwa was the capital of a large Sinhalese state, whose rulers waged a struggle against the separatism of the big feudal lords and repelled incursions from the southern Indian states, such as Pandya. The wars inflicted enormous damage and led to the disintegration of the unified state. In the 13th century the inhabitants began settling the central and southwestern regions of the island. In the 15th century three large states were formed: the Sinhalese kingdoms of Kotte (in the west and southwest) and Kandy (in the central regions) and the Tamil kingdom of Jaffna (in the north).

The country's political fragmentation and economic weakness facilitated European expansion. In 1517 the first trade agreement was concluded between the Portuguese, who threatened to use military force, and the rulers of Kotte. The Portuguese obtained the right to export spices and other goods from the island to Europe. They created a network of forts along the western coast, and the fort of Colombo became their stronghold. To consolidate

their domination, the Portuguese sent Catholic missionaries to the island for the purpose of converting the indigenous population to Catholicism. The protracted wars waged by the Portuguese against the Kandy state ended in defeat.

In the mid-17th century, the rivalry between the Dutch and the Portuguese over the island intensified. In 1658 the Dutch expelled the Portuguese and seized up to one-fourth of the island. The Dutch monopolized trade in cinnamon and a number of other items. The specialization of many regions in the production of commodity crops led to the development of commodity-monetary relations. The Dutch colonialists harshly exploited the country's population, which led to an uprising in 1723. In the mid-18th century the conflict between the English and the Dutch for possession of the island intensified. In 1795–96, the Dutch were expelled.

British colonial domination; development of capitalist relations and growth of the national liberation movement (to 1917). The areas seized by the British colonialists were made part of the Madras Presidency, administered by the British East India Company. The British introduced heavy taxes. At the end of 1796, a major anti-British uprising broke out; it was suppressed by the British authorities, who nevertheless were compelled to abolish some of the taxes and promulgate administrative reforms. In 1802, Ceylon became a separate British colony. In order to consolidate their domination, the British colonial authorities decided to eliminate the independent Kandyan state. Great Britain's war against Kandy in 1803–05 ended in a British defeat, but in 1815 the British succeeded in annexing the Kandyan state, the last stronghold of Sinhalese independence. The seizure of the Kandyan state exacerbated relations between the Kandyan feudal lords and the British colonialists. In 1818 almost all of the area formerly occupied by the Kandyan state was engulfed by an anti-British uprising, headed by the Kandyan aristocracy and the Buddhist clergy. The uprising was harshly suppressed, and the Kandyan feudal aristocracy was deprived of many privileges. The former Kandyan state was divided into 11 districts and placed under the control of British officials. A standardized administrative and taxation system was introduced throughout the entire island. In 1833 an advisory body—the Legislative Council—was instituted under the governor's jurisdiction, and the trade monopoly of the British East India Company was transferred to the colonial authorities. The colonialists increased the tax burden, which engendered anti-British uprisings among the peasants in the areas of Kandy, Matale, and Kurunegala (1848) under the leadership of the Kandyan aristocracy and the Buddhist clergy. The uncoordinated peasant detachments were unable to offer substantial resistance to the British forces.

In the 1830's a plantation economy gradually developed on the lands taken from the peasants. By the 1850's, vast tracts of land were occupied by coffee plantations. The expropriation of the rights of the peasants intensified. In the 1890's tea became the chief export crop. The plantation crop production was dominated by British colonialists; Ceylonese landowners were also involved in plantation agriculture, but local capital was in a subordinate position.

The nascent Ceylonese bourgeoisie demanded political and economic rights. An indigenous intelligentsia began developing. The first national sociopolitical organization—the Ceylon League—was founded in 1864. Its members advocated increased Ceylonese participation in the country's rule; in particular, they sought a Ceylonese majority in the Legislative Council. In the second half of the 19th century various educational and religious reforms were instituted. By the turn of the 20th century, the country's transformation into an agrarian raw material adjunct of the home country was complete. Nevertheless, capitalist relations developed rapidly. A working class emerged, consisting primarily of plantation workers, mostly immigrants from India. Tenant farming became the predominant form of peasant land utilization. Criticism of the British colonial system by the indigenous bourgeoisie and other groupes of the population grew. The national liberation movement of the peoples of India exerted a considerable influence on the development of the anticolonialist struggle. At the beginning of the 20th century a number of bourgeois political organizations were formed that demanded the implementation of constitutional reforms. Leaders of the national liberation struggle included J. Peiris, P. Arunachalam, P. Ramanathan, D. B. Jayatilaka, and E. W. Perera. The labor movement developed at the beginning of the 20th century, and one of the first major actions of the working class was a railroad strike (1912).

During World War I (1914–18), the colonial exploitation of Ceylon intensified. Traders and moneylenders took advantage of the colony's dependence on the importation of foodstuffs and raised the prices on rice and other commodities. In 1915 spontaneous outbreaks occurred among the poorest groups of the urban and rural population against the Muslim traders. The British colonialists unleashed repressive actions against the participants in these outbreaks, as well as against the leaders of the national liberation movement. The terror imposed by the British colonial authorities impelled new groups of the Ceylonese people to join the liberation struggle.

Development of the struggle for national independence (1918–48). Led by the nationalist bourgeoisie, the anti-imperialist movement took on the form of a struggle for democratic reforms. In May, 1917, P. Arunachalam founded the Ceylon Reform League. In the period 1917–19, conferences of bourgeois representatives were convoked to revise the constitution. The Great October Socialist Revolution exerted an important influence on the development of the national liberation and labor movement on the island.

The first major political party—the Ceylon National Congress (CNC)—was founded in December 1919 by P. Arunachalam, P. Ramanathan, D. B. Jayatilaka, D. S. Senanayake, and F. R. Senanayake, among others. The CNC program included a demand for the creation of an elected Ceylonese majority in the Legislative Council, for implementation of the principle of territorial representation, and the formation of a responsible government. In 1922 the Ceylon Labor Union was formed.

Political and economic demonstrations by the working masses intensified during the worldwide economic crisis. Between 1929 and 1933 there were major strikes by dockworkers, streetcar operators, and printers. In 1931 a constitution was adopted, which provided for the creation of an elected parliament—the State Council. The introduction of universal suffrage was an important political victory for the democratic forces. In the 1931 and 1936 elections a majority of seats in the State Council were won by members of the CNC, representatives of the Sinhalese big bourgeoisie. At the beginning of the 1930's, the first Marxist circles emerged, which established ties with the working class. The Suriya Mal aniticolonialist movement developed in the country (*suriya mal* is the name of the flower that was sold by the adherents of the movement to build up a fund to assist the workers); the movement attracted the broad masses to the anti-imperialist struggle. In 1935 the Socialist Equality Party (Lanka Sama Samaja Party; LSSP) was founded.

World War II (1939–45) brought enormous hardships to the people of Ceylon. There were severe food shortages, since Ceylon lost its traditional supplier of rice as a result of the Japanese occupation of Burma. The increase in prices on essential goods considerably surpassed the increase in wages. The export of the plantation products continued to bring in large profits to British firms and the big Ceylonese planters. In 1942 the CNC demanded the abolition of the colonial regime after the end of the war. A decisive struggle to consolidate the democratic forces and attain independence was led by the Communist Party of Ceylon (CPC), founded in July 1943. The growth of the anti-imperialist movement compelled the British government to appoint a commission to draft a new constitution for Ceylon. In 1945–46 the commission's report and draft of a new constitution were made public. The refusal of the British imperialists to grant immediate independence provoked widespread protest. There were many large-scale demonstrations by the workers, including a general strike in May and June 1947. Under pressure from the national liberation movement of the peoples of Ceylon and the neighboring Asian countries, the British government on Feb. 4, 1948, granted dominion status to Ceylon.

After the achievement of political independence. After the achievement of independence, political power in the country was attained by the bourgeois United National Party (UNP; founded 1946), headed by D. S. Senanayake. According to the conditions

of the Anglo-Ceylonese defense agreement (1947) the British were to retain troops and military bases on the island. The Senanayake government adopted a course that was not directed at the decisive abolition of the colonial heritage. The British monopolies continued to occupy the key positions in the export of plantation crops and to control the country's economy. Persons of Indian origin were deprived of their citizenship and the right to vote. The policies of the UNP government were subjected to criticism by the working class and a number of national bourgeois groups. The policies of the UNP were opposed by a group of Tamil bourgeoisie, which in 1949 established the Federal Party (FP). In 1951 a national bourgeois group, led by Solomon Bandaranaike, split from the UNP and formed the Sri Lanka Freedom Party (SLFP), whose program included demands for the abolition of the colonial heritage and the implementation of progressive socioeconomic reforms. The forces in opposition to the government rallied around the SLFP and created the People's United Front (Mahajana Eksath Peramuna; MEP), which defeated the UNP in the 1956 parliamentary elections. The Bandaranaike government embarked on a program reinforcing the country's independence and promulgating progressive socioeconomic reforms. British military bases were closed down in 1957. Diplomatic relations were established with the USSR (1957) and other socialist countries (1957–58). In 1958 an agreement was signed with the USSR on economic and technical cooperation. Plans for economic development were worked out. The government's progressive course provoked dissatisfaction among the reactionary elements, who organized a conspiracy; Solomon Bandaranaike was assassinated in September 1959.

In the parliamentary elections held in March 1960, the UNP gained a victory, but the new government soon received a vote of no confidence. The SLFP emerged victorious in the 1960 parliamentary elections. The government was headed by the party's new leader, Sirimavo Bandaranaike, the widow of Solomon Bandaranaike. It adopted a nonaligned course in foreign policy. The economic program sought to accelerate industrial development, restructure agriculture, and expand the state sector. The government nationalized three foreign oil companies (1963). With Soviet aid, it carried out the construction of enterprises. An agrarian reform was instituted in 1958 (the law on lands under rice), which sought to protect the rights of peasant tenant farmers and poor peasants. Important social and cultural reforms were also promulgated.

In the course of the struggle against the reactionaries, the left-wing forces gradually united; an expression of the growth of their solidarity was the creation in 1963 of the United Left Front (ULF), which included the CPC, the LSSP, and the MEP (the name adopted in 1960 by the Revolutionary Socialist Party of Ceylon, founded in 1951). In 1964 an SLFP-LSSP coalition government was formed. Because of the government's attempts to further democratize the country, the right-wing members of the SLFP left the party. The opposition elements created a government crisis, and the coalition government was compelled to resign.

In the 1965 parliamentary elections, a relative majority of seats was won by the UNP. Dudley S. Senanayake, the UNP leader, assured himself of the support of the FP and a number of Sinhalese bourgeois parties and formed a government. The new government adopted a policy of encouraging the private sector and attracting foreign capital. The mass firing of workers and trade union leaders who had participated in the strike of Jan. 8, 1966, was carried out. Nevertheless, the workers continued their struggle to improve their economic position and political rights. A major strike under the leadership of the Joint Committee of Trade Union Actions took place at the end of 1967 and the beginning of 1968; there were many strikes in 1968 and 1969.

Cooperation between the UNP and the FP was conditional upon a number of concessions to the Tamil leaders. A great deal of pressure on the UNP government was also exerted by the Sinhalese nationalists. Increasing disagreements between the Sinhalese and Tamils led to the withdrawal of the FP from the government in 1968. In June 1968 a platform was worked out for joint actions by the SLFP, the CPC, and LSSP; the United Front (UF), whose platform was supported by the country's progressive forces, was created. In the May 1970 parliamentary elections, the UF emerged victorious, having won 115 seats out of a total of 151. The UF government, which included members of the SLFP, LSSP, and CPC, was headed by Sirimavo Bandaranaike. It proclaimed a program of broad democratic reforms directed at eliminating the remnants of colonialism. In foreign policy the government sought to expand cooperation with peace-loving nations. State control over important economic spheres, primarily foreign trade, increased, and the activities of the state sector were strengthened. The UF government came under the attack of right-wing forces, who took advantage of objective economic and political difficulties to sabotage the government's efforts. The reactionary elements succeeded in provoking an antigovernment revolt by left-wing extremist youth (April and May 1971).

On May 22, 1972, Ceylon was proclaimed the Republic of Sri Lanka. The new constitution abolished all forms of the country's dependence on Great Britain. Of great importance for strengthening the Republic of Sri Lanka's independence was the promulgation of a peace-loving foreign policy. Contacts with the USSR and other socialist countries continued to expand. Sri Lanka has taken part in all the conferences of the nonaligned countries. It made a great contribution to the organization of the Fifth Conference of the Heads of State or Government of Nonaligned Countries, held in Colombo in August 1976.

Agrarian reforms were developed further. A maximum was established for the amount of land that could be owned, and excessive amounts held by large foreign and indigenous landowners were confiscated. However, the government was unable to improve substantially the position of the working masses; it could not prevent price increases on essential goods, nor could it bring a stop to the growth of unemployment. Pressure from the right wing of the SLFP complicated relations within the ruling coalition. The exacerbation of disagreements between the LSSP and the other parties of the coalition supporting the UF platform led to the withdrawal from the government of the LSSP in September 1975 and the CPC in February 1977. In May 1977 the CPC, LSSP, and People's Democratic Party (founded 1977) formed the United Left Front. That same year, the Tamil nationalist parties created the Tamil United Liberation Front. In the parliamentary elections of the July 1977, the UNP emerged victorious. Its leader, J. R. Jayewardene, became head of the government. In February 1978 he became president. E. D. TALMUD

Political parties and trade unions

The United National Party (UNP), founded in 1946, expresses the interests of the middle and upper bourgeoisie. The Sri Lanka Freedom Party (SLFP), founded in 1951, expresses the interests of various strata of the national bourgeoisie. The Lanka Sama Samaja Party (LSSP; Socialist Equality Party) was founded in 1935. The Communist Party of Sri Lanka (CPSR) was founded in 1943. The People's Democratic Party was founded in 1977. The Federal Party (FP), founded in 1949, expresses the interests of Tamil bourgeois nationalist circles. The United Tamil Liberation Front (UTLF) is a bloc of the Tamil bourgeois parties that emerged from the United Tamil Front (UTF), founded in 1972.

The Ceylon Workers' Congress, founded in 1936, unites plantation workers. The Sri Lanka Federation of Trade Unions (until 1965, the Ceylon Federation of Trade Unions) was founded in 1940. It is affiliated with the World Federation of Trade Unions. The Ceylon Federation of Labor was founded in 1939. The Democratic Workers' Congress was founded in 1956.

Economic geography

General state of the economy. Sri Lanka's economy is dominated by agriculture, which accounts for more than one-third of the gross national product (industry accounts for only about one-eighth). The plantation economy, which emerged during the colonial period, forms the basis of the country's present economy, which continues to be heavily dependent on the foreign market. After the achievement of independence, a number of state development programs (the latest in the period 1972–76) and reforms have been carried out; they are directed at transforming agriculture to increase food production, expanding power production and industrial construction, and strengthening the state's control over foreign capital.

The growth of the state sector has been a key factor in the strengthening of the country's economic independence and the creation of a national industry; for example, in 1976 the state sector accounted for approximately one-third of the entire industrial output. Under state ownership are the railroads, the port facilities, the major industrial enterprises, the electric power plants, and the irrigation installations. A system of state-sponsored corporations has been established (in 1973 there were about 84 such corporations, of which 26 were in industry); the corporations are responsible for the management of many industrial enterprises (and the construction of new facilities), plantations, and trade institutions. One example is the state petroleum corporation, which has established a monopoly on the importation and domestic trade of petroleum products and which controls the supply of foreign vessels; another state corporation is the tea export corporation.

As a result of the nationalization of plantations (by a 1975 law) owned by foreign and domestic capital (under conditions whereby specified compensation was paid), more than 400 tea, rubber, and coconut plantations, with a total area of 160,000 hectares (ha), were transferred to state control. All plantations with an area of more than 20 ha were nationalized. By the mid-1970's, the proportion of foreign, primarily British, capital decreased sharply, to a level of 26 percent in tea production and 12 percent in rubber production. The activities of foreign banks have been curtailed; all financial operations pertaining to the tea trade are handled by the Central Bank of Ceylon.

Along with the growth of the state sector, the role of the private capitalist sector has been maintained and strengthened. The number of mixed state-private companies has increased. The restructuring of Sri Lanka's economy has been financed by both domestic and foreign (albeit with certain limitations) capital investments and loans. The USSR and other socialist countries have granted substantial financial and technical aid to Sri Lanka, and a majority of the most important industrial enterprises of the state sector have been built with the aid of socialist countries.

Agriculture. The 1972 agrarian reform, which placed limits on large-scale landownership (a maximum of 20 ha), succeeded in somewhat curtailing landownership by the big landlords (by the beginning of 1975 more than 200,000 ha had been taken away from landlords). However, the nature of landownership and land tenure essentially remains unchanged. A considerable portion of the land is still concentrated in the hands of the relatively large-scale landowners, temples, and monasteries. Much of the peasantry lacks land or has too little. Rent payments for the use of the lands have been somewhat curtailed. The following two types of farms predominate: capitalistic, primarily plantation, farms, which make extensive use of hired labor; and small, truck-garden or seminatural peasant farms (with average plots of about 0.3 ha), managed by tenant farmers or the owners themselves. The renting of land is widespread. In accordance with the present state plan for developing new lands, every peasant may buy 1.5–2 ha of irrigated land on credit and several ha of unirrigated land. The formation of farm cooperatives is an important feature of the agrarian changes.

About 37 percent of the country's land area is used for agriculture (2.4 million ha in 1974), primarily in the Wet Zone; 895,000 ha are occupied by arable lands, 1.084 million ha by perennial plantation crops, and 439,000 ha by pastures and meadows. As of 1974, 430,000 ha were being irrigated. More than 40 percent (2.9 million ha) of the country is forested. During the years of independence there has been a 45-percent increase in the amount of land cultivated as a result of assimilation of state-owned lands in the Dry Zone (the northern and eastern parts of the island) and the expansion of irrigation construction. In 1970 complex hydraulic-engineering contruction was begun on the Mahaweli Ganga, a project developed by a group of UN experts under the direction of a Soviet engineer.

Plantation farming, concentrated in the central and southwestern parts of the island, specializes in the production of export crops—namely, tea, rubber, and coconut products. In 1976, Sri Lanka's tea harvest accounted for nearly one-eighth of the world production; Sri Lanka ranks behind only India and China in tea production. The coconut harvest is considerable, one of the highest in the world; in the production of copra and export of coconut oil, Sri Lanka also ranks high on the world market. Sri Lanka is a major producer of natural rubber, ranking fourth in the world, after Malaysia, Indonesia, and Thailand.

Food crops for domestic needs are grown primarily by the peasant farms. The principal food crop is rice, which is harvested twice a year. During the years of independence, the harvest of unmilled rice (paddy) has increased considerably, primarily owing to the state policy of subsidizing and granting credits to rice-growing farms and the achievement of somewhat higher harvest yields. However, the country's rice production meets only 65–75 percent of the country's needs. Other food crops include millet, corn, legumes, sweet potatoes, manioc, green vegetables, and spices—cinnamon, black pepper, and cardamon. Industrial crops include fiber and oil crops; among fruits grown are bananas and pineapples. (See Table 1 for the production of farm crops.)

Stock raising is poorly developed; cattle are primarily used as draft animals. In order to improve this branch of agriculture, state stock-raising farms are being established, and ways are being sought to expand the fodder base. As of 1975, there were 2.5 million head of cattle (including 700,000 buffalo) and 550,000 goats. Elephants are also used as work animals.

The fish catch amounted to 129,000 tons in 1975. There is also a pearl-fishing industry.

Industry. Sri Lanka's industry is still characterized by the predominance of many small-scale enterprises, including cottage-type handicraft enterprises; individual large-scale enterprises have been constructed, for the most part, in the state sector.

The island is poor in mineral fuel, and consequently fuel is imported. Sri Lanka supplies the foreign market with high-grade graphite (the Bogala and Ragedara mines; 7,800 tons mined in 1975); small amounts of ilmenite, rutile, zircon, salt, and precious stones (rubies, sapphires, and aquamarines) are also mined. The principal source for expanding the energy base is waterpower. Construction is under way on state hydroelectric power plants on the Kehelgomu, Maskeliya, and other rivers.

Traditional branches of the processing industry are the processing of tea and rubber and the production of copra and coconut oil. The enterprises of these branches are located primarily in regions with large plantations. There are rice-cleaning enterprises, sugar refineries (output of raw sugar amounted to 28,000 tons in 1975), and other enterprises of the food industry, as well as textile enterprises (one of the largest textile enterprises in southern Asia was built in cooperation with the German Democratic Republic) and enterprises of the footwear and certain other branches of light industry.

Heavy industry is still in its infancy. In Oruvella, near Colom-

Table 1. Principal agricultural crops

	Area (ha)			Harvest (tons)		
	1961–65[1]	1974	1975	1961–65[1]	1974	1975
Rice	505,000	638,000	597,000	967,000	1,875,000	1,154,000
Tea	239,000	240,000	242,000	217,000	201,000	—
Rubber	—	—	—	107,000	145,000	150,000[2]
Coconuts	—	—	—	2,040,000	1,350,000	1,650,000
Copra[3]	—	—	—	284,000	109,000	170,000

[1]Yearly average [2]1976 [3]Output

bo, the first metallurgical plant, with a capacity of 50,000 tons of rolled steel per year, was built in 1967 (with the cooperation of the USSR). Machine-building and metalworking enterprises include mainly assembly plants, which supply equipment for light industry, transportation equipment, and agricultural equipment. Certain branches of industry are being expanded, such as the production of fertilizers, the oil-refining and rubber industries (a tire plant was built in Kelani, a suburb of Colombo, in 1967 with the cooperation of the USSR), the wood-products industry (a large plant has been built with the cooperation of Poland), and the production of construction materials (a plant has been built near Colombo with aid from the USSR). The principal industrial center is the city of Colombo and it environs.

The old-fashioned, traditional crafts are widespread, for example, blacksmithing, pottery-making, cloth weaving, basketry, the plaiting of bags, hats, and ropes, rug weaving, carving in wood, antler, ivory, and tortoiseshell, metal stamping, and the production of gold and silver ornaments with precious stones.

Transportation. The leading form of transportation is automotive transport, and the length of roads exceeds 21,500 km. There are about 1,500 km (1976) of railroads. Most of the overseas merchant marine is owned by British companies; Sri Lanka is also establishing its own fleet, which by mid-1976 totaled 36 vessels. About 5 million tons of cargo are handled by the ports, including Colombo, which handles up to 90 percent of Sri Lanka's imports and more than one-half of its exports, Galle, and Trincomalee. Colombo has an international airport—Katunayaka Airport—located north of the capital.

Foreign trade. More than 90 percent of the total value of exports is provided by tea (40–60 percent of the monetary revenues), natural rubber, and coconut products. The principal imports are foodstuffs, which account for one-third to one-half of the total value of imports (707,000 tons of rice in 1975–76); other important imports are industrial goods, raw materials, and fuel. The chief foreign trading partners are China, Great Britain, Saudi Arabia, Australia, the USA, Pakistan, Japan, and India. The USSR and the socialist countries of Europe account for 5.2 percent (1975) of the value of foreign trade turnover.

The monetary unit is the Sri Lanka rupee. In May 1978, at the exchange rate of Gosbank of the USSR, 100 rupees equaled 4 rubles and 50 kopeks.

L. I. BONIFAT'EVA

Armed forces

The armed forces comprise an army, air force, and navy. The supreme commander in chief is the president; direct leadership is exercised by the minister of defense. The armed forces, which consist of paid volunteers, number (1976) about 14,000 persons.

The army, with about 9,000 men, comprises one brigade, intelligence and artillery regiments, and military supply and service units. The weapons are of foreign make. The air force, which numbers about 2,300 men, has five combat and six transport airplanes, a communications squadron, about 20 trainers, and 15 helicopters. The navy, which numbers 2,400 men, has one frigate, five gunboats, and 23 patrol boats.

Health and social welfare

Medicine and public health. According to data of the World Health Organization (1972), the birthrate is 29.5 births per 1,000 population, and the death rate, 7.7; the infant mortality rate is 45.1 per 1,000 live births. Infectious and parasitic diseases predominate. Malaria and tuberculosis are widespread, as are gastrointestinal infections, which constitute the principal cause of death.

In 1973, Sri Lanka had 456 hospitals, with 39,700 beds (approximately three beds per 1,000 inhabitants). Outpatient care is provided by 334 polyclinics attached to hospitals, 546 dispensaries, and 1,300 maternity and child-welfare centers. In 1972 there were 3,200 physicians in Sri Lanka (one physician per 4,000 inhabitants), 280 stomatologists, and more than 11,000 other medical personnel, as well as more than 10,000 practitioners of traditional folk medicine—the Ayurvedas. Physicians are trained at two medical faculties at the universities.

In 1970–71 expenditures on health care made up 3.5 percent of the state budget.

Veterinary services. Foot-and-mouth disease, pasteurellosis, fowl pox, coccidiosis, and mastitis are widespread in Sri Lanka. Also registered have been leptospirosis of cattle (in regions where buffalo are bred), anthrax among cattle (rare), Newcastle's disease, hoof rot, blackleg, salmonellosis, brucellosis, avian leukosis, rabies among dogs, cattle, and wild animals, anaplasmosis, babesiasis, theileriasis, fascioliasis, and mange.

As of 1976 there were 284 veterinarians in Sri Lanka; they are trained in the faculty of agriculture and veterinary science of the University of Sri Lanka and in India and other countries. There is a research center for veterinary science.

M. G. TARSHIS

Education and cultural affairs

Sri Lanka has a high literacy rate; more than 80 percent (1974) of the adult population is literate. In 1972, on the initiative of the United Front government, an educational reform was instituted in the country, in accordance with which an 11-year school replaced the previous 12-year general-educational school: a primary school (five years), a junior (incomplete) secondary school (four years), and a senior (complete) secondary school (two years). Nine years of instruction—five in primary and four in the junior secondary school—are compulsory for children ranging in age from six to 14. During the 1974–75 school year, there were 1.370 million pupils in grades 1–5 and 1.064 million students in grades 6–11. Instruction is free and conducted in Sinhalese or Tamil; English is taught in the secondary schools. Teachers for the general-education schools are trained at two-year teacher-training colleges, based on the complete secondary school. In the 1973–74 academic year, there were 28 teacher-training colleges, with an enrollment of 9,300 students.

Teachers for the secondary schools are trained at the universities. Vocational and technical training is conducted after completing the nine-year school in two-year schools or the four-year technical institutes. The University of Sri Lanka (established 1972 through a merger of previously existing universities) has campuses in Peradeniya, Colombo, Vidyalankara, Vidyodaya, Katubedde, and Jaffna (opened in 1974). During the 1975–76 academic year, the university had an enrollment of more than 15,600 students.

The largest libraries are the Public Library in Colombo (with more than 132,000 volumes in 1975), the National Museum Library in Colombo (more than 500,000 volumes), and the university library in Peradeniya (400,000 volumes). Museums include the National Museums of Sri Lanka, which comprise the national museums in Colombo, Kandy, and Ratnapura and the folk museum in Anuradhapura.

V. Z. KLEPIKOV

Science and scientific institutions

Scientific research is coordinated by the National Science Council (founded 1968) under the Ministry of Industries and Scientific Affairs. The state finances projects related to the country's economic development. The International Bank for Reconstruction and Development provides funds for the Ceylon Institute of Scientific and Industrial Research (1955). Scientific personnel are primarily trained abroad. The leading scientific center is the University of Sri Lanka, where research in the natural sciences, history, sociology, and linguistics is conducted. Applied research is conducted at the Central Agricultural Research Institute (1965) and the institutes of the departments of the Ministry of Agriculture and Lands, such as the Tea Research Institute of Ceylon in Talawakele (founded 1925). The Ceylon Medical Research Institute (1900) works on the study and treatment of tropical diseases. Archaeological and ethnographic studies are concentrated at the Colombo National Museum.

The most important scientific societies are the Sri Lanka Association for the Advancement of Science (1944) and the Royal Asiatic Society (1845), a branch of the Royal Asiatic Society of Great Britain. With the aid of the USSR research is being conducted in hydraulic-engineering construction, industry, and agriculture. In collaboration with foreign scholars, including scholars from the USSR, the multivolume *Buddhist Encyclopedia* is being published.

E. D. TALMUD

Press and radio

In 1976 more than 30 periodicals were being published (in Sinhalese, Tamil, and English).

The most widespread newspapers, all published in Colombo, are the Sinhalese-language *Lankadipa* (since 1947; circulation, 67,000), *Dinamina* (1909; circulation, more than 129,000), and *Dinakara* (1977), the Tamil-language *Virakesari* (1930; circulation, 32,000), and the English-language *Ceylon Daily News* (1918; circulation, 65,000), and *Ceylon Observer* (1834; circulation, 5,000). The Communist Party of Sri Lanka publishes the following newspapers: the Sinhalese-language *Aththa* (1964; circulation, 17,500), the Tamil-language *Desabhimani* (1946; circulation, 10,000), and the English-language *Forward* (1950; circulation, 9,000). The Press Trust of Ceylon, a national cooperative news agency, was founded in 1951. The national information agency *Lanka Tuvat* was founded in 1978.

Radio broadcasting is directed by the state-sponsored Sri Lanka Broadcasting Corporation (founded 1967). It is conducted in four languages—Sinhalese, Tamil, English, and Hindi.

E. D. TALMUD

Literature

Literature has developed primarily in Sinhalese, although literature in Tamil and English is also of some importance. The first literary works—the *Dipavamsa* chronicle (fourth century) and *Mahavamsa* chronicle (fifth century)—were written in the Pali language. In addition to historical facts, the *Mahavamsa* includes myths and legends. During the fourth and fifth centuries, various commentaries on the basic tenets of Buddhism were recorded. Circa the fifth century, *jatakas*, borrowed from India, were written in Pali. Literature in Pali formed the basis of Sinhalese literature. Works in Sanskrit also became widespread.

The first works in Sinhalese appeared in the sixth century. Verse and prose excerpts have been preserved, along with cave and rock inscriptions; later works contain references to the poets of the period. Medieval Sinhalese literature borrowed the genres of the chronicle and the epic poem from ancient Indian literature.

Medieval authors considered religious preaching to be the principal goal of creative art. The epic poem *The Crest-Gem of Poetry* by the Sinhalese king Parakrama Bahu II (1236–70) includes sections that, to a certain extent, reflected Parakrama's own epoch. Beginning in the 13th century, prose acquired increasing importance, since its simpler language made it easier to expound the ideas of Buddhism (for example, *The Flood of Nectar*, 13th century, by Gurulugomi). Important prose works of the 13th century were Vidyachakravarti's *The Refuge of Buddha* and Mayurapadathera's *The History of Offerings*, a collection of sermons in which the hard lot of the peasants was first depicted in Sinhalese literature. *A Garland of Jewels of the Good Doctrine*, by the Buddhist monk Dharmasena, depicts the life of the peasants, along with their language and customs. In *The Ornament of the Good Law* (14th century), Dharmakirti wrote about the famine that had devastated the country and about peasant life and its many deprivations.

In the 14th century the translation of the *jatakas* into Sinhalese was completed. In the 15th century poetry once again acquired importance. Epistolary narrative poems provided a detailed description of Sri Lanka's cities, villages, and monasteries. Sri Rahula wrote *The Dove's Message*, *The Starling's Message*, and *The Diadem of Poetry*. In Guttilaya, Vœttœve Thera expressed opposition to the king's court. In the narrative poem *The Ornament of the Buddha's Virtues*, Vidagama expressed displeasure with the greed and injustice of the powers that be. The last major representative of medieval poetry—Alagiyavanna Mohottala (late 16th and early 17th centuries)—in his narrative poem *The Great War* depicted the struggle of the Sinhalese King Rajasinha II against the Portuguese colonialists.

Colonization impeded the development of Sinhalese literature, but as early as the second half of the 19th century and the beginning of the 20th, there was a noticeable increase in national self-awareness and a striving to retain originality and a national culture. The first Sinhalese novels were published in the first decade of the 20th century. S. de Silva spoke out in defense of national customs and Buddhism, and P. Sirisena (1875–1946) expressed similar ideas in the novel *Jayatissa and Rosalind, or The Happy Marriage* (1906). W. A. Silva (1892–1957), in such historical novels as *Sunetra, or The Dark Age* (1936), described the struggle of the people against the Portuguese; in the novel *The Puppet Chieftain* (1939), he satirized the wealthy landowners. Elements of realism are evident in his short stories.

The establishment of realism and the subsequent development of the Sinhalese literary language are linked with the writer and literary scholar M. Wickramasinghe (1891–1976), whose trilogy *Changing Village* (1944), *The Last Century* (1947), and *The End of an Age* (1949) depicted class stratification in the village, the rise of a new merchant class, and the emergence of a working class.

During the 1940's the short-story genre gained importance; the leading short-story writers include H. Munidas (1903–57) and G. B. Senanayake (born 1903). The achievement of political independence (1948) and the ensuing democratic changes, as well as the adoption of Sinhalese as the official state language, gave new life to literature. During the 1950's and 1960's reality became the principal object of depiction. Humanity and sympathy for the simple working man characterize the works of E. Sarathchandra (born 1914) and K. Jayatilaka (born 1926), as well as the works of Gunadasa Amarasekara (born 1929), author of the novels *Prisoners of Destiny* (1955) and *The Legless Ones* (1961) and of short stories and poems depicting the life of the people. The plots of some of his short stories echo the works of N. V. Gogol and A. P. Chekhov. The heroes of Jayatilaka's novels *Those Who Have Suffered Defeat* (1960) and *Three Characters* (1963) and his short stories are helpless in the face of life. The themes of disillusionment and confusion are at the center of Sarathchandra's novels *A Tired Man Sees Not the Path* (1962) and *A Day of Remembrance for the Dead* (1965). Sarathchandra's *The Sinhalese Novel* (1950) presents an analysis of the national literature from the mid-19th century to the 1950's. A comparison of the urban and rural ways of life is the theme of Madawala Ratnayake's novel *Five Acres* (1959). The novellas of L. Gunasekara depict village life.

At the end of the 1960's and the beginning of the 1970's, criticism of social relations increased. Kumara Karunaratna's novella *Colombo 7* (1972) and Gunadasa Liyanage's novels *Dona Kamalawathie* (1971) and *I Will Come Back, Mama* (1973) expose the hypocrisy and corruption of the bourgeois politicians. The hero of contemporary prose joins the struggle for a better life, for example, in *Heyiyammaruva* (1971) by A. V. Suravira. The themes of poetry (S. Mahinda, Munidas Kumaranatunga, Sagara Palansuriya, G. H. Perera, Alwis Perera, Vilmalaratna, Kumaragama, Chandraratna Manavasimha) include the beauties of nature, the hard lot of the working masses, and the awakening of civic and national feelings. Sarathchandra's plays *Maname* and *Sinhabahu* are based on ancient legends. The life of the people of Sri Lanka and social changes constitute the themes of works by Amaradasa Samaravira and Henri Jayasena.

In 1969 the progressive writers of Sri Lanka formed the organization called the "People's Writers Front", which since 1973 has published the literary newspaper *Jana ruchiya*. The journals *Sahityaya, Sanskruti*, and *Kala puvat* publish materials dealing with literary history and criticism.

A. A. BEL'KOVICH

In the course of many centuries the Tamil-language literature of Sri Lanka developed as part of India's Tamil literature and thus lacked an independent, national character. With the upsurge in the national liberation movement at the end of the 19th and beginning of the 20th centuries and with the growth of national self-awareness among the Tamils of Sri Lanka, Tamil literature assumed increasingly more original traits. The greatest development in the 20th century was attained by poetry and by prose, specifically, the novella and the one-act play. The Tamil writers have addressed social themes. Their heroes are the toilers of the city and the village—petty clerks, workers, peasants, and fishermen—voicing their protest against exploitation and social injustices. Popular prose writers and poets include S. P. Amarasingam, Varathar, J. Vijaytunga, C. V. Velupillai, S. Ganeshalingam, K. Daniel, D. D. Jiva, Ilangayarkone, V. A. Rajaratnam, Kanaga Senthinathan, Nirvai Ponnaiyan (born 1930), Sargunar Ponnuthuram, Premji, and Sokkalingam. The emergence of Tamil dramaturgy has been facilitated by the festivals in Colombo organized every year by the division of Tamil drama of the Cultural Council of Sri Lanka.

English-language literature originated in the 19th century and developed under the influence not only of the European but also of Sinhalese and Tamil literatures of Sri Lanka. R. L. Spittel published novellas, narrative poems, and stories, including *Vanished Trails, or The Last of the Veddas* (1950), *Where the White Sambhur Roams*, and *Wild White Boy* (1958). Popular writers include J. Vijayatunge, author of the short-story collections *Grass for My Feet* (1935) and *Girl From the Rodiya Caste and Other Stories* (1960); G. Virasuriya, author of the realistic novel *Harijan in Trousers*, drawn from the life of petty clerks; J. Gunawarhana (or Goonawardine), author of novellas in English and Sinhalese; R. Proctor, author of the novella *The Fisherman's Daughter* and short stories; and Anna Ranasinghe (poems, 1971, 1975).

Children's short stories and tales based on Sinhalese and Tamil folklore are also published. IU. N. MASLOV

Architecture and art

The ancient period of the art of Sri Lanka (third century B.C. to eighth century A.D.), which owes much to the art of India, is represented by Buddhist monuments, concentrated, for the most part, in Anuradhapura.

During the early medieval period (eighth to 13th centuries), construction was carried out primarily in the new capital—Polonnaruwa—where Hindu temples were also erected. The monumentality and grandeur of the early stupas gave way to harmonic restraint in proportions, while retaining the former moderation (in comparison with India) in the interior and exterior sculptural decoration. Particularly characteristic for the medieval plastic arts of Sri Lanka are statues of Buddha, including huge rock statues, characterized by a sense of balance and clarity of strongly stylized forms. Also preserved are numerous examples of secular stone sculptures, metal statuettes of deities, and the well-known rock paintings of Sigiriya.

Under the colonial regime (beginning in the 16th century), the art of Sri Lanka, which on the whole had entered a period of decline, was developed only by village masters of temple paintings, artistic metalworking (utensils and weapons), wood carving (carved architectural details, furniture, tools, small boxes), carving in ivory (statuettes, panels, boxes, chalices, door stops, and combs), lacquer work, and work in stone and clay. Jewelry was also made, as well as artistic fabrics, mats, embroidered items, and wooden masks.

Professional easel art in Sri Lanka originated at the end of the 19th century under the influence of the official art of the British Academy of Arts. The first art association was the Ceylon Society of Arts (founded 1887; A. Amarasekere, J. D. A. Perera, T. Rajapaksha, and others). During the first half of the 20th century, a school of painting emerged in connection with the development of the liberation movement that combined national traditions with elements of the new European trends; this school included members of the 43 group (beginning in 1943; J. Daraniyagala, G. Keyt, H. Peiris, and others) and the Society of Folk Arts, which included primarily nonprofessional masters working in the gouache technique (beginning in 1950; V. L. A. Mendis and others).

After the achievement of independence, the time was ripe for the formation of a national school of architecture; urban and rural complexes were erected that combined elements of national medieval and contemporary European architecture.

S. I. TIULIAEV

Theater

Sri Lanka's theatrical art is rooted in the folk games, rituals, and dances of the various tribes that had settled the island in antiquity. Religious holidays were accompanied by songs and dances, and various spectacles were arranged in honor of the gods and legendary heroes. The chronicle-poem *Mahavamsa* (fifth century) attests to the ancient origin of the theater; it contains passing mention of dance spectacles and descriptions of the *mandaran*, a stage area where dancers and musicians performed. With the spread of Buddhism, the mystery-like drama appeared in the monasteries, propagandizing religious and philosophical doctrines. There also existed various forms of folk theater, some of which have been preserved, including the *kolam*, a masked dance and mime presentation whose origin was linked with magical religious rituals (it was widespread in the vicinity of Ambalangoda and Bentara), and the *sokari* ("threshing-floor" theater), a humorous theatrical production. A newer theatrical form, based on folk music and dance, arose—the *nadagama*, a unique musical spectacle with singing, dancing, and pantomime that became popular in the early 19th century (it is not staged in the 20th century, and only the songs have been preserved).

The emergence of the modern theater is closely linked with the growth of national self-awareness and the national liberation struggle of the peoples of Sri Lanka. At the end of the 19th century, plays clearly divided into acts appeared, the curtain was introduced, and women began performing on the stage. A new type of play, the *nurtiya*, while retaining the music and dance form of the *nadagama*, included dialogue. Among such plays were *Romlin* (1866) and *Rolina* (1879) by C. Don Bastian, an adaptation of Shakespeare's *Romeo and Juliet* (1885), and J. de Silva's *Siri Sangabo* (1903), *Vihara Maha Devi* (1916), and other plays, constructed in accordance with the rules of Sanskrit drama. De Silva's plays were staged by the professional companies Arya Subodha Natya Sabha and Vijaya Ranga Sabha. During the 1920's and 1930's, plays dealing with social issues appeared, such as B. Jayamanna's *Iranama* and *Hadisi Viniscaya*, which are about urban workers.

The establishment of Sri Lanka's independence (1948) facilitated the revival and development of national traditions. New theatrical forms emerged, including the ballet, which synthesized traditional and folk-dance arts. In 1944 a ballet school and troupe were formed (known since 1955 as the Chitrasena Dance Company), under the direction of Chitrasena, Sri Lanka's first professional dancer and choreographer. The company's repertoire includes the ballets *The Triumph of Peace*, which depicts the struggle for peace, *Kardiya* (Salt Water), which deals with the life of fishermen, and *Nala and Damayanti*, which is based on the ancient Indian epic *Mahabharata*. (In 1960 and 1963 the troupe toured the USSR.) The state Folk Dance Ensemble of Sri Lanka was founded in 1973 under the direction of Pani Bharata (it toured the USSR in 1974).

There are many amateur theatrical groups in Sri Lanka. A group at the university in Colombo is well known; its repertoire includes the plays by the contemporary Sinhalese playwright E. Sarathchandra *Maname* and *Sinhabahu*, as well as plays by A. P. Chekhov, O. Wilde, and other writers. M. P. KOTOVSKAIA

SRIVIJAYA, an Indonesian state that arose circa the mid-seventh century in the region of what is now Palembang, on the island of Sumatra.

Srivijaya developed from a principality or principalities that had existed from at least the early third century; its emergence was facilitated by its favorable location on the trade route from India to Southeast Asia and by the fall of Funan. Between the second half of the seventh century and the ninth century, Srivijaya grew into a powerful maritime empire; it conquered the neighboring Sumatran states, western Java, western Kalimantan, and the Malay Peninsula. The empire reached its height in the second half of the ninth century and in the tenth century, during which period it was ruled by the Sailendra dynasty.

Srivijaya was probably an early feudal despotism with a highly developed system of vassal relationships. The principal source of revenue for its rulers was trade, based on the export of gold, tin, and products from the tropical rain forests; in addition, the maharajas received duties from the numerous foreign trading vessels and exploited the population through the levying of taxes and the exaction of tribute payments. Circa 922 a war began with Mataram for control of the peninsula. Circa 1016 the struggle ended in victory for Srivijaya, which was invaded, however, by the Indian state of Chola in 1025. Although its power was undermined by these conflicts, Srivijaya maintained control over the western regions of the archipelago for another two centuries. In the late 13th century, the Javans and Siamese redoubled their attacks on the empire. In the mid-14th century, Srivijaya became a tributary state of Majapahit, and it is last mentioned in 1376.

Srivijaya was a leading cultural center of Southeast Asia and an international center of Buddhism. The chief language was Old Malay; the official language was Sanskrit. In Indonesian history, Srivijaya is notable for being the first state to unite politically and culturally a significant area of the archipelago; it also established extensive ties with the states of Southeast Asia, India, China, and the Middle East.

IU. V. MARETIN [29–1416–3]

SRUTI (also *shruti*), in the classical music of India, the smallest interval between two sounds. It is also a principle of scale gradation into 22 unequal degrees. [29–1443–2]

STACHYS (woundwort), a genus of annual and perennial herbs or subshrubs of the family Labiatae. The leaves are opposite and entire. The usually pink, purple, white, or yellow flowers are in false whorls that form spicate inflorescences. The corolla has a flat or helmet-shaped upper lip. The fruit consists of four nutlike lobes.

There are about 300 species of woundwort, distributed in the temperate and subtropical zones of both hemispheres and in the mountains of the tropics. The USSR has about 55 species. The marsh woundwort (*S. palustris*) and the annual woundwort (*S. annua*) are weeds of fields, gardens, and fallow lands. The former occurs along bodies of water and in wet meadows, swamps, and marshy forests. The annual woundwort grows on dry slopes, along embankments, and in precipices and wastelands. It is poisonous to horses, as is the species *S. recta*, which grows wild on steppe and rocky slopes. The hedge nettle (*S. sylvatica*) grows in shady broad-leaved and mixed forests, amid underbrush, in ravines, and in damp meadows.

The Chinese, or Japanese, artichoke (*S. sieboldii*) is widespread in China and Japan. It is cultivated as a vegetable in East Asia and in some countries of Europe and the Americas; the tuberous formations on the roots are eaten boiled, fried, or pickled. Many species of *Stachys* yield a substantial amount of nectar. The woolly betony (*S. byzantina*, formerly *S. lanata*) is cultivated as an ornamental. [29–639–1]

STACKER, a materials-handling machine with a frontally attached lifting device or pair or forks capable of being raised and lowered. A stacker travels along the surface of the floor on wheels made of metal, plastic, or solid rubber and is designed to stack merchandise or place it on racks to a height of up to 8 m. A stacker is controlled from its cab, which, in some cases, may be raised and lowered itself. The load-lifting capacity of a stacker can be as much as 3.2 tons. [29–1443–3]

STADEN, HEINRICH VON. Born circa 1542 in Ahlen; date of death unknown.

From 1564 to 1576, Staden lived in Russia and was an *oprichnik*. After returning to Western Europe, he engaged in anti-Russian activities and worked out plans for intervention in Russia by the German emperor Rudolf II (1578) and the Swedish king John III (1581). Staden was the author of *The Land and Government of the Muscovites*, an extremely valuable source on the history of Russia in the *oprichnina* era.

STADTHOLDER, in a number of European countries, an official who exercised state authority over a certain territory. Stadtholders existed in the Netherlands during the rule of the Burgundian and Hapsburg dynasties, in the crown lands of the Austrian Empire, and in Austria-Hungary until 1918. In the German Empire from 1871 to 1918, the term stadtholder was applied to the governor of Alsace-Lorraine. The office of *Reichsstatthalter* existed in fascist Germany from 1933 to 1945. [29–1458–1]

STAFF, the chief body responsible for troop command and control. There are combined-arms staffs, staffs for the combat arms and services, and staffs for the individual branches of the armed forces.

The most important missions of the staff are to maintain troops and command bodies in combat readiness; to collect, study, process, and assess situation data and to report operational and tactical estimates and proposals to the commander to enable him to make decisions during the planning of battles and operations and in the course of combat; to plan the battle or operation, delivering missions to the troops and organizing troop command and control, cooperation, and comprehensive support; to regulate the everyday life, training, and indoctrination of military personnel; and to maintain firm discipline, military order, and organization. The staff does its work on the basis of the commander's decisions and the orders of the higher-ranking staff. The staff is headed by the chief of staff, who is the first deputy commander and who has the right to give orders to subordinate troops in the commander's name.

The armies of the slaveholding and feudal states (until the 16th century) were comparatively small and waged battle in relatively small areas, so that the leader or commander saw the field of battle and did not need a special body, or staff, for command and control of his troops. With the formation of standing national armies in Europe between the late 16th century and the early 18th century, the growth in the size of the armies, and improvements in troop organization, the functions of command and control of troops became more complex; it became necessary, for example,

to establish special quartermaster positions in charge of troop movement, billeting, and the compilation of plans and maps. The needs to be met by the general staff, therefore, gradually emerged. Commanders had adjutants who were used to command and control troops. With the appearance of mass armies in the late 18th century and an increase in the scale and duration of military operations, it became necessary to establish special bodies among the armies for command and control of large and smaller units. These bodies, which facilitated the commander's work, were the staffs. In 1792 the General Quartermaster Department in France was renamed the Main Staff of the army. In the early 19th century a main staff, staffs of armies and corps, and later staffs of divisions were established in Russia. By this time the staffs were already being given considerable authority and acted as bodies to ensure that the commander's plans were carried out.

By the late 19th century and the early 20th century, staffs in the armies of most countries had permanent tables of organization and the functions of their personnel were clearly defined. Various types of technical equipment, such as the telegraph, telephone, and radio, were used for command and control of troops. At the start of World War I, staffs of fronts were formed in the Russian Army and staffs of army groups were established in the armed forces of Germany, France, and, during the war, Great Britain. The Russian staffs of fronts and armies consisted of the directorate of the quartermaster general, who had authority over the operational, intelligence, military topography, and other sections, and the directorate of the duty general, who had authority over the inspection, general, printing, and other sections. The staff of a division included a senior adjutant of the general staff and a senior adjutant (a regimental adjutant in a regiment) who managed operational affairs, intelligence, and matters pertaining to drill and inspections. The staffs of divisions and regiments also included chiefs of communications and administrative affairs, a weapons officer, commandants and quartermasters, a senior doctor, and others.

The modern staff structure took shape in the period between the two world wars, and staffs were supplied with more advanced means of communication and transportation and with reconnaissance forces and equipment. The Staff Manual was developed in the Red Army. The staff was elaborated further during World War II. In the Red Army the staffs of fronts, armies, corps, divisions, and regiments consisted of the operational, reconnaissance, and other directorates or sections; battalion staffs comprised several officers. There were also staffs of the combat arms and services. A system of control points (command, observation, rear, and other posts) was established during offensive operations using staff forces and means to command and control troops. Experience was gained in collecting and processing situation data; organizing and supporting reliable communication with troops; carrying on cooperative operations; coordinating work among combined-armed staffs, the staffs of combat arms and services, and other command and control bodies; and setting up command and control points and moving them behind the troops during the battle or operation. In 1942 the new Field Service Manual for Staffs of the Red Army was published.

After the war the following general structure took shape in the Soviet armed forces: the General Staff of the Armed Forces of the USSR; main staffs of the branches of the armed forces; the Staff of the Rear Services of the Armed Forces; the Civil Defense staff; and staffs of the chiefs of the combat arms and services and of special forces. There are also troop staffs in formations, large units, units, and subunits. Similar staffs exist in the armed forces of foreign countries. The unified armed forces of NATO have established a unified staff, and the unified armed forces of the Warsaw Pact of 1955 have a staff of the unified armed forces of these countries. There are also various other large staffs and staffs of formations, large units, and units that differ in composition. For example, in the armed forces of the United States the staff of an infantry division and the headquarters company included within it comprise 102 men; the staffs of mechanized and armored divisions each have 115 men. The command staff of all types of divisions in the US ground forces includes a headquarters section and sections for personnel, intelligence, operations and combat training, logistics, civilian affairs, adjutant general, army aviation, field artillery, antiaircraft artillery, signal troops, engineer troops, the chemical, financial, medical, transport, and meteorological services, the commandant's office, military police, and chaplains.

With the adoption of nuclear weapons by the armed forces of various countries in the 1950's and 1960's and with the introduction of electronic equipment and full motorization and mechanization of troops, the functions of staffs became more diverse and important and their working conditions grew more complex. In the most advanced armies of today, staffs are incorporating a new technical base, setting up automated command and control systems that include computers and high-speed and secret communications equipment. Scientific methods of work for all bodies involved in troop command and control are being introduced and incorporated.

I. S. LIAPUNOV [29–1443–7]

STAFF, the full complement of properly approved employees' positions in an enterprise, institution, or organization.

In the USSR, the positions that make up an administrative staff are determined in accordance with the Model Branch Structure approved for enterprises, institutions, and organizations. A staff schedule sets forth an administrative framework, job titles, the number of staff members for each position, and salaries and pay supplements. The classification of employees as administrative personnel is carried out in accordance with the official job titles adopted by the Central Statistical Board of the USSR. The managers of enterprises, construction administrations or sites, territorial geological administrations, and certain other organizations have the right to approve and make changes in the administrative personnel within limits established for labor (centrally determined plan targets for labor) and administrative expenditures. The Ministry of Finance of the USSR decides which enterprises, institutions, and organizations belong to a particular wage category and monitors compliance with staff finance discipline (*see* DISCIPLINE, STATE). The staff, official salaries, and estimated administrative expenditures approved by the manager of an enterprise need not be registered at financial agencies.

L. N. KACHALINA [29–1459–3]

STAFF CAPTAIN (Russian, *shtabs-kapitan*), an officer's rank in the Russian Army (except for the cavalry). The rank was introduced in 1801; the corresponding rank in the period 1705–98 was lieutenant captain (*kapitan-poruchik*). [29–1443–5]

STAFF ROTMISTR (Russian, *shtabs-rotmistr*), an officer's rank in the cavalry of the Russian Army from 1801 to 1917. [29–1443–6]

STAHL, GEORG ERNST. Born Oct. 21, 1659, in Ansbach, in what is now the Federal Republic of Germany; died May 14, 1734, in Berlin. German physician and chemist.

Stahl graduated from the medical faculty at the University of Jena in 1683 and subsequently became a professor there. In 1694 he was named a professor at the University of Halle, and in 1716 he became the personal physician of the king of Prussia. Further developing the concepts of J. J. Becher, Stahl formulated the phlogiston theory in 1697; in 1703 he advanced a more detailed version. The theory, which synthesized a large body of data on reduction, combustion, and calcination, gained considerable popularity in the 18th century; it was later proved erroneous, however, by research on gases (*see* PNEUMATIC CHEMISTRY) and the findings of A. Lavoisier.

In his works on physiology, Stahl supported the idea of vitalism, and he developed the reactionary theory of animism, a term he introduced.

STÄHLIN, JAKOB (also Iakov Iakovlevich Shtelin). Born May 10, 1709, in Memmingen, Swabia; died June 25, 1785, in St. Petersburg. Art scholar and engraver. Member of the St. Petersburg Academy of Sciences.

Stählin moved to Russia in 1735. He was the tutor of Grand Prince Peter Fedorovich (later Emperor Peter III) from 1742 to 1745 and Peter's librarian from 1745 to 1747 and from 1754 to 1762. Stählin became a member of the Free Economic Society in 1766. A collector of reminiscences about Peter I the Great, Stählin wrote diaries and memoirs about events occurring in the 1740's to 1760's.

STAIGER, EMIL. Born Feb. 8, 1908, in Kreuzlingen, Switzerland. Swiss literary scholar. Writes in German.

Staiger became a professor at the University of Zürich in 1943. With W. Kayser (1906–60; Federal Republic of Germany) he established the "school of interpretation," which is related to the New Criticism. The school of interpretation views the literary work as being outside and independent of the social, historical, and biographical factors entering into its creation; it perceives the work as a specific phenomenon of human consciousness that can be understood by "direct impression" and by the interpretation of its individual aspects and components as a united whole. Staiger expounded his critical views in such works as *Time As the Imagination of the Poet* (1939) and *The Art of Interpretation* (1955).

Staiger also wrote on the classics of German literature, including the works of Geothe, and translated works of ancient Greek authors into German.

STAMMLER, RUDOLF. Born Feb. 19, 1856, in Alsfeld; died Apr. 25, 1938, in Wernigerode. German neo-Kantian legal philosopher, whose social views were close to those of the Katheder-socialists.

Stammler became a professor at the University of Marburg in 1882, at the University of Giessen in 1884, and at the University of Halle in 1885. From 1916 to 1923 he was a professor at the University of Berlin. In his book *Economy and Law From the Point of View of A Materialist Conception of History* (1896; Russian translation, 1899), he adopted a "juridical" world view and tried to refute Marxism by equating it with economic determinism. Stammler asserted that law is primary with respect to the economy and state—if not in a temporal and causal sense, then at least from the standpoint of logic. All types of societies require that people live together in an orderly manner, and law provides such regulation. Economic and political development must therefore be accomplished through partial changes in the law, and the criteria for making such changes must be the "correct law" created by human reason.

Stammler's views were criticized by V. I. Lenin, G. V. Plekhanov, and other Marxists.

STAMPS, DIES AND PRESS TOOLS (in Russian, *shtamp*), in engineering, a tool for imparting a given configuration to a workpiece by means of plastic deformation of metal stock or the division of the stock into sections. Each article requires its own tool, the design of which depends on the type of metal stock (section or sheet stock), the type of machine used (hammer forge or press), the nature of the operations to be performed, and the size of the production run.

When dies are used with forge hammers to shape section stock, the die cavities fill with stock metal during deformation, and the stock acquires the shape and size of the die cavity. The deformation of the metal is accomplished by the relative displacement of the individual working elements of the die. In this case there are two such elements: the upper half of the die, which is attached to the hammer, and the lower half, which is attached to the anvil. A distinction is made between open dies, in which the clearance between the working elements decreases during deformation, and closed dies, in which the clearance is constant. In open dies the metal is partially forced into the clearance during deformation, forming a flash, which is subsequently removed by special trimming dies. Open dies have several impressions, in which the stock is successively deformed to effect a gradual approximation of the shape of the manufactured article. The impressions are sometimes made in separate dies, and the billet is consecutively transferred from one die to the next. A distinction is made between preforming die impressions, which give the stock a preliminary shape that makes it easier to achieve the required final shape of the article, and final impressions.

In order to facilitate removal of the workpiece from the die, the side walls of the cavity are made to slope. The slopes can be made less steep if the dies are designed to incorporate knockouts (die shedders), which forcibly remove the forged articles from the die cavity. In closed impression die forging of articles with complex shapes, the dies are made in several parts with several parting lines to facilitate removal of the forging from the die. Closed dies with two cavities are used, for example, in horizontal forging machines. Dies for sheet stamping and hot stamping of section stock on crank presses consist of many parts mounted on upper and lower plates (the working elements of dies include the punch and matrix in sheet stamping, components to guide the upper plate relative to the lower, guide and locating components for positioning the stock in the die, and attachment components). Dies for cold forging and sheet-metal forming may be designed for a single operation or multiple operations. Dies of the second type are classified as progressive-action dies (the stock is subjected to various operations in different positions in the direction of the feed), and compound-action dies (various operations are performed in a single position). Small-series production calls for the use of simple dies with fewer auxiliary components and dies that are not attached to the machine elements.

STANDARD. **(1)** The banner carried by Russian cavalry units from 1731 to 1917 and by various foreign armies from the 18th to the 20th century. It consisted of a square cloth smaller than the regular banner. The staff was fitted to the stirrup and grasped by the horseman by means of a looped strap.

(2) The personal flag of a head of state, such as a monarch or president, used in several countries in the 19th and 20th centuries, including Russia. It served to mark the position of the head of state, for example, in the palace or on board a ship.

[29–1453–5]

STAPLE FIBER, chemical fiber obtained by cutting or breaking a tow of longitudinally arranged filaments into staple lengths of 40–70 mm. Yarn from staple fiber is used to make dress and other fabrics. Use of the Russian term *shtapel'noe volokno* is not recommended by GOST (All-Union State Standards.) [29–1454–1]

STAPLING MACHINE, a machine used in the textile industry to obtain sliver of staple length from chemical fibers gathered into tow; the sliver is then used to produce yarn. Stapling is accomplished by cutting or breaking the fibers in the tow. Cutting has several advantages, inasmuch as the fibers produced are more uniform in length and are free of excessive internal stress.

In the modern production process of stapling, the stapling machine uses a taker-in to form a lap or sliver from several tows, stretches the lap between feed and intermediate rollers, and cuts the fibers (at an angle of approximately 8° to the direction of the lap motion) to the required staple length with a cutting device. It then draws the staple sliver with separating cylinders and drawing rollers, crimps it with a special device, and coils it into a can by means of guide rollers in a coiling head.

STARHEMBERG, ERNST RÜDIGER VON. Born May 10, 1899, in Eferding, near Linz; died Mar. 15, 1956, in Schruns. Austrian state and political figure; large landholder. One of the leaders of the Heimwehr.

Starhemberg was minister of internal affairs in 1930 and vice-chancellor from 1934 to 1936. One of the chief organizers of the reign of terror against the working-class movement, he was particularly active in the suppression of the armed uprising of February 1934. Starhemberg left Austria after the *Anschluss* of 1938 and lived abroad until 1955. [29–1454–2]

STARK, JOHANNES. Born Apr. 15, 1874, in Schickenhof; died June 21, 1957, in Traunstein. German physicist (Federal Republic of Germany).

Stark became a professor at the Technische Hochschule in Hanover in 1906, at the Technische Hochschule in Aachen in 1909, at the University of Greifswald in 1917, and at the University of Würzburg in 1920. From 1933 to 1939, he was the president of the Reich Physical-Technical Institute in Berlin. Between 1934 and 1936, he was the president of the German Scientific Society.

In 1919, Stark received a Nobel Prize for the discovery of the Doppler effect in canal rays and for the discovery of the splitting of spectral lines in electric fields (*see* STARK EFFECT). Stark also carried out research in gas discharges. He discovered the deflection of light as it passes through nonuniform electric fields.

During Hitler's regime, Stark was an active Nazi. [29–1454–3]

STARK EFFECT, the splitting of spectral lines in electric fields. The effect was discovered in 1913 by J. Stark while studying the spectrum of the hydrogen atom. Observed in the spectra of atoms and of other quantum systems, it results from a shift of a quantum system's energy levels and the splitting of the energy levels into sublevels under the influence of an electric field. The splitting and the sublevels are referred to as Stark splitting and Stark sublevels. The term "Stark effect" is applied not only to the splitting of spectral lines in electric fields but also to the shift and splitting of energy levels in such fields.

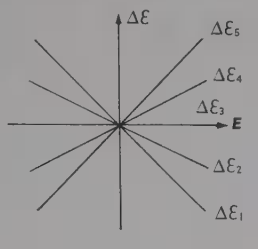

Figure 1. Dependence of the magnitude of level splitting ΔE on the strength of the electric field E in the linear Stark effect for the splitting into five sublevels of a hydrogen atom's energy level specified by a principal quantum number $n = 3$

The Stark effect has been explained on the basis of quantum mechanics. An atom (or some other quantum system) in a state with a given energy $\mathcal{E}$ acquires additional energy $\Delta\mathcal{E}$ in an applied electric field E as a result of the polarizability of the atom's electron shell and the appearance of an induced dipole moment. A nondegenerate energy level, or an energy level to which one possible state of an atom corresponds, will have an energy of $\mathcal{E} + \Delta\mathcal{E}$ in a field E; that is, the level will shift. The various states of a degenerate energy level may acquire different additional energies $\Delta\mathcal{E}_\alpha$; here, $\alpha = 1, 2, \ldots, g$, where g is the degree of degeneracy of the level (*see* ATOM). As a result, a degenerate level is split into Stark sublevels, the number of which is equal to the number of different values of $\Delta\mathcal{E}_\alpha$.

Thus, in an electric field, an energy level of an atom with a given angular momentum $M = (h/2\pi)\sqrt{J(J+1)}$—where h is Planck's constant and $J = 1, 2, \ldots$ is the quantum number of total angular momentum—is split into sublevels characterized by different values of the magnetic quantum number m_J, which represents the projection of M in the direction of the electric field. The same additional energy $\Delta\mathcal{E}$ corresponds to the values $-m_J$ and $+m_J$. Therefore, all the Stark sublevels except the sublevel with $m = 0$ turn out to have a twofold degeneracy, in contrast to the case of splitting in a magnetic field, where all the sublevels are not degenerate (*see* ZEEMAN EFFECT).

A distinction is made between the linear Stark effect, where $\Delta\mathcal{E}$ is proportional to E (Figure 1), and the quadratic Stark effect, where $\Delta\mathcal{E}$ is proportional to E^2 (Figure 2). In the linear effect, the pattern of the energy-level splitting and of the spectral lines produced upon transitions between the levels is symmetric. In the quadratic effect, the pattern is asymmetric.

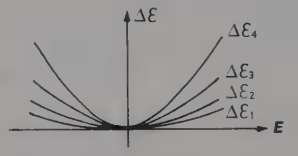

Figure 2. Dependence of the magnitude of level splitting ΔE on the strength of the electric field E in the quadratic Stark effect; the sublevels turn out to be unequally spaced

The linear Stark effect is characteristic of hydrogen in electric fields that are not too strong. For example, in fields of $\sim 10^4$ volts per cm (V/cm), the effect amounts to a few thousandths of an electron volt. An energy level of a hydrogen atom with a given principal quantum number n is split symmetrically into $2n - 1$ equidistant sublevels (Figure 1 corresponds to $n = 3$, $2n - 1 = 5$). The components of a spectral line that is split in a field E are polarized. If the direction of E is perpendicular to an observer, some of the components—called the π components—are polarized parallel to the field, while the remaining components—known as the σ components—are polarized perpendicular to the field. When observed in the direction longitudinal to the field, the π components do not appear and the σ components are replaced by unpolarized components. The intensities of the various components differ. The splitting of the H_α spectral line of hydrogen (the first line of the Balmer series) as a result of the Stark effect in shown in Figure 3.

The linear Stark effect is also observed in hydrogen-like atoms (He^+, Li^{2+}, Be^{3+}, . . .) and for highly excited states of other atoms; in a number of cases, the effect results in the appearance of forbidden lines. The quadratic Stark effect, which exhibits an asymmetric splitting pattern, is typical of many-electron atoms. The magnitude of the quadratic effect is small. For example, in fields of $\sim 10^5$ V/cm, the splitting amounts to a few ten-thousandths of an electron volt. The linear Stark effect is characteristic of molecules that are sufficiently symmetric and have a constant dipole moment. In other cases, the quadratic Stark effect is usually observed.

An important case of the Stark effect is the splitting of the electronic energy levels of an ion in a crystal lattice under the influence of the crystalline field E_{cr}, which is generated by surrounding ions. Such splitting may be as high as a few hundredths of an electron volt, is taken into account in crystal spectroscopy, and is essential for the operation of quantum mechanical amplifiers.

The Stark effect is also observed in variable electric fields. The change in the position of the Stark sublevels in a variable field E

may be used to vary the frequency of a quantum transition in quantum-mechanical devices. An example is Stark modulation (*see* MICROWAVE SPECTROSCOPY).

In particular, the influence of a rapidly varying electric field on the energy levels of atoms or ions determines the Stark broaden-

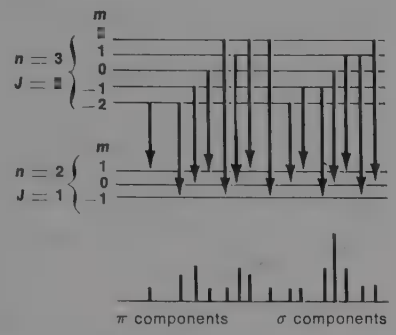

Figure 3. The splitting of the H_α line of hydrogen in an electric field. Differently polarized line components — the π components and the σ components — appear for specific combinations of sublevels.

ing of spectral lines in a plasma. The motion of plasma particles and the associated change in the distances between the particles lead to rapid changes in the electric field around each radiating particle. As a result, the energy levels of atoms or ions shift by differing amounts when they are split, leading to the broadening of spectral lines in the emission spectra of a plasma. Stark broadening makes it possible to estimate the concentration of charged particles in a plasma, for example, in a stellar atmosphere.

STARNBERG LAKE (also Starnberger See, Würmsee), a lake in the southern part of the Federal Republic of Germany, in Bavaria. Starnberg Lake is situated at an elevation of 584 m; it has an area of 57 sq km and a maximum depth of 123 m. The Würm River of the Danube basin issues from it. In summer the temperature of the lake varies from 15°C to 24°C. The lake is a popular recreation area. The city of Starnberg is located on the northern shore. [29–1457–1]

STASSFURT, a city in the German Democratic Republic, in Magdeburg District; situated on the Bode River. Population, 26,000 (1975). The city produces televisions, equipment for the soda industry, chemicals (including soda), metal goods, woodworking products, garments, and food products. [29–1457–2]

STASSFURT SALT-BEARING BASIN (also Stassfurt Basin), a section of the Upper Permian (Zechstein) Western European Basin, located within the German Democratic Republic and the Federal Republic of Germany. In the broad sense, the term is sometimes used as a synonym for the Western European Salt-bearing Basin, which stretches from Great Britain to the northwestern USSR. The salt-bearing deposits also continue beneath the North Sea.

The Stassfurt Basin covers an area of 1–1.2 million sq km. It stretches for more than 1,600 km from west to east in a band measuring 300 to 600 km in width. The thickness of the salt-bearing deposits reaches 1,200–1500 m. The basin includes geological reserves of rock salt, which, according to overall estimates amount to 1.5×10^5 cu km, or 3×10^{14} tons, and potassium salts, with estimated reserves of 135 billion tons of K_2O). Potassium salts account for its major industrial importance.

The rock salt of the Stassfurt Basin has been known since the beginning of the Middle Ages; the potassium salts were discovered in 1857. The Zechstein salt-bearing deposits are subdivided stratigraphically into five series (in ascending order): Werra, Stassfurt, Leine, Aller, and Ohre. Blanket deposits of potassium salts are found in the three lowest series. There are eight such deposits in the Werra and Northeastern German depressions, five of which are exploited by the German Democratic Republic and the Federal Republic of Germany. The deposition conditions of the strata range from nearly horizontal to complex salt dome formations. The thickness of the strata ranges from 2 to 35–40 m, and the depth at which the deposits occur, from 300 to 1,500–2,000 m. Mining work is carried out at depths of 400 to 1,000 m (rarely to 1,200 m). The Stassfurt stratum is the largest, occupying an area of at least 80,000 sq km.

The potassium deposits are of the sulfate type and contain more than 20 sulfate and chloride potassium and potassium-magnesium minerals. Kieserite-containing sylvinite (hartsalz), mixed potassium-magnesium salts, and carnallite rocks are the major products. The K_2O content in the salts mined is 10–18 percent. The mining of rock salt is carried out by underground methods (in mines) or by leaching through drilled wells. Potassium salts are worked in mines in the German Democratic Republic and the Federal Republic of Germany. In 1974, 2.8 and 2.6 million tons of potassium salts (with respect to K_2O content) were produced in the German Democratic Republic and the Federal Republic of Germany, respectively.

STATE, in a number of federated countries (USA, Mexico, Venezuela, Brazil, India, Australia, Nigeria), the name of the governmental-territorial units that form the federation. With the exception of India, states are not usually created along national lines.

The rights of a state are determined by the federal constitution and the constitution of the individual state (USA, Venezuela, Australia); however, a state does not always have the right to adopt its own constitution (in India only two of the 22 states have a constitution). The states create their own governmental bodies. As a rule, the central power either formally or in fact controls the legislative and executive activities of the states. A state is usually headed by a governor elected by the population (USA and Mexico) or chosen by the head of the federal government (India and Australia). Each state is represented in the upper chamber of the federal legislative body, either by an even number of representatives (USA, two; Mexico, two; Venezuela, two; Brazil, three; Australia, ten) or according to a norm of representation that depends on the size of the state's population (India). The mutual relations of the states to the federation and of the states among themselves are determined by the constitutions, judicial decisions, agreements among the states, and custom.

A. A. MISHIN [29–1457–4]

STATE EXPENSES COLLEGIUM (Shtats-kontor Kollegiia), a state institution in Russia in the 18th century. The staff, president, and vice-president were approved in December 1717, and the functions of the body, in December 1718. The collegium managed state expenditures and, upon order of the Senate, distributed specific amounts to governmental institutions and officials.

In November 1723 the State Expenses Collegium was converted to a Senate office, called the State Office of the Senate; between 1726 and 1730 it was subordinate to the Chamber Collegium. In July 1730, however, its status as an independent collegium was restored. In October 1780 the State Expenses Collegium was abolished. Most of its functions were transferred to the treasury offices established in St. Petersburg and Moscow, but some were transferred to the provincial financial boards and district treasury offices. [29–1459–2]

STAUB, RUDOLF. Born Jan. 29, 1890, in Glarus; died June 25, 1961, in Fex, Graubünden Canton, Switzerland. Swiss geologist.

Staub became a student at the Eidgenössische Technische Hochschule in Zürich in 1908 and later studied at the University of Zürich. From 1928 to 1957 he was a professor at both schools. His principal works dealt with the geological structure, tectonics, and geomorphology of the Alps and with general questions of geotectonics. Staub developed the idea that the continental blocks of the earth's crust sometimes shift toward the poles, as a result of subcrustal magmatic currents, and sometimes toward the equator, as a result of centrifugal forces; this leads to alternating compressions and extensions of the geosynclinal regions in the equatorial zone of the globe.

STAUDINGER, HERMANN. Born Mar. 23, 1881, in Worms; died Sept. 8, 1965, in Freiburg. German chemist (Federal Republic of Germany).

Staudinger studied at the Technische Hochschule in Darmstadt and at the universities of Halle and Munich. He was a professor at the Technische Hochschule in Karlsruhe from 1908 to 1912, at the Swiss Federal Institute of Technology in Zürich from 1912 to 1926, and at the University of Freiburg from 1926 to 1951. From 1940 to 1956 he was the director of the State Institute for Macromolecular Compounds.

Staudinger's principal works deal with the chemistry of macromolecular compounds. In 1905 he discovered ketenes, a class of organic compounds. In 1919 he proposed a method of substituting an imino group for the oxygen atom of a carbonyl group by using triphenylphosphine imines; the process is known as the Staudinger reaction. In 1922 he proved that polymers are compounds consisting of large molecules, the atoms of which are joined by covalent bonds. To describe such molecules he introduced the concept of the macromolecule. Staudinger also advanced the theory of the chain structure of macromolecules, to which he subsequently added the concepts of the branched macromolecule and the three-dimensional polymer network. He demonstrated the relationship between the molecular weight of a polymer and the viscosity of its solutions, thus laying the foundations for the development of the viscometric method for determining molecular weight. He also proposed polymer-analogue transformation reactions. In 1947, Staudinger founded the journal *Die makromolekulare Chemie*.

Staudinger received a Nobel Prize in 1953.

STAUDT, KARL GEORG CHRISTIAN VON. Born Jan. 24, 1798, in Rothenburg; died June 1, 1867, in Erlangen. German mathematician.

Staudt became a professor at the University of Erlangen in 1835. His principal works dealt with projective geometry. They sought to provide a logically complete construction of projective geometry that would not rest on concepts borrowed from metric geometry. Staudt contributed a purely projective introduction of general projective (homogeneous) coordinates and an interpretation of the introduction of imaginary quantities into projective geometry.

STAUDTE, WOLFGANG. Born Oct. 9, 1906, in Saarbrücken. German stage and motion-picture director of the Federal Republic of Germany (FRG).

Staudte became an actor in the Volksbühne Theater in 1926 and worked in the companies of M. Reinhardt and E. Piscator. He began his film career in 1931, first as an actor and later as a director. In 1943 he directed *Hooray for the Acrobat*, a comedy film about the fate of an honest performer, a clown named Charlie, in Nazi Germany. In 1946, Staudte and the directors S. Dudow, K. Maetzig, and F. Wolf formed the motion-picture studio DEFA (Deutsche Film Aktiengesellschaft) in Babelsberg, near Berlin, German Democratic Republic. This studio produced such antifascist films as *The Murderers Among Us* (1946; released in the USSR as *They Won't Be Able to Hide*), *Rotation* (1949, Soviet release, *The Brown Spiderweb*), and *The Loyal Subject* (1951, after a work by H. Mann). In the mid-1950's, Staudte began working in the film studios of the FRG. His best works, several of which warn of the danger of a rebirth of Nazism and revanchism, include *Roses for the Public Prosecutor* (1959), *The Fair* (1960), *A Get-together With the Boys* (1964), and *The Commissar* (1971).

STEDINGERS, free peasants, probably of Frisian and Saxon origin, who in the 11th and 12th centuries settled in the marshy area along the lower course of the Weser River, below the city of Bremen, on land owned by the archbishop of Bremen. For a long while the Stedingers successfully resisted enserfment. They were proclaimed heretics in 1230, and a crusade was conducted against them from 1232 to 1234. They were defeated in 1234 by the united forces of the princes at Altenesch. Some of the Stedingers were later killed; others became feudally dependent peasants. [29–1461–4]

STEENBECK, MAX. Born Mar. 21, 1904, in Kiel. German physicist (German Democratic Republic). Member of the German Academy of Sciences (1956); vice-president of the academy from 1962 to 1967.

Steenbeck studied at the Christian Albrechts University in Kiel from 1922 to 1927. From 1927 to 1945, he was employed by the firm of Siemens and Schuckert. From 1945 to 1956, he worked in the USSR. Steenbeck became a professor at the University of Jena in 1956 and was made the director of the Institute of Magnetohydrodynamics in 1958. From 1957 to 1962, he directed research in nuclear physics and nuclear power engineering in the German Democratic Republic. In 1965 he became the chairman of the Scientific Council of the German Democratic Republic.

Steenbeck's main works deal with gas-discharge physics, semiconductor physics, isotope separation, and magnetohydrodynamics. Steenbeck took part in the development of the first nuclear power plant in the German Democratic Republic.

Steenbeck was awarded the Lomonosov Gold Medal of the Academy of Sciences of the USSR. He became a foreign member of the Academy of Sciences of the USSR in 1966. [29–1461–5]

STEERING WHEELS AND CONTROL COLUMNS, control devices connected by linkage with the rudder of a ship, the elevator and ailerons of an airplane, or the road wheels of a machine such as a motor vehicle or a tractor.

The steering wheel of a ship is located in the pilothouse, and the control column of an airplane, in the cockpit. The steering wheel of a transport vehicle such as a motor vehicle is in the cab. Small ships have steering wheels that are operated manually, as are the control columns in light aircraft. Larger craft are equipped with auxiliary steering mechanisms, or boosters, which reduce to acceptable levels the force needed to turn the wheel or to operate the controls. The operation of the steering wheel on modern ships is fully automated and is facilitated by what is called a servomechanism. [29–1501–2]

ŠTEFÁNIK, MILAN RASTISLAV. Born July 21, 1880, in Košariska, Slovakia; died May 4, 1919. Czechoslovak political and military figure.

The son of an evangelical minister, Štefánik graduated from Charles University. In 1904 he moved to France, where he became a French citizen (1910) and carried out special diplomatic and intelligence assignments for the authorities. During World War I Štefánik was an officer in the French Army; he became a general in the summer of 1918.

In 1916, Štefánik became a member of the Czechoslovak National Council in Paris. He helped form Czechoslovak military units composed of prisoners of war and emigrés in the countries of the Entente and the USA. He became minister of war in the Czechoslovak emigré Provisional Government in October 1918 and helped the Entente carry out its intervention in Soviet Russia. Štefánik died in a plane crash en route from Italy to Czechoslovakia.

STEIGER, OTTO. Born Aug. 4, 1909, in Uetendorf, Bern Canton. Swiss writer. Writes in German.

Steiger studied in Bern and Paris; in the 1930's he lived in France. His main genre is the novel of social criticism, characterized by a tendency toward allegory and the use of elements of the grotesque in the plot. In such novels as *Portrait of a Respected Man* (1952; Russian translation, 1957), *The Trevenbold Brothers* (1954), and *Journey to the Sea* (1960), he satirizes and expresses hostility toward the antihumanist tendencies of bourgeois society. Steiger is also the author of the novel *The Eleven-month Year* (1962; Russian translation, 1966), the collection of short stories *A Hole in the Sound Barrier* (1965), and the political comedy *The Siege* (1960).

STEIN, BARON VOM (full name, Heinrich Friedrich Karl, Baron vom und zum Stein). Born Oct. 26, 1757, in Nassau; died June 29, 1831, at the estate of Kappenberg, Westphalia. German state figure. *Reichsfreiherr* (imperial baron).

Beginning in the 1780's, Stein held a series of important posts in the mining industry of Westphalia. From 1804 to 1807 he was a minister of the Prussian government, in which capacity he proposed sweeping reforms of the government that met with resistance from the king and his circle. Developments following the defeat of the Prussian Army at the battle of Jena-Auerstädt (1806) eventually led to Stein's appointment as head of the Prussian government in October 1807; despite the objections of the *Junkers*, who favored reactionary policies, he implemented a number of bourgeois reforms (*see* STEIN-HARDENBERG REFORMS).

In November 1808, under pressure from Napoleon I, who feared a strong Prussia, Stein was dismissed. Forced to leave Prussia, he took up residence in Prague; in May 1812 he arrived in Russia at the invitation of Tsar Alexander I. Stein developed a plan for a general uprising against Napoleonic rule in Germany. He headed the Committee on German Affairs, an organization independent of the German princes that played an important role in the struggle to liberate Germany from the Napoleonic yoke. In 1813 and 1814, Stein headed the council of administration of the liberated German territories.

Stein insisted on the need to create a German state. With the onset of reaction in Germany, he withdrew from politics. In 1827 he became a member of the Prussian Staatsrat (State Council). Stein helped found the series *Monumenta Germaniae historica*.

STEINER, RUDOLF. Born Feb. 27, 1861, in Kraljević, Croatia; died Mar. 30, 1925, in Dornach, near Basel. German mystical philosopher and founder of anthroposophy.

Steiner was influenced by the natural philosophy of Goethe, and in the period 1883–97 he edited the poet's scientific writings. Steiner was also influenced by the evolutionary teachings of C. Darwin and E. Haeckel and subsequently by the philosophy of F. Nietzsche. In 1902, Steiner embraced theosophy, heading the German branch of the Theosophical Society; after a conflict with the society in 1913 over the proclamation of J. Krishnamurti as the new Messiah, Steiner founded the Anthroposophical Society with its center at Dornach, Switzerland.

Steiner attempted to transform theosophy into an experimental science, setting as its goal the revelation of the "secret" forces of man through the use of a system of special exercises that involved eurythmics, music, the contemplation of mysteries, and meditation. Steiner's "spiritual science" claimed to combine German classical idealist philosophy and the natural scientific ideas of modern times with the various religious doctrines of antiquity and the Middle Ages (the ancient mysteries, Christianity, and Eastern religions), as interpreted in the spirit of occultism. Steiner's writings ranged over such subjects as pedagogy, education, the arts, medicine, cosmology, and the history of religion.

In 1919, Steiner began developing utopian ideas for overcoming the soulless, mechanistic economy on the basis of a spiritual approach to nature—for example, by transforming agriculture through the comprehension of the biorhythms of plants. Plato's influence was evident in Steiner's political utopia in his division of the social organism into three independent spheres—juridical, spiritual, and economic. Under conditions of the post-World War I crisis, Steiner's doctrine gained widespread acceptance primarily in Germany; it had a definite effect on the artistic intelligentsia.

Steiner was also a playwright, sculptor, and architect; the Goetheanum, an architectural complex that was built in Dornach in accordance with his design, exerted a considerable influence on architectural expressionism. The Anthroposophical Society was persecuted by the Nazis, who banned Steiner's works after 1933. Since the 1960's there has been a revival of Steinerism in Western Europe and the USA (for example, the therapeutic clinical center in Arlesheim, Switzerland).

STEIN-HARDENBERG REFORMS, bourgeois reforms implemented in Prussia from 1807 to 1814 by governments headed by Baron vom Stein and K. A. von Hardenberg.

The Edict of 1807 freed the peasants from hereditary servitude and permitted landowners to dispose of their property as they saw fit, thereby making it possible for burghers and peasants to acquire land; the edict did not affect, however, the peasants' obligations deriving from the tenure of land. The Edict of 1811, designed to regulate the freeing of the peasants, made it extremely difficult for the peasants to redeem their obligations; in order to become a freeholder, the peasant had to cede one-third to one-half the land he occupied or pay 25 times the amount of the yearly lease. The agrarian reforms fostered the development of capitalism in agriculture along "the Prussian path," by which many vestiges of feudalism were retained.

In November 1808 a municipal reform was promulgated giving the cities limited self-government. At the same time institutions at the highest level of government were reorganized, with the creation of ministries of war, domestic affairs, foreign affairs, justice, and finance. Administrative reforms were carried out to strengthen the bureaucratic centralization of Prussia; these included placing an *Oberpräsident*, appointed by the government, in charge of each province.

In 1810 and 1811 legislation was enacted to remove restrictions on productive activity, thereby abolishing the guild system, which had slowed the development of industry. Under the military reform of 1807–14 members of the nobility were no longer guaranteed officers' posts, and the use of corporal punishment was sharply curtailed. The implementation of army reforms on the bourgeois model was completed during the German people's war of liberation against Napoleon, when what was in fact universal military service was introduced (subsequently enacted into law in 1814), and a national militia—the *Landwehr*—was established.

STEINITZ, WOLFGANG. Born Feb. 28, 1905, in Breslau (now Wrocław, Poland); died Apr. 21, 1967, in Berlin. German linguist, ethnographer, and folklorist (German Democratic Republic; GDR). Academician of the German Academy of Sciences in Berlin (1951); the academy's vice-president from 1954 to 1963. Member of the Communist Party of Germany from 1927. Member of the Central Committee of the Socialist Unity Party of Germany (1954–58).

Steinitz graduated from the University of Berlin in 1927. In 1934 he emigrated to the USSR, where he was a professor at the Leningrad Institute of the Peoples of the North from 1934 to 1937. He taught at the universities of Tartu and Stockholm from 1938 to 1945. In 1945 he returned to Germany (GDR), where in 1946 he became a professor at the Humboldt University of Berlin. He served as director of the Institute of Finno-Ugric Studies and in 1953 became director of the Institute of Ethnography of the German Academy of Sciences.

In his principal works Steinitz dealt with Finno-Ugric linguistics and the history, daily life, and folklore of the Finno-Ugrian peoples; he traced the history of the sound system of the Finno-Ugric languages. He also conducted research on Russian and modern German. Steinitz wrote a textbook on the Russian language (1945) and a work on German democratic songs.

STEINMETZ, CHARLES PROTEUS (Karl August Rudolf Steinmetz). Born Apr. 9, 1865, in Breslau (now Wrocław), Poland; died Oct. 26, 1923, in Schenectady, N.Y. American electrical engineer; consulting engineer with the General Electric Company.

Steinmetz studied at the University of Breslau and graduated from the Polytechnic Institute in Zürich. He had fled to Zürich to escape the persecution of the authorities for his participation in the labor movement. In 1889 he emigrated to the USA and settled in Yonkers, N.Y., where he went to work at a small electrical shop. In 1893 he joined the General Electric Company, where he held responsible positions under the title of consulting engineer.

Steinmetz' main work dealt with the processes in electric machines and devices. He proposed an empirical formula for determining hysteresis loss (1890–92) and, in 1897, developed a symbolic method for calculating alternating current phenomena. He studied aspects of the design and analysis of illumination devices and large electric machines produced at General Electric plants.

Steinmetz was a socialist by conviction. In 1922 he addressed a letter to V. I. Lenin, in which he welcomed the social transformations in Russia.

STEINTHAL, HEYMANN. Born May 16, 1823, in Gröbzig; died March 14, 1899, in Berlin. German linguist.

Steinthal, who became a professor at the University of Berlin in 1863, was a follower of W. von Humboldt, one of the founders of the psychological school of linguistics. He developed a subjective idealist conception of language, which he applied to the solution of problems in ethnopsychology (*Völkerspsychologie*). Stein-

thal pointed out the special role of language in ethnopsychology. His views influenced the early work of A. A. Potebnia and the neogrammarians (*see* NEOGRAMMARIAN). Steinthal advanced an onomatopoeic theory of the origin of language and laid the foundations of cultural anthropology. Steinthal is known as a popularizer of Humboldt's typological classification of languages, although the changes that he introduced into this classification in 1860 did not gain recognition.

STEPHĂNESCU, GEORGE. Born Dec. 13, 1843, in Bucharest; died there Apr. 25, 1925. Rumanian composer, teacher, and conductor.

Stephănescu studied at the conservatories in Bucharest from 1864 to 1867 and in Paris from 1867 to 1871. From 1877 to 1890 he was a conductor and composer at the National Theater in Bucharest. A seminal figure in the Rumanian school of composition, he made a particularly important contribution to orchestral and chamber music. Stephănescu composed the first Rumanian symphony in 1869. He founded and was the conductor of several professional opera companies in Rumania that paved the way for the creation of a national opera theater. Stephănescu, a professor of voice and opera at the Bucharest Conservatory from 1872 to 1904, helped develop a national school of vocal music.

STEPPER MOTOR (also magnetic stepping motor), a synchronous motor in which current pulses supplied to stator windings are converted into discrete angular motions, or steps, of a rotor. A stepper motor may be either a salient-pole motor or a nonsalient-pole motor. The field windings are on the stator, and the rotor has no winding. In a variable-reluctance stepper motor, the rotor is made of a soft magnetic material. In a permanent-magnet stepper motor, the rotor is made of a hard magnetic material.

The current pulses are supplied from a power source to the field windings in sequence through a commutator. As a result, the direction of the magnetic flux in the space between the stator poles changes in discrete steps (Figure 1), causing the rotor to rotate through a certain angle θ. Each such rotation of the rotor is called a step.

The magnitude of a step depends on the number of field windings and either on the number of rotor projections (for a variable-reluctance stepper motor) or on the number of salient poles (for a permanent-magnet stepper motor). The step is usually 1.5°–3° for variable-reluctance motors or 15° for permanent-magnet stepper motors. A permanent-magnet stepper motor makes it possible to obtain a relatively high torque and ensures that the rotor does not move when the windings are not energized.

Stepper motors are used in electric stepping drives.

STEP VOLTAGE, a voltage that is caused by a current flowing in the ground or in a conducting floor and is equal to the potential difference between two points on the surface of the earth or of the floor that are separated by a distance of one pace. The magnitude of a step voltage depends on the current and on the resistivity of the ground or the floor.

Hazardous step voltages may be produced near the grounding conductors of electrical installations when a ground fault occurs. Therefore, permissible values of the resistance of grounding conductors and the resistivity of the ground are set by standards.

[29–804–2]

STERN, LEO. Born Mar. 27, 1901, in Woloka, Austria. German historian and social figure (German Democratic Republic). Member of the German Academy of Sciences (1955); professor at the University of Halle (1950).

In 1921, Stern joined the Communist Party of Austria. He studied at the University of Vienna and took part in armed proletarian uprisings in Vienna in 1927 and 1934. He emigrated in 1934 and lived first in Czechoslovakia and then in the USSR. Stern fought in the international brigades in Spain. From 1941 to 1945 he was an officer in the Red Army and fought against fascist Germany; he joined the National Committee, Free Germany.

Upon his return to Austria, Stern became a teacher. He moved to the German Democratic Republic (GDR) in 1950 and joined the Socialist Unity Party of Germany. He was vice-president of the German Academy of Sciences from 1963 to 1968; from 1957 to 1975 he was chairman of the German section of the Commis-

STERN, OTTO. Born Feb. 17, 1888, in Sorau (Żary), Silesia; died Aug. 17, 1969, in Berkeley, Calif. Physicist.

Stern graduated from the University of Breslau (Wrocław) in 1912. He joined the staff of the University of Frankfurt in 1920 as a docent and subsequently became a professor there. He was named a professor at the University of Rostock in 1922. From 1923 to 1933, Stern was a professor at the University of Hamburg and director of its physicochemical laboratory. He then emigrated to the United States; from 1933 to 1945 he was a professor at the Carnegie Institute of Technology in Pittsburgh.

Stern's principal works were devoted to nuclear physics, quantum physics, and thermodynamics. In 1920, in what is now called the Stern-Zartman experiment, he became the first to measure directly the velocities of molecules. In 1921 he suggested the possibility of experimentally verifying the space quantization of the magnetic moment of an atom; together with the German physicist W. Gerlach, he performed the verification, a report of which was published in 1922. In 1933, Stern and the German physicist O. R. Frisch became the first to measure the magnetic moment of a proton in the H_2 molecule. The method of molecular or atomic beams was developed by Stern and his colleagues. Stern received a Nobel Prize in 1943. [29–1473–2]

STERN, WILLIAM. Born Apr. 29, 1871, in Berlin; died Mar. 27, 1938 in Durham, N.C. German psychologist and idealist philosopher.

Stern was on the faculty of the University of Breslau from 1897 to 1915, becoming a professor in 1907. From 1916 to 1933 he was a professor in Hamburg, where he founded an institute of psychology to study mainly problems of child and pedagogical psychology. Stern emigrated to the United States in 1933 and became a professor at Duke University the following year.

Stern was the author of classical works on child psychology (*Psychology of Early Childhood*, 1914; Russian translation, 1915). He was particularly interested in gifted children. Stern's studies embraced a wide range of aspects of general, genetic, and applied psychology, including differential psychology. Stern was one of the first to engage in a systematic study of individual differences and to use intelligence tests. He introduced the concept of the intelligence quotient. He also pioneered in forensic psychology (see his article in the collection *Problems of Psychology*, fasc. 1, 1901). In philosophy, Stern developed the concept of "personalistics" (*Person and Matter*, vols. 1–3, 1906–24), regarding the world as a hierarchical system of "personalities" of varying ranks (adult human being, child, animal, plant, crystal). Stern contrasted matter as something determined from without with personality as some internally active and purposeful integral whole.

STERN-GERLACH EXPERIMENT, an experiment that confirmed that atoms have a magnetic moment, the projection of which on the direction of an applied magnetic field takes on only specific values, that is, is quantized with respect to direction in space. The experiment was performed in 1922 by the German physicists O. Stern and W. Gerlach. They investigated the passage of a beam of Ag atoms (and, later, beams of atoms of other elements) in a highly inhomogeneous magnetic field (see Figure 1) in order to verify the theoretically obtained equation for the space quantization of the projection μ_z of the magnetic moment μ_0 of an atom on the Z direction. The equation is $\mu_z = \mu_0 m$, where $m = 0, \pm 1, \ldots$.

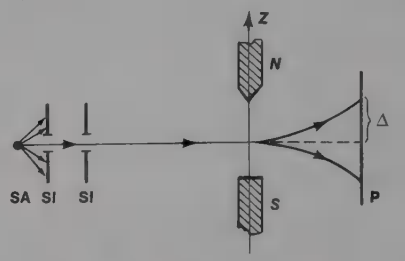

Figure 1. Schematic of the Stern-Gerlach experiment: (SA) source of atoms, (SI) slits that formed a narrow beam, (*N*, *S*) poles of a magnet created by the steady inhomogeneous field, (P) plate on which the atoms were deposited, (Δ) magnitude of the beam deflection from the original direction; the experiment was carried out in a vacuum

A force $\mathbf{F} = \boldsymbol{\mu}_z \partial \mathbf{H}/\partial Z$ acts on an atom having a magnetic moment and moving in a magnetic field **H** that is inhomogeneous in the direction longitudinal to Z. The force deflects the atom from its original direction of motion. If the projection of the magnetic moment of an atom could vary continuously, a broad diffuse band would be observed on the photographic plate P. However, in the Stern-Gerlach experiment, the atomic beam was found to be split into two components that were symmetrically shifted by a quantity Δ with respect to the original direction of propagation; that is, two narrow bands appeared on the plate. The results of the experiment indicated that the projection μ_z of an atom's magnetic moment on the direction of the field **H** takes on only two values, $\pm \mu_0$, that differ in sign. In other words, μ_0 is oriented in the direction parallel to **H** and in the opposite direction. The value of the magnetic moment μ_0 that was measured in the experiment from the shift Δ turned out to be equal to the Bohr magneton.

The Stern-Gerlach experiment played a major role in the further development of concepts of the electron. According to the Bohr-Sommerfeld theory, the orbital angular momentum and, consequently, the magnetic moment of the atoms used in the experiment, which have a single electron in the outer shell, should be equal to zero. Therefore, such atoms should not, in general, be deflected by a magnetic field. The Stern-Gerlach experiment showed that, contrary to the theory, the atoms used have a magnetic moment. In 1925, the Stern-Gerlach experiment, together with previous experiments, led G. E. Uhlenbeck and S. Goudsmit to the hypothesis that the electron has intrinsic angular momentum, which is called spin.

STERNHEIM, CARL. Born Apr. 1, 1878, in Leipzig; died Nov. 3, 1942, in Brussels. German writer and critic.

The son of a banker, Sternheim studied philosophy, literature, and psychology in Munich and Leipzig. He emigrated to Belgium before 1933; in the latter years of his life he withdrew from literature. In his early works, Sternheim polemized with the aesthetics of naturalism from a neoromantic point of view. He revealed the inner decay and degeneration of the bourgeoisie and the kaiser's arrogant aristocracy in a cycle of satirical plays drawn "from the

heroic life of a bourgeois." These plays, which make use of elements of the grotesque, include *The Trousers* (1911), *The Box* (1912), *Burgher Schippel* (1913), *The Snob* (1914), *1913* (1915), and *Tabula Rasa* (1916). Sternheim's perceptive characterization and sometimes shockingly expressive language gave his plays a formal similarity to the drama of expressionism. Sternheim also wrote novellas; publicist works, such as the collection of essays *Berlin, or Juste Milieu* (1920); works about art; and literary criticism.

STERN-ZARTMAN EXPERIMENT (in Russian, called the Stern experiment), an experimental determination of the speeds of gas molecules in thermal motion. It was first carried out by O. Stern in 1920. The Stern-Zartman experiment confirmed the validity of the foundations of the kinetic theory of gases.

The gas studied in the experiment was a rarefied silver vapor, which was obtained by vaporizing a silver coating from a platinum wire heated by an electric current. The wire was placed in a vessel from which air had been evacuated, so that the silver atoms freely escaped from the wire in all directions. To obtain a narrow beam of escaping atoms, a barrier with a slit, through which the atoms impinged on a brass plate maintained at room temperature, was set up in the path of the escaping atoms. The silver atoms were deposited on the plate as a narrow band, forming a silver image of the slit. A special device was used to set the entire apparatus in rapid rotation about an axis parallel to the plane of the plate. As a result of the rotation of the apparatus, the atoms impinged on another site on the plate because the plate shifted as the atoms traversed the distance l from the slit to the plate (see Figure 1).

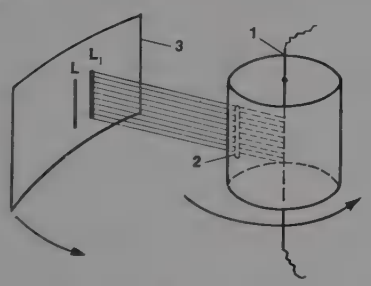

Figure 1. Schematic of the Stern-Zartman experiment: (1) silver-coated platinum wire, (2) slit forming a beam of silver atoms, (3) plate on which the silver atoms were deposited, (L) location of the band of deposited silver when the apparatus was stationary, (L_1) location of the band when the apparatus rotated

The shift of the plate increases as the angular velocity ω of the apparatus increases and decreases as the speed v of the silver atoms increases. If ω and l are known, v may be determined. Since the atoms move with different speeds, the band spreads and becomes broader as the apparatus rotates. The density of the silver deposit at a given point of the band is proportional to the number of atoms moving with a given speed. The maximum density of the deposit corresponds to the most probable velocity of the atoms.

The values obtained in the Stern-Zartman experiment for the most probable velocity were in good agreement with the theoretical values obtained on the basis of the Maxwellian distribution of molecules over velocities. [29–1473–3]

STETTIN, PEACE OF (1570), a treaty concluded between Sweden and Denmark, in the city of Stettin in Pomerania (now Szczecin, Polish People's Republic). The Peace of Stettin ended the Seven Years' War of the North (1563–70) and reestablished the former boundaries between Sweden and the Danish-Norwegian kingdom. In return for an indemnity, Denmark gave back to Sweden the port of Älvsborg, which had been captured during the war. [29–1477–2]

STETTIN LAGOON, a lagoon off the Baltic Sea, on the coasts of the German Democratic Republic (GDR) and Poland. The Stettin Lagoon measures 33 km in length and 46 km in width. The depth of the shipping channel reaches 8.5 meters. The Oder (Odra) River flows into the lagoon. Its principal port is Szczecin, which is situated on the Oder. [29–1603–2]

STIEBER, WILHELM. Born 1818; died 1882. Prussian police official.

Stieber was head of the Prussian political police from 1850 to 1860. Using forgery and provocation, he organized the trial of a group of participants in the Silesian weavers' uprising of 1844, accusing them of forming a "communist conspiracy"; he also organized a trial of members of the Communist League (*see* COLOGNE COMMUNIST TRIAL OF 1852). Stieber was one of the authors of the slanderous book *Communist Plots of the 19th Century* (1853–54).

STIEDRY, FRITZ. Born Oct. 11, 1883, in Vienna; died Aug. 9, 1968, in Zürich. Austrian conductor.

Stiedry studied music at the Vienna Conservatory and received further training in the opera theaters of Vienna and Dresden as an assistant conductor to G. Mahler and E. von Schuch. Until 1923 he conducted the Berlin Opera. He led the Vienna Volksoper in 1924 and 1925 and the Berlin Municipal Opera from 1929 to 1933; he also undertook several European tours.

After the fascists came to power, Stiedry left Germany and served as principal conductor of the Leningrad Philharmonic from 1933 to 1937. In 1938 he took up residence in the USA, where he founded and conducted the New Friends of Music Orchestra. In 1946 he was engaged as a conductor at the Metropolitan Opera. He spent the last years of his life in Switzerland.

Stiedry combined an impetuous performance style with a logical approach to the music and a sense of form. These qualities made him an outstanding interpreter of the Viennese classical school and the romantics, notably W. A. Mozart, J. Haydn, L. van Beethoven, J. Brahms, and G. Mahler. He was also known for his performances of the operas of G. Verdi and R. Wagner. Stiedry conducted the premiere of D. D. Shostakovich's First Piano Concerto. M. M. IAKOVLEV [29–1478–2]

STIERNHIELM, GEORG. Born Aug. 7, 1598, in Svartskär, Dalarna; died Apr. 22, 1672, in Stockholm. Swedish poet; scholar of encyclopedic scope.

Stiernhielm studied in Germany and Holland. In the allegorical-didactic narrative poem *Hercules* (1648, published 1658) he affirmed the ideas of Renaissance humanism and moral stoicism. Stiernhielm was the first in Swedish literature to use classical and Renaissance plots; he introduced accentual versification, the hexameter line, the alexandrine, the sonnet, and other verse forms and meters into Swedish poetry. Stiernhielm was the compiler of an unfinished dictionary entitled *Treasury of the Language of the Svear and Götar* (1643).

[29–1143–1]

STIFTER, ADALBERT. Born Oct. 23, 1805, in Oberplan; died Jan. 28, 1868, in Linz. Austrian writer and painter of the late romantic period.

Stifter studied at the University of Vienna from 1826 to 1830. From 1849 to 1866 he was an inspector in the public schools of Upper Austria.

Stifter's belief in the humanistic ideals of the German Enlightenment is reflected in his *Indian Summer* (1857), a psychological *Bildungsroman*; his political conservatism is seen in the historical novel *Witiko* (1865–67). In his collections of short stories and novellas, such as *Studies* (vols. 1–6, 1844–50) and *Colored Stones* (1853), he gives an idyllic depiction of the mores of an Austrian village. His idealist views on public education and the humanistic upbringing of the individual are presented in such pedagogic works as *On the School and the Family* (published 1952); he based these views on a faith in the power of reason to destroy social evils.

As a painter, Stifter produced for the most part romantic landscapes, such as *View of the Meadows of the Western Hungarian Alps in Inclement Weather* (A. Stifter Museum, Vienna). Stifter's expressive, plein-air style of painting made him one of the forerunners of German and Austrian impressionism.

ŠTIGLIC, FRANCE. Born Nov. 12, 1919, in Kranj, Slovenia. Yugoslav motion-picture director.

Štiglic studied in an art school in Ljubljana. During the fascist occupation he served in the war of liberation. After 1945 he worked as an actor and journalist, and in 1946 he directed his first film, the documentary *Youth Builds*. Štiglic later directed several feature films, mainly about the heroic struggle of the Yugoslav people against the German and Italian occupiers during World War II. These include *On Our Own Land* (1948), *Trieste* (1950), *Wolf Night* (1955), *Valley of Peace* (1957), and *The Ninth Circle* (1960). Štiglic has made several films on modern life, including *Visa of Evil* (1959), *One Fine Day* (1962), the children's comedy *Don't Cry, Peter* (1964), and *A Tale of Good Folk* (1975).

O. V. IAKUBOVICH [29–1477–6]

STILLE, HANS. Born Oct. 8, 1876, in Hanover; died there Dec. 26, 1966. German geologist (Federal Republic of Germany).

Stille graduated from the University of Göttingen (1899). He began working in the geological survey in Berlin in 1900. He was a professor at the Technische Hochschule in Hanover (from 1908) and at the universities in Leipzig (1912), Göttingen (from 1913), and Berlin (from 1932). From 1945 to 1950 he was vice-president of the German Academy of Sciences, and from 1946 to 1950 he served as director of the Geotectonic Institute, which he had founded in West Berlin.

Stille's works on the tectonics of Europe and comparative historical analysis of the folded regions of Europe, North and South America, Southeast Asia, and the Pacific Ocean became world famous. Stille developed the idea of the alternation in earth history of long periods of growing consolidation of the crust and shorter global phases of folding, stressing the universality of these phenomena throughout the world. He noted the consistent relationship between manifestations of magmatism and the stages of development of geosynclinal regions, singling out initial, subsequent, and terminal magmatism. He subdivided geosynclinal regions into the highly magmatic eugeosynclines and the weakly magmatic miogeosynclines. He identified (1955) the Assyntic orogenic phase, establishing the importance of a late Precambrian tectonic stage in the development of the earth.

STIRNER, MAX (pen name of Johann Kaspar Schmidt). Born Oct. 25, 1806, in Bayreuth; died June 26, 1856, in Berlin. German Young Hegelian philosopher, ideologist of anarchism.

In his *The Ego and His Own* (1845), Stirner attempted to promulgate a solipsistic point of view in anthropology, ethics, and law. The theoretical point of departure for Stirner's world view is his thesis of self-awareness as the creative force of history. Man's ideals and social traits, according to Stirner, represent something universal, since all personality is the same. Hence everything relating to man in general does not relate to the given ego. The concepts of man, law, morality, and the like were treated by Stirner as "specters," alienated forms of the individual consciousness. Denying all norms of conduct, Stirner asserted that the original sources of law and morality are the power and the might of the individual personality. The will of the individual establishes the truth of phenomena ("I am the criterion of truth"). Man should seek not social, but his own personal freedom, inasmuch as, according to Stirner, behind every social formation are concealed the egotistical interests of individual persons. Nihilism and anarchism proved to be the general result of Stirner's views.

During the 1840's and 1850's, Stirner enjoyed a certain success among the petit bourgeois intelligentsia, and he exerted some influence on M. A. Bakunin and F. Nietzsche. K. Marx and F. Engels, in their *The German Ideology* (see *Soch.*, 2nd ed., vol. 3, pp. 103–452), offered a devastating critique of Stirner's subjective idealism and his petit bourgeois individualism and anarchism; they demonstrated the utter groundlessness of his criticism of communism.

ŠTÍTNÝ, TOMÁŠ. Born circa 1333; died circa 1405. Czech writer.

Štítný studied at the University of Prague. He wrote the first prose works in Czech and was a forerunner of the writers of the Hussite era. His tracts include *On the Three States—Virgin, Married Woman, and Widow; On Man, Wife, and Servants*; and *Words From Conversations*. Reflecting the views of the petty nobility, who were opposed to the Catholic Church, the tracts criticized the contemporary social order, defended the common man, and preached Christian morality and moral self-improvement. Štítný's style was simple and clear.

STOCK (geology), a cylindrical, tear-shaped, or cube-shaped body of rock or useful mineral. Its intersecting contacts with the country rock are irregular in outline and complicated by swells

and shoots. Stocks vary in width from a few meters to several kilometers and have a vertical extent of up to several kilometers.

Three types of stocks are distinguished according to conditions of formation: tectonic, magmatic, and metasomatic. Tectonic stocks occur as a result of squeezing out the plastic substance of rocks during tectonic deformations, for example, stocks of rock salt in regions of tectonic salt structures.

Magmatic stocks form when a magmatic melt enters the country rock. In the early geosynclinal stage, stocks of ultrabasic and basic rocks are formed, as well as stocks of chromites and titanomagnetites associated with them. In the middle stage, stocks of granitoids are formed. In the late stage of the geosynclinal cycle and under platform conditions, stocks of syenites, porphyries, porphyrites, diabases, and andesites are formed.

Metasomatic stocks form when the rock is replaced by a mineral substance precipitated from hot hydrothermal solutions circulating in the crust. Examples of such stocks are those of copper, lead, zinc, tin, antimony, and other metal ores. [29–1482–3]

STOCKHAUSEN, KARLHEINZ. Born Aug. 22, 1928, in Mödrath, near Cologne. German composer (Federal Republic of Germany). Leading exponent of avant-garde music.

In 1951, Stockhausen graduated from the Hochschule für Musik in Cologne, where he had studied piano; he later studied composition under F. Martin, O. Messiaen, and D. Milhaud. In 1953 he began composing in the electronic music studios of West German Radio in Cologne. Most of his compositions, notably *Counterpoints* (1953), *Groups* (1957), *Cycle* (1959), and *Moments* (1962), are the result of explorations in aleatoric and electronic music and are devoid of any significant ideological or artistic content. Stockhausen's music, a typical example of elitist bourgeois art, has not gained recognition from the public.

[24–1484–1]

STOCKWORK, an ore body formed by a mass of rock permeated by a dense network of variously oriented veins and veinlets containing the ore minerals; such minerals in the form of phenocrysts are usually found in rocks interpenetrated by veinlets.

A distinction is made between areal and linear stockworks. Areal stockworks are cube-shaped with sinuous boundaries. Linear stockworks extend in one direction. The dimensions of stockworks range from a few dozen meters to several kilometers. Stockworks are classified with the group of hydrothermal formations that arise upon the deposition of the metal-bearing substance from hot mineralized solutions circulating in fissured rock. Some deposits of copper, molybdenum, tungsten, gold, tin, beryllium, uranium, mercury, and other metal ores belong to this group. [29–1483–1]

ŠTOLL, LADISLAV. Born June 26, 1902, in Jablonec nad Nisou. Czech critic, literary scholar, and publicist. Academician of the Czechoslovak Academy of Sciences (1960). Honorary doctor of Moscow State University (1972). Member of the Communist Party of Czechoslovakia since 1926; member of the Central Committee of the CPC since 1946.

Štoll became the director of the Czech and World Literatures Institute of the Czechoslovak Academy of Sciences in 1972. A leading Czech Marxist critic since the 1930's, he is the editor of a number of Communist publications. His work deals chiefly with the contemporary ideological struggle, the development of socialist culture, the role of the intelligentsia in public life, and *Partiinost'* (party spirit) in literature. In his work *Thirty Years of Struggle for Socialist Poetry* (1950), Štoll revealed the importance of the tradition of S. K. Neumann and J. Wolker for the development of Czech literature. In the monograph *On Form and Structure in the Art of the Word* (1966; K. Gottwald State Prize, 1972), Štoll gave a critical analysis of the Russian formalist school and Czech structuralism.

STOPH, WILLI. Born July 9, 1914, in Berlin. Party and state figure of the German Democratic Republic (GDR). Hero of Labor of the GDR.

The son of a worker, Stoph was a mason by trade. He joined the Communist Youth League in 1928 and the Communist Party of Germany in 1931. Under the fascist dictatorship (1933–45) he actively opposed the Nazi regime. After the defeat of fascism he engaged in high-level party and administrative work.

From 1945 to 1948, Stoph headed several departments of the German Central Administration for Industry. In 1950 he became a member of the Central Committee of the Socialist Unity Party of Germany (SED). He was a secretary of the party's Central Committee from 1950 to 1953, when he became a member of the Politburo of the Central Committee. In 1950 he became a deputy to the People's Chamber of the GDR, and from 1950 to 1952 he served as chairman of of its commission on economic affairs.

Stoph was minister of the interior from 1952 to 1955 and minister of national defense from 1956 to 1960. In 1959 he was given the rank of general of the army. He served as deputy chairman of the Council of Ministers of the GDR from 1954 to 1962, first deputy chairman from 1962 to 1964, and chairman from 1964 to 1973; he became chairman again in 1976. Stoph was a member of the Council of State of the GDR in 1963 and 1964, deputy chairman from 1964 to 1973, and chairman from 1973 to 1976, when he again assumed the post of deputy chairman.

Stoph has been awarded the Order of Karl Marx, other orders and medals of the GDR, and the Order of Lenin. [29–1487–2]

STORM, THEODOR. Born Sept. 14, 1817, in Husum; died July 4, 1888, in Hademarschen. German writer.

The son of a lawyer, Storm studied law in Kiel in 1837 and 1838 and in Berlin in 1838 and 1839. He began his career as a lawyer in 1843 and practiced law in Husum, Potsdam, and other cities.

In many ways, Storm's lyric poetry continued the romantic tradition. His verse was characterized by immediacy and sincerity of feeling and by musicality; it had roots in folklore. Storm's main themes were love, art, and the natural beauty of Schleswig-Holstein; many of his poems are about the history of his native region. Storm's novellas are also deeply lyrical. He evolved from his early novellas of mood, such as *Immensee* (1849, published 1852) and *Angelica* (1855), to his novellas of action written in the 1870's and 1880's.

The social content of Storm's later and artistically most perfect novellas, such as *Hans and Heinz Kirch* (1882), attest to the increasingly realistic and antibourgeois tendencies of his work. The theme of art, as seen in *Paul Puppetmaster* (1874), and that of the historical past, as seen in *Renate* (1878), are linked to Storm's basic theme of the disappearance of the patriarchal order. Storm's greatest literary achievement is the novella. *The Rider of the White Horse* (1888).

ZH. P. SARKISIAN [29–1485–2]

STORM, an assault upon an enemy force defending a population point such as a fortress or a large city or upon enemy forces defending positions they have fortified strongly. Pillboxes, individual strongpoints, and fortified buildings are usually attacked by specially trained storm detachments or groups, which are formed from subunits of various branches of the armed forces or from special troops. [29–1502–3]

STOSS, VEIT (also Wit Stosz, Wit Stwosz). Born circa 1455 in Horb, Württemberg; died 1533 in Nuremberg. German sculptor, painter, and engraver; marked the transition from the Middle Ages to the Renaissance in German and Polish sculpture.

From 1477 to 1496, Stoss worked primarily in Kraków. His works executed in Poland include the tombstone of Peter of Bnin (stone, c. 1494) in the cathedral in Włocławek and his most important Polish work, the high altar of the Church of St. Mary in Kraków (wood, 1477–89). The altar has a round wooden sculpture in the central portion and relief work, with painted landscape backgrounds, on the side panels. The festive polychromy of the Kraków altar, its wealth of human types, and its dramatic emotional force, which is emphasized by the tense rhythm of the folds of the clothing, place this work by Stoss among the finest examples of European sculpture.

In 1496, Stoss returned to Nuremberg, where he was to remain for virtually the rest of his life. His works from the 1490's to the 1520's include the *Madonna From Stoss' House* (wood, c. 1499, German National Museum, Nuremberg), the *Annunciation* (wood, 1517–18, Church of St. Lorenz, Nuremberg), and the altar of the cathedral in Bamberg (wood, 1520–23). These works attest to a deepening of Stoss' Renaissance tendencies. The faces are softer and smoother; the play of the folds of the clothing and the gestures and poses of the figures reveal more harmoniously the plasticity of the forms. Stoss, moreover, made less use of polychromy in these later works.

STRAIN, a pure culture of a species of microorganism in which its morphological and physiological characteristics are studied.

Strains can be isolated from a variety of sources, for example, soil, water, or food, or they can be isolated from a single source at different times. Hence, the same species of bacterium, yeast, or microscopic fungus may have a great many strains, differing from one another in several characteristics, such as sensitivity to antibiotics and capacity to produce toxins and enzymes. Commercial strains of microorganisms developed as a result of selection and used in industry for the microbiological synthesis of proteins (including enzymes), antibiotics, vitamins, and organic acids are much more productive than wild strains. [29–1446–5]

STRALSUND, a city in the German Democratic Republic, in the *Bezirk* (district) of Rostock. Population, 72,100 (1975). Stralsund, a port on the Baltic Sea and a railroad junction, is linked by a road and rail embankment with Rügen Island. Industry is represented by shipbuilding, which produces chiefly fishing vessels, and the production of tin cans for the canning industry. Stralsund has a wood-products industry and a food-processing industry, whose products include beet sugar. [29–1487–5]

STRALSUND, PEACE OF (1370), a treaty between Denmark and the Hanseatic League concluded on May 24, 1370, in the city of Stralsund to end a war (1367–70) between the two parties. The victorious Hanseatic cities secured confirmation and broadening of their trade privileges, freedom of trade in Denmark, and possession for 15 years of four cities on the eastern shore of the Øresund and two-thirds of the customs' revenues of the cities; Denmark also promised not to choose a new king without the agreement of the Hanseatic cities. The peace consolidated the trade monopoly of the Hanseatic cities in northern Europe and their military and political power. [29–1488–1]

STRAUSS, DAVID FRIEDRICH. Born Jan. 27, 1808, in Ludwigsburg; died there Feb. 8, 1874. German philosopher, a Young Hegelian.

Strauss studied in Tübingen from 1825 to 1831 and was influenced by F. C. Baur (*see also* TÜBINGEN SCHOOL). In his *The Life of Jesus Critically Examined* (vols. 1–2, 1835–36; Russian translation, books 1–2, 1907), which began the "process of the decomposition of the Hegelian system" (K. Marx and F. Engels, *Soch.*, 2nd ed., vol. 3, p. 15), Strauss rejected the historical reliability of the evangelical legends and examined them as myths created by the spiritual substance of the era. Strauss regarded Jesus Christ as a historical person and separated him from the "eternal" idea of god-man as a foundation of Christian faith. In the second edition of *The Life of Jesus* (1864) and in *The Old Faith and the New* (1872; Russian translation, 1906), Strauss followed L. Feuerbach in preaching a pantheistic religion based on the feeling of human dependence on universal law.

STRAUSS, JOHANN (the Elder). Born Mar. 14, 1804, in Vienna; died there Sept. 25, 1849. Austrian composer, violinist, and conductor.

Strauss studied violin with A. Polischansky and composition with I. von Seyfried. He joined J. Lanner's quartet in 1819 and became assistant conductor of Lanner's orchestra in 1824. In 1825, Strauss organized his own orchestra, which, in 1833, embarked on a series of European concert tours.

Strauss, one of the most popular masters of dance music of his day, further developed the musical idiom of Lanner, particularly in his waltzes. His distinctive dance cycles consist of several waltzes framed by an introduction and conclusion. Among Strauss' more than 250 works are 152 waltzes, the most popular of which are the *Donau-Lieder, Lorelei-Rheinklänge, Gabrielen-Walzer, Taglioni-Walzer*, and *Bajaderen-Walzer*. [29–1489–1]

STRAUSS, JOHANN (the Younger). Born Oct. 25, 1825, in Vienna; died there June 3, 1899. Austrian composer, conductor, and violinist. Son of the composer J. Strauss.

In 1844, J. Strauss, the Younger, organized his own orchestra; after his father's death he merged the family orchestras into an ensemble with which he made several European tours and appeared in America. From 1856 to 1865 and in 1869 and 1872 he directed concert seasons in Pavlovsk, near St. Petersburg, and in 1886 he performed in St. Petersburg and Moscow. Several of his compositions have a Russian theme: *Farewell to St. Petersburg* (1858), the polka *In Pavlovsk Forest* (1869), and the fantasy-waltz *In a Russian Village* (1873).

Strauss was both an outstanding conductor and a remarkable violin virtuoso, and he combined both these roles in his concert performances. He enriched the dance music repertoire with a variety of compositions, including some 500 waltzes, galops, polkas, and quadrilles. His waltzes, notable for their beautiful melodies and stirring rhythms, have many ties with traditional Austrian folk music and with Viennese music evocative of everyday life.

Strauss created the classic Viennese waltz, for which he was crowned "King of the Waltz" by his contemporaries. The melodies of his finest waltzes (*An der schönen blauen Donau* [the *Blue Danube*], *An Artist's Life, Tales From the Vienna Woods, Vienna Blood, Voices of Spring*, and *Wine, Women, and Song*), galops

(Perpetuum Mobile), and polkas (*Tritsch-Tratsch* and *Pizzicato Polka*) have achieved world renown. Strauss also composed classic Viennese operettas, the finest of which include *Die Fledermaus* (1874), *The Merry War* (1881), *A Night in Venice* (1883), and *The Gypsy Baron* (1885).

Strauss' younger brothers Joseph (1827–70) and Eduard (1835–1916) were also composers and conductors.

M. M. IAKOVLEV [29–1489–2]

STRAUSS, RICHARD. Born June 11, 1864, in Munich; died Sept. 8, 1949, in Garmisch-Partenkirchen. German composer and conductor.

The son of a horn player, Strauss studied piano and violin as a child. He studied music theory and orchestration under F. W. Meyer. Strauss achieved an international reputation as a conductor, above all for performances of his own works. He regularly toured various countries, traveling to Russia for the first time in 1896. He was the principal conductor of the Royal Opera in Berlin from 1898 to 1918 and of the Vienna State Opera from 1919 to 1924. After the fascists came to power, Strauss was appointed president of the Reichsmusikkammer (State Music Council), but he was removed from the post in 1935.

Strauss' most important compositions are his program symphonies, symphonic poems, and operas. His symphonic poems, which continue the traditions of the program symphony established by H. Berlioz and F. Liszt and of the orchestral style of R. Wagner, often take their plots and subject matter from classical literature, as in *Macbeth* (1886), *Don Juan* (1888), *Till Eulenspiegel's Merry Pranks* (1895), and *Don Quixote* (1897), and from ancient legends. Several of Strauss' works were influenced by F. Nietzsche's philosophy, notably the tone poems *Death and Transfiguration* (1889) and *Thus Spake Zarathustra* (1896).

In his first works for the stage, the operas *Guntram* (1894; years here and below refer to production) and *Feuersnot* (1901), Strauss was influenced by Wagner; he subsequently developed his own style, which reflected elements of expressionism and neoclassicism. In his operas he drew on a variety of traditions: *Salome* (1905), *Elektra* (1908), and *Ariadne auf Naxos* (1912) are in the tradition of the mythologically oriented *opera seria*; *Der Rosenkavalier* (1911) recalls the old comic opera; and *Die ägyptische Helena* (1928) and *Die Lieb der Danae* (1952) are based on subject matter from ancient history and mythology.

At their finest, Strauss' scores are characterized by deep psychological insight, a heightened expressiveness, dramatic tension, and the subtle transmission of states of mind ranging from a profound sense of tragedy and philosophic concentration to joyful humor. Strauss' music is noted for its elegance, its beautiful melodies, its bold and rich harmonies, and its magnificent and colorful orchestration; at the same time, elements of naturalism appear in such works as *Sinfonia domestica* (1903), and certain works exhibit an exaggerated expressiveness and an attempt to create musical "pictures."

In his final period Strauss turned away from large orchestras and strove for a transparent orchestration, a more subtle and simple musical idiom, and a laconic means of expression in such works as the opera *Capriccio* (1941); *Metamorphosen* (1946), for 23 solo strings; and *Three Songs for Voice and Orchestra* (1948).

Strauss, who greatly influenced 20th-century European music, contributed to the development of program music and of the opera and enriched the expressive possibilities of the orchestra. His finest works are marked by a humanist spirit, a love of life, and an affirmation of the ideals of beauty. Strauss was awarded honorary doctorates by the universities of Heidelberg and Munich in 1902 and was elected a member of the Academy of Arts in Berlin in 1909.

M. M. IAKOVLEV [29–1490–1]

ŠTRBSKÉ PLESO, a mountain climatic health resort in Czechoslovakia, in the Slovak Socialist Republic, in the Tatra Mountains. Štrbské Pleso is situated on the shore of the lake of the same name, at an elevation of 1,350 m. Winters are mild, with an average January temperature of −5.6°C; summers are moderately warm, with an average July temperature of 14.3°C. Precipitation is 955 mm annually. Štrbské Pleso has a sanatorium for children and adults suffering from respiratory diseases other than tuberculosis. The health resort also has facilities for tourism, skiing, and mountain climbing. [29–1493–2]

STRECKER, ADOLF FRIEDRICH LUDWIG. Born Oct. 21, 1822, in Darmstadt; died Nov. 7, 1871, in Würzburg. German organic chemist.

Having studied under J. von Liebig, Strecker became a professor at the University of Christiania (now Oslo) in 1851. He became a professor at the University of Tübingen in 1860 and at the University of Würzburg in 1871.

Strecker's principal works are devoted to the study and synthesis of compounds that occur in nature. In 1850 he developed the process known as the Strecker amino acid synthesis, a method for preparing α-amino acids from aldehydes, hydrocyanic acid, and ammonia. He demonstrated that amino acids, when acted upon by nitrous acid, form hydroxy acids, and in 1851, together with N. N. Sokolov, he prepared glycolic acid from glycine; Strecker also produced lactic acid from alanine. In 1848 he extracted taurocholic acid and taurine from bile. In 1861 he became the first to prepare guanidine by the action of potassium chlorate and hydrochloric acid on guanine. In 1868, Strecker proposed a method for synthesizing the salts of alkanesulfonic acids by the alkylation (with alkyl halides) of sulfites; the process is known as the Strecker synthesis. [29–1495–1]

STREITBERG, WILHELM. Born Feb. 23, 1864, in Rüdesheim; died Aug. 19, 1925, in Leipzig. German linguist.

Streitberg became a professor at the University of Fribourg (Switzerland) in 1889, the University of Münster in 1899, the University of Munich in 1909, and the University of Leipzig in 1920. A neogrammarian, he dealt in his principal works with comparative and historical Germanic linguistics. In addition to conducting research on the Proto-Germanic and Gothic languages, he published Gothic texts (with parallel Greek originals), which he furnished with commentary and *apparatus criticus*. He was also interested in questions of general Indo-European studies. In 1892, Streitberg founded, with K. Brugmann, the journal *Indogermanische Forschungen*.

A. A. KOROLEV [29–1494–3]

STRESEMANN, GUSTAV. Born May 10, 1878, in Berlin; died there Oct. 3, 1929. German political figure.

From 1903 to 1918, Stresemann was deputy chairman of the League of Saxon Manufacturers. In 1903 he joined the National Liberal Party of Germany, and in 1907 he was elected for the first of several times to the Reichstag. During World War I, Stresemann was an active supporter of annexation. After the war he was one of the organizers and leaders of the German People's Party. During this period he shunned the extreme right groupings of the bourgeoisie and cooperated with Social Democratic leaders. From August to November 1923, Stresemann as chancellor headed the so-called Great Coalition (including representatives ranging from the German People's Party to the Social Democrats), which helped the German bourgeoisie deal with a severe political crisis. In August 1923, Stresemann became foreign minister. Strengthening German imperialism under cover of peacemaking rhetoric, Stresemann concluded international agreements (Dawes Plan, Locarno Treaties of 1925) and arranged for

Germany's entry into the League of Nations (1926)—all of which constituted a revision of the Versailles Treaty of 1919. Stresemann carried out a policy of rapprochement with the Western countries while advocating development of relations with the USSR (the Berlin Treaty concerning neutrality of 1926).

L. I. GINTSBERG [29–1494–1]

STRIKEBREAKER, in capitalist countries, an individual used by employers to disrupt strikes and to weaken workers' unions. Strikebreakers are recruited from déclassé elements and from people without class consciousness, as well as from unemployed people who are pressed by need. Unemployment is the economic foundation of strikebreaking. In many capitalist countries, especially the USA, there are legal organizations that supply strikebreakers to firms whose employees are involved in job actions. Bourgeois propaganda uses any means to hide the profound amorality of strikebreaking by evoking the right to work that labor allegedly enjoys under capitalism. Bourgeois labor law actively encourages strikebreaking. [29–1494–2]

STRITTMATTER, ERWIN. Born Aug. 14, 1912, in Spremberg. German writer of the German Democratic Republic (GDR). Member of the Academy of Arts of the GDR (1959). Member of the Socialist Unity Party of Germany. First secretary (1959–61) and vice-president of the Writers' Union of the GDR.

Strittmatter, a soldier in the Wehrmacht, deserted toward the end of the war. Since 1945 he has lived in the countryside. The success of his first novel, *The Oxherd* (1950), encouraged him to become a professional writer. His play *Katzgraben*, which was performed by the Berliner Ensemble in 1953 and published in 1954, was highly praised by B. Brecht. The novel *Ole Bienkopp* (1963; Russian translation, 1965) portrayed the development of socialist consciousness in the postwar German countryside.

Strittmatter's novel *Miracle Worker* (part 1, 1957; Russian translation, 1960; part 2, 1973) is written in the *Bildungsroman* genre. Against a panorama of German history, it depicts a man evolving from a naïve peasant youth into a socially aware Communist grown wise from experience. Strittmatter also wrote several collections of short stories and novellas. His work strongly reflects the traditions of classic German literature and folklore.

Strittmatter has been awarded the National Prize of the GDR (1953, 1955, 1964, 1976), the G. Lessing Prize (1961), and the T. Fontane Prize (1966).

STROBILUS THEORY, a theory on the origin of the flower according to which the flower is a special reproductive and primary bisexual shoot or sprout, the anthostrobile, which developed as a result of modifications in the entomophilous cone, or strobile. The strobilus theory contradicts the pseudanthous theory.

[29–1634–5]

STROBL, ALAJOS. Born June 21, 1856, in Liptóújvár; died Dec. 13, 1926, in Budapest. Hungarian sculptor.

Strobl studied at the Vienna Academy of Fine Arts in the 1870's. His monumental works, such as the monuments to J. Arany (bronze, 1893) and other figures of Hungarian history and culture in Budapest, are dominated by a tendency toward superficial effects. Strobl's portrait work, including his self-portrait (terra-cotta, 1878, Hungarian National Gallery, Budapest), is characterized by moving, realistic expressiveness.

STROHEIM, ERICH VON. Born Sept. 22, 1885, in Vienna; died May 12, 1957, at Château Maurepas, near Paris. American director and actor; Austrian by nationality.

Stroheim moved to the USA in 1909. He began his career in 1915 as an actor. He wrote the screenplays and painted the sets for his films and sometimes acted the leading role. In his acting and directing he combined sarcasm, satire, and elements of the grotesque with documentary realism. He exposed in telling fashion the venality, depravity, callousness, and hypocrisy of bourgeois society. Stroheim created variations on the role of the cynic of refined cruelty, who was often a maniac. His films include *Greed* (1924), his greatest motion picture; *Blind Husbands* (1918); *The Merry Widow* (1925); and *Wedding March* (1928).

Stroheim's films provoked angry protests from producers and the press. His motion pictures were often subjected to cutting and distortion, with other directors being called in to remake them. An artist who refused to compromise, Stroheim gave up directing in the 1930's to work mainly as an actor. Stroheim's most famous roles include von Rauffenstein in *The Grand Illusion* (1937), the Spy in *Gibraltar* (1938; released in the USSR under the title *The Spy Network*), General Rommel in *Five Graves to Cairo* (1943), and the Butler in *Sunset Boulevard* (1950). [29–1497–1]

STRONG GALE, a wind with a force of nine points on the Beaufort scale and a velocity of 20.8–24.4 m/sec. In order of increasing strength, winds with a force greater than nine points are termed whole gale, storm, or hurricane. A strong gale often causes destruction on land and high waves at sea and is most often associated with tropical and extratropical cyclones. [29–1486–1]

STROSSMAYER, JOSEPH GEORGE (also Josip Juraj Štrossmajer). Born Feb. 4, 1815, in Osijek; died Apr. 8, 1905, in Djakovo. Croatian political figure.

Strossmayer received a theological education; he became a doctor of philosophy in 1834 and a doctor of theology in 1842. In 1850 he was named bishop of Djakovo.

One of the leaders of the liberal Narodna Stranka (National Party) from 1860 to 1873, Strossmayer advocated an Austro-Slav program that included the federalization of the Hapsburg empire and the unification, with broad autonomy, of the Croatian lands. At the same time he was a supporter of Yugoslavism, a movement that called for the cultural and political union of the Slavic peoples and the creation of a united federated South Slavic state. Strossmayer hoped that Russia would liberate the South Slavs and defend them against German expansion.

In 1869 and 1870, at Vatican Council I, Strossmayer opposed the dogma of papal infallibility. Strossmayer helped organize the Yugoslav Academy of Sciences and Arts in 1867 and the University of Zagreb in 1874. [29–1497–3]

ŠTROUGAL, LUBOMÍR. Born Oct. 19, 1924, in Veselí nad Lužnicí. Czechoslovak state and political figure.

The son of a worker, Štrougal was educated as a lawyer. He joined the Communist Party of Czechoslovakia in 1945. In 1958 he became a member of the Central Committee of the CPC. He was minister of agriculture, forestry, and water resources from 1959 to 1961 and minister of internal affairs from 1961 to 1965. He served as secretary of the Central Committee of the CPC from 1965 to 1968.

In 1968 and 1969, Štrougal was deputy prime minister of the Czechoslovak Socialist Republic (CSSR). From 1968 to 1970 he was secretary of the Central Committee of the CPC and chairman of the Bureau for Directing Party Work in the Czech Lands of the Central Committee. In November 1968, Štrougal became a member of the Presidium of the Central Committee of the CPC; he

became prime minister of the CSSR in 1970. He was a deputy to the National Assembly from 1960 to 1968 and became a deputy to the Federal Assembly of the CSSR in 1969. Štrougal was awarded the Order of the Republic in 1974. [29–1498–1]

STRUT FRAME (in Russian, *shprengel'*), in structural mechanics, a structural element in the form of an open bar system with a triangular or polygonal shape attached to the principal bearing elements of a structure. As geometrically variable systems, strut frames are used mainly in systems that retain their stability after removal of the frames. They may be designed from the start as part of a structure, or they may be used to reinforce existing systems.

Strut frames have various uses: to increase the number of joints in truss chords (for the suspension of crane equipment and to decrease the free length of panels), to increase the bearing capacity and rigidity of flexible structures (trusses, beams, and plates), and to decrease the flexing of columns subject to buckling. Strut frames are calculated according to the general methods used for bar systems. [29–1409–2]

STUB, in microwave engineering, a section of transmission line that is joined to a main line and through which microwave energy is transmitted from an oscillator to a load. The transmission line may be a hollow-pipe wave guide, a dielectric wave guide, a strip transmission line, a coaxial cable, or a two-wire line. A stub is regarded as a type of two-terminal network with a specified inductive or capacitive reactance. It may be connected to a load either serially or in parallel. A variable-impedance stub may be designed either as a short-circuited or open-circuited section of transmission line of variable length or as a section of transmission line of fixed length with a variable capacitive or inductive reactance.

In microwave engineering, stubs are frequently used to match lines and loads. A stub is connected to a load in parallel in a section of a main line where the conductance of the main line is equal to the line's characteristic admittance $1/\rho$, where ρ is the line's characteristic impedance. The susceptance of the main line is balanced by the admittance of the stub, which is equal in magnitude but opposite in sign. Examples of two-wire matching stubs are the Tatarinov stub and the Nadenenko stub.

Quarter-wave stubs, which have a very high input impedance, are used in coaxial and strip transmission lines as quarter-wave isolators. Systems of open-circuited and short-circuited stubs are employed in the technology of strip-line and coaxial electric filters. Variable-impedance stubs, which can be moved along a line (especially in coaxial and two-wire lines), and systems consisting of several stationary variable-impedance stubs are used as general-purpose impedance transformers; a system of several stationary stubs usually consists of three stubs separated from one another by a distance of $\lambda/8$, where λ is the wavelength in the line.

Variable-impedance stubs with a short-circuiting plunger, which are usually coaxial or wave-guide stubs, are widely used to measure the characteristics of microwave four-terminal networks. Stubs with a variable reactive load are very promising in the technology of adjustable strip-line and coaxial phase shifters, switches, and attenuators. In such stubs, the reactive load may be a *p-i-n* diode, a varactor, or an electrical component containing a ferroelectric.

Systems of stubs in combination with certain types of ion devices are used in antenna switches to switch antennas from the receiving mode to the transmitting mode. The ion devices change the reactive load in the stubs as a function of the power level of the oscillations in the line.

STUCK, FRANZ VON. Born Feb. 23, 1863, in Tettenweiss, Lower Bavaria; died Aug. 30, 1928, in Munich. German painter.

Stuck attended the Munich Academy of Fine Arts in 1885, but he was basically self-taught. He was influenced by A. Boecklin and F. von Lenbach and was one of the founders of the art association known as the Munich Sezession. Stuck's allegorical and mythological canvases, such as *Sin* and *War* (both in the Bavarian State Collections of Paintings, Munich), are full of pretentious, intentionally brutal symbolism; they combine features of academic naturalism and *Jugendstil*. Stuck was also a portrait painter and sculptor.

STUMPF, CARL. Born Apr. 21, 1848, in Wiesentheid; died Dec. 25, 1936, in Berlin. German psychologist, idealist philosopher, and musicologist. Student of F. Brentano and R. H. Lotze.

Stumpf was a professor in Würzburg (1873), Prague (1879), Halle (1884), Munich (1889), and Berlin (1894–1921). He served as joint president with T. Lipps of the Third International Congress of Psychology (Munich, 1896). Stumpf was a pioneer in the empirical psychological study of musical perception (*Tone Psychology*, vols. 1–2, 1883–90) and was the author of *The Psychological Origin of Space Perception* (1873). He anticipated the main ideas of Gestalt psychology (W. Köhler was one of Stumpf's students). As a philosopher, Stumpf was a theorist of phenomenology. His ideas were the connecting link between Brentano and E. Husserl, who was Stumpf's student in Halle. Stumpf founded the institute of psychology at Berlin University.

D. N. LIALIKOV [29–1500–1]

ŠTÚR, L'UDOVÍT. Born Oct. 29, 1815, in Uhrovec, central Slovakia; died Jan. 12, 1856, in Modra, near Bratislava. Slovak poet, philologist, and public figure. Ideologist of the national liberation movement in the 1840's.

Štúr studied philosophy and philology at the Bratislava Lycée from 1829 to 1833 and at the University of Halle from 1838 to 1840. With J. Hurban and M. M. Hodža, he carried out a reform of the literary language that based the language on the Central Slovak dialect; he organized the cultural and educational society Tatrin. From 1845 to 1848, Štúr published *Slovenskje narodňje novini*, the first Slovak political newspaper, and a literary supplement, *Orol tatrański*.

In 1847 and 1848, Štúr was a deputy to the Hungarian Diet. At the Slavic Congress in Prague in 1848 he demanded recognition of the Slavic peoples' rights to free national and cultural development. He took part in the Prague Uprising of 1848, and in the Revolution of 1848–49 he led the struggle of the Slovaks for national liberation.

The refusal of the Hungarian bourgeois revolutionary government to satisfy the national aspirations of the oppressed peoples brought about Štúr's conversion to Austro-Slavism and the camp of counterrevolution. After 1848 he lived in Modra under police surveillance; he engaged in literary, scholarly, and publicist activities.

Štúr's socioeconomic, political, and cultural program, which was objectively bourgeois-democratic in nature, became the foundation of the national ideology and of romanticism in Slovak literature. The program called for the abolition of feudalism, the introduction of democratic freedoms, and the creation of condi-

tions for socioeconomic progress and the development of the national culture within the framework of the multinational Kingdom of Hungary.

In the political treatise *Slavdom and the World of the Future* (published 1867, in Russian), Štúr argued that it was possible for the Slovak people to follow a noncapitalist path of development in the form of the peasant commune. In his lectures on Slavic history, aesthetics, and philosophy, he attempted to apply G. Hegel's philosophical method to the analysis of the historical development of the Slavic peoples and their prospects for future development.

In his works on literature and aesthetics, such as *On the Folk Songs and Stories of the Slavic Tribes* (1853), Štúr apotheosized folklore as an expression of the national spirit and the national cultural tradition. In poetry Štúr helped develop the genres of the patriotic lyric and the epic with his collection *Lyrics and Songs* (1853) and the narrative poems *Sviatoboj* (1853) and *Matúš From Trenčin* (1853).

I. A. BOGDANOVA [29–1501–1]

STÜRGKH, COUNT KARL VON. Born Oct. 30, 1859, in Graz; died Oct. 21, 1916, in Vienna. Austrian statesman.

From 1908 to 1911, Stürgkh was Austria's minister of education, and in 1911 he became head of the government. In March 1914, Stürgkh disbanded parliament; his government's foreign policy contributed to the outbreak of World War I. Stürgkh was assassinated by F. Adler. [29–1510–1]

STURM, JACQUES CHARLES FRANÇOIS. Born Sept. 29, 1803, in Geneva; died Dec. 18, 1855, in Paris. French mathematician. Member of the Académie des Sciences (1836); foreign corresponding member of the St. Petersburg Academy of Sciences (1836).

In 1840, Sturm became a professor at the Ecole Polytechnique in Paris. His principal works deal with the solution of boundary value problems of the equations of mathematical physics and the associated problem of finding the eigenvalues and eigenfunctions for ordinary differential equations. He gave a general method for determining the number of roots of an algebraic equation that lies on a given interval. Sturm also contributed papers on optics and mechanics. [29–1502–1]

STURM, JOHANN CHRISTOPH. Born Nov. 3, 1635, in Hippolstein, Bavaria; died Dec. 25, 1703, in Altdorf. German mathematician, astronomer, and physicist.

Sturm became a professor of mathematics and physics at the University of Altdorf in 1669. In 1670 he published a German translation, with a detailed commentary, of works by Archimedes. Sturm also wrote mathematics textbooks and observed comets. [29–1502–2]

STURM-LIOUVILLE PROBLEM, the problem of finding nonzero solutions of the differential equation

$$-[p(x)y']' + q(x)y = \lambda y \tag{1}$$

that satisfy boundary conditions of the form

$$A_1y(a) + B_1y'(a) = 0$$
$$A_2y(b) + B_2y'(b) = 0$$

and of finding the values of the parameter λ for which these solutions exist. Such solutions are called eigenfunctions, and the corresponding values of λ are called eigenvalues. Under certain conditions on the coefficients $p(x)$ and $q(x)$, the Sturm-Liouville problem can be reduced to the consideration of the analogous problem for an equation of the form

$$-y'' + q(x)y = \lambda y \tag{2}$$

The problem was first investigated between 1837 and 1841 by J. Liouville and J. C. F. Sturm.

The solution of some types of equations of mathematical physics by the Fourier method leads to the Sturm-Liouville problem. For example, the problem of the vibrations of a string of uniform density that is fastened at the ends leads to a Sturm-Liouville problem for the equation $-y'' = \lambda y$ with the boundary conditions $y(0) = y(\pi) = 0$. In this case there is an infinite sequence of values $1^2, 2^2, \ldots, n^2, \ldots$ to which the eigenfunctions $\sin nx$, which form a complete orthogonal system of functions on the interval $[0, \pi]$, correspond. A similar situation obtains in the general case, which arises, for example, in the study of the flow of heat in a heterogeneous bar. Here too, if the function $q(x)$ in equation (2) is continuous and real on the interval $[a, b]$ and A_1, B_1, A_2, and B_2 are real numbers, then there exists an increasing sequence of real eigenvalues $\lambda_1, \ldots, \lambda_n, \ldots$ that tends to infinity. To each λ_n there corresponds an eigenfunction $\phi_n(x)$ that is defined to an accuracy of a constant factor and that has n zeros on the interval $a < x < b$. The functions $\phi_n(x)$ form on $[a, b]$ a complete orthogonal system of functions; for equation (1) the eigenfunctions are orthogonal with respect to the weight function $p(x)$.

The completeness of the system of eigenfunctions was proved by V. A. Steklov in 1896. In 1904, D. Hilbert, using the theory of linear integral equations, proved extremely general theorems on the expansion of functions in Fourier series with respect to the system $\phi_n(x)$. As n increases, the eigenvalues and eigenfunctions of the Sturm-Liouville problem for equation (2) tend to the eigenvalues and eigenfunctions for the equation $-y'' = \lambda y$ under the same boundary conditions. The majority of the orthogonal systems of functions encountered in mathematics, such as Legendre polynomials and Hermite polynomials, are systems of eigenfunctions of some Sturm-Liouville problems.

Also sometimes called a Sturm-Liouville problem is the boundary value problem of equation (1) under the more general boundary conditions

$$\alpha_i y(a) + \beta_i y'(a) + \gamma_i y(b) + \delta_i y'(b) = 0 \qquad i = 1, 2$$

where α_i, β_i, γ_i, and δ_i are constants. The most important boundary conditions of this form are $y(a) = y(b)$ and $y'(a) = y'(b)$ (periodic conditions) and $y(a) = -y(b)$ and $y'(a) = -y'(b)$ (semiperiodic conditions).

Many problems of mathematical physics, such as the problem of the flow of heat in an infinite heterogeneous bar, lead to a Sturm-Liouville problem on a half axis or on the entire axis. In the first case, solutions of equation (2) that satisfy the condition $A_1y(0) + B_1y'(0) = 0$ are considered; instead of a sequence of eigenfunctions, we have the set of eigenfunctions $\phi(x, \lambda)$, which depend on the continuously changing parameter λ. Instead of an expansion in Fourier series, expansions of the following form are considered:

$$f(x) = \int_{-\infty}^{\infty} F(\lambda)\phi(x, \lambda)\, d\rho(\lambda)$$

where $\rho(\lambda)$ is some nondecreasing function. These expansions are analogous to the Fourier integral. Here

$$F(x) = \int_0^{\infty} f(x)\phi(x, \lambda)\, dx$$

and

$$\int_{-\infty}^{\infty} F^2(\lambda)\, d\rho(\lambda) = \int_0^{\infty} f^2(x)\, dx$$

A similar situation occurs for the Sturm-Liouville problem on the entire axis.

For some problems of mathematical physics the inverse Sturm-Liouville problem, or the problem of reconstructing the differential equation from the function $\rho(\lambda)$, is of great importance. This problem, which was posed in a special case by V. A. Ambartsumian and in a more general case by the Swedish mathematician G. Borg, was solved by M. G. Krein, I. M. Gel'fand, and B. M. Levitan.

The Sturm-Liouville problem also arises in some problems of quantum mechanics and the calculus of variations.

STURM'S THEOREM, a theorem that provides a basis for finding nonoverlapping intervals such that each contains one real root of a given algebraic polynomial with real coefficients. The theorem was given in 1829 by J. C. F. Sturm.

For any polynomial $f(x)$ without multiple roots, there exists a system of polynomials

$$f(x) = f_0(x), f_1(x), \ldots, f_s(x)$$

for which the following conditions are fulfilled: (1) $f_k(x)$ and $f_{k+1}(x)$, $k = 0, 1, \ldots, s - 1$, do not have common roots; (2) the polynomial $f_s(x)$ has no real roots; (3) it follows from $f_k(\alpha) = 0$, $1 \leq k \leq s - 1$ that $f_{k-1}(\alpha)f_{k+1}(\alpha) < 0$; and (4) it follows from $f(\alpha) = 0$ that the product $f(x)f_1(x)$ is increasing at the point α. Let $w(c)$ be the number of changes of sign in the system

$$f(c), f_1(c), \ldots, f_s(c)$$

If the real numbers a and b ($a < b$) are not roots of the polynomial $f(x)$, then the difference $w(a) - w(b)$ is nonnegative and equal to the number of real roots of the polynomial $f(x)$ that lie between a and b. Thus, the number line may be divided into intervals each of which contains one real root of the polynomial $f(x)$. [29–1502–5]

ŠTURSA, JAN. Born May 15, 1880, in Nové Město, Moravia; died May 2, 1925, in Prague. Czech sculptor.

Štursa studied at a school for masons and sculptors in Hořice from 1894 to 1898 and at the Academy of Arts in Prague under J. V. Myslbek from 1899 to 1903. His statues reveal the influence of symbolism. They include human figures of sensuous beauty, for example, *Eve* (1908), and of dramatic power, such as *Wounded Man* (1920–21); both works are housed in the National Gallery, Prague. Štursa designed many monuments and monumental decorative compositions, such as the sculptural groups *Labor* and *Humaneness* for the Hlávkův Bridge in Prague (1911–13) and a monument to S. Čech, also in Prague (1921–22). His works also include expressive portraits, notably a likeness of B. Němcová (1924, National Gallery, Prague).

Štursa worked mainly in bronze. His statues, which are distinguished for their emotional force, had a great influence on the development of Czechoslovak realist sculpture in the 20th century.

STUTTGART, a city in the Federal Republic of Germany (FRG), on the Neckar River. Capital of the *Land* (state) of Baden-Württemberg. Population, 600,400 (1976).

Stuttgart, an important financial and cultural center of the FRG, forms the nucleus of an industrial conurbation (area, 1,500 sq km; population, approximately 1.5 million) that accounts for about one-third of the industrial output of Baden-Württemberg. The city is an important transportation hub: the railroad system handles 12 million tons of freight annually, and the river port, 1.0 million tons (1974).

The city's machine-building industry produces motor vehicles, primarily at the Daimler-Benz and Porsche plants. The electrical engineering industry is represented by the Robert Bosch and Standard Electric Lorenz plants; the precision engineering and optical industry is represented by the Kodak and Zeiss-Ikon firms. The city produces armaments and military gear and has enterprises of the publishing, food-processing, textile, garment, leather, and footwear industries. Stuttgart lies on the Mannheim-Karlsruhe-Stuttgart-Göppingen-Aalen petroleum pipeline.

I. A. Basova

At the center of Stuttgart lies the Old Town, to the north of which is the Reiche Vorstadt (second half of the 15th century), which is laid out on a grid pattern. Heavily damaged during World War II, the city underwent extensive reconstruction from the 1950's to 1970's. Notable buildings include the Romanesque and Gothic Stiftskirche (collegiate church; 12th and 15th centuries), the Gothic St. Leonard's Church (1463–66, architect A. Jörg), the Old City Hall (1456–58), the Renaissance Old Palace (begun 1553, architect A. Tretsch), and the baroque New Palace (1744–60, architects L. Retti and P. de la Guêpière).

Important examples of modern architecture include the Weissenhof Housing Estate (1927, architects Le Corbusier and L. Mies van der Rohe), the television tower (1954–55, architect F. Leonhardt), and the high-rise apartment buildings "Romeo and Juliet" (1957–59, architects H. Scharoun and W. Frank).

The Württemberg Landesmuseum, of the National Collections of Art, houses primarily primitive, medieval, and folk art. The State Art Gallery of Stuttgart has holdings mainly of German art, from the Middle Ages to the 20th century.

STYRIA (also Steiermark), a historical region of Central Europe, in the basin of the Mur River. The historical nucleus of Styria was the Carinthian Mark, which was one of several territories that remained when Greater Carantania broke up in the early 11th century. In 1180 the Carinthian, or Styrian, Mark became a duchy of the Holy Roman Empire. Inhabited chiefly by Slovenes, Styria was subjected to German colonization and germanization. It became a possession of the Babenberg dukes of Austria in 1192 and passed to the Hapsburgs in 1282. From 1867 to 1918 it was a crown land of the Austro-Hungarian Empire. Under the Treaty of St. Germain (1919), most of Styria went to Austria, forming the *Bundesland* (federal state) of Styria; the remainder, including the city of Maribor, was incorporated into the Kingdom of the Serbs, Croats, and Slovenes, which became the Kingdom of Yugoslavia in 1929. [29–1479–3]

STYRIA (also Steiermark), a *Bundesland* (federal state) of Austria. Area, 16,400 sq km. Population, 1,193,600 (1975). The capital is the city of Graz. Styria is divided according to relief into two regions: Upper Styria, an area of high mountains in the northwest that includes the Niedere Tauern, Dachstein, and the Eisenerz Alps, and Lower Styria, a hilly area in the southeast.

Upper Styria is primarily an industrial region. Its rich natural resources include iron ore at Erzberg and Radmer; magnesite at Breitenau, Veitsch, and Trieben; brown coal; graphite; and salt. Considerable electric power is produced at fossil-fuel-fired steam power plants and by hydroelectric power stations. Ferrous metallurgy is represented by the production of pig iron, steel, and rolled steel products in Leoben-Donawitz and steel and rolled steel products in such cities as Kapfenberg, Kindberg, and Mürzzuschlag. The wood-products enterprises of various cities, notably Niklasdorf and Pöls, produce for the entire country. Upper Styria also has light industry and enterprises of the machine-building, chemical, and food-processing industries. Agriculture is represented by dairy farming, swine raising, and the cultivation of rye and barley, maize, and potatoes.

Lower Styria is an important agricultural region. In the Graz "bay" livestock are raised for meat and dairy products, and grain crops are grown; the area also has orchards and vineyards. Industry includes machine building in Graz, Weiz, and Andritz, and there are enterprises of the wood-products and the pulp and pa-

per industries in Gratkorn and Gratwein. Lower Styria has a printing industry, and footwear is manufactured in Graz.

A. I. MUKHIN [29–1479–4]

STYRIAN ALPS, the part of the Eastern Alps situated in Austria, in the *Land* of Styria. Elevations range to 2,995 m (Dachstein). [29–1479–2]

ŠUBAŠIĆ, IVAN. Born May 27, 1892, in Vukova Gorica, Karlovac; died Mar. 22, 1955, in Zagreb. Yugoslav political and state figure. A lawyer by education.

Šubašić was one of the leaders of the Croatian Peasant Party. From 1939 to 1941 he was *ban* (chief executive) of the *banovina* of Croatia, in the Kingdom of Yugoslavia; he emigrated from Yugoslvavia in April 1941. From June 1944 to March 1945, Šubašić was premier of the Yugoslav government in exile. He signed the Tito-Šubašić agreements of 1944, and from March to November 1945 he was minister of foreign affairs in the Provisional Government of Democratic Federal Yugoslavia. Šubašić retired in November 1945. [29–1512–1]

ŠUBIC, Slovenian painters; brothers.

Jurij Šubic. Born Apr. 15, 1855, in Poljane; died Sept. 8, 1890, in Raschwitz, near Leipzig. From 1873 to 1879, Šubic studied at the Academy of Arts in Vienna. Šubic, whose style evolved from academicism to plein-air painting, executed portraits and intimate genre pictures, such as *Before the Hunt* (1882, National Gallery, Ljubljana).

Janez Šubic. Born Oct. 26, 1850, in Poljane; died Apr. 25, 1889, in Kaiserslautern. A representative of the academic style, Šubic produced altar paintings, murals (in the National Theater in Prague, 1881–83), portraits, and genre compositions.

Mesesnel, F. *Janez in Jurij Šubic.* Ljubljana, 1939. [29–1517–1]

SUBULARIA (awlwort), a genus of annual plants of the family Cruciferae. The plants are dwarf, usually aquatic herbs with a rosette of awl-shaped leaves and a leafless stem (scape). The white, frequently cleistogamous flowers are in few-flowered racemes. The fruit is a bulging ellipsoid silicle. There are two species in the temperate belt of Eurasia and in the hills of East Africa. The USSR has one species, *S. aquatica.* The plant grows in shallow waters and on the sandy shores of reservoirs in the European USSR, in the southern part of Western Siberia, and in the Far East. It apparently is eaten by swimming birds. [29–1197–2]

SUDRA, the lowest of the four ancient Indian varnas.

The Sudra varna, which became established during the formation of a class society in India, was made up of conquered tribes and of outsiders who were admitted into the community; the latter included persons who had become separated from their own tribes and persons whose tribes had broken up. In the ancient Indian slaveholding society, the Sudras were servants, artisans, and dependent and subordinate workers. In confirmation of their lowly status, they were forbidden to undergo the initiatory rite ("second birth") that would entitle them to full civil rights; as a result, the Sudras, unlike the three higher varnas, were "once born."

The Sudras were subject to many social restrictions: they were forbidden to own land, hold priestly or governmental office, or take part in politics or religious ceremonies. Their unequal status was reflected in various practices; for example, if convicted of a crime, Sudras were punished more severely than members of the higher varnas would be in similar circumstances, and money could be lent to them at unusually high rates of interest.

In the first centuries of the Common Era, the Sudras achieved higher status, and many restrictions disappeared; their social position came to resemble that of the Vaisyas. In various parts of India, castes were classified as Sudra regardless of their actual status, and the term lost a fixed meaning for India as a whole.

G. F. IL'IN [29–1522–1]

SUDRAKA, the name or, more likely, pen name of the author of one of the most significant works of ancient Indian drama—the Sanskrit play *The Little Clay Cart* (Russian translation, 1956). No reliable information about Sudraka exists, although he is referred to as a legendary king in many old works of literature and folklore. It is usually assumed that the play was written no earlier than the fourth century and no later than the eighth.

The main characters of *The Little Clay Cart* are city dwellers; the everyday life and mores of an ancient Indian city are described with considerable accuracy, a rare feature for ancient Indian literature. The play skillfully combines romantic and political themes. It also expresses contempt for the caste system and contains elements of social satire. *The Little Clay Cart* has a dynamic, dramatically powerful plot with tragic scenes alternating with comical, lyrical, and farcical ones. The play is well known in India, as well as in Europe (including the USSR) in numerous translations and stage productions.

ŠUFFLAY, MILAN. Born Nov. 9, 1879, in Lepoglava; died Nov. 19, 1931, in Zagreb. Croatian historian and political figure.

A graduate of the University of Zagreb, Šufflay was a professor of subsidiary historical disciplines at the university from 1908 to 1918. After the establishment in December 1918 of the Kingdom of the Serbs, Croats, and Slovenes (since 1929, Yugoslavia), he became a leader of the Croatian nationalist Party of Rights. Šufflay incorporated a broad range of sources in his works on the history of Croatian-Byzantine relations in the 11th and 12th centuries, the history of medieval Albania, and the study of sources for medieval Dalmatia.

ŠUMAVA, mountains on the border of Czechoslovakia with the Federal Republic of Germany and Austria, forming the southwestern border of the Bohemian Massif. The Šumava consists of two parallel ranges with a length of approximately 140 km. The maximum elevation, at Mount Grosser Arber, is 1,456 m. The mountains are composed mainly of granites, gneisses, and schists. The smoothed surface of the peak shows traces of ancient glaciation. The slopes are covered with beech and spruce forests and meadows. [29–1533–1]

SUMER, a historical region in southern Mesopotamia, between the Tigris and Euphrates rivers, in what is now the southern part of Iraq.

Until the end of the third millennium B.C., Sumer was inhabited primarily by Sumerians and, to a lesser extent, the Akkadians, an Eastern Semitic people who circa 2400 B.C. founded the city of Agade, from which the northern regions of Sumer, as far as the latitude of the modern city of Baghdad, came to be called Akkad. The time when the Sumerians settled southern Mesopotamia remains obscure; during the period of the Jemdet Nasr archaeological culture and probably during the period of earlier cultures—the Uruk and Ubaid (Ubayd or Obeid) cultures (fifth and fourth millennia B.C.)—the population was Sumerian (*see* JEMDET NASR). A class society and state emerged in Sumer circa 3000 B.C. (the Protoliterate period). Researchers refer to the period 2700–2300 B.C., when a genuine writing system—the cuneiform system—had developed, as the Early Dynastic period.

The Early Dynastic period was characterized by numerous city-states, whose centers were vast temple domains, surrounded by large family communities. The chief producers were the community members, who possessed full rights, and temple clients, or dependents who were deprived of the ownership of the means of production. Slavery was a recognized institution. There was a wealthy community elite. The economy was based on river irriga-

tion; floodwaters were collected in reservoirs, a practice that gave rise to continuous wars for head channels and irrigated fields. The military chieftains of individual city-states alternately achieved temporary hegemony over neighboring cities; the earliest well-known chieftains were the rulers of the First Dynasty of Kish and the First Dynasty of Uruk (or Erech) (28th and 27th centuries B.C.) and later rulers of Ur, Lagash, and other city-states. (*See* KISH; URUK; UR; and LAGASH.)

Within the cities a struggle was waged for power over the temple domains between the priestly-clan nobility and the secular palace nobility, which supported the ruler's claims. The best-known manifestation of this struggle was the reform instituted by Urukagina (Uru'inimgina) in Lagash in the 24th century B.C. (*see* URUKAGINA). The last Early Dynastic ruler was Lugal-zaggesi, the ruler of Umma, which bordered on Lagash, and later of Uruk as well (*see* LUGAL-ZAGGESI and UMMA). The king of the city of Agade, Sargon I the Ancient (*see* SARGON I THE ANCIENT), subjugated Umma, Uruk (Erech), Lagash, and other independent Sumerian states and established the Kingdom of the Four Regions of the World in Mesopotamia (Akkadian dynasty, 24th to 22nd centuries B.C.). The state of Akkad was destroyed by the onslaught of mountain Guti tribes. At the end of the 22nd century B.C., the Guti were driven out by the king of Uruk, Utu-khegal, after whose death power passed to Ur-Nammu, founder of the Third Dynasty of Ur and the Kingdom of Sumer and Akkad. The economy of this state was based on vast royal domains administered by an enormous apparatus of officials and overseers. Workers were reduced, in effect, to the status of slaves. The economic, political, and cultural life of the communities died out. Under the Third Dynasty of Ur, the pantheon of gods was unified, and kings were deified during their lifetimes. The idea of man's slavelike dependence on the gods was inculcated. Circa 2000 B.C., the Third Dynasty of Ur fell as a result of the incursion of the Amorites, Western Semitic stock raisers, and the Elamites, a mountain people. (For information on Sumerian culture, *see* BABYLONIAN AND ASSYRIAN CULTURE.)

I. M. D'IAKONOV [29–1538–2]

SUMERIAN, the language of the Sumerians, spoken until the late third millennium B.C.

Sumerian, whose linguistic affinity has not been established, is attested in cuneiform texts written in the period beginning in the 29th or 28th century B.C. and ending between the third and first centuries B.C. The texts are classified as Archaic Sumerian (before the 25th century); Classical Sumerian (24th–22nd centuries); New Sumerian (21st century); Late Sumerian (early second millennium), which is attested mainly in literary texts but also in business documents; and Post-Sumerian, which appeared in written form when Sumerian was retained only as a second literary language, after Akkadian.

Sumerian grammar includes an ergative construction, in which the subject of a transitive verb is marked by means of a special case and the subject of a verb of state (including a state resulting from an action—that is, an object) is unmarked. Verbs of action have two aspects; there is no category of tense. Sumerian has affixes that express agreement with the subject of a verb of action or of state, as well as with all indirect objects and several adverbial expressions.

Case relationships are marked by suffixes that are added sequentially to the noun; these suffixes, which may reach approximately ten in number, also serve as subordinating elements in nominalized constructions that replace subordinate clauses. There are markers for several types of plural, including, in addition to the collective and definite plurals, a plural that expresses all the objects in a given class. All nominal grammatical markers appear at the end of such syntagms as "headword—modifier" or "noun–subordinate clause" in inverse order with respect to the words they refer to. Certain words and phonemes were taboo for women.

SUMERIANS, an ancient people inhabiting southern Mesopotamia. Judging from the existing scanty linguistic and toponymic data, the Sumerians were not indigenous to the region, although they had inhabited it as early as the fifth millennium B.C. Anthropologically they belonged to the Mediterranean and Balkan-Caucasian races of the major Europeoid race.

In the middle of the third millennium B.C., the Sumerians began to intermix with the Akkadians, an eastern Semitic people who had settled in the northern part of southern Mesopotamia. In the second half of the second millennium B.C., the Sumerians merged with the eastern Semites into a single Akkadian people. The Sumerian language remained the language of scholarship and religion in Mesopotamia until the second or first century B.C. The Sumerians were the inventors of the first writing system in Mesopotamia, the cuneiform writing system.

[29–1540–2]

ŞUMLA, the Turkish name for the Bulgarian city of Shumen, frequently encountered in Russian and Soviet works on the Russo-Turkish wars. [29–1542–4]

ŠUMPERK, a city in Czechoslovakia, in the Czech Socialist Republic; situated in northern Moravia, in the foothills of the Jeseníky. Population, 26,200 (1974). Šumperk is an old center of the silk and linen industry. Alloyed steel bands are also produced in the city. [29–1544–1]

SUOJELUSKUNTA (Swedish, Skyddskår), a paramilitary organization of the Finnish bourgeoisie and Finnish kulaks.

Founded in 1921, the Suojeluskunta was formed from volunteer detachments of White Guards that had helped suppress the Finnish Revolution of 1918. A law enacted on Dec. 22, 1927, named the president of the republic the commander of the Suojeluskunta and made the organization an auxiliary unit of the national defense system. In 1939, the membership of the organization numbered more than 100,000. The first children's detachments of the Suojeluskunta were formed in 1929.

Formally incorporated into the armed forces in 1940, the Suojeluskunta took part in fighting against Soviet troops during World War II. It was disbanded on Nov. 3, 1944, in accordance with the terms of the Soviet-Finnish armistice. [29–1565–3]

SUPPORT, a device for mounting a motion-picture camera during filming or a still camera during shooting or for mounting a geodetic, astronomical, or other instrument during work with such an instrument.

The most widely used type of support is the collapsible tripod, which may be made of metal or wood. A camera or instrument is attached to a tripod by means of a projecting stud, which is screwed into a threaded socket in the base of the camera or instrument. As a rule, tripods are equipped with movable heads, which make it possible to mount a camera in various positions with respect to the vertical axis. In professional motion-picture filming, panoramic heads are also used.

Portable devices are also used as camera supports (*see* TRAVELING SHOTS, EQUIPMENT FOR). During filming with a handheld motion-picture camera, a gunpod, which fits into the cameraman's shoulder, is often used.

In a number of cases, a clamp may be used as a support for a still camera. A clamp is employed to attach a camera to the back

of a chair, to the edge of a table, or to some other firmly standing object.

The use of camera supports permits exposures longer than 1/30 sec. S. V. KULAGIN [29–1458–2]

SUPPORT, TELESCOPE, a simplified base for mounting small amateur telescopes and special portable telescopes used for the visual observation of artificial earth satellites, meteors, and other objects.

A telescope support consists of a collapsible tripod or vertical column with three bases and heads to which the telescope is secured. The head is fitted with two mutually perpendicular axes. Altazimuth mounting (with horizontal and vertical axes) is used in the simplest telescope supports. The telescope is rotated manually after loosening the tightening screws, and fine adjustment is accomplished by micrometer screws.

To observe celestial bodies moving as a result of the apparent diurnal rotation of the sky, a telescope mounted on such a support must be rotated simultaneously about two axes. More convenient is a telescope support with parallactic, or equatorial, mounting, in which one axis is directed toward the earth's pole and the other is directed perpendicularly to the first axis. The micrometer screws and reading dials on the axes make it possible to direct a telescope at a body according to its celestial coordinates —its hour angle and declination. More advanced telescope supports are fitted with clockwork mechanisms for tracking a star with the telescope.

Navashin, M. S. *Teleskop astronoma-liubitelia*, 3rd ed. Moscow, 1975. N. N. MIKHEL'SON [29–1458–3]

SURFACE ROUGHNESS, the aggregate of the irregularities that form the microrelief of a part's surface. Surface roughness results mainly from plastic deformation of the surface layer of a workpiece during machining. It is caused by, for example, irregularities of a tool's cutting edges, friction, the tearing of particles of material from the surface of the workpiece, and vibration of the workpiece or the tool.

Surface roughness is an important index in the specifications of a manufactured article. It affects the service properties of machine parts and assemblies, such as the wear resistance of rubbing surfaces, fatigue strength, corrosion resistance, and the maintenance of negative allowance in tight fits. Surface-roughness requirements are specified on the basis of the designated purpose of the surfaces of parts and the design characteristics of the parts. For a long time, a system characterizing the finish of a surface by means of classes of surface roughness was used in Soviet production. A new system, which was introduced on Jan. 1, 1975, replaced the classes of surface roughness that were previously used in the USSR.

The extensive set of parameters of the new system facilitates the specification of precise requirements for surfaces intended for various purposes. When numerical values of surface roughness are determined, reference is made to a single datum line, for which the mean line m of a surface profile is used. Measurements are performed within the limits of a roughness-width cutoff l, that is, the length of the surface segment chosen for the measurement of roughness without taking into account other types of irregularities, such as waviness, whose spacing is greater than l. The numerical value of the roughness-width cutoff may be 0.01, 0.03, 0.08, 0.25, 0.8, 2.5, 8, or 25 mm. Quantitatively, surface roughness is evaluated by means of one or more of the following main parameters: the arithmetical average deviation of the surface profile (R_a), the height of irregularities at ten points (R_z), the maximum height of irregularities (R_{max}), the average spacing of irregularities (S_m), the average peak spacing of irregularities (S), and the sampling length of the profile (t_p).

The numerical values of the roughness parameters and the types of roughness lays—for example, parallel, perpendicular, and circular—are specified by a standard. The choice of roughness parameters depends on the design of the parts and the designated purpose of their surfaces. For example, permissible values of R_a or R_z, R_{max}, and t_p, as well as the roughness lay, are specified for rubbing surfaces of critical parts, while R_{max}, S_m, and S are specified for the surfaces of critical parts subjected to fluctuating loads. Surface-roughness specifications are indicated by the numerical value or a range of values of one or more parameters and by the roughness-width cutoff. For noncritical surfaces, surface-roughness requirements are dictated by the requirements of industrial design, corrosion resistance, and manufacturing methods.

Nowadays, the above parameters are used in the USSR instead of the classes of surface roughness that were in use until 1980.

The surface roughness that parts have after their manufacture and assembly is altered when the parts are worn in. The surface roughness of parts after wearing-in is known as optimum surface roughness; it is produced by, for example, rolling friction or sliding friction. Optimum surface roughness assures minimum wear and is retained during the long-term operation of machinery. The parameters of optimum surface roughness depend on the design and material of parts that rub together, the quality of the lubrication, and other service conditions.

Surface roughness is usually measured by means of contact or noncontact methods. Stylus-type instruments, such as profile meters or profilographs, are used in the contact methods; optical instruments are employed in the noncontact methods. In machine building, a visual method is often used. In the visual method, a comparison is made between the surface under inspection and the surface of a specimen or part whose surface roughness has been certified.

O. A. VLADIMIROV and A. A. PARKHOMENKO [29–1143–2]

SUTURE, the surgical uniting, chiefly by a surgical needle and suture material, of tissues cut during surgery or separated by an injury. Threads made of silk, linen, or Dacron and other polymeric materials are used in superficial sutures. In buried sutures, which are applied to internal organs and tissues, absorbable materials, such as catgut or biologically inert polymeric threads, are used; buried sutures are not removed.

One type of superficial suture, cosmetic suture, which is applied to the face, is made using threads of horsehair or thin capron. Osteorrhaphy (osteosynthesis) is a type of buried suture. Primary, primo-secondary, and secondary sutures are distinguished on the basis of when the sutures are applied, which depends on the type of wound. The sutureless union of tissues is achieved with various adhesives made from polymeric materials (for example, cyanoacrylate) or with metal clamps. [29–1329–4]

ŠVABINSKÝ, MAX. Born Sept. 17, 1873, in Kroměříž; died Feb. 10, 1962, in Prague. Czech graphic artist and painter. People's Artist of Czechoslovakia (1945).

Švabinský attended the Prague Academy of Fine Arts from 1891 to 1898. He was an easel painter, a painter of murals, and a stained-glass artist. He became particularly famous, however, for his graphic work, which included drawings in pencil, ink, and charcoal, and for his engravings, which included lithographs, etchings, drypoint, mezzotints, and wood engravings.

Although influenced by symbolism, Švabinský generally preferred life-affirming, romantic subjects. Characteristic of his work are compositions in which luxuriant natural scenes are populated by real or fairy-tale, allegorical characters; such works include *The Tiger Hunt* (drypoint, 1914) and *The Harvest* (drypoint, 1927). Landscapes imbued with emotion and portraits are also characteristic.

Švabinský is known for his portraits of Czechoslovak cultural figures, such as J. Mánes (wood engraving, 1917) and J. Fučik (drypoint, 1950). In addition, he illustrated works by such writers as V. Hugo (1944) and S. P. Shchipachev (1955). Švabinský received the State Prize of the Czechoslovak Socialist Republic in 1952.

ŠVEHLA, ANTONÍN. Born Apr. 15, 1873, in Hostivař; died there Dec. 12, 1933. Czechoslovak state and political figure. Landowner.

A leader of the Agrarian Party, Švehla became chairman of the Central Committee of the party in 1909. Between 1916 and 1918 he was secretary and then deputy chairman of the National Committee, a group made up of representatives of seven bourgeois parties in Prague. Minister of internal affairs of the bourgeois Czechoslovak state from 1918 to 1920, he took part in the suppression of the December political strike of 1920. Švehla was prime minister for most of the period from 1922 to 1929. [29–932–5]

ŠVENČIONĖLIAI, a city in Švenčionys Raion, Lithuanian SSR. Švenčionėliai is a junction for railroad lines to Vilnius, to Utena, and to Daugavpils in the Latvian SSR; it is located 75 km northeast of Vilnius. The city has a brickyard, an ironworks, a branch of a Vilnius winery, and a logging and timber distribution establishment. [29–997–5]

ŠVENČIONYS, a city and the administrative center of Švenčionys Raion, Lithuanian SSR. Švenčionys is located 86 km northeast of Vilnius. Industry is represented by a garment factory, a pharmaceutical factory for the processing of medicinal plants, and a butter factory. The city has a museum of local lore. [29–997–6]

ŠVENTOJI, the name of two rivers in the Lithuanian SSR:

(1) A right tributary of the Neris of the Neman basin. The Šventoji is 249 km long and drains an area of 6,890 sq km. It rises on the Baltic Ridge, where it flows through a number of lakes. The river is fed by various sources and has an average flow rate of approximately 56 cu m per sec. Ice appears on the river from November through early April. The cities of Anikščiai, Kavarskas, and Ukmergė are on the Šventoji.

(2) A river which empties into the Baltic Sea north of Palanga. The Šventoji is 73 km long and drains an area of 472 sq km. [29–1063–3]

ŠVERMA, JÁN. Born Mar. 23, 1901, in Mnichovo Hradiště; died Nov. 10, 1944. Figure in the Czechoslovak and international communist movements. Hero of the Czechoslovak Socialist Republic (1969, posthumously).

The son of a lawyer, Šverma was educated in the law. He became a member of the Communist Party of Czechoslovakia in 1921 and the editor of a newspaper of the CPC, *Večerni rudé právo*, in 1924. From 1926 to 1928 he studied at the Lenin School in Moscow. He became a member of the Central Committee and of the Politburo of the Central Committee of the CPC in 1929 and a candidate member of the Executive Committee of the Communist International in 1935.

From 1935 to 1938, Šverma served as a Communist deputy to the National Assembly of Czechoslovakia. From 1936 to 1938 he was editor in chief of the central organ of the CPC, the newspaper *Rudé právo*. After the signing of the Munich Pact of 1938, he was sent by the Central Committee of the CPC to work with its foreign bureau in Paris; he moved to the USSR in 1940. Šverma worked on the Czechoslovak editorial staff of Moscow Radio and in 1942 undertook political work among Czechoslovak military units in the USSR; he also edited the newspaper *Československé listy*.

Šverma helped develop the Košice program. After the Slovak national uprising began on Aug. 29, 1944, he was sent to Slovakia by the leadership of the CPC. He was killed during the uprising. The author of works on the history of Czechoslovakia and the national question, Šverma was awarded the Order of Lenin in 1969.

WORKS

Vybrané spisy. [Prague] 1955.

Cheshskii narod v bor'be protiv nemetskikh okkupantov. [Moscow] 1942. [29–998–4]

SWABIA, initially a medieval German duchy, later a historical region of southwestern Germany.

Swabia was originally settled by a German tribe, the Alamanni (Suevi), and comprised southwestern Germany, Alsace, and eastern Switzerland; in the tenth century it became one of the tribal duchies that made up the Kingdom of Germany. In the 11th century ducal power over most of Swabia was seized by the von Staufens (Hohenstaufens), who ruled until 1268; a smaller area was taken by the Zähringens, who ruled until 1218.

In the second half of the 13th century, Swabia disintegrated into a number of secular and ecclesiastical principalities, including Württemberg, Baden, the Hapsburg lands, and the bishoprics of Augsburg and Konstanz (Constance); the imperial cities, notably Augsburg, Ulm, and Konstanz, possessed large territories. Gradually all the Swabian lands in southwestern Germany—the areas that make up the historical region of Swabia—became part of Württemberg. [29–924–1]

SWABIAN JURA (also Swabian Alps), a cuesta in the southern part of the Federal Republic of Germany, extending southwest from the Franconian Jura. The Swabian Jura is approximately 200 km long and rises to an elevation of 1,015 m at Mount Lemberg. It is composed primarily of Jurassic limestones. At its higher elevations, the Swabian Jura forms a karst plateau; the northwestern slope is steep, and the southeastern slope is gentle. The Swabian Jura is dissected by tributaries of the Neckar and Danube rivers. In addition to coniferous, beech, and oak forests, there are meadows, shrubs, and wasteland. [29–924–3]

SWABIAN LEAGUE, a confederation of imperial knights and the imperial cities of southwestern Germany that was established in 1488 in the city of Esslingen, Swabia. Soon after its formation, the league was joined by several princes, including the electors of Mainz, Trier, and the Palatinate, the landgrave of Hesse, and the duke of Bavaria. In practice, the Swabian League became an instrument with which the princes carried out a policy designed to further divide Germany into feudal principalities, preserve feudal privileges, and subordinate the cities. The league played a major role in suppressing the insurgents in the Peasant War of 1524–26. Internecine strife among the members of the Swabian League resulted in its disintegration in late 1533 and early 1534. [29–925–1]

SWABIAN LEAGUE OF 1376, a union of 14 imperial cities, including Ulm, Konstanz (Constance), and Ravensburg, that was formed to resist oppressive taxation, the arbitrary rule of the princes, and feudal anarchy in Germany. The league's successes, notably its victory over the count of Württemberg at Reutlingen in 1377, attracted nearly all the cities of Swabia to its side. In 1381 the league merged with the League of the Rhine; they were soon joined by the cities of Franconia and by some Swiss cities, the total number reaching 89. As the Swabian League grew, it became a powerful political force and was opposed by the emperor, the princes, and the knights. In a battle at Döffingen on Aug. 23, 1388, the league's troops were routed. The Swabian League disintegrated in 1389. [29–925–2]

SWABIAN WAR OF 1499 (also Swiss War of 1499), a war begun in February 1499 by the Hapsburg Maximilian I—the Holy Roman emperor—and the Swabian League against the Swiss Confederation. The immediate cause of the war was the rejection by the Swiss of the decrees of the Diet of Worms of 1495 on implementing imperial reform. The reforms, which included the introduction of a common imperial tax and the creation of common imperial institutions, would have meant the de facto subordination of the Swiss Confederation, which had become essentially independent, to the empire. After the Swiss won victories at Schwaderloh on April 11, Frastanz on April 20, Calven on May 22, and Dornach on July 22, the Peace of Basel was concluded between the Swiss and the emperor on September 22. The treaty amounted to a recognition of Switzerland's independence from the empire. [29–924–2]

SWATOW (also Shant'ou), a city in China, in Kwangtung Province, on the coast of the South China Sea, in the delta of the Han Chiang. Population, more than 300,000 (1970). Swatow is a transportation hub and seaport. The city's machine-building industry produces ships, diesel locomotives, machine tools, hydraulic generators, agricultural implements, and instruments. The chemical industry produces photographic paper and film,

plastics, and caustic soda. There are enterprises of the rubber, match, textile, tobacco, canning, and sugar industries. Craftsmen make bamboo articles, lacquer ware, umbrellas, and fans. Swatow is a center of the fishing industry. [29–845–1]

General information

A state in northern Europe, occupying the eastern and southern parts of the Scandinavian Peninsula, Sweden is bounded by Norway on the west and north, Finland on the northeast, the Baltic Sea and the Gulf of Bothnia on the south and east, and the straits of Öresund (dividing Sweden from Denmark), Kattegat, and Skagerrak on the southwest. The Baltic islands of Gotland and Öland are part of Sweden. The country has an area of 450,000 sq km (excluding inland bodies of water, 411,500 sq km) and a population of 8,268,000 (1978). Stockholm is the capital.

For administrative purposes Sweden is divided into 24 counties (see Table 1). Historically, the country has been divided into the geographic regions of Götaland, Svealand, and Norrland.

Table 1. Administrative divisions of Sweden

County (län)	Area (sq km)[1]	Population (1976)	Administrative center
Älvsborg	11,400	418,000	Vänersborg
Blekinge	2,900	155,000	Karlskrona
Gävleborg	18,200	294,000	Gävle
Göteborg och Bohus	5,100	715,000	Göteborg
Gotland	3,100	54,000	Visby
Halland	5,400	220,000	Halmstad
Jämtland	49,900	134,000	Östersund
Jönköping	9,900	302,000	Jönköping
Kalmar	11,200	241,000	Kalmar
Kopparberg	28,400	281,000	Falun
Kristianstad	6,000	272,000	Kristianstad
Kronoberg	8,500	170,000	Växjö
Malmöhus	4,900	740,000	Malmö
Norrbotten	98,900	264,000	Luleå
Örebro	8,500	274,000	Örebro
Östergötland	10,600	387,000	Linköping
Skaraborg	7,900	263,000	Mariestad
Södermanland	6,100	252,000	Nyköping
Stockholm	6,500	1,494,000	Stockholm
Uppsala	7,000	230,000	Uppsala
Värmland	17,600	284,000	Karlstad
Västerbotten	55,400	236,000	Umeå
Västernorrland	21,800	268,000	Härnösand

Constitution and government

Sweden is a constitutional monarchy whose present constitution went into effect on Jan. 1, 1975. The constitution consists of three basic laws, adopted Feb. 27, 1974: the Instrument of Government, the Act of Succession, and the Freedom of the Press Act. The head of state is the king, who exercises representative functions. The highest legislative body is the Riksdag, a unicameral parliament whose 349 deputies are popularly elected for three-year terms on the basis of proportional representation. All citizens who have attained the age of 18 may vote. The Riksdag enacts laws, adopts the budget, establishes taxes and levies, regulates government borrowing, ratifies international treaties, elects the prime minister, confirms the government (cabinet), and appoints standing committees, financial inspectors, and ombudsmen.

The government prepares legislation, and at the request of the Riksdag may adopt acts having the force of law. It appoints diplomats, governors, and high officials, and it directs the armed forces and governmental bodies.

The central government is represented in the counties (*län*) by a governor, who heads a special administrative bureau consisting of ten members, half of whom are appointed by the cabinet and half by the Landsting. The governor supervises the local governing bodies: the Landstings in the counties and the assemblies of deputies in the cities and rural communities. These local bodies are elected by the population for three years.

The judicial system includes the Supreme Court, six appellate courts, and municipal and district courts. Special courts exist for certain types of cases, for example, cases relating to the division of property, land ownership, and police matters. There are also administrative courts.

M. A. MOGUNOVA

Natural features

Sweden is located in the Atlantic sector of Europe, in the northern part of the temperate zone. The land is part of the Fennoscandia geographical region.

Coastline. The Swedish coast, generally low and rocky, is fringed by small islands and skerries that hinder coastal navigation. Stretches of low, primarily sandy, aggradation shores are found along the northern and southwestern ends of the Gulf of Bothnia. The Skåne Peninsula in the south has an abrasion coast.

Topography. The northern and western regions of Sweden are occupied by the Scandinavian Mountains, rising to 2,123 m on Mount Kebnekaise. The mountains consist of ranges with stretches of alpine relief, high plateaus, and intermontane basins. More than 200 small glaciers, chiefly cirque but also some valley and diffluent glaciers, cover a total area of about 400 sq km. There are traces of ancient continental glaciation. The Norrland Plateau in the north, with elevations of 200–800 m, descends in several broad steps, bounded by escarpments, from the Scandinavian Mountains to the Gulf of Bothnia. The plateau is deeply dissected by fractures in which river and lake valleys have formed. To the south lies the Central Swedish Lowland, where low ranges and isolated ridges eroded by ancient glaciers alternate with flat depressions, many of them occupied by lakes. Glacial landforms such as eskers and moraine hills and ridges are widely found in the lowland. In the southern part of the country rises the Småland Upland, divided into ridges and massifs by a system of radiating valleys.

Geological structure and minerals. Sweden is located on the Baltic Shield of the Eastern European Platform and on the Caledonian folded structures surrounding the platform. The structure of the shield includes Proterozoic metamorphic complexes (leptites, granites, gneisses, quartzites, phyllites, spilites) of the Svecofennian, Karelian, Gothian, and Dalslandian and nonmetamorphosed strata of the sub-Jotnian (Rapakivi), Jotnian (sandstones, shales, and diabases), Sparagmite (sandstones and limestones), and Varegian (quartzites, tillites, and banded clays). The mantle is composed of some Cambrian-Silurian residual rock but chiefly of Quaternary glacial deposits. The Caledonides in northwestern Sweden contain Upper Proterozoic (Jotnian, Sparagmite and Varegian) deposits and Cambrian-Silurian sandstones, alum and clay shales, and bituminous limestones.

The principal minerals are iron ore (reserves of 3.4 billion tons with an iron content of 58–68 percent) and ores of copper (1.6 million tons), lead (about 2.3 million tons), and zinc (2.4 million

tons). The largest iron ore deposits (apatite-magnetite), associated with Svecofennian metamorphic rocks, occur in northern Sweden at Kiruna, Gällivare, and other sites. Sulfide deposits of copper, zinc, and lead ore—sometimes containing gold, silver, and arsenic—are found at Boliden, Kristineberg and other places in the Skellefteå region. In northern and central Sweden deposits of iron ore (Grängesberg), zinc and lead (Laisvall), and copper (Aitik) are associated with Svecofennian leptites, and the uranium deposit at Ronstad is associated with Cambrian bituminous shales. The country also has small ore deposits of manganese, tungsten, rare elements, and fluorite, as well as mineral springs.

Climate. Sweden has a temperate climate that is strongly affected by the warming Gulf Stream. The January temperature is 10°C higher than the average for these latitudes and the July temperature 3°C higher. The climate is harsher in the northern regions, where continental temperate and arctic air masses play a greater role. The climate in the central and southern regions is transitional between marine and continental, although some places have a clearly marine climate. The mean January temperature ranges from 0° to 5°C in the south and from −6° to −14°C in the north. Summers are cool, with mean July temperatures of 15°–17°C in the south and 10°–11°C in the north.

The annual precipitation in the mountains is 1,500–1,700 mm, increasing to 2,000 mm in some places. The southern plains receive 700–800 mm and the northeast, 300–600 mm. The snowpack lasts six or seven months in the northern mountains, diminishing to one month toward the south; in some areas a stable snow cover is not formed during the winter.

Rivers and lakes. Most of the rivers are short and full, fed chiefly by snow and rain. The largest rivers are the Dal, Torne, Klar, Ångerman, and Göta. The rivers have significant gradients with many rapids and waterfalls. The maximum flow occurs in the spring and summer, although fluctuations in water level are small because of the regulating effect of the numerous lakes and swamps. The rivers freeze over for three or four weeks in the south and for five or six months in the north. Sweden's hydroelectric potential, about 80 billion kilowatt-hours a year, is the third largest in Europe after the Soviet Union and Norway. Lakes cover about 9 percent of the country's area. The largest lakes are in the Central Swedish Lowland: Vänern, the largest lake in Europe outside the USSR, Vättern, Hjälmaren, and Mälaren. Numerous lakes in tectonic basins are found in Norrland. The lakes are frozen over for six or seven months in the north and three or four months in the south.

Soils and vegetation. Forests occupy more than half of the country's area. Taiga forests growing on podzolic soils form vast tracts north of 60° N lat.; they consist chiefly of pine and spruce with some birch, aspen, and other deciduous species. To the south, mixed forests of conifers and broadleaf species occur on soddy podzolic soils. Broadleaf forests of oak and beech grow on brown forest soils on the Skåne Peninsula. Sweden has timber reserves of about 2.4 billion cu m (the largest in Europe outside the Soviet Union), of which about 2 billion cu m are conifers (1972). Swamps, found chiefly in Norrland, cover about 14 percent of the country.

Mountain taiga vegetation, growing on mountain podzolic soils, covers the slopes of the Scandinavian Mountains to elevations of 900–950 m in the south and 350–400 m in the north. At higher elevations the taiga gives way to birch krummholz, which in turn are supplanted by a swampy mountain tundra of mosses, lichens, junipers, dwarf birch, and berry bushes, growing on mountain tundra and marsh soils. Tundra vegetation occupies about 15 percent of Swedish territory. Heaths and meadows are found on the plains and along the coast.

Wildlife. The forests are inhabited by elk, brown bears, wolves, lynx, foxes, squirrels, marten, and blue hares. Badgers and hedgehogs are found in the south, and wolverines, arctic foxes, and lemmings live in the tundra. Waterfowl, chiefly ducks and geese, are common. Salmon, trout, perch, and pike are commercially valuable freshwater fish; cod, herring, and other marine species are obtained from the coastal waters of the Baltic.

Protected territories. In 1975, Sweden had 16 strictly protected national parks and 850 preserves. The principal parks are Abisko, Muddus, Peljekaise, and Sareks-Sjöfallets.

Natural regions. Sweden has five natural regions: the Scandinavian Mountains, Norrland, the Central Swedish Lowland, Småland, and Skåne. In the Scandinavian Mountains individual ranges alternate with plateaus and intermontane basins. The region has modern glaciers and landforms created by ancient glaciation. The vegetation consists of taiga and mountain tundra. Norrland is a plateau in northern Sweden crossed by numerous turbulent rivers and bearing traces of ancient glaciation. It is covered by taiga vegetation.

The Central Swedish Lowland is a region of lake plains, moraine hill landscapes, and rocky outliers. A significant part of this densely populated region has been brought under cultivation. Småland is an upland in southern Sweden with a moraine hill topography. It has conifer and mixed forests. In the Skåne Peninsula in the extreme south plains, mostly under cultivation, alternate with ridges of granite and gneiss. There are small tracts of oak and beech woods.

Population

Ethnically, Sweden is a homogeneous land, with Swedes making up about 96 percent of the population. Lapps, the indigenous inhabitants of the north, constitute a national minority of some 10,000 persons. There is also a small Finnish population. The official language is Swedish, and Lutheranism is the state religion. The Gregorian calendar is used.

The average annual birth rate has tended to decline, while the death rate has stabilized. Between 1971 and 1975 the annual rate of natural increase averaged 3.5 per 1,000 population. The male and female populations are approximately equal. A low birth rate and a long life expectancy (72 years for men and 76 years for women) has caused a substantial "aging" of the nation. Between 1950 and 1975 the proportion of children under 15 declined from 23 percent to 20 percent of the population, while the proportion of people over 60 increased from 15 percent to 20 percent.

Of the total work force of 3.7 million (1975), 34 percent were employed in industry, 7 percent in agriculture, forestry, and fishing, 8 percent in construction, 7 percent in transportation and communications, and 44 percent in commerce and other service sectors. The low natural increase of the population has put a strain on the country's labor resources. The number of foreign workers reached 200,000 in 1975, and foreigners accounted for more than 10 percent of the country's industrial workers. The population density averages 20 per sq km (1976), with most of the population being concentrated in the central and southern regions. Some four-fifths of the population lives in cities and urban-type settlements. In 1976 the largest metropolitan areas were Stockholm (1,358,000 inhabitants), Göteborg (691,000), and Malmö (454,000).

Historical survey

Primitive communal system and origin of class society (to the 12th century). The earliest traces of man on the territory of modern Sweden date from the eighth and ninth millennia B.C. Around the third millennium B.C., the inhabitants, who had hitherto engaged in hunting and fishing, shifted to livestock raising and agriculture. In the next millennium, Sweden was invaded by livestock-raising tribes, presumably Indo-European, which subjugated the indigenous inhabitants. Property and social stratification, which began in the Bronze Age (1500–500 B.C.), was somewhat arrested in the early Iron Age (from the second half of the first millennium B.C.). Tacitus and other classical writers mention the Suiones (Svear), Götar (Goths), and other northern Germanic tribes that inhabited the area in the first centuries A.D. The disintegration of the

primitive communal system among these tribes accelerated in the middle of the first millennium. Tribes and tribal confederations, subordinate to a military chief (*konung*), traded first with Rome and its Germanic provinces and, from the fifth century, with the Franks, Frisians, western (maritime) Slavs, and peoples of the eastern Baltic region.

Between the late eighth and mid-11th centuries, the Swedish Vikings, known in Western Europe as the Normans and in Russia as the Varangians, traded with and plundered not only the neighboring lands but also Rus', Byzantium, the Volga Bulgars and Khazars, and the Arab Caliphate. The first Swedish city, Birka (founded c. 800), and somewhat later the island of Götland became trade centers on the Baltic. Christianity gained a foothold in Sweden at the beginning of the 11th century. At that time the kingdom of the Svear, Svitiod, subjugated all but the coastal areas of the state created by the Götar in the west and south. The Swedish, Norwegian, and Danish nations began to emerge from the conglomeration of ancient Scandinavian tribes.

Feudalism (12th to 17th centuries). ESTABLISHMENT OF FEUDAL RELATIONS (12TH AND 13TH CENTURIES). Feudal relations developed slowly in Sweden, where tribal-clan vestiges were firmly rooted. The labor of slaves (*träls*) and semifree men (*brytes*) was employed in the land communes. A feudally dependent peasantry evolved from among free peasants who had lost their land and slaves who had been emancipated and settled on the land; both became the temporary holders of land belonging to the king, the church, or the secular aristocracy. The peasants remained personally free in Sweden.

A class of feudal lords emerged from the ranks of the king's retinue and other royal servitors, the tribal aristocracy, and the upper echelons of the *bönder* (free farmers). The adoption of Christianity also promoted the development of feudal relations; an archbishopric was established in 1164 at Uppsala, the religious and political center of ancient Sweden. In return for the support of the church, the kings of Sweden granted land to monasteries and the high clergy. New commercial centers sprang up, among them Sigtuna, Visby, Kalmar, and Lödöse. The Swedes began establishing shaft mines and smelting iron and copper. The free population was gradually divided into a tax-paying majority not subject to military duty (the exploited peasantry) and a non-tax-paying minority, the *frälse* (knights), who performed mounted military service. Slavery was not abolished until 1335.

The early-feudal centralization of Sweden was completed by Birger Jarl and his sons, who founded the Folkung dynasty (ruled 1250–1363). In this period stone fortress-castles were erected, among them Stockholm (mid-13th century), Sweden's capital from the late 14th century. By the end of the 13th century Swedish society was divided into estates. Crusades against the Finnish tribes, begun in the mid-12th century, culminated in the final conquest of Finland in the early 14th century. After repeated defeats, notably the rout at the battle of the Neva (1240), Swedish attempts to conquer northwestern Rus' resulted in the establishment of a boundary between Sweden and Rus' under the Orekhovets Peace, concluded between Sweden and Novgorod in 1323.

FEUDAL UNIONS (14TH TO EARLY 16TH CENTURIES). After the election of the Norwegian king Magnus Eriksson (ruled 1319–63) to the Swedish throne in 1319, Sweden was united with Norway until 1355. From this time, royal power was limited by a king's council of secular and ecclesiastical magnates, later renamed the state council, or Riksråd. A national law code, the Landslag (c. 1350), was compiled, and the country was divided into *läns* headed by royal viceroys called lords of the *läns*. Weakened by feudal strife, Sweden in 1389 entered into a union with Denmark, a move that foreshadowed the Union of Kalmar (1397–1523) between Denmark, Sweden, and Norway. Under King Erik of Pomerania (ruled 1412–39), Denmark began to gain ascendancy over economically weaker Sweden. Oppressive taxation and a war against the Hanseatic League (1426–32) sparked the anti-Danish uprising led by Engelbrekt Engelbrektsson (1434–36). The first four-estate Riksdag, representing the nobility, clergy, townspeople, and peasants (excluding those on noblemen's domains), was convened in 1435–36.

The union with Denmark effectively broke up in 1448, and Sweden achieved relative independence in 1471 after its victory over the Danes at the battle of Brunkeberg. From 1471 to 1520 it was ruled by regents of the aristocratic house of Sture, under whom the central government was consolidated, the national culture strengthened (in 1477 the first university in northern Europe was opened at Uppsala), and the guild system was established in a number of cities. With the support of the Catholic Church, the Danish king Christian II forcibly reestablished the Danish-Swedish union in 1520 (*see* STOCKHOLM BLOODBATH). The large popular uprising of 1521, led by the nobleman Gustav Eriksson, put an end to the dominance of the Danes. Elected king of Sweden (Gustavus I) in 1523, Gustav Eriksson founded the Vasa dynasty.

SWEDISH HEGEMONY ON THE BALTIC AND THE BEGINNING OF CAPITALISM (EARLY 16TH TO LATE 17TH CENTURIES). The support given to the Danes by the Catholic prelates became the grounds for secularizing church holdings and carrying out the Lutheran Reformation (1527–39), which strengthened the authority of Gustavus I Vasa (ruled to 1560). The deterioration of the peasants' condition, largely owing to the restrictions placed on their land rights for the benefit of the crown, touched off a series of uprisings, notably the Dal uprisings of 1524–25, 1527–28, and 1531–32 and the uprising of "forest robbers" of 1542–43.

In the middle of the 16th century the strengthened national monarchy (hereditary from 1544) joined the struggle for Baltic supremacy, renewing its aggression in the east during the Russo-Swedish War of 1555–57. Taking advantage of the Livonian War of 1558–83, King Erik XIV (ruled 1560–68) captured Revel and northern Estonia in 1561. Hostility to the strengthened Russian state temporarily drew Sweden closer to the Polish-Lithuanian Commonwealth in the late 16th century. A personal union between the two countries under King Sigismund III Vasa (1592–99) ensured a favorable outcome in the war of 1570–95 against the Russian state, but it exposed Sweden to the threat of the Catholic Counter-Reformation, actively encouraged by Sigismund. After the breakup of the union, Sweden and the Polish-Lithuanian Commonwealth became embroiled in a long struggle for control over the Baltic. In the course of this struggle, Sweden initially aided Tsar V. I. Shuiskii against the Polish interventionists, but in the summer of 1610 it embarked on overt aggression against Russia (*see* POLISH AND SWEDISH INTERVENTION OF THE EARLY 17TH CENTURY).

Sweden's foreign trade, especially metal exports, grew steadily from the late 16th century. The metallurgy industry expanded in the first half of the 17th century in conjunction with the increased mining of copper and iron. By the middle of the century early-capitalist enterprise was developing, primarily in mining and metalworking, and Swedish capital was accumulating. Under the command of King Gustavus II Adolphus (ruled 1611–32), the Swedish Army won victories in the war of 1610–15 against Russia, its conquests confirmed by the Peace of Stolbovo (1617). Sweden's wars against the Polish-Lithuanian Commonwealth (1600–11 and 1617–29) ended in its seizure of Livonia and the Truce of Altmark (1629).

From 1630, Sweden fought on the side of the anti-Hapsburg coalition in the Thirty Years' War (1618–48), acquiring a number of north German territories under the Treaty of Westphalia (1648). The wars against Denmark (1643–45 and 1657–60) concluded with the seizure of Danish possessions in the southern Scandinavian Peninsula (principally Skåne) and part of eastern Norway, ceded to Sweden by the Roskilde Peace (1658). Sweden's conquests in the Baltic region during the Northern War of 1655–60 were confirmed by the Peace of Oliva (1660). The Treaty of Kardis (1661), which ended the Russo-Swedish War of 1656–58 in an "eternal peace," reiterated the terms of the Peace of Stolbovo. As a result of the 17th-century wars, Sweden became one of the most powerful countries in Europe.

The burden of conscription, taxes, and duties grew heavier in the 17th century. Peasant holdings (taxpaying) and crown lands fell into the hands of the nobility, chiefly the aristocracy, on various terms. Under Queen Christina (ruled 1632–54), when nearly 70 percent of the arable and meadow land passed to the nobility, feudal reaction reached its peak. Exploiting the hostility of the tax-paying estates in the Riksdag to the aristocracy, King Charles X Gustavus (ruled 1654–60) began a partial reduction (recovery of crown lands) in 1655. From 1680 to 1682, King Charles XI (ruled 1660–97) carried out an extensive reduction, as a result of which more than 50 percent of the crown land previously ac-

quired by the nobility was returned to the king. The implementation of a reduction heralded Sweden's transformation into a bourgeois state. The Riksdag of 1680 declared that the king's power was absolute and that the Riksråd was solely an advisory body. An absolute monarchy was thus established, its main support drawn from the middle-level nobility, the officials and officers of noble birth, and the commercial-manufacturing bourgeoisie.

Decline of feudal relations and further development of capitalism (18th century). By the beginning of the 18th century Sweden had become Europe's chief iron exporter, as well as a major importer of grain. Noble landowners increasingly leased small holdings to peasants in exchange for their labor (*see* TORPARE) or employed hired laborers. Some of the nobility began investing in industry. Exploiting its military and economic superiority, Sweden achieved successes in the early stages of the Northern War of 1700–21. In 1708–09, Swedish forces invaded Russian soil, but they were routed at the battle of Poltava (1709); on the seas, they were defeated at the battle of Hangö (1714). Under the Treaty of Nystadt (1721), Sweden lost its possessions in the eastern Baltic, as well as southwestern Karelia and Vyborg. The majority of Sweden's German possessions were also renounced.

With the death of Charles XII (ruled 1697–1718), the period of Swedish absolutism came to an end; moreover, military defeat had undermined Sweden's status as a great power. Between 1719 and 1723 royal power was substantially restricted in favor of the Riksråd and Riksdag, marking an important stage in the bourgeoisification of the state. The government headed by Chancellor A. Horn, in power from 1720 to 1738, carried out a series of reforms aimed at strengthening the country economically; in foreign affairs it supported the maintenance of peace with Russia. The revanchist party that formed in the 1730's, known as the Hats, concluded an alliance between Sweden and France in 1738 and brought down the Horn government. (The supporters of peace with Russia were nicknamed the Caps.) The war against Russia (1741–43) unleashed by the Hats government (in office from 1735 to 1765) ended in Sweden's defeat. Under the Åbo Peace Treaty (1743) southeastern Finland passed to Russia. Sweden was also defeated in the Seven Years' War (1756–63), which it joined in 1757.

From 1765 to 1769 and in 1772 the government of the Young Caps, a party founded in the early 1760's, introduced a series of social and economic reforms, including freedom of the press and equal opportunity for advancement in government service, irrespective of class origin. The mounting hostility to the nobility led to clashes in the Riksdag session of 1771–72 and to peasant antilandlord disturbances in Skåne from 1772 to 1776.

In August 1772, King Gustavus III (ruled 1771–92) carried out a bloodless coup d'etat. Political parties were banned, and the constitution adopted that year curtailed the rights of the Riksdag, strengthened royal power, and confirmed the privileges of the nobility. In view of the growing strength of commercial-manufacturing capital, however, Gustavus was obliged to pursue a policy of enlightened absolutism. Agreeing to a number of bourgeois reforms—including the equalization of privileges of 1789, giving the peasants equal rights with the other tax-paying estates—and suppressing the gentry constitutionalists of the Anjala League, Gustavus temporarily restored absolutism in Sweden.

Consolidation of capitalist relations (19th century). THE BOURGEOIS REVOLUTION AND REFORMS OF 1800–50. Feudal relations rapidly disintegrated in Sweden in the first quarter of the 19th century. The agrarian reforms introduced between 1807 and 1827 and the partition and sale of forest tracts, which continued throughout the 19th century, destroyed the land commune and made the individual farm the basis of agriculture. Dispersed manufacture, wherein the entrepreneur bought up goods produced by independent artisans, became widespread; mine owners and merchants formed an influential segment of the propertied elite; and the gentry was bourgeoisified. Sweden's military defeats under the despotic king Gustavus IV, who ruled in his own right from 1796, led to the king's overthrow in March 1809 by gentry officers and high officials. The coup was equivalent to a bourgeois revolution of the elite. The constitution adopted in June 1809, which remained in force, with modifications, until 1974, again limited royal power in favor of the Riksdag, proclaimed various civil liberties, and abolished many of the nobility's privileges. Under the Treaty of Fredrikshamm (1809), which concluded the Russo-Swedish War of 1808–09, Sweden lost Finland and the Åland Islands.

In 1810 the Riksdag elected as heir to the throne the former French marshal J. B. Bernadotte, who immediately became the de facto ruler of the country. (He ruled as Charles XIV John from 1818 to 1844.) Bernadotte secretly violated the continental blockade, which Sweden joined in 1810, when it declared war on Great Britain. Although he concluded a treaty of alliance with Russia in 1812, Bernadotte did not actually make war on Napoleon until the spring of 1813, after forming an alliance with Great Britain. In the fall of 1813, Swedish troops invaded the German possessions of the Danish crown. By the Treaties of Kiel (1814), Denmark ceded Norway to Sweden, paving the way for a personal union (*see* SWEDISH-NORWEGIAN UNION OF 1814–1905). Sweden sold Swedish Pomerania—the last of its German holdings—to Prussia in 1815.

The economic revival that began in the 1830's coincided with an industrial revolution, as the Swedes shifted to mechanical spinning, introduced new methods of forging iron, and began producing machinery. The Liberal opposition, led by L. Hierta, called for parliamentary reform and freedom of trade and industry. Guilds were abolished and semifeudal labor legislation was modified in the late 1840's. In March 1848 there were popular disturbances in Stockholm, as in a number of other European capitals. In its foreign policy Sweden tried to steer a middle course between Great Britain and Russia, issuing a declaration of neutrality in 1834. Pan-Scandinavianism became a popular cause in Sweden.

PREMONOPOLY CAPITALISM (1850–1900). The building of the first railroads and telegraph system in the 1850's and 1860's coincided with the founding of large private banks and joint-stock companies. Complete freedom of commercial and industrial activity was proclaimed in 1864. The creation of large-scale industry did not keep pace with the agrarian revolution, however, and large numbers of rural people emigrated, mainly to the USA. Local government was reorganized and expanded in 1862, and in 1865–66 the four-estate parliament was replaced by a bicameral Riksdag whose members were to be elected by qualified propertied voters. After a law providing for universal public education was enacted in 1842, the spread of public schools resulted in the complete elimination of illiteracy.

Industrialization reached its peak in the last third of the century, a time when the foreign trade turnover increased by a factor of 5, reaching 1 billion gold kronor. Large forest tracts and ore deposits were developed in the north, and railroad construction expanded (Stockholm-Boden trunk line, 1863–94). The peasant cooperative movement spread from the 1880's, and numerous workers' consumer cooperatives were organized in the 1890's. By 1900 industrial and agricultural laborers made up 57 percent of the gainfully employed population. One of the first large strikes took place in the sawmills of Sundsvall in 1879. Trade unions were established in the first half of the 1880's, and the Swedish Trade Union Confederation was founded in 1898. In 1889, A. Palm, K. H. Branting, and others organized the Social Democratic Labor Party of Sweden. Under King Oscar II (ruled 1872–1907), Sweden established a tradition of neutrality, although leaning toward Germany.

Twentieth century. TO 1918. By the outbreak of World War I, Sweden had become an industrial and agricultural nation. Various branches of machine building had been established, and large private banks were playing a larger role in financing industry. A protectionist customs policy encouraged the domination of the domestic market by cartels; in 1911 there were about 150 monopolistic associations, chiefly cartels.

Capitalist industrialization was accompanied by an upsurge in the workers' movement, manifested in the metalworkers' strikes of 1905 and the general strike of 1909, which V. I. Lenin rated highly despite its defeat. The Liberal Coalition Party, founded in 1900 and led by K. Staaff, and the Social Democratic Labor Party worked for parliamentary reform. (At the beginning of the 20th century, only 9.5 percent of the population had the right to vote.) In 1905 the Swedish government agreed to a peaceful dissolution of the union with Norway (*see* KARLSTAD, TREATY OF). The limited

parliamentary reform carried out between 1907 and 1909 instituted universal suffrage for men (with partial retention of the property qualification) in elections to the second chamber of the Riksdag, with the first chamber remaining the organ of the upper classes. With tensions growing in Europe, right-wing (pro-German) circles, calling for intensified military preparations, were able to bring the Conservative government of H. Hammarskjöld to power in 1914 with the support of King Gustavus V (ruled 1907–50).

In World War I, neutral Sweden in fact took a pro-German position. From 1914 to 1916 the country's economy was deluged with foreign orders, but from late 1916, the submarine war and blockade brought on a fuel shortage and an industrial crisis. Calling for "civil peace," the Social Democratic leaders espoused a policy of social patriotism. The leftist opposition, led by Z. Höglund, J. Vennerström, and F. O. Ström, seceded to found the revolutionary Left Social Democratic Party of Sweden in May 1917. The leftists welcomed the October Revolution in Russia. Under pressure from the Entente, Sweden in late 1918 ceased trading with Soviet Russia, breaking the Soviet-Swedish trade agreement signed in June of that year. Although it joined the anti-Soviet blockade, Sweden refrained from participating in the armed intervention.

1918 TO 1939. The revolutionary situation that developed in Sweden in 1917—partially in response to the October Revolution in Russia—reached its peak in late 1918 under the impact of the November Revolution of 1918 in Germany. However, the right-wing Social Democrats kept the masses under their control. Confronted with a mass strike movement, which lasted from 1918 to 1920, the government in 1918–19 carried out an electoral reform giving women the right to vote in parliamentary elections, democratizing the first chamber, and essentially abolishing the voter property qualification in elections to the second chamber. A law providing for an eight-hour workday was adopted in 1919. The next year a Social Democrat, K. H. Branting, headed the government for the first time. Sweden became one of the founders of the League of Nations. At its Fourth Congress in 1921 the Left Social Democratic Party accepted the 21 conditions for membership in the Comintern and was renamed the Communist Party of Sweden (since 1967, the Left Party–Communists).

At the end of 1920 the postwar boom gave way to a crisis of overproduction, and in the course of 1921, the value of exports declined by two-thirds in comparison with the previous year. The transition of Swedish capitalism to the monopoly stage was completed in the 1920's, when Sweden became a major exporter of capital (2 billion kronor between 1922 and 1937), and its companies gained international renown. From 1920 to 1932 the governments of Sweden, which changed nine times, were generally headed by Liberals. Trade with the Soviet Union was resumed in 1920, and in March 1924 diplomatic relations were established between the two countries. In 1928 the Liberal government adopted laws on collective bargaining and on arbitration in labor conflicts (of a legal nature) between workers and entrepreneurs.

The world economic crisis reached Sweden at the end of 1930. Industrial production declined by 11 percent from 1930 to 1932, and in 1932–33 one-fifth of the trade union members were unemployed. The government used force against the expanding mass strike movement, which was headed by the Communist Party. (In 1931 troops fired on a workers' demonstration at Ådalen.) Promising to combat the economic crisis by government regulation of the economy, the Social Democrats were victorious in the parliamentary elections of 1932. Until 1946 the government of Sweden was headed by the Social Democratic leader P. A. Hansson, who ushered in the "Social Democratic era." Among the social reforms instituted between 1936 and 1939 were government aid to mothers and children, partial subsidies for unemployment assistance and housing construction, a two-week paid vacation for all workers, and compulsory seven-year education.

A shift from monopoly capitalism to state-monopoly capitalism became apparent in the 1930's as indirect forms of economic regulation (taxation and credit-monetary policy) came to predominate, and national and municipal government investments gave priority to the infrastructure, chiefly transportation, energy, and communications. At the same time, the public sector continued to represent a comparatively small share of industrial production, and the nationalization of private means of production was virtually renounced. Consolidating its ranks in the second half of the 1930's, the Communist Party intensified its struggle on behalf of the working class, stiffened its opposition to war and fascism, and redoubled its efforts to create an antifascist front.

WORLD WAR II. At the outbreak of World War II, Sweden proclaimed a policy of strict neutrality and hastened to conclude trade agreements with both Germany and Great Britain. During the Soviet-Finnish war of 1939–40, Sweden took the position of a "nonbelligerent," while providing military aid to Finland. The coalition government of national unity created in December 1939 and headed by the Social Democrats resisted the efforts of Great Britain and France to draw Sweden into the war. A threat to Sweden's security was posed by the German invasion of Scandinavia in April 1940. To a degree, Germany refrained from occupying Sweden because of the position of the Soviet government, which in a note to the German government on Apr. 13, 1940, declared the desirability of maintaining Swedish neutrality.

After the victories of fascist Germany in Western Europe, Sweden agreed to allow German soldiers on leave to use its railroads in going to and from Norway, and it redirected about half of its exports to Germany. In September 1940, Sweden concluded a trade agreement and a credit agreement, the first such pact, with the USSR. Sweden also maintained economic ties with Great Britain and the USA, which together chartered half of Sweden's maritime transport. After fascist Germany's attack on the USSR, Sweden increased its aid to the fascist bloc, permitting the passage of German troops and armaments to Finland. In August 1943, after the Soviet Army's victories at Stalingrad and at Kursk, Sweden forbade German military transit, and in the fall of 1944 it broke off trade with Germany. In May 1945, Sweden severed diplomatic relations with Germany. During the war a marked shift to the left took place in Swedish society. The influence of the Communist Party increased among the masses: in the parliamentary elections of 1944 it won 15 seats in the second chamber.

SINCE 1945. Although industrial production increased by 13 percent between 1937 and 1945, inflation and unemployment (3.3 percent of trade union members in 1946) plagued Sweden's economy, and the living standard of the population declined. In view of the growing militancy of the workers' movement, reflected in the five-month strike of 130,000 metalworkers between February and June 1945, entrepreneurs were obliged to begin raising wages at the end of 1945.

In July 1945 the coalition government was replaced by a single-party Social Democratic government headed by Hansson and after his death in October 1946, by T. Erlander, who also became the party's chairman. The Social Democratic government pledged to base its policies on the Postwar Program of the Workers' Movement, calling for radical socioeconomic and political reforms and the "transformation of society in a socialist direction." The program had been adopted in 1944 by the Social Democratic Labor Party and the Swedish Trade Union Confederation. Supported by a majority of the representatives of the workers' parties in the Riksdag, the government carried out a series of progressive measures. Universal health insurance was introduced in 1946, although it was not fully implemented until 1955. In 1946 the government enacted a worker safety law, established family allowances for every child, increased old age pensions (called national pensions), and raised income taxes for the wealthier strata of the population and joint-stock companies.

Growing economic difficulties and the cold war atmosphere of the late 1940's caused the Social Democratic government to curtail its reform program and to concentrate on stabilizing the economy in the interest of big capital. In 1948 it adopted a program of modernizing the country's armed forces under which military expenditures increased from 860 million kronor in 1948 to 2,026,000,000 kronor in 1953. Although Sweden agreed to participate in the Marshall Plan in 1949, it refused aid under the plan in 1951. Seeking to strengthen their parliamentary base, the Social Democrats in 1951 formed a coalition government with the Farmers' Party, which had been founded in 1913. (In the 1948 elections the Social Democrats had lost five seats in the second chamber of the Riksdag and the Communists, eight seats.) The

country's progressive forces, above all the Communists, stepped up their struggle against the threat of war. The Swedish Peace Committee was established in 1949, and the next year the Permanent Committee of the World Congress of Partisans of Peace, meeting in Stockholm, issued an appeal for a ban on nuclear weapons.

Sweden's postwar foreign policy was defined in a government declaration, issued Oct. 25, 1945, as one of noninvolvement in military-political blocs with the aim of maintaining neutrality in the event of war. In 1946 Sweden became a member of the UN; in 1948 it joined the Organization for European Economic Cooperation (from 1961, the Organization for Economic Cooperation and Development); and in 1949 it joined the Council of Europe. In 1948–49 the Swedish government tried to prevent its neighboring Scandinavian countries from joining NATO, proposing as an alternative a neutral defensive alliance between Sweden, Denmark, and Norway. In 1952, Sweden founded the Nordic Council jointly with Denmark, Norway, and Iceland. Sweden actively developed its relations with the USSR and the other socialist countries. The trade and credit agreements signed by the USSR and Sweden in 1946 promoted the growth of commodity exchange between the two countries.

In the 1950's Sweden's economy underwent periods of stagnation, notably in 1952–53 and in 1958. Much of the working class secured an increase in real wages in this period. In 1951 the coalition government led by the Social Democrats pushed through the Riksdag a law establishing a three-week paid vacation (effective as of 1953), and in 1957 it sponsored a law providing for a 45-hour work-week (introduced in 1960). The pension question dominated domestic political life in the late 1950's. Supported by the Communists, the Social Democrats proposed the introduction of a labor pension, supplementing the national pension, for all industrial and office workers, to be financed by employers. The Social Democrats' draft legislation obtained 46 percent of the votes in a consultative referendum held on Oct. 13, 1957.

Sharp disagreement over the pension issue and other questions of economic policy led to the breakdown of the government coalition and the establishment on Oct. 31, 1957, of a one-party Social Democratic minority government headed by Erlander. On Apr. 25, 1958, the government's labor pension bill was rejected by the bourgeois majority of the second chamber of the Riksdag, resulting in the chamber's dissolution. In the early elections of June 1, 1958, the Social Democratic Labor Party and the Communist Party together obtained a one-vote majority in the second chamber of the Riksdag. On May 14, 1959, the labor pension law was adopted. Although the pension age was set at 67 and the law was not to take full effect until 1981, the reform was the most important social victory won by Sweden's working class after 1945.

The state sector of the economy expanded somewhat in the mid-1950's. As early as 1949 a law had been enacted establishing a state commercial bank, the Swedish Credit Bank, and in 1955 the Riksdag adopted a resolution to buy up half of the privately owned shares of the Lapland iron mines. Subsequently, the Social Democratic Labor Party retreated further and further from its plans to "socialize" the economy, confining itself to state-monopolistic regulation within the limits of a "mixed economy." On the basis of an agreement between the Social Democrats and the bourgeois parties, the Riksdag in 1958 adopted a new program to build up the country's armed forces, as a result of which military expenditures rose from 2,706,000,000 kronor in 1958 to 3,839,000,000 kronor in 1963. Despite the demands of the military and the bourgeois opposition, the government opposed equipping the Swedish Army with nuclear weapons. The public organization known as the Campaign Against Swedish Atomic Weapons, founded in 1958, played a major role in keeping Sweden from being drawn into the nuclear arms race.

In the 1950's Sweden's government advocated a policy of nonalignment for all the Scandinavian countries. In 1956 it condemned the aggression of Great Britain, France, and Israel against Egypt. Although it favored the ban on nuclear weapons testing and the creation of a nuclear-free zone in Central Europe, Sweden's government did not support the Finnish proposal (1959) that northern Europe be declared a nuclear-free zone. The tradition of reciprocal visits by Soviet and Swedish heads of state began with Prime Minister Erlander's official visit to the USSR in 1956.

In the parliamentary elections of 1960 the Social Democrats won 114 out of 231 seats in the second chamber of the Riksdag, more seats than all the bourgeois parties taken together. The Social Democratic government continued its policy of reforms: in 1963 the Riksdag adopted a law providing for a four-week paid vacation (instituted in 1965), and in 1962 and 1963 the national pension and the annual child allowances were increased. Nevertheless the problem of improving the condition of low-paid workers, who in 1967 constituted one-third of the membership of the Swedish Trade Union Confederation, remained unresolved and grew more acute. Increased rationalization of production, entailing the closing of unprofitable enterprises, aggravated the unemployment problem. The Communist Party and leftist forces in the trade union movement and in the Social Democratic Labor Party demanded that decisive measures be taken to counteract the power of the monopolies, guarantee employment for industrial and office workers, to end inflation, to increase wages, particularly for low-paid groups, and to reduce the workweek to 40 hours. They also called for the development of backward regions, primarily through the construction of large state enterprises, and for the transfer of large banks, insurance companies, and the petroleum-product and pharmaceutical industries to the ownership of the national government, local governing bodies, or cooperatives.

In 1967–68 the Social Democrats took steps to strengthen the regulatory role of the state in the economy by creating a state investment bank and a concern to manage state industrial enterprises AB Statsföketag. In the parliamentary elections of 1968 the Social Democrats received more than 50 percent of the votes for the first time since 1940. In 1968 and 1969 the Riksdag approved a partial constitutional reform, although the new constitution did not take effect until 1975. The two-chamber Riksdag was replaced by a one-chamber parliament elected on a proportional basis. The king retains mainly a representative function. On Oct. 1, 1969, O. Palme was elected chairman of the Social Democratic Labor Party and later that month he became prime minister.

Complex questions of the country's economic and social development still remained unresolved at the beginning of the 1970's. Between 1971 and 1975 the average annual number of unemployed persons was three times higher than it had been in the 1960's. The annual inflation rate, averaging 7–8 percent between 1969 and 1973 was largely owing to the introduction in 1969 of the value-added tax, called *moms*, which replaced the turnover tax. As a result of the rapid increase in prices and in rents, the growth in real wages slowed down or effectively ceased. The strike struggle of the working people gained momentum: the number of strikers and lost workdays increased from 9,000 and 112,000, respectively, in 1969, to 27,000 and 156,000 in 1970 and to 63,000 and 839,000 in 1971. Along with economic concessions, the strikers demanded guaranteed employment, the repeal of antilabor legislation, the restoration of the full right to strike, and limitations on the power of employers in enterprises.

After the parliamentary elections of 1970 the Social Democrats were able to maintain an absolute majority in the Riksdag only by forming a coalition with the Communist Party, which was named the Left Party–Communists in 1976. Between 1971 and 1973 taxes were lowered for low- and middle-income persons, laws were enacted to improve the health insurance system, and a bill was passed providing for the appointment of government representatives to the boards of private banks. In 1972–73 the government succeeded in pushing through the Riksdag laws providing for the representation of industrial and office workers on the boards of enterprises, for occupational safety, and for guaranteed employment, placing certain restrictions on management's right to hire, fire, or transfer workers. The system of unemployment insurance was improved. Although the Communists supported the government's measures, which were opposed by the bourgeois parties, they nevertheless criticized the halfway nature of the measures and the government's concessions to big capital.

In the parliamentary and municipal elections of 1973, the Social Democrats received 43.5 percent of the votes, and the Center

Party, known as the Farmers' Party until 1957, won 25 percent of the votes by expanding its social base among the petite and middle urban bourgeoisie, office employees, and industrial workers. An equilibrium was established in the Riksdag between the Social Democratic Labor Party and the Left Party–Communists on the one hand and the bourgeois parties on the other. Remaining in power with a weakened parliamentary base, the Social Democratic government decided to collaborate with the bourgeois People's (Liberal) Party, founded in 1934, and the Center Party.

Reaching an understanding with the bourgeois parties, the government took steps to stimulate the economy, worked out tax policies, and sponsored various other measures. In 1974 the Riksdag adopted a law lowering the pension age to 65; two years later the Left Party–Communists demanded that the pension age be lowered to 60 for miners and workers in other hazardous occupations. The new program adopted by the Social Democrats in 1975 embodied the reformist concept of a "third path," or "democratic socialism," but it also included certain progressive social and economic demands. Between 1974 and 1976 the government put through the Riksdag laws lowering direct taxes for low and middle-income groups while increasing levies on employers. In 1976 the Riksdag adopted a law on the "participation" of industrial and office workers in the management of enterprises that replaced existing legislation on mediation in labor conflicts (1920), collective bargaining (1928), and trade unions (1936). The new law obliged employers to negotiate with representatives of industrial and office workers on important questions pertaining to the operation of the enterprise. On the other hand, the law put some restrictions on the workers' right to strike and did not precisely define the forms of "participation."

Seeking to replace the government, the bourgeois parties in 1976 launched an extensive demagogic campaign (under the slogan "Social reforms without socialism!") against the "socialization" of Sweden. In the parliamentary elections of 1976, the Social Democrats received 42.8 percent of the votes, losing another four seats in the Riksdag; the Left Party–Communists lost two seats. The bourgeois parties obtained an 11-seat majority. For the first time since 1932, a purely bourgeois coalition government was formed by the Center, the Moderate Coalition, and People's parties, with the Center Party leader T. Fälldin serving as prime minister. In a declaration issued on October 1976 the government pledged to continue carrying out social reforms and stated that Sweden's policy of neutrality would remain unchanged. Dissension within the Left Party–Communists over questions of proletarian internationalism and the class character of the party resulted in the founding of the Workers' Communist Party.

In the second half of the 1970's the world economic crisis spread to Sweden. Industrial production declined by 10 percent between 1975 and 1977 and, despite further economic revival, the production output remained at the 1974 level. The number of unemployed reached between 90,000 and 100,000 in 1977, and about 150,000 persons were employed on special projects for the jobless. Social reforms were suspended as the government focused on stabilizing the economy by lowering the living standard and undermining the social condition of working people.

The importance of foreign policy increased steadily in the 1960's and 1970's. In 1961, Sweden's government appealed to the nonnuclear countries to refrain from producing, acquiring, or stockpiling nuclear weapons. In 1963, Sweden signed the Nuclear Test-ban Treaty and in 1968, the Nuclear Nonproliferation Treaty. Swedish representatives have participated in the work of the Geneva-based UN Committee on Disarmament since 1961. Sweden's expanding cooperation with the other countries of northern Europe was reflected in the founding of the Nordic Investment Bank in 1976 with capital from Sweden, Denmark, Norway, Finland, and Iceland. Sweden was a founding member of the European Free Trade Association (1960). Despite the pressure of the bourgeois opposition, the Social Democratic government did not agree to Sweden's inclusion in the European Economic Community, although a free trade agreement with the EEC was signed in 1972.

During the 1960's and 1970's Sweden's relations with the USSR and other socialist countries developed successfully. Five-year trade agreements between Sweden and the USSR were initiated in 1970, and from 1968 to 1975 the turnover of goods between the two countries increased from 160 million to 545 million rubles. A number of Soviet-Swedish governmental agreements were signed, including a consular convention (1967) and an agreement on economic and scientific-technical cooperation and on cooperation in the peaceful use of atomic energy (1970). In 1975 the two countries adopted a joint program for the development of economic, industrial and scientific-technical cooperation between 1975 and 1985.

In the 1960's and 1970's Sweden expanded its ties with the developing countries. By 1980 its economic aid to these countries exceeded 5,000,000,000 kronor, or 1 percent of the gross national product. In 1969, Sweden was the first capitalist country to recognize the Democratic Republic of Vietnam, and in 1976 its economic aid to that country amounted to 225 million kronor. In 1967, Sweden condemned Israel's aggression against the Arab countries. An information bureau of the Palestine Liberation Organization was opened in Stockholm at the end of 1975. In 1969, Sweden recognized the existing Oder-Neisse boundary, and in 1972 it established diplomatic relations with the German Democratic Republic. After the 1973 fascist coup in Chile, the Swedish government supported the Chilean patriots. Prime Minister Palme signed the Final Act of the Conference on Security and Cooperation in Europe on Aug. 1, 1975, in Helsinki. In 1980, Sweden maintained diplomatic relations with 122 countries.

Political parties, trade unions, and other social organizations

Political parties. The Social Democratic Labor Party of Sweden (Sveriges Socialdemokratiska Arbetarepartiet), founded in 1889, has more than 1 million members (1979). It draws its strength chiefly from industrial and office workers and also attracts some members of the middle strata of the population. The party belongs to the Socialist International.

The Center Party (Centerpartiet), called the Farmers' Party until 1957, was founded in 1913. Its 141,000 members (1979) include farmers, members of the petite and middle urban bourgeoisie, and office and industrial workers. The Moderate Coalition Party (Moderata Samlingspartiet), founded in 1904 and called the Conservative Party until 1969, has about 150,000 members (1979). It is supported by various strata of the bourgeoisie, high officials, and the intelligentsia, and it represents the interests of the big industrial and financial bourgeoisie. The People's, or Liberal Party (Folkpartiet), founded in 1934, has 60,000 members (1978). It brings together representatives of the petite, middle, and big bourgeoisie, office workers, and a certain number of industrial workers. The Christian Democratic Party (Kristen Demokratisk Samling), founded in 1964, expresses the interests of right-wing clerical circles.

The Left Party–Communists (Vaensterpartiet Kommunisterna), founded in 1917, was initially called the Left Social Democratic Party of Sweden (1917–21) and then the Communist Party of Sweden (1921–67). It includes industrial workers, office workers, and members of the intelligentsia. The Workers' Communist Party (Arbetarepartiet Kommunisterna) was founded in 1977 by disaffected members of the Left Party–Communists.

Trade unions and other social organizations. The Swedish Trade Union Confederation, founded in 1898, has 2,100,000 members (1979), united in 25 affiliated trade unions. It works closely with the Social Democratic Labor Party and belongs to the International Confederation of Free Trade Unions. The Central Organization of Salaried Employees, founded in 1944, has 1,100,000 members (1979), united in 24 affiliated unions. The Confederation of Professional Associations, founded in 1947, has 203,000 members (1979).

The Cooperative Union of Sweden, founded in 1899, has more than 1.5 million member-shareholders (1979). The Worker Educational League, founded in 1912, has about 4.5 million members (1979) and operates under the auspices of the Social Democratic Labor Party. The Social Democratic Youth League of Sweden, founded in 1917, has about 70,000 members (1979); the Youth League of the Center Party has more than 40,000 members (1979); the Youth League of the Moderate Coalition Party, founded in 1934, has about 40,000 members (1979); and the Youth League of the People's Party, founded in 1934, has about 25,000 members (1975). Communist Youth, founded in 1973 to replace the Leftist Youth League, established in 1958, is the youth organization of the Left Party–Communists. The Communist Youth League of Sweden, founded in 1977, is the youth organization of the Workers' Communist Party. Two other important organizations are the Swedish Peace Committee, founded in 1949, and the League of Sweden—Soviet Union Societies, founded in 1935. E. A. VOROZHEIKIN

Economic geography

General state of the economy. Sweden is one of the highly developed industrial capitalist countries of Western Europe, noted for its intensive agriculture and broad foreign economic ties, With just 0.3 percent of the population of the capitalist world, Sweden produces more than 1 percent of the industrial output of the capitalist countries and accounts for more than 2 percent of the world capitalist exports. Few countries surpass Sweden in per capita gross national product, amounting to $8,400 in 1975. This high level of economic development was reached through an exceptionally favorable combination of historical circumstances (not only has Sweden avoided war for more than 150 years, but it has enriched itself during the two world wars) and natural resources (the richest timber and iron ore reserves in Western Europe and enormous hydroelectric potential).

Industries engaged in the processing of wood and iron ore were the mainstay of industrial production and export until the mid-20th century. In the present economy wood, iron ore, and the semifinished products made from them have slipped into second place behind machinery, chiefly ships, motor vehicles, aircraft, and electrical and electronic equipment. Nevertheless, Sweden continues to be one of the world's largest producers and exporters of iron ore, high-grade steel, lumber, and pulp and paper goods. In 1974 industry accounted for 32 percent of the gross national product and agriculture, including forestry and fishing, for just 6 percent.

One of the most important features of the Swedish economy is its strong export orientation: one-fourth of the gross national product and more than one-third of industrial output is sold on the foreign market. At the same time, the country depends heavily on imports, which satisfy as much as one-fourth of Sweden's demand for goods and services. Crises in the world capitalist economy have an unhealthy effect on the country's market forces and cause frequent recessions, accompanied by declining employment.

In times of economic difficulty the large Swedish monopolies increase their export of capital; between 1961 and 1977 direct foreign investments by Swedish firms exceeded 24 billion kronor. Monopolistic industrial companies are clearly shifting from the export of goods to the export of capital. Whereas in the early 1960's the value of the output of foreign enterprises belonging to Swedish companies was about half the value of goods exported from Sweden, by the mid-1970's it was more than nine-tenths of the value of exports. The rise in foreign capital investment has caused national wealth to shift abroad in the interest of monopoly capital. By the mid-1970's the value of the output of the foreign enterprises of Swedish companies had reached one-fifth of the gross national product.

The Swedish economy is marked by a high degree of concentration of production and capital. A small number of large concerns, many of which have become multinational monopolistic associations, dominate the leading sectors of industry, merchant shipping, banking, and insurance. The SKF, ASEA, L. M. Ericsson, Elektrolux, Volvo, Saab-Scania, and Alfa-Laval companies dominate the machine-building sectors; Sandvik and Fagersta are the giants in high-grade metallurgy; and Svenska Cellulosa and Mo och Domsjö produce most of the country's pulp and paper. These and many other companies have close financial ties to the country's largest banks, the Skandinaviska Enskilda Bank (SEB) and the Svenska Handelsbanken. The country's industry and banks are actually controlled by the 20 to 25 families of the Swedish financial oligarchy, among them the Wallenbergs, who control SEB and as much as 15 percent of Swedish industry, including 25 percent of machine building, the Jönssons, the Broströms, and the Bonniers.

The state sector accounts for more than 15 percent of the gross national product and for up to 30–40 percent of gross investments. State enterprises produce about 10 percent of Sweden's industrial output. The state sector is most important in the production of iron ore (four-fifths of output), electricity (more than two-fifths), and steel (more than one-fifth). Sweden has also attracted considerable foreign capital investments; about 10 percent of the capital of joint-stock companies operating in Sweden belongs to foreign firms.

In the mid-1970's the Swedish economy went into a recession caused primarily by the falling demand for Swedish industrial goods on foreign markets. From 1975 to 1977 industry was operating at 75–80 percent of capacity; the annual industrial output dropped an average of 3 percent; and gross capital investments declined by 1.5 percent. As the balance of trade and payments grew worse, Sweden resorted to foreign loans to cover the deficit, borrowing about 25 billion kronor between 1975 and 1977. The average annual rate of inflation exceeded 10 percent. Full or par-

tial unemployment affected 2.5–3.5 percent of the economically active population. The steady rise in prices (the consumer price index rose 62 percent between 1970 and 1976), high direct taxes (30–35 percent of the average family's total income), high indirect taxes, high rents, and the high cost of transportation are a heavy burden on the working people.

Industry. Sweden's limited domestic market and labor resources, characteristic of a country with a small population, force Swedish industry to concentrate on the production of a comparatively small assortment of high-quality products. In the output of a number of important industrial products Sweden is on a par with the principal capitalist countries, and in several cases it even surpasses some of them, for example, in shipbuilding, pulp and paper manufacture, and high-grade metallurgy.

In 1974 industry employed 929,000 production and office workers and had a gross output of 179 billion kronor and a conventional net output of 82 billion kronor. Capital investments totaled 12.5 billion kronor.

There are two main groups of sectors: the metal industry, including mining, metallurgy, metalworking, and machine building, and the forest industry, comprising lumbering, woodworking, and pulp and paper production. These two groups of sectors account for more than two-thirds of the total number of persons employed in industry, for more than three-fifths of the gross industrial output, and for more than two-thirds of all industrial capital investments. Products from the metal and forest industries also constitute nine-tenths of the value of Swedish exports. Both groups of sectors are clearly oriented toward export: up to two-fifths of the output of the metal industry and more than half of the output of the forest industry are sold on the foreign market. They determine Sweden's specialization in the international division of labor. The rapid development of machine building has brought about an important shift in the sectorial structure of industry since World War II. Table 2 shows the structure of industry.

POWER INDUSTRY. The country's primary sources of energy are imported mineral, chiefly liquid, fuel and waterpower. Imported petroleum and petroleum products (26.4 million tons in 1975) provide more than 70 percent of the total energy consumption, and imported hard coal and coke (about 3 million tons), 5 percent. Hydroelectric power accounts for about another 15 percent of the total energy used; electricity generated by atomic power plants, 2–3 percent; and electricity produced using local fuel (primarily waste from sawmills), 6–8 percent. Petroleum refineries, which had a capacity of 22 million tons at the end of 1976, are located on the west coast at Göteborg and Lysekil and in the Stockholm region at Nynäshamn.

Table 2. Structure of industry
(percentage, 1974)

	Total number of employees	*Gross output*	*Conventional net output*	*Capital investment*
Mining	1.5	1.7	2.8	4.0
Manufacturing	98.5	98.3	97.2	96.0
Food and condiments	7.7	13.1	7.4	7.5
Textile, garment, and footwear	6.5	3.9	4.2	2.4
Woodworking and furniture	8.7	8.6	9.1	10.0
Pulp and paper	6.4	11.0	11.1	18.0
Chemical and petroleum refining	7.3	10.5	9.0	11.6
Metallurgy	7.5	9.5	8.1	9.0
Machine building and metalworking	45.5	35.7	40.1	33.6
Other sectors	8.9	6.0	8.2	3.9

In per capita electricity production (10,500 kW-hr in 1977) Sweden is surpassed only by Norway and Canada. Hydroelectric power plants, most of them located on the rivers of northern Sweden, supply about two-thirds of the country's electricity. The largest plants are Stornorrforsen on the Ume River (capacity, 375 megawatts); Harsprånget (330 MW), Vietas (320 MW), Messaure (300 MW), Letsi (290 MW), and Seitevare (225 MW) on the Lule River; Kilforsen (270 MW) on the Ångerman; and Krångede (210 MW) on the Indals. The power plants operate in a unified grid that is connected with the power systems of Denmark, Norway, and Finland. In the 1970's construction began on large atomic power plants in central and southern Sweden. By late 1977 atomic power plants were in operation at Oskarshamn (1,000 MW), Ringhals (1,500 MW), and Barsebäck (1,200 MW).

Table 3. Output of leading industrial products

	1950	*1960*	*1976*
Electricity (billion kW-hrs)	18.2	34.7	84.3
hydroelectric power plants	17.3	31.1	54.3
Iron ore (million tons)	13.6	21.8	30.5
Pig iron (million tons)	0.8	1.5	3.0
Steel (million tons)	1.4	3.2	5.1
Rolled ferrous metal products (million tons)	0.9	2.2	3.6
Electrolytic copper (tons)	26,000	38,000	60,000
Refined lead (tons)	24,000	45,000	49,000
Primary aluminum (tons)	5,000	16,000	83,000
Conifer lumber (million cu m)	5.2	6.8	11.3
Cellulose and wood pulp (million tons)	3.2	5.0	8.3
Paper and cardboard (million tons)	1.2	2.0	5.0
Cement (million tons)	1.9	2.9	2.9
Synthetic resins and plastics (tons)	12,000	85,000	570,000
Petroleum products (million tons)	1.0	2.5	13.8
Cars	14,000	109,000	317,000
Trucks and buses	3,000	20,000	51,000
Merchant vessels (launched, gross tonnage)	340,000	711,000	2,367,000

MINING. Sweden ranks second in Western Europe, after France, in the extraction of commodity iron ore (first if the ore output is calculated in terms of metal content). About three-fourths of the iron ore reserves and more than four-fifths of the extraction are concentrated in the extreme north at Kiruna and Gällivare. The Grangesberg mine is the largest in central Sweden. More than four-fifths of the ore is exported (32 million tons in 1974). The extraction of nonferrous metals in 1974 was as follows: copper, 40,000 tons; lead, 73,000 tons; and zinc, 109,000 tons. The largest mines are at Aitik (copper) and Laisvall (lead). In addition to copper, zinc, and lead, the complex sulfide ores mined in the Boliden-Kristineberg region yield pyrite, arsenic, gold, and silver.

MANUFACTURING. Although its output of ferrous metals is relatively limited, Sweden is noted for its development of high-grade metallurgy, chiefly the production of alloy and high-carbon steels. Most of the centers of high-grade metallurgy, among them Sandviken, Hofors, Fagersta, Avesta, Degerfors, and Hagfors, are located in the old Bergslagen mining region of central Sweden, which accounts for two-thirds of the country's steel output, including nine-tenths of its high-grade steel. Large plants with full metallurgical cycles have been built at Borlänge and in the ore-exporting ports of Luleå and Oxelösund. More than 40 percent of the steel is produced in electric furnaces. The principal centers of nonferrous metallurgy are Skellefteå (copper and lead), Sundsvall (aluminum from imported alumina), and Västerås and Finspång (rolled nonferrous metals).

Alongside the prewar machine-building industries, linked to Swedish inventions (bearings, telephone equipment, turbines, separators), new machine-building sectors have arisen since the war whose output has found a steady demand on the domestic and world market. Among these sectors are shipbuilding, the automotive and aviation industries, and the manufacture of calculators and computers. Two-fifths of the machinery and equipment produced is exported.

The shipbuilding industry specializes in the construction of supertankers with deadweights of 100,000–500,000 tons. The largest shipyards are located on the western and southwestern coasts at Göteborg (Götaverken and Eriksberg companies), Malmö (Kockums), Uddevalla, and Landskrona. The electrical engineering industry excels in the production of powerful generators, transformers, and motors, most of them built by ASEA's plants in Västerås and Ludvika, and in the manufacture of telephone

and other communications equipment, produced chiefly by the L. M. Ericsson Company in Stockholm. The SKF Company, with large plants in Göteborg and in the Federal Republic of Germany, France, Italy, the USA, and other capitalist countries, produces about one-fifth of the ball and roller bearings manufactured in the capitalist world; four-fifths of this output comes from the company's foreign enterprises. The automotive industry is represented by the Volvo Company, which has a truck factory in Göteborg, a car factory in the city's suburb of Torslanda, and a vehicle assembly plant in Kalmar, and by Saab-Scania, which produces trucks at Södertälje and cars at Trollhättan. The Saab-Scania Company also owns a large aircraft plant in Linköping, which manufactures military aircraft and guided missiles.

Sweden ranks fourth in the capitalist world, after the USA, Canada, and Japan, in the output of paper pulp, three-fourths of which is chemical pulp and one-fourth mechanical pulp. It produces about 10 percent of the capitalist world's paper pulp. About half of the output is exported and the remainder is made into paper and cardboard. Sweden is second only to Canada in the export of paper pulp (5 million tons in 1974) and paper and cardboard (3 million tons). Most of the country's pulp and paper enterprises and sawmills are located along the Bothnian coast of northern Sweden (near Sundsvall, Kramfors, Örnsköldsvik, and Umeå) and along the northwestern and northern shores of Lake Vänern (Karlstad-Säffle).

The chemical industry does not have a broad raw material base. The annual capacity of the country's chlorine-alkali plants, using imported raw material (salt) and supplying products to the paper and pulp enterprises, reached 400,000 tons of chlorine and about 500,000 tons of caustic soda in 1975. The capacity of the sulfuric acid plants, which draw on local pyrites, exceeds 1 million tons. The launching of a large petrochemical complex in Stenungsund has opened the way for the production of synthetic materials.

The various sectors of light industry (textiles, garments, leather footwear) produce almost exclusively for the domestic market, depend heavily on imported raw material, and face sharp competition from foreign goods. The number of persons employed in light industry is steadily decreasing. Borås is the major textile and garment center.

Table 3 shows the output of major industrial products.

Agriculture. Sweden's highly productive and market-oriented agriculture supplies more than four-fifths of the country's demand for foodstuffs, including virtually all its milk, meat, grain, and livestock feed and nine-tenths of its sugar and vegetable oil. Capitalist farms dominate agricultural production. The concentration of landed property has been promoted by government measures supporting large farms, such as the 1947 law On the Rationalization of Agriculture, extending credit and other privileges to farms of at least 20–30 hectares (ha). Between 1951 and 1975 the total number of farms declined by more than half. But while the number of farms with less than 20 ha decreased by a factor of 2.5, the number of farms with more than 30 ha grew by a factor of 1.4. The distribution of land by farm category is shown in Table 4.

Table 4. Distribution of cultivated land by category of farms (1975)

Farm size (hectares)	Farms		Area	
	number	percentage	hectares	percentage
Less than 10	55,000	42	328,000	11
10–20	33,000	25	479,000	16
20–50	32,000	24	1,016,000	34
More than 50	12,000	9	1,157,000	39
Total	132,000	100	2,980,000	100

Swedish agriculture has become highly mechanized: in 1974 there were 184,000 tractors, or one per 16 ha of arable land, and 47,000 grain combines, or one per 34 ha of grain crops. Consequently, although the number of farm workers declined by a factor of more than 2.5 between 1950 and 1975, the volume of agricultural output increased by a factor of 1.2. In the structure of agricultural production animal husbandry predominates, producing three times as much income as crop farming. In 1975, Sweden had 3,347,000 ha of farmland (covering 8 percent of the country's area), including 2,980,000 ha of arable land and 367,000 ha of pastures and meadows. This represented a 28 percent decrease in agricultural land since 1950, including a 20 percent reduction in arable land.

ANIMAL HUSBANDRY. In livestock raising the income from meat is 1.5 times greater than the income from milk. Although the number of cattle has decreased, productivity has risen. In 1976 the average yield per dairy cow was about 4,500 kg, and the average fat content of the milk exceeded 4 percent. Table 5 shows the changes in livestock population. In 1976, Swedish farms produced 3 million tons of milk (deliveries to dairies), 434,000 tons of meat, 44,000 tons of butter, 83,000 tons of cheese, and 109,000 tons of eggs.

Table 5. Livestock population

	1950	1960	1970	1976
Cattle	2,648,000	2,501,000	1,926,000	1,900,000
cows	1,654,000	1,298,000	758,000	736,000
Hogs	1,300,000	1,915,000	2,074,000	2,500,000

CROP FARMING. About three-fourths of the cultivated land is allocated for fodder crops, chiefly grain and grasses. Feed grains, primarily barley and oats, occupy 41 percent of the total arable land; grasses, 32 percent; food grain (primarily wheat), 13 percent, and oil crops (chiefly rape), 6 percent. Table 6 gives the sown area and yield of the main crops.

FISHING. The annual fish catch, obtained chiefly from the Baltic and North seas, averages about 150,000 tons.

FORESTRY. The lumber industry exploits productive forests covering 23.4 million ha (1968–72 assessment). The annual increase in timber is 70 million cu m. In 1974–75 timber production totaled 52.6 million cu m.

Transportation. Rail shipping is the principal means of transporting domestic freight, but it is facing rapidly growing competition from trucking. The length of the rail network decreased from 16,000 km in the early 1950's to 12,100 km in 1976; 7,500 km, or 62 percent of the network, have been electrified. More than nine-tenths of railroad freight is hauled by electric traction. Ferries connect the Swedish railroads with those of Denmark, the Federal Republic of Germany, and the German Democratic Republic. At the beginning of 1978 the country's motor vehicle pool included 2,857,000 cars and 182,000 trucks and buses. In 1977 the merchant fleet had a tonnage of 6.8 million gross registered tons. The principal ports are Göteborg, which handled 20.2 million tons of cargo in 1975, Luleå (7.7 million tons), Hälsingborg (6.7 million tons), and Stockholm (5.5 million tons). The main international airport is Arlanda near Stockholm.

Foreign trade. Sweden ranks tenth among the developed capitalist countries in volume of foreign trade. In 1976 its exports were valued at 80.2 billion kronor and its imports at 83.3 billion kronor. The principal exports are machine-building and metalworking goods (49 percent by value in 1976), woodworking and pulp-paper industry output (20 percent), and metallurgical products (8 percent). The main imports are machinery and equipment (36 percent), fuel (18 percent), chemicals (8 percent), and metals (7 percent). The geographical orientation of Sweden's foreign trade attests to its strong economic and commercial-political affiliation with Western Europe, which accounts for three-fourths of Swedish exports and imports. Half of the foreign trade is conducted with the Common Market countries. Sweden's principal trading partners in 1976 were the Federal Republic of Germany (which bought 10 percent of its exports and provided 19 percent of its imports), Great Britain (11 and 10 percent), Norway (11 and 6 percent), Denmark (10 and 7 percent), Finland (6 and 6 percent), and the USA (5 and 7 percent).

The socialist countries of the Council for Mutual Economic Assistance account for 6 percent of Swedish foreign trade; commercial and economic ties are most extensive with the USSR, Poland, and the German Democratic Republic. Sweden imports

Table 6. Sown area and yield of principal crops[1]

	Area (hectares)			Yield (tons)		
	1951–55	*1961–65*	*1971–75*	*1951–55*	*1961–65*	*1971–75*
Wheat	366,000	278,000	250,000	797,000	897,000	1,149,000
Rye	120,000	59,000	96,000	245,000	147,000	350,000
Barley	166,000	436,000	644,000	363,000	1,185,000	2,003,000
Oats	491,000	519,000	520,000	809,000	1,277,000	1,547,000
Mixed grain	311,000	190,000	72,000	656,000	469,000	194,000
Potatoes	127,000	92,000	45,000	1,607,000	1,559,000	1,083,000
Sugar beets	54,000	45,000	45,000	1,767,000	1,615,000	1,880,000
Oil crops	125,000	87,000	160,000	181,000	173,000	340,000
Sown grasses (hay)	1,209,000	1,044,000	847,000	4,428,000	4,146,000	3,650,000

[1]Average annual

liquid and solid fuels, metals, chemicals, and machine tools from the USSR, to which it sells primarily machinery and equipment. Production cooperation between Swedish and Soviet enterprises is expanding in industry, power engineering, and transportation.

Each year 3–4 million foreign tourists visit Sweden. Its monetary unit is the kronor. By the exchange rate of the USSR State Bank, 100 kronor equaled 14 rubles 96 kopecks in April 1978.

Economic regions. Central Sweden, encompassing the lowlands around the large lakes and stretching from the Baltic Sea in the east to the Kattegat in the west, emerged historically as the economic nucleus of the Swedish state. The combination of iron ore, timber, and waterpower resources promoted early industrial development. Although it occupies less than one-third of the country, the region accounts for three-fifths of the population and two-thirds of Swedish industrial production. The chief production specialization is the metal industry. The region produces more than two-thirds of the country's machine-building output (including three-fourths of its electrical equipment and more than two-thirds of its ships) and more than four-fifths of its steel.

Southern Sweden, including the Småland Upland south of Lake Vättern, the adjacent coast of the Baltic Sea and Kattegat, and the Skåne Peninsula in the extreme south, developed historically as the principal agricultural region. Occupying just one-eighth of the country's territory and inhabited by one-fourth of its population, the region includes more than one-third of the cultivated land and produces two-fifths of the agricultural output. Southern Sweden also manufactures one-fourth of the country's industrial output.

Northern Sweden is a vast, sparsely populated land rich in resources. With about two-thirds of the country's area and one-eighth of its population, northern Sweden possesses more than half of the nation's timber reserves, three-fourths of its iron ore reserves, nine-tenths of its nonferrous metal ore reserves, and four-fifths of its hydroelectric resources. The region clearly specializes in lumbering, mining and metallurgy, and electricity generation, producing half of the country's timber, about half of its wood products, four-fifths of its iron ore, and about two-thirds of its electric energy. It has large enterprises of ferrous (Luleå) and nonferrous (Skellefteå) metallurgy. In general, however, the region's share of the country's economic potential is small, inasmuch as it provides only one-tenth of the industrial output.

M. N. Sokolov

Armed forces

Sweden's armed forces, consisting of an army, an air force, and a navy, are under the ultimate direction of the government and the direct command of the supreme commander. The three services, numbering 68,000 men in 1977, are recruited on the basis of conscription. The term of active duty is 7½–15 months in the army, 8–15 months in the air force, and 10–17½ months in the navy.

The army, numbering about 46,000 men, consists of 50 infantry, artillery, tank, and other mobilizable training regiments that in wartime can be expanded into brigades and battalions. The air force of about 10,000 men comprises more than 30 squadrons of various kinds (about 600 fighter planes) and ten helicopter groups, each having two to four helicopters. The navy of about 12,000 men is equipped with 17 submarines, six destroyers, six frigates, about 40 torpedo boats, 16 patrol boats, three mine-layers, and more than 30 minesweepers. There are about 65 mobile and stationary coastal artillery units. The largest naval bases are at Horsfjärd (Stockholm skerries), Karlskrona, and Göteborg, and the rocky indented coast provides many shelters for ships. The armaments of all the branches of the armed forces are of Swedish or foreign manufacture.

Health and social welfare

In 1976 the birth rate was 11.9 per 1,000 inhabitants, the mortality rate 11, and infant mortality 8.7 per 1,000 live births. Cardiovascular diseases, malignant neoplasms, and lung diseases are the leading causes of illness and death. Infectious diseases include influenza, childhood diseases, epidemic hepatitis, and venereal diseases.

The public health service is under the jurisdiction of the Ministry of Health and Social Affairs and the National Council of Public Health and Social Insurance. Direct supervision over medical treatment and disease prevention is exercised by the county councils, which have departments of medical services.

In 1972 there were 721 hospitals with 123,100 beds (15 per 1,000 population). Outpatient care was provided by 200 hospital clinics, 11 independent clinics, and 848 public health centers. There were 11,900 practicing doctors (one for every 680 persons), 7,000 dentists, 3,400 pharmacists, and more than 100,000 other medical personnel. Doctors are trained at six medical faculties and secondary medical personnel, at 34 medical schools. Public health expenditures amounted to 4.4 percent of the state budget in 1972.

The best-known spas are the balneological resorts of Medevi and Ronneby, the pelotherapy resorts of Gustafsberg and Loka, and the climatic resort of Marstrand.

Sweden's unified, state-run, compulsory social insurance system was improved substantially by the reforms of 1973 and 1975. Social insurance is financed by the state, by employers, and to a lesser degree by the citizens themselves, for example, unemployment insurance, available under a voluntary program financed by payroll deductions. Sickness insurance covers up to 90 percent of the lost earnings of most workers as well as the greater part of medical expenses. Maternity benefits have also been instituted. Old-age pensions consist of a national pension, a fixed amount that all citizens are eligible for upon reaching the age of 65 (since 1975), and a pension based on length of employment, which is financed by employers. Family allowances are paid for each child up to the age of 16.

O. A. Aleksandrov and A. G. Kan (social insurance)

Veterinary services. Sweden is free of the majority of infectious and parasitic animal diseases. Isolated cases of cattle vibriosis have been recorded (one outbreak in 1976); cysticercosis of cattle and hogs is prevalent in some regions; and leukosis of cattle and Marek's disease (among fowl) are encountered.

The veterinary service is under the jurisdiction of the National Agricultural Council. Supervision over foodstuffs, including meat, is exercised by the National Food Administration. Veterinary services, available in all the counties, were provided by

1,312 veterinarians in 1976. One of the oldest higher veterinary schools in Europe, the Veterinary School of Uppsala, functions as a faculty of the Swedish University of Agricultural Sciences. Veterinary research is conducted by the National Veterinary Institute and a number of Veterinary research institutions. The production of biologicals has been initatied. Two veterinary journals are published.

M. G. TARSHIS

Education

The first schools in Sweden, founded in the 13th century, were either monastic schools established by the Dominican and Franciscan orders or urban schools offering instruction in arithmetic and writing. By the 16th century there were 20 church and monastery schools and ten urban schools. The Lutheran Reformation of the 16th century promoted the spread of literacy. Schools were controlled by the church down to the middle of the 19th century. Under a law enacted in 1842 compulsory elementary schools were established for the lower estates. A law providing for compulsory seven-year education was adopted in 1936, and in 1962 the length of compulsory schooling was extended to nine years. Public education is directed by the Ministry of Education.

Kindergartens and play schools are available for children between the ages of three and six. At the age of seven children are enrolled in the compulsory basic nine-year school, which is divided into three levels each consisting of three grades. All pupils receive the same general education during the first six years of instruction. The curriculum of the seventh, eighth, and ninth grades includes both required and elective subjects. After completing the nine-year school, students continue their education in secondary schools—integrated *Gymnasiums* with 22 departments. The technical, natural sciences, humanities, economics, and social sciences departments offer three- or four-year programs that prepare students for entry into higher educational institutions; the other departments offer two-year programs of vocational and technical training.

In the 1974–75 school year 1,195,000 pupils were enrolled in the basic schools, including 311,000 in the seventh, eighth, and ninth grades. The *Gymnasiums* had an enrollment of 221,000. The higher educational system includes 35 institutions, in which 101,800 students were enrolled in the 1976–77 academic year. The course of study ranges from three to six years. University faculties of humanities and natural sciences have an open admissions policy; admission to faculties of medicine, pharmacy, and dentistry, as well as to specialized higher schools, is based on competition and is contingent on having work experience in the chosen field. The largest higher educational institutions are the University of Stockholm, the universities in Uppsala (founded 1477), Lund (1668), Göteborg (1891), Umeå (1963), and Linköping (1970), the Royal Institute of Technology in Stockholm (1827), the university of technology in Göteborg (1829), and the Caroline Institute (Karolinska Institutet) in Stockholm (1810).

The major libraries are the Royal Library in Stockholm (1 million volumes), where V. I. Lenin did research; the libraries of the universities in Uppsala (more than 2 million volumes), Lund (more than 1.3 million volumes), and Göteborg (1.25 million volumes); and the city libraries of Stockholm (more than 1.4 million volumes) and Göteborg (more than 1 million volumes). Important museums in Stockholm include the National Museum, the Contemporary Art Museum, the Ethnographical Museum, the City Museum of Stockholm, the Museum of National Antiquities, the Nordic Museum, the Museum of Natural History, the National Maritime Museum, and Skansen, an open-air museum exhibiting ancient rural structures and utensils. Several fine museums are found in Göteborg, notably the Art Gallery, the Museums of the City of Göteborg (history, archaeology, and ethnography), and the Maritime Museum. Also noteworthy is the Cultural History Museum in Lund.

L. G. MOZHAEVA

Science and scientific institutions

Natural and technical sciences. The development of natural science in Sweden was linked to the founding of the first universities in Uppsala and Lund and to the opening of astronomical observatories in Uppsala (1650) and Lund (1670). In the 18th century Swedish science was influenced by Enlightenment ideas emanating from France and Great Britain. The Royal Society of Sciences was established in Uppsala in 1710 and the Royal Academy of Sciences in Stockholm in 1739.

The first president of the Royal Academy of Sciences was C. Linnaeus (honorary member of the St. Petersburg Academy of Sciences from 1754), who greatly influenced the development of science in the country. Linnaeus worked out a system for classifying plants and animals (published 1735) that was, for its time, all-embracing, and he was the first to begin systematically using binomial nomenclature. The Royal Academy of Sciences began publishing the first Swedish scientific journal in 1739. A founder of the academy, M. Triewald, promoted experimental physics in Sweden, built the first steam engine in Scandinavia, and wrote a work on mining.

The Stockholm Observatory was founded in 1753 by P. V. Wargentin (honorary member of the St. Petersburg Academy of Sciences from 1760). Systematic scientific work in astronomy was begun by A. Celsius, the director of the observatory in Uppsala, who proposed a 100-degree temperature scale. S. Klingenstierna was known for his work in mathematics. P. Artedi worked out a system of classifying fish, and E. Acharius laid the foundation for lichenology. Significant advances were made in chemistry in the 18th century. T. O. Bergman perfected qualitative analysis. K. Scheele, a skillful experimenter, discovered manganese and was the first to obtain chlorine, potassium manganate, glycerol, a number of acids, and other compounds. He also described the properties of oxygen, as well as a method of obtaining it. A. F. Cronstedt discovered nickel and worked out a classification of minerals based on their chemical properties (*An Essay Toward a System of Mineralogy*, 1758).

The 17th and 18th centuries saw considerable progress in the technology of metallurgy and metalworking, naval shipbuilding, and the manufacture of cold weapons and firearms. C. Polhem had a marked influence on the development of technology, primarily mining and metallurgy.

In the 19th century, when most research was conducted at higher educational institutions, the leading branches of science were chemistry and mineralogy. J. J. Berzelius (honorary member of the St. Petersburg Academy of Sciences from 1820) won international recognition for experimentally confirming the atomic theory and introducing it into chemistry. He introduced the system of designating chemical elements that is used today. Berzelius and his students, notably C. G. Mosander, made a major contribution to the discovery and study of the rare-earth elements lanthanum, yttrium, terbium, and erbium. These studies were continued by L. F. Nilson, who discovered scandium, and by P. T. Cleve, who isolated thulium and holmium. J. A. Arfvedson discovered lithium. C. W. Blomstrand developed the chemistry of complex compounds. A. Nobel, who established the Nobel Prizes, invented dynamite in 1867 and initiated its industrial production. In 1888 he developed ballistite. One of the greatest achievements of 19th-century chemistry was the electrolytic theory of dissociation proposed by S. A. Arrhenius (honorary member of the Academy of Sciences of the USSR from 1925), the first Swedish scientist to receive the Nobel Prize (1903).

The physicist and astronomer A. J. Ångström measured with great precision the wave lengths of the solar spectrum and introduced the unit of length that bears his name. His son, the geophysicist K. J. Ångström, invented a compensation pyrheliometer and pyrgeometer. The research of J. R. Rydberg on the systematization of atomic emission spectra was important to atomic physics; in 1890 he introduced the fundamental physical constant that bears his name. H. J. Holmgren became known for his work on differential equations. M. G. Mittag-Leffler (elected honorary member of the Academy of Sciences of the USSR in 1926) initiated the Swedish school of the theory of functions of a complex variable. In 1882 he founded one of the most important mathematical journals, *Acta mathematica*. At his invitation S. V. Kovalevskaia came to teach at the University of Stockholm. L. Ahlfors studied methods of topology in the theory of analytic functions. J. A. H. Gulden (corresponding member of the St. Petersburg Academy of Sciences from 1882) developed the theory of the perturbation of comets and small planets and worked out its mathematical apparatus. E. Jäderin invented a reference device in 1880.

The meteorologist H. Hildebrand-Hildebrandsson (corre-

sponding member of the St. Petersburg Academy of Sciences from 1882) studied general air circulation and conducted important observations of clouds and the upper strata of the atmosphere with the aid of sounding balloons. A. Erdmann, the founder of the Geological Survey of Sweden (1858), holds a prominent place in the development of mineralogy and geology. G. J. De Geer (honorary member of the Academy of Sciences of the USSR from 1925), who did pioneering work in Quaternary geology, established the origin of annual strata in banded clays. At the end of the 19th century, J. R. Sernander conducted systematic studies of the climate and flora of Scandinavia in the postglacial period; he was also concerned with the protection of Sweden's natural environment. N. A. E. Nordenskjöld (corresponding member of the St. Petersburg Academy of Sciences from 1879) made a major contribution to the study of the arctic. In 1878–79 he was the first to navigate the Northeast Passage from the Atlantic to the Pacific, wintering along the way. In 1897, S. A. Andrée made an attempt to reach the north pole in an air balloon of his own design.

Between 1850 and 1853, C. Andersson crossed the Kalahari Desert and the Damara Plateau in Africa. S. Hedin explored Tibet, the Gobi Desert, and other regions of Central Asia from 1893 to 1902. In another expedition, lasting from 1905 to 1908, he reached the sources of the Brahmaputra and the Sutlej and discovered the Trans-Himalayas. The first Swedish expedition to the antarctic was organized in 1901 under the direction of O. Nordenskjöld.

A significant contribution to 19th-century biology was the work of the algologists K. A. Agardh (who devised a classification system for algae and whose work was continued by his son, J. G. Agardh), J. Areschong, F. Kjellman, and G. Lagerheim. The botanist E. M. Fries (corresponding member of the St. Petersburg Academy of Sciences from 1850) was one of the founders of mycology. C. J. Hartman compiled a basic guide to Scandinavian flora. S. Loven (corresponding member of the St. Petersburg Academy of Sciences from 1860) was noted for his work on the fauna of Sweden's lakes and the Baltic Sea. F. Holmgren, who established the first physiology laboratory in Sweden, worked out a method for revealing color blindness. Outstanding work in medical physiology was done by G. M. Retzius (corresponding member of the St. Petersburg Academy of Sciences from 1895). A. Gullstrand revised the theory of the refraction of light in the eye (Nobel Prize, 1911). J. G. Zander founded medical mechanotherapy.

A major engineering project of the first half of the 19th century was the Göta Canal, built under the direction of N. Ericson. His brother, J. Ericsson, introduced into shipbuilding the screw propeller with blades (1836) and is remembered in the history of technology as the designer of steamships (including the *Monitor*) and steam locomotives.

Swedish industrial inventions and improvements of the second half of the 19th and early 20th centuries became known throughout the world. After G. E. Pasch invented safety, or Swedish, matches in 1844, J. E. Lundström worked out the technology and equipment to mass produce them. C. D. Ekman invented a method of producing high-quality sulphite cellulose, and the first chemical pulp factory went into operation in 1874. L. M. Ericsson, credited with numerous improvements in telephony, founded a telephone firm in 1896. C. G. P. de Laval invented a continuous-operation centrifugal cream separator in 1878 and an impulse steam turbine in 1889. He also developed a theory of nozzles and proposed one of the first designs for milking machines in 1896. J. A. Brinell developed a method for determining the strength of metals that is widely used today. N. G. Dalen invented a device for automatically lighting (nightfall) and extinguishing (daybreak) acetylene lighthouse lamps (Nobel Prize, 1912). S. Wingquist invented spherical roller bearings, putting them into mass production in 1907. Hydroelectric construction expanded at the turn of the century; the Trollhättan hydroelectric power plant, the world's largest at the time, went into operation in 1910.

In the 20th century, Swedish mathematicians continued to work on the theory of functions of a complex variable (Mittag-Leffler's students E. Lindelöf and O. Frostman), on differential and integral equations (E. I. Fredholm and E. A. Holmgren), on the theory of functions and integral equations (T. Carleman), and on algebra and number theory (T. Nagell). H. Cramér did fundamental work on probability theory and mathematical statistics. L. Carleson has won acclaim for his work on the theory of multiple-valued analytic functions, and L. Hörmander for his work on the theory of differential operators. C. Charlier applied methods of mathematical statistics to the study of the spatial distribution of stars in the Milky Way Galaxy. E. Bergstrand worked on problems of stellar astronomy, and K. Lundmark studied spiral galaxies. T. Elvius and his wife, A. Elvius, have gained international recognition for their work in stellar astronomy.

Major contributions to physical chemistry were made by T. Svedberg, who developed a method of ultracentrifugation (Nobel Prize, 1926), by A. Tiselius, who worked on electrophoresis and adsorptive analysis (Nobel Prize, 1948), and by A. Ölander and S. Claesson (member of the Academy of Sciences of the USSR since 1976). Internationally acclaimed biochemical studies of enzymes and vitamins were carried out by H. von Euler-Chelpin (Nobel Prize, 1929; member of the Academy of Sciences of the USSR from 1927), A. H. Theorell (Nobel Prize, 1955), and E. Brunius. The biochemist S. Bergström (honorary member of the Academy of Sciences of the USSR since 1976) did major work on prostaglandins.

Among eminent Swedish physicists of the 20th century are K. M. G. Siegbahn, the founder of nuclear spectroscopy (Nobel Prize, 1924; member of the Academy of Sciences of the USSR from 1958), and his son K. M. Siegbahn, who has worked on problems of nuclear and photoelectron spectroscopy. H. Alfvén has achieved international renown for his work on the physics of plasma and cosmic radiation and on astrophysics (Nobel Prize, 1970; member of the Academy of Sciences of the USSR from 1958). Alfvén formulated the basic principles of magnetohydrodynamics. Outstanding research in atomic physics has been done by P. Ohlin, T. Gustafson, and S. E. Nilsson, and B. Lehnert has done important work in plasma physics and the physics of thermonuclear reactions. In solid-state physics, G. Ising proposed the model of magnetics that bears his name. A. K. Ångström has conducted research in geophysics, notably the physics of the atmosphere, climatology, and actinometry. Research is under way on the isostasy of the Baltic Shield.

In oceanography, V. W. Ekman worked out a theory of drift and gradient currents. H. Pettersson directed the deep-water expeditions of the *Albatross* in the middle Atlantic in 1947–48. F. Malmgren studied the physical and chemical properties of sea ice; he perished in the expedition of the dirigible *Italia*. Meteorological research has been advanced by C. G. A. Rossby, who studied the thermodynamics of atmospheric processes, by T. Bergeron, who founded dynamic climatology, and by B. Bolin, who developed mathematical methods of weather forecasting.

Well-known geological studies have included H. G. Backlund's research on the petrography and tectonics of the Baltic Shield, the mineralogical investigations of P. Quensel and G. Lindström (corresponding member of the St. Petersburg Academy of Sciences from 1886), the work of L. von Post, who developed methods for spore and pollen analysis in geology, and the research of A. Hadding, the author of a basic work on the geology of Sweden. Important contributions to the study of the geology of Sweden's ore deposits were made by P. Geijer and S. Gavelin. W. Lindgren has done valuable research in metallogeny and H. Ahlmann in glaciology.

In the biological sciences, there have been major achievements in zoology (S. Ekman, B. Hanström, S. Hörstadius, K. Curry-Lindahl), cytology (J. Runnström), and embryology (T. Gustafson, member of the Academy of Sciences of the USSR from 1976). The development of paleontology owes much to the work of A. G. Nathorst (corresponding member of the St. Petersburg Academy of Sciences from 1901), E. J. G. Holm (corresponding member of the St. Petersburg Academy of Sciences from 1910), and E. Stensiö (member of the Academy of Sciences of the USSR from 1929). Among botanists, outstanding work has been done by O. Rosenberg in plant cytology, by H. Lundegårdh, J. E. Melin, and G. Borgström in plant physiology, by J. A. Nannfeldt in floristics, and by K. Björling in phytopathology. G. Erdtman became known for his work in palynology.

The main center of research in medicine and physiology is the Caroline Institute (founded 1810) in Stockholm. G. Forssell was one of the first to use X-ray diagnosis and X-ray therapy for cancer; R. Granit studied the neurophysiological processes of vision (Nobel Prize, 1967); and U. von Euler established the role of noradrenaline in the transmission of nerve impulses (Nobel Prize, 1970). Among other medical men who have won acclaim for their scientific work are H. Olivecrona (neurosurgery), C. Crafoord (lung and heart surgery), G. Nylen and E. Mannheimer (cardiology), T. Sjöstrand (hematology), and S. Friberg (orthopedics and traumatology; member of the Academy of Medical Sciences of the USSR since 1967).

In the agricultural sciences, important results have been achieved in the selective breeding of cereals and fodder grasses at the Svalöv and Weibullsholm institutes. E. Åkerberg (member of the V. I. Lenin All-Union Academy of Agricultural Sciences [VASKhNIL] since 1967) is noted for his work on plant breeding, and K. Fröier (member of VASKhNIL since 1972) is a leading agricultural geneticist. Important contributions to the study of the genetics and hybridization of crops were made by N. H. Nilsson-Ehle (corresponding member of the Academy of Sciences of the USSR from 1932) and E. Åkerberg.

Scientific research and development in technology has expanded rapidly in the 20th century. Theoretical and applied research in electrical engineering has been conducted by E. H. Norinder (transmission of high-tension currents and lightning protection), F. Dahlgren (theory of electrical machines), and E. Velander. Research and development in high-tension technology are largely confined to the ASEA firm, and research in radio electronics and its application to communications are conducted by the L. M. Ericsson firm and Televerket, the government department of electric communications. The principles of modern telegraph and telephone technology have been developed by T. Laurent, E. Löfgren, E. Hallén, and H. Sterky.

The postwar period saw the rapid expansion of aviation research and development, conducted chiefly by the National Aeronautical Research Institute (founded 1940) and the Saab-Scania industrial firm. E. Pettersson and G. Drougge did important work in aviation aerodynamics. The *Draken* and *Viggen* supersonic fighter interceptors were designed in the 1960's and 1970's. Sweden is engaged in joint space research with other Scandinavian and Western European countries. In shipbuilding, research and development are carried out by the State Shipbuilding Experimental Establishment (founded 1940) and the leading shipbuilding firms—Götaverken, Eriksberg, and Kockums. The Arendal shipyard, built in Göteborg in the 1960's, is the world's first facility for the rapid continuous sectional construction of supertankers. The "safe car" developed by the Volvo Company was put into assembly-line production in 1975. Since the 1950's large hydroelectric power plants with underground machine rooms have been built on the rivers of northern Sweden. A number of nuclear power plants have also been constructed.

Significant contributions to physical metallurgy have been made by A. Westgren (X-ray structural analysis), O. Forsman (fatigue in steel and stress in welding), and A. Hultgren (methods of testing metals). In the technology of ferrous metallurgy, the work of G. Wallquist and M. Wiberg holds an important place. B. Kalling developed a process, subsequently known as the Kal-Do process, for smelting steel in an oxygen converter. Much of the country's scientific research and development is carried out within the framework of inter-Scandinavian scientific cooperation. In 1975 the Royal Swedish Academy of Sciences and the Royal Swedish Academy of Engineering Sciences concluded an agreement with the Academy of Sciences of the USSR providing for scientific cooperation and the exchange of scientific personnel.

M. N. SOKOLOV

Social sciences. PHILOSOPHY. In the Middle Ages the development of philosophical thought in Sweden was closely linked to Christian mysticism and Scholasticism, as illustrated by the *Revelations of St. Bridget*, a 14th-century Thomist work. The teachings of P. Ramus, the French philosopher whose followers opposed the scholastic method, spread to Sweden in the late 16th century.

An independent, secular philosophy emerged in Sweden in the 17th century with the incipient secularization of cultural life. The first significant Swedish philosopher and poet was G. Stiernhielm, whose works eclectically combined Pythagoreanism, Neoplatonism, and Renaissance natural philosophy. The adherents of R. Descartes, who came to Stockholm in 1649, attacked medieval Scholasticism. A. Rydelius propounded a rationalist ethics and theory of knowledge. Materialist empiricism and sensationalism, expounded by P. Christiernin, M. Fremling, C. G. Leopold, and N. von Rosenstein, attracted a large following in the 18th century. Influenced by the Enlightenment, T. Thorild polemicized against Kantianism from the standpoint of "dynamic pantheism." In the 1740's E. Swedenborg abandoned his mechanistic materialist views in favor of a mystical philosophy.

The first follower of Kant in Sweden, D. Boëthius initiated the turn away from sensationalist and materialist trends, derived from English and French thinkers, to German idealist philosophy. Another prominent exponent of Kantian philosophy was B. Höijer. In the first half of the 19th century, philosophical thought was influenced by romanticism, championed by the Phosphorists (*fosforisterna*) and the members of the Gothic Society. The great Swedish historian and poet E. G. Geijer was also an original philosopher whose social views evolved from conservative romanticism to bourgeois liberalism and faith in democracy. The "philosophy of the individual" as a peculiarly Swedish form of idealism was developed by N. Biberg, S. Grubbe, and especially C. J. Boström, all of whom held speculative theistic views.

The early 20th century was marked by a rejection of speculative systems, primarily Boströmianism, and a growing interest in positivism and experimental psychology. Some of Boström's followers embraced neo-Kantianism and the philosophy of life (V. Norström); others gravitated toward logical positivism (P. Wikner). The "new Uppsala school" that emerged around 1910 expounded an early form of logical positivism. Its founders, A. Hägerström and A. Phalén, anticipated many of the basic ideas of the Vienna circle. A spokesman for the antipositivist views of certain Swedish scholars, poets, and writers, H. Larsson attacked Hägerström's theory of the "nihilism of values" and developed a doctrine of intuition in a rationalist manner. Problems of axiology were elaborated by A. Vannérus. The views of J. Landquist, who wrote extensively on the history of philosophy, were similar to those of H. Bergson.

Since World War II, Swedish philosophers have sought to integrate bourgeois philosophy on the basis of neopositivism. The leading exponents of this trend are A. Wedberg, K. Marc-Wogau, M. Moritz, I. Segelberg, and I. Hedenius. Empirical sociology and psychology have become popular. G. Aspelin has studied the history of ideas and their relation to the social milieu. T. Segerstedt has aimed at transcending the limitations of positivist concepts in sociology. The neopositivist "philosophy of science" is also opposed by the neo-Protestant "philosophy of man," many of whose exponents, notably A. Nygren and T. Simonsson, have nevertheless come under the influence of logical analysis.

Known in Sweden as early as the mid-19th century, Marxism gained ground from the 1880's through the efforts of A. Palm and A. Wermelin. The methods of historical materialism and scientific communism were first applied to the analysis of social conditions in Sweden by A. Danielson. After the creation of the Communist Party of Sweden in 1917, the struggle between the Marxist (S. H. Linderot) and the reformist (K. H. Branting) concepts of social development grew more intense. Contemporary Marxist theoretical thought is marked by a concern with such current social issues as the changes taking place in the social-class structure of Swedish society, the question of the allies of the working class, the transition from capitalism to socialism, the development of democracy, and the unity of the workers' movement. The Marxist social science journal *Häften för kritiska studier* has been published since 1968.

The centers for the study of philosophy are the departments of philosophy at the universities of Stockholm, Uppsala, and Lund. *Theoria*, the leading philosophy journal, has been published since 1935.

A. G. MYSLIVCHENKO

HISTORY. Church chronicles, written in Latin, were compiled in Sweden as early as the mid-13th century. In the next century there appeared more detailed rhymed chronicles in Old Swedish, of which the most famous is the *Erikskrönikan*. The first known

Swedish historian was Erik Olai, a professor of theology at Uppsala University in the 15th century. In the second third of the 16th century historical works reflecting a humanist outlook were written by the Lutheran Reformation leader Olavus Petri and two Catholic archbishops, the brothers J. Magnus and O. Magnus.

During Sweden's age of greatness (17th and early 18th centuries), the State Archive was established, and the post of state historiographer was created (1618–1834); in the 17th century the post was occupied for a time by the German S. von Pufendorf, who wrote an apologist history of the 17th-century Swedish kings. The College of Antiquities was founded in 1667 (around 1837 it was reorganized as the Stockholm Historical Museum). The great-power notion that the Swedes were descended from the people of ancient Atlantis was given final form by O. Rudbeck. The late 17th century saw the first studies of Scandinavian antiquities (J. Schefferus) and the publication and scholarly critique of historical sources (Archbishop E. Benzelius). The country's first historical learned society was founded in Uppsala in 1710.

Swedish 18th-century Enlightenment historiography provided a secular periodization of the country's history from earliest times, the first rationalist exposition of national history (O. von Dalin), and the first example of historical scholarship (S. Lagerbring). The establishment of the Statistical Department in 1749 opened the way for the study of the country's population and economy. The Royal Academy of Letters, History, and Antiquities was founded in Stockholm in 1788. The tradition of monarchism and hostility to the aristocracy that characterized Swedish Enlightenment historiography was continued in the romantic historiography that emerged in the first third of the 19th century against the background of the European Restoration. The leading romantic historian was E. G. Geijer, the founder of the bourgeois-conservative Uppsala historical school, which came to prominence in the third quarter of the 19th century. The school's leading exponents were W. Svedelius, C. G. Styffe, F. F. Carlson, and C. G. Malmström. Like the influential German historians of the Ranke school and the *kleindeutsch* school, Swedish historians were primarily interested in political history, centered on the Swedish king. The 19th-century historians embarked on the publication of vast collections of national historical sources, including narratives, medieval laws and documents, and acts of the Riksdag. A number of historical societies, notably the Swedish Historical Society (1880), museums, and journals were founded.

With the onset of the imperialist age, the growing monarchist, antidemocratic, and chauvinist (cult of Charles XII) tendencies in Swedish historiography crystallized in the "new school" founded by H. Hjärne, a professor at the University of Uppsala. The school nevertheless produced a number of eminent historians in the first half of the 20th century, among them S. Tunberg, C. G. Westman, G. Carlsson, H. Almquist, G. Wittrock, S. Clason, and N. Ahnlund. A positivist trend emerged in historiography in the early 20th century, somewhat later than in archaeology and the history of material culture (G. O. A. Montelius, H. Hildebrand). Between 1910 and 1920 positivism had a strong impact on medieval studies through the "critical" Lund school, founded by the brothers L. Weibull and C. Weibull. A liberal, opposition historiography arose in the first decade of the century, leaving its mark on the study of Swedish political history of the 18th and 19th centuries. Its leading exponents were N. Edén, A. Brusewitz, and F. Lagerroth. Right-wing socialist histories of the workers' movement were produced in the 1920's by G. Magnusson and J. Lindgren and later by Z. Höglund.

The first attempts at a Marxist interpretation of Swedish history were made in the 1930's by P. Nyström. In the interwar period there were notable achievements in the study of economic history (E. F. Heckscher), the Viking age (S. Bolin, H. Arbman), feudal Sweden (K. Löfqvist, J. E. Almquist, E. Lönnroth, S. A. Nilsson), and modern popular movements and radical social thought (A. Kjellén, A. Strindberg, C. A. Hessler). Significant contributions were made to runology (O. von Friesen, S. B. Jansson), toponymy (J. Sahlgren), cultural-historical geography (H. Nelson), and some aspects of Oriental studies and the history of the ancient world (M. P. Nilsson). Important work was also done in ethnography (S. Erikson's school) and in the archaeology of prehistoric Europe (M. Stenberger, S. Lindqvist, C. A. Althin), prehistoric Asia (G. Andersson), the classical world (Swedish institutes were founded in Rome in 1926 and in Athens in 1948), and the Middle Ages (T. Arne, B. Nerman, W. Holmqvist, H. Arbman).

Since World War II, Swedish historiography has been profoundly affected both by the gradual radicalization of bourgeois concepts and by the growing influence of neopositivism and the historical-sociological and economic-historical thought of France (primarily the Annales school) and the USA ("the new economic history"), on the one hand, and Marxism on the other. Marxist studies have been published by K. Bäckström, C. H. Hermansson, P. O. Zennström, and L. Herlitz. Swedish historians have shown a heightened interest in socioeconomic and contemporary history and in questions of methodology. Since the 1960's they have frequently collaborated on joint projects (series of monographs) on various themes. Such series have been devoted to the social and financial problems of 17th-century Sweden, the wars of Charles X, the popular movements of the 19th and 20th centuries, and Sweden in World War II. In world history, there have been outstanding studies of classical society, Egyptian antiquities, the Baltic region in the 16th and 17th centuries, World War II, and international relations after 1945.

The leading contemporary historians are R. Torstendahl and B. Gustafsson in methodology; Å. Kromnow in archival studies; L. A. Norborg in source study; C. A. Moberg in prehistoric archaeology; E. Lönnroth, J. Rosén, S. U. Palme, I. Hammarström, G. Westin, B. Odén, and S. A. Nilsson in the study of the Middle Ages; S. Carlsson, F. Lindberg, R. Karlbom, and G. Rystad in modern history; W. M. Carlgren, C. G. Andrae, K. Wahlbäck, S. A. Söderpalm, K. Molin, and J. Torbacke in contemporary history; and A. Attman, L. Jörberg, and R. Adamson in economic history. Since the 1960's Swedish historians have been expanding their contacts with the historians of the socialist countries; Soviet-Swedish symposia were held in Tallinn in 1973 and in Stockholm in 1976.

The centers of historical scholarship are the history and philosophy divisions of the humanities faculties of the universities of Uppsala, Lund, Stockholm, Göteborg, and Umeå. (Some research is also conducted by the social science faculties.) The principal historical journals are *Historisk tidskrift* (1881–1937), *Aktuellt och historiskt* (since 1953), *Economy and History* (since 1958), and the inter-Scandinavian *Ethnologia Scandinavica* (since 1971). *Scandia* (since 1928), *Acta archaeologica* (since 1930), *Scandinavian Economic History Review* (since 1953), and *Scandinavian Journal of History* (since 1976). A. S. KAN

ECONOMICS. The emergence of Swedish economic thought dates from the 17th century, when the prevailing economic doctrine was mercantilism. In the first half of the 18th century, as Enlightenment ideas and notions concerning the bourgeois liberalization of economic life began to penetrate the public consciousness, a sharp controversy broke out between the partisans and opponents of mercantilism. A. Nordencrantz and A. Chydenius were the leading theoreticians of "economic liberalism," calling for the free development of the national economy. The Physiocrats and A. Smith exerted considerable influence on Swedish economic thought in the last third of the 18th century. Economic liberalism became popular in the first half of the 19th century, when protectionist restrictions and precapitalist relations were abolished.

The founder of the national school of political economy was D. Davidson, whose works, written in the late 19th and early 20th centuries, show the influence of both English classical bourgeois political economy, principally D. Ricardo, and the Austrian school of vulgar political economy. In the late 19th and early 20th centuries the Swedish economists G. Cassel and K. Wicksell made a significant contribution to the neoclassical trend in bourgeois political economy by developing mathematical methods of studying problems of prices, income, monetary circulation, and the economic cycle.

Against the background of the world economic crisis of 1929–33, the general restructuring of bourgeois political economy, and the emergence of Keynesianism in Sweden, the Stockholm school evolved as an original school of bourgeois political economy whose main objective was to find practical ways of dealing with economic crises and unemployment. The school's views became the theoretical justification for the economic policy

adopted by the right-wing Social Democrats who came to power. The most prominent representatives of the school were B. Ohlin, G. Myrdal, E. Lindahl, D. Hammarskjöld, and E. Lundberg. Anticipating in many respects the ideas of J. M. Keynes, the economists of the Stockholm school were instrumental in developing and revitalizing the methods of ideologically defending and improving the mechanism of state-monopoly regulation of the Swedish economy. The current views of the Stockholm school, approaching a neoclassical synthesis, integrate neo-Keynesian ideas of state-monopoly regulation of the economy with neoclassical prescriptions for automatic self-regulation based on maintaining the "general conditions of balanced growth."

The idea of a mixed economy, expounded by E. Wigforss and adopted by the Social Democrats as the basis of their economic doctrine, has carried considerable weight in Swedish economics since the early 1930's. Contemporary reformist economists, notably P. Holmberg, T. Lindbom, P. Lindblom, and G. Adler-Karlsson, specialize in socioeconomic problems, studying production relations and the influence on them of technological development. In propounding the idea of so-called democratic socialism, Adler-Karlsson has advanced the most recent version of the convergence theory—the theory of "functional socialism."

Since World War II bourgeois theories concerning the world capitalist economy have attracted a large following among Swedish economists. Ohlin and Myrdal, who subscribe to these theories, have worked out methods for the state-monopoly regulation of currency and trade relations between capitalist countries on the basis of Keynesian or neo-Keynesian concepts of economic growth. Among contemporary Swedish economists, Myrdal has become famous as a leading exponent of institutionalism, as an authority on the economic problems of the Third World countries, and as the author of numerous works on the economic relations between the developed capitalist nations and the developing countries. Since the 1960's the Swedish bourgeois economists S. Carlson, I. Swennilson, and B. Hansson have focused on the practical aspects of the state-monopoly regulation of prices, inflation, and monetary circulation, as well as on problems of taxation.

Swedish bourgeois economists began their polemic with Marxism in the late 19th and early 20th centuries. The country's Marxist economists rallied around the Left Social Democratic Party, founded in 1917. (The party was called the Communist Party from 1921 to 1967, when it was renamed the Left Party—Communists.) The conflict between two conceptions of social development—the Marxist and the reformist—in the Swedish workers' movement intensified after World War II. Contemporary Marxist economic thought is primarily concerned with socioeconomic problems. A central place in the works of such Swedish Marxist economists as C. H. Hermansson is given to analyzing the changes in the social-class structure of the Swedish "welfare state" and to justifying the need for fundamental reforms that would create the preconditions for a socialist transformation of society.

The main centers of economic research are the Institute for International Economic Studies of the University of Stockholm (founded 1962) and the Economic Research Institute at the Stockholm School of Economics (founded 1929). Economists are trained at the Stockholm School of Economics (founded 1909) and at the universities of Göteborg, Lund, Stockholm, Uppsala, and Umeå.

The principal economics journals are *Svensk handelstidning justitia* (since 1890), *Ekonomisk tidskrift* (since 1899), *Ekonomisk revy* (since 1944), *Economy and History* (since 1958), and *Affärsvärlden* (since 1901). Important statistical data are published in the statistical yearbook *Statistisk årsbok för Sverige* (since 1914), the journal *Allmän månadsstatistik* (since 1963), and various specialized statistics series published by the Central Bureau of Statistics. K. V. VORONOV

LINGUISTICS. The first works of a linguistic nature appeared in the 16th century. As the Swedish nation and national language evolved, it became necessary to standardize the language and to develop its national literary norms, a task that long determined the practical bent and normative character of linguistic work. In 1541, L. Petri and O. Petri completed and published the first full translation of the Bible, subsequently called the Bible of Gustav Vasa, which showed considerable uniformity and consistency in orthography and grammar.

In the 17th century there were advances in general philology: the Old Swedish and Icelandic language and literature were studied by J. Bureus; ancient manuscripts were collected and studied by O. Verelius; and the study of runes was begun by J. Peringskiöld, J. Hadorph, and M. Celsius. The scientific study of the Swedish language was initiated in the second half of the century. The first Swedish grammar, written in Latin, was published by E. Aurivillius in 1684; it was followed in 1696 by N. Kjellman's grammar in Swedish. E. Schroderus published dictionaries, and S. Columbus and N. Kjellman addressed themselves to the problems of standardizing the orthography and bringing it closer to pronunciation.

In the 18th century U. Hjärne, C. G. Tessin, S. Hof, J. Ihre, and A. Botin studied questions of orthography. H. Spegel's dictionary (1712) and A. Sahlstedt's *Swedish Grammar* (1769) and *Swedish Dictionary* (1773) were intended to serve a normative function. A collection of engravings of runic monuments, based on drawings assembled by J. Hadorph and J. Peringskiöld in the late 17th century, appeared in 1750. Ihre's etymological dictionary of the Swedish language, published in 1769, laid the foundation for the comparative and historical schools in Swedish linguistics. In the late 18th century, the Swedish Academy took up the problem of correct usage, issuing the Academy Grammar in 1836.

In the 19th century Swedish linguists, among them J. Rydqvist, E. Tegnér, and A. Noreen, continued to work on orthography. A conference was held in 1869 to discuss questions of orthography, and the Orthography Society was founded in 1885. A catalog of Swedish runic inscriptions, the most complete of its time, was compiled by J. Liljegren and published in 1833. C. Schlyter published collections of medieval regional laws. The history of the Swedish language was the subject of works by Rydqvist and G. Cederschiöld, Noreen's *History of the Scandinavian Languages*, and K. Söderwall's *Dictionary of the Swedish Language of the Middle Ages*. The Royal Swedish Academy of Sciences began publishing a historical dictionary of the Swedish language in 1893.

Outstanding 20th-century works include Noreen's *Grammar of Old Swedish* (1904), A. Kock's *Historical Phonetics of the Swedish Language* (1906–29), and E. Wessén's *History of the Swedish Language* (1941–56). The philological study of medieval manuscripts has continued. Runology has been developed by O. von Friesen, Wessén, and I. Lindquist, and Swedish runic inscriptions have been published serially since 1900. The living language and its dialects have been studied. The normative *Academy Dictionary of the Swedish Language* has been published since 1874, and O. Östergren's dictionary of modern Swedish, since 1915. The illustrated Swedish explanatory dictionary came out in 1955. Other major works include Noreen's seven-volume theoretical grammar *Our Language* (1903–25, unfinished) and the descriptive grammars of E. Wellander and N. Beckman. Since the 1960's problems of general linguistics have been elucidated by B. Malmberg, who has also done important phonological research along with G. Fant.

The main linguistics centers are the Scandinavian languages divisions at the universities of Lund, Uppsala, Stockholm, and Göteborg; the general linguistics departments at the universities of Lund and Stockholm; the Institute of Dialectology and Folklore at Uppsala; the Institute of Language Culture at Stockholm; and the Royal Swedish Academy of Sciences. The leading periodicals are *Arkiv för nordisk filologi* (since 1882), *Nysvenska studier* (since 1921), *Språkvård* (since 1965), *Studia linguistica* (since 1947), and *Svenska landsmål och svensk folkliv* (since 1879). G. I. ANDREEVA

Scientific institutions. In the area of research and development an important role is played by the Swedish government, which after World War II adopted a coordinated policy in scientific research. The Science Advisory Council, created in 1962, coordinates scientific work and sets scientific and technical policy. The council is headed by the prime minsiter and includes the ministers of education, finance, industry, agriculture, and defense, as well as representatives of the leading industrial firms and prominent scientists and scholars. The Ministry of Education directs the

scientific research of universities and technical institutions of higher learning; other ministries are responsible for specific areas of applied research and development carried out by both state and private scientific research institutions. Supervision over the development of scientific research and design work is exercised by eight government research councils: for the natural sciences, the technical sciences (Board for Technical Development), medicine, agriculture and forestry, the humanities, the social sciences, and atomic research. A special body, the Scientific Preparatory Commission, is charged with the selection of the most important projects.

The main tasks of the Royal Swedish Academy of Sciences, founded in 1739 and having 160 members and 120 foreign members in 1975, are to promote the development of the mathematical and natural sciences, to organize congresses and symposia, to maintain contacts with foreign and international scientific centers, and to award Nobel Prizes in physics and chemistry. The Academy of Engineering Sciences (founded 1919, 382 members) exercises organizational and informational functions in the technical sciences and maintains attachés for science and technology at the Swedish embassies in the USA, USSR, Japan, and a number of other countries.

Most basic research is done at research centers and institutes attached to universities and other higher educational institutions. Applied research and development is conducted chiefly by the research institutes and design departments of leading industrial firms, as well as by government research centers operating under the direction of ministries, for example, the Research Institute for Atomic Physics and the Aeronautical Research Institute. Among higher educational institutions, the universities of Uppsala, Lund, Stockholm, and Göteborg, the Royal Institute of Technology in Stockholm, and the Chalmers University of Technology in Göteborg have the greatest research capability. The Caroline Institute in Stockholm conducts scientific research in medicine and physiology and awards the Nobel Prizes in those fields.

About 1.5 percent of the gross national product is spent annually on scientific research, in which some 26,000 people are engaged (1975). Approximately three-fifths of the 4.2 billion kronor spent on research and development in 1975 came from private industrial companies and foundations (Wallenberg, Wenner-Gren). State budgetary funds are used primarily to finance basic research, as well as military, energy-related, and ecological research and development.

In 1975 industry spent about 2.7 billion kronor on research and development, about three-fifths of all the money allocated for scientific research. A breakdown of this amount by branch of industry shows that electrical engineering and radio electronics accounted for an estimated 25 percent, transportation machine building for about another 25 percent, other machine building for 15 percent, metallurgy for 10 percent, the paper and pulp industry for 5 percent, the chemical industry for 5 percent, and other branches for 15 percent. Universities and higher technical schools received more than one-fourth of all the money spent on research and development; government organizations obtained one-tenth. About 3 percent of those employed by industrial firms (21,000 persons in 1975) are engaged in scientific research and development, which accounts for about 4 percent of the value of the net industrial product. Of the funds allocated from the state budget in 1972–73, and distributed through the government research councils, 47 percent went for technological research, 18 percent for the natural sciences, 16 percent for medical research, 8 percent for atomic research, 4 percent for agricultural research, 4 percent for the social sciences, and 3 percent for the humanities.

Press, radio, and television

In 1979 the country's more than 145 daily newspapers had a combined circulation of 4.6 million copies; some 2,500 other newspapers and periodicals were also published. The most influential dailies, with their 1977 circulation, are *Arbetet* (since 1887; circulation, 104,000), published in Malmö as the press organ of the Social Democratic Labor Party; *Aftonbladet* (since 1830; circulation, 423,000), published in Stockholm by the Swedish Trade Union Confederation; the Liberal *Göteborgs-Posten* (since 1858; circulation 294,800), published in Göteborg; the Liberal *Dagens Nyheter* (since 1864; circulation, 480,000), published in Stockholm; *Svenska Dagbladat* (since 1884; circulation, 186,000), published in Stockholm; the rightist Liberal *Sydsvenska Dagbladet Snällposten* (since 1848; circulation, 115,700), published in Malmö; and the evening *Expressen* (since 1944; circulation 532,700), published in Stockholm.

The newspaper *Arbetartidningen—Ny Dag*, founded in 1974 and published twice a week in Stockholm, is the organ of the Left Party—Communists. The daily *Norrskensflamman*, founded in Luleå in 1906, has been the organ of the Workers' Communist Party since 1977. Founded in Stockholm in 1921, the Swedish information bureau, called the Newspapers' Telegraph Agency, is a joint-stock company owned by Swedish newspapers.

The country's radio and television broadcasting is conducted by Swedish Radio, a state-supervised joint-stock company founded in 1924 in Stockholm. Since 1979, Swedish Radio has maintained four branches: national radio, local radio, educational radio and television, and television. The country's three domestic radio programs and its foreign radio broadcasts are conducted in English, Spanish, German, Portuguese, Russian, French, and Swedish. Regular television broadcasting was initiated in 1956, after two years of experimental broadcasting; color television is available.

I. N. LOBASHEVA

Literature

The oldest extant literary works are runic stone inscriptions devoted to heroic subjects, such as the alliterative verses on the Rök Stone, dating from the ninth century. Latin-language religious literature appeared during the rise of feudalism and the spread of Christianity. The most famous works of this kind are *The Life of Kristina of Stumbelen* by Petrus de Dacia (1235–89) and *The Revelations of Saint Bridget* (14th century). Many ballads were composed in the 14th and 15th centuries, and historical chronicles and courtly poetry appeared at the beginning of the 14th century. The poet Thomas Simonsson of Strengnäs (died 1443) was known for his patriotic songs. A leader of the Swedish Reformation, O. Petri (1493–1552) wrote the *Swedish Chronicle* and, with his brother L. Petri, translated the Bible. The 17th century saw the birth of dramaturgy in the plays of J. Messenius (1579–1636), devoted to subjects from Swedish history and folklore, and the rise of lyric poetry, written by L. Wivallius (1605–69). A Renaissance spirit animated the poetry of G. Stiernhielm (1598–1672), best known for his narrative poem *Hercules* (1658), and the drinking songs of Lucidor (L. Johansson, 1638–74). Baroque literary trends influenced the poems of J. Runius (1679–1713).

An Enlightenment literature emerged in the early 18th century. In his magazine *Then swänska Argus* (1732–34) and in his satires and narrative poems, O. von Dalin (1708–63) criticized the monarchy and the mores of the aristocracy and clergy. The first Enlightenment novel, *The Adventures of Adalrik and Giöthilda* (1742–44), was written by J. H. Mörk (1714–63). The traveler's narratives of J. Wallenberg (1746–68) and the naturalist C. Linnaeus played an important role in the development of prose. The "builders of thought," a literary society that included

Hedvig Charlotta Nordenflycht (1718–63), G. P. Creutz (1731–85), and G. F. Gyllenborg (1731–1808), championed sentimentalism, as did the poet J. G. Oxenstierna (1750–1818). A writer and publicist of the late Enlightenment who took a critical view of the monarchy and church, J. H. Kellgren (1751–95) defended the principles of classicism without rejecting preromanticism. The poet K. M. Bellman (1740–95), noted for his collection *Fredman's Epistles* (1790), raised the traditional drinking song genre to the level of national poetry by giving his themes a democratic and realistic dimension. The idyls and satires of Anna Maria Lenngren (1754–1817) were also imbued with democratic sympathies. Preromanticism, whose theoretician was T. Thorild (1759–1808), a staunch defender of the French Revolution, steadily gained ground in the struggle against classicism. The poetry of Thorild, B. Lidner (1757–93), and F. M. Franzén (1772–1847) is remarkable for its intensity of feeling and rich imagery.

The struggle against the epigones of classicism, notably C. G. Leopold (1756–1829), and against Enlightenment illusions about the bourgeois system was brought to a close by the Romantics, who rallied around the magazine *Phosphoros* (1810–13). The romantic conflict between the ideal and the real was expressed in religious, mystical terms in the lyrics and dramatic poem *Isle of the Blessed* (1824–27) by the leader of the Phosphorists, P. D. Atterbom (1790–1855), and in the poetry and lyrical plays of E. J. Stagnelius (1793–1823), who shared their outlook. The mystical tendencies of the Phosphorists were attacked by the Romantics of the Gothic Society in their magazine *Iduna* (1811–24), published by their leader E. G. Geijer (1783–1847). The "Goths" called for a revival of heroic traditions and drew inspiration from folklore. E. Tegnér (1782–1846), who was associated with the Goths, embodied their patriotic and humanistic ideals in his narrative poem *The Saga of Frithiof* (1819–25), which became a kind of national epic.

The sharpening of social contradictions in the 1830's impelled writers to a critical examination of society and hastened the birth of realism, trends best exemplified in the prose of K. J. L. Almqvist (1793–1866). From the 1830's to the 1850's daily life was skillfully portrayed in the novels of Fredrika Bremer (1801–65) and Emilie Flygare-Carlén (1807–92), the sketches of C. A. Wetterbergh (1804–89), and the comedies of A. Blanche (1811–68). The upsurge in the bourgeois-democratic movement was reflected in the political verse of O. P. Sturzen-Becker (1811–69) and C. V. A. Strandberg (1818–77). The traditions of romanticism were continued in the historical novels (*The Last Athenian*, 1859; *The Armorer*, 1891) and lyrics of A. V. Rydberg (1828–95).

In the late 1870's and early 1880's, marked by the rapid growth of capitalism and the workers' movement, the writings of the Danish literary critic G. Brandes did much to strengthen realism. An important work of this period was *The Red Room* (1879), a highly critical novel by A. Strindberg (1849–1912). The Young Sweden writers grouped around Strindberg—Anne Charlotte Leffler-Edgren (1849–92), Victoria Benedictsson (1850–88), and G. Geijerstam (1858–1909)—explored pressing problems of Swedish life. In the late 1880's naturalist tendencies grew stronger in the works of Strindberg, Geijerstam, and the novelist and playwright T. Hedberg (1862–1931). Strindberg's naturalist plays *The Father* (1887) and *Miss Julie* (1888) marked a new phase in the development of European drama. The poetry and prose of O. Hansson (1860–1925) reflected the evolution from naturalism to impressionism and symbolism

In the 1890's the neoromantics, led by V. von Heidenstam (1859–1940), launched an attack on naturalism. In his literary manifesto *Renaissance* (1889), his lyrics, and his novel *Hans Alienus* (1892) Heidenstam contrasted humdrum bourgeois existence with a highly aesthetic vision of Renaissance and Oriental life and the cult of pleasure. Aestheticism and a withdrawal into the past or a dream world characterized the lyrics of O. Levertin (1862–1906) and the short stories of P. Hallström (1866–1960). Images of a patriarchal rural way of life, derived from folklore, were evoked in the neoromantic poetry of G. Fröding (1860–1911), noted for his collection *Guitar and Concertina* (1891), and A. Karlfeldt (1864–1931). The early work of Selma Lagerlöf (1858–1940), who drew heavily on folk tales and legends, was influenced by the neoromantic movement. Her novel *Gösta Berlings Saga* (1891) was imbued with humanism and a rejection of bourgeois utilitarianism. In the 1890's Strindberg became interested in mysticism and Nietzscheanism, which simultaneously attracted and repelled him, as revealed in the novel *By the Open Sea* (1890). His refusal to accept the bourgeois world was reflected in the dramas *To Damascus* (parts 1–3, 1898–1904) and *The Ghost Sonata* (1907), which heralded European expressionist drama.

In his psychological novels and short stories H. Söderberg (1869–1941) took an ironic and skeptical view of the moral, religious, and social conventions of bourgeois society. Söderberg's works, as well as the lyrics and short stories of B. Bergman (1869–1967), center on life in Stockholm and the fate of the "little man."

At the beginning of the 20th century, against the background of capitalist industrialization and the upsurge in the workers' movement, the first significant works about the working class were produced by M. Koch (1882–1940), G. Hedenvind-Ericksson (1880–1967), and D. Andersson (1888–1920). The novelists L. Nordström (1882–1942), G. Hellström (1882–1953), and Elin Wägner (1882–1949) wrote about the everyday life of various strata of Swedish society. The psychological novel *Downstream* (1920) by P. S. Siwertz (1882–1970) sharply satirized bourgeois mores. Keen psychological insight, a feeling for the grotesque, and symbolism distinguished the cycle of novels by H. Bergman (1883–1931) about the industrial region of Bergslagen (*God's Orchid*, 1919).

The sense of confusion and anguish engendered by World War I was conveyed by P. Lagerkvist (1891–1974) in his collection of expressionist poems *Fear* (1916) and by B. Sjöberg (1885–1929). Under the influence of the October Revolution in Russia, revolutionary themes appeared in the poetry of E. Blomberg (1894–1965). A Swedish section of the international society Clarté, which promoted the spread of socialist ideas, was organized in 1924 by the poets Karin Boye (1900–41) and A. Ljungdal (1901–68). In 1929 a group of five poets—G. Sandgren (born 1904), H. Martinson (1904–78), A. Lundkvist (born 1906), J. Kjellgren (1907–48), and E. Asklund (born 1908)—published the poetic anthology *Five Youths*. The group championed nebulous socialist ideals and primitivism and indulged in a romantic celebration of the "machine age" and "free love." Albeit utopian, their convictions helped bring literature closer to life. Lundkvist's verse collection *Naked Life* (1929) evoked the modern city and the life of workers, and Kjellgren's novel *People and a Bridge* (1935) was imbued with the spirit of proletarian solidarity. A romanticism of the sea pervaded the poems of Martinson.

The social autobiographical novel flourished in the 1930's; the finest examples of this genre are *Flowering Nettle* (1935) and its sequel *The Way Out* (1936) by Martinson, the cycle of novels about Olof (1934–37) by E. Johnson (born 1900), and the Knut Toring trilogy (1935–39) by W. Moberg (1898–1973). A strong social consciousness marked the works of the *statare* school, a group of writers who described the poverty and social inequality of farm laborers. The leading writers of the school were Moa Martinson (1890–1964), J. Fridegård (1897–1968), and I. Lo-Johansson (born 1901). The cycle *The Misses von Pahlen* (1930–35) and other novels by Agnes von Krusenstjerna (1894–1940) portrayed the degeneration of the gentry in a naturalist manner. The novels of F. Nilsson-Piraten (1895–1972), notably *Bombi Bitt and I* (1932), and those of O. Hedberg (1899–1974) satirized bourgeois morality. A quest for new artistic means of expression is discernible in the prose of T. Aurell (1895–1976), W. Ljungqvist (1900–74), and T. Jonsson (1910–50). The poets H. Gullberg (1898–1961) and J. Edfeld (born 1904) continued the traditions of expressionism, and E. Taube (1890–1976) and N. Ferlin (1898–1961) developed the democratic traditions of the urban song. In the poetry of G. Ekelöf (1907–68) surrealistic motifs gave way to philosophical meditation.

A number of outstanding antifascist works were produced before and during World War II, among them the allegorical tale *The Hangman* (1933) by Lagerkvist, Johnson's novel *The Soldier's Return* (1940), the antiutopia *Kallocain* (1940) by Karin Boye, and Moberg's historical novel *Ride This Night!* (1941). In the immediate postwar years some Swedish writers, disillusioned

with bourgeois civilization, began to explore man's inner world. Their works show the influence of existentialism. An intense feeling of fear and guilt pervades the novel *Isle of the Damned* by S. Dagerman (1923–54) and the early lyrics of E. Lindegren (1910–68) and K. Vennberg (born 1910). Man's alienation in bourgeois society is the central theme of the works of S. Arnér (born 1909) and L. Ahlin (born 1915).

The moral conflicts of modern man are echoed in Lagerkvist's cycle of novels on biblical themes (*Barabbas*, 1950). Johnson dealt with important contemporary problems in his philosophical historical novels *Surf* (1946) and *The Age of His Greatness* (1960). Martinson's fantasy epic *Aniara* (1956) is a pessimistic antiutopian work. In his cycle of autobiographical novels, published between 1951 and 1960, Lo-Johansson painted a picture of Swedish life in the first third of the 20th century. Between 1949 and 1959, Moberg published a cycle of novels about the emigration of Swedish peasants to America in the middle of the 19th century. The traditions of the realistic novel were also continued in the 1940's and 1950's by Lundkvist, F. Fridell (born 1904), Å. Wassing (born 1919), and Sara Lidman (born 1923).

A central theme of the 1960's and 1970's was the polemic against the official thesis of the "universal welfare state." For Birgitta Trotzig (born 1929), material and spiritual poverty may be transcended through religion. Social and spiritual vices were exposed by L. Jörling (1931–66) and B. Runeborg (born 1937), by the satirists P. Rådström (1925–65) and P. C. Jersild (born 1935), and by the coauthors of detective novels with a social message P. Wahlöö (1926–75) and Maj Sjöwall (born 1935). The intellectual and analytical novels of P. O. Sundman (born 1922), L. Gyllenstein (born 1921), and P. O. Enquist (born 1930) were directed against moral and ideological stereotyping. The anti-imperialist and anticolonial movement engendered its own engagé literature, some of the finest examples of which are the anticolonial novels of Lidman (*I and My Son*, 1961) and B. Söderbergh (born 1925; *Stirrup*, 1961) and the political novel *Wool* (1973) by L. Gustafsson (born 1936).

Documentary literature reached a high level in the reportage of Lundkvist, the articles about South Africa by P. Wästberg (born 1933), Lidman's articles about Swedish miners and life in Vietnam, and the documentary novels of Enquist and S. Delblanc (born 1931). Works of epic proportions were produced by P. A. Fogelström (born 1917), the author of the novel cycle *City* (1960–68), and by Delblanc, who wrote a series of novels about the province of Södermanland (1970–76). Astrid Lindgren (born 1907) has become internationally famous for her children's books about Karlsson and Pippi Longstocking.

A group of writers, among them Ö. Fahlström (born 1928), emerged in the early 1960's to champion formalist "concrete" poetry. They were opposed by the "new simplicity" school of G. Palm (born 1931), Sonja Åkesson (born 1926), and B. Häkanson (born 1937), which sought to revive realistic poetry. The poets L. Södeberg (born 1931), Häkanson, and G. Sonnevi (born 1939) dealt with current political issues in their lyrics of the late 1960's and early 1970's.

The Swedish Union of Writers, founded in 1893, is the professional organization that protects the economic and intellectual interests of writers.

From the outset Swedish literary criticism has developed under the influence of Western European trends; in the 20th century American criticism has also been closely studied. The foundation of scholarly literary criticism was laid by the Romantics L. Hammarsköld (1785–1827), the author of *Swedish Literature* (1818–19), and Atterbom, both of whom applied aesthetic and psychological criteria in their analysis of literary works. The most influential 20th-century literary scholar was H. Schück, an adherent of the cultural history school whose work was based on a careful study of sources. Schück's method was developed by M. Lamm (1880–1950), F. Böök (1883–1961), and A. Nilsson (1878–1936). The critic V. Svanberg (born 1896) has affirmed the social roots and significance of literary works in his *Poetry and Politics* (1931) and other works. In the 1950's, G. Tideström (born 1906) emerged as the leading exponent of the New Criticism.

Architecture and art

Among the oldest examples of prehistoric art in Sweden are the Bronze Age rock carvings in Bohuslän showing schematized figures of deities, hunting scenes, battles, and military campaigns. Archaeological excavations have also uncovered Bronze Age ornamented weapons and utensils. Artistic relics dating from the Iron Age (beginning in the sixth century B.C.) and from the first millennium A.D. include stone stelae, metal and wood objects richly decorated with interlace ornamentation in the "animal style," and representations of people and animals. The Vikings (late eighth to mid-11th centuries) left behind the remains of frame buildings and stelae depicting narrative scenes.

In the 11th and 12th centuries massive Romanesque stone churches were built at Sigtuna, Old Uppsala, Lund, and elsewhere. Gothic churches with graceful towers, best exemplified in the Storkyrka (Great Church) in Stockholm and the Cathedral of Uppsala, were constructed over the next three centuries. Renaissance influences were strongest in 16th-century castle architecture (Gripsholm, Vadstena, Kalmar). The Middle Ages saw the rise of towns with a dense network of narrow streets and the development of decorative painting and sculpture and miniature painting.

In the 17th century Swedish noblemen built baroque and classical urban palaces and country residences with parks, designed by the architects J. de la Vallée, N. Tessin the Elder, and N. Tessin the Younger. Native artists, of whom the most famous were J. Sylvius and D. Ehrenstrahl, worked alongside German, French, and Dutch masters. Classical architecture (C. F. Adelcrantz) and sculpture (J. T. Sergel) flourished in the 18th century, as did genre painting, both in the courtly manner of the rococo (N. Lafrensen) and in the bourgeois-didactic style (P. Hilleström). Realistic portraiture reached a high level in the work of A. Roslin, C. G. Pilo, the pastelist G. Lundberg, and the miniaturist P. A. Hall. New city districts were built on a grid pattern.

In 19th-century architecture classicism gave way to a ponderous eclecticism. Romanticism became the prevailing style in the visual arts in the first half of the century. A heightened interest in the country's past, its natural setting, and its people marked the paintings of N. Blommér, E. Lundgren, and M. Larsson and the sculpture of J. P. Molin. The development of realistic painting in the second half of the 19th and the early 20th centuries culminated in the joyous portraits and genre compositions of A. Zorn, the psychological portraits of E. Josephson, the everyday scenes of C. Wilhelmsson and C. Larsson, the landscapes of Prince Eugen, and the animal paintings of B. Liljefors. Official historical paintings were produced by G. Cederström.

In the 20th century a quest for new paths in architecture, stimulated by national romantic aspirations, was initiated by F. Boberg and C. Bergsten. A neoclassical style was evolved by the architects R. Östberg and I. Tengbom, and a school of modern architecture, blending functionalism with features akin to organic architecture, was founded by G. Asplund, S. Markelius,

and S. Backström. Swedish architects have made a major contribution to the development of satellite cities (Vällingby and Farsta near Stockholm, with their extensive system of commercial centers), well-planned, self-sufficient residential districts (microdistricts in Stockholm, Göteborg, and Malmö), and various types of high-rise apartment buildings.

Outstanding examples of 20th-century Swedish sculpture include the monumental-decorative works of C. Milles, B. Hjorth, and B. Marklund, who combined a realistic treatment of national life with romantic symbolism and fantasy. The fine paintings of S. Derkert, E. Jolin, and A. Amelin deal with important social themes. Another group of artists has produced highly colorful, often symbolic canvases: I. Aguéli, I. Grünewald, V. Nilsson, L. Engström, and E. Hallström. Technical excellence and keen observation distinguish the graphic art of P. von Schantz and L. Lindeberg. Swedish artists have also been attracted to various modernist currents, ranging from surrealism and abstract art (E. Nemes and T. Renquist) to pop art, conceptual art, and hyper-realism. The country's extremely rich folk art tradition includes wood architecture (churches, houses, farm buildings), weaving, pottery, the working of metal and leather, and carving on wood and bone.

Music

Until the 19th century, Swedish music developed within the mainstream of Scandinavian musical culture. Long influenced by German and Norwegian music, it acquired distinctive national traits by the early 20th century. Folk songs and dances—both round dances with singing and couple dances—differ in the various counties. The oldest folk instruments are the *lur* (a shepherd's horn) and bells; later, village ensembles came to include violins, clarinets, flutes, and harps.

The bearers of musical culture down to the 13th century were the skalds; thereafter, until the early 16th century, their role was assumed by itinerant musicians called *lekare*, who played violins, pipes, and drums on city streets and at court. Folk ballads and antifeudal political songs appeared in the 14th and 15th centuries, and evangelical psalms became popular after the Reformation. The development of professional music was influenced by Gregorian chant, which spread to Sweden along with Christianity in the 11th century, and by the Protestant chorale, introduced at the time of the Reformation. The center of secular musical life was the royal court in Stockholm, where a court choir performed from 1526 and where several generations of the German Düben family served as musicians.

In the 18th century the court choir was headed by J. H. Roman (1729–37), one of the first professional Swedish composers (church choral music) and the organizer of the first public concerts in 1731 and by F. Uttini (from 1768), who wrote the first Swedish-language opera, *Thetis and Pelée* (1773), and who formed an opera company that evolved into the Swedish Royal Opera. The opera company performed at the Bollhus Theater from 1773 to 1776 and at the Drottningholm Palace near Stockholm from 1777 to 1782, when it acquired a permanent theater. (A new theater building was constructed in 1898.) The opera theater's early repertoire included works by the Swedish composer J. G. Naumann (*Gustavus Vasa*, 1786). In the early 19th century it presented the operas of F. A. Berwald, the greatest Swedish romantic composer and the first Swedish symphonist, as well as a fine violinist and conductor, and the comic operas of C. Stenborg. In the latter part of the century it gave fine performances of A. Hallén's operas.

Other important composers of the late 18th and early 19th centuries were G. J. Vogler and J. M. Kraus, who produced religious and secular works, and J. F. Palm, who wrote songs. The Royal Academy of Music was founded in Stockholm in 1771, initially as a concert organization. In the late 19th century it was designated a conservatory, and in 1940 it became the Academy of Music, renamed the State Academy of Music in 1971.

Under the influence of romanticism, national folk music drew increasing attention in the early 19th century. Folk songs were collected by E. Drake, J. B. Struve, and R. Dybeck, and the first anthologies were published between 1814 and 1816 by A. Afzelius, E. G. Geijer (also a composer), and A. I. Arwidsson. Several composers of the second half of the 19th century used folk melodies, notably A. F. Lindblad, the Swedish Schubert, who also wrote operas, symphonies, and instrumental chamber works. Folk influences are also apparent in I. Hallström's opera *The Bewitched* (1874) and in A. Hallén's operas, symphonic poems, and choral works. After 1850 musical life developed in Malmö, Norrköping, and Göteborg, where B. Smetana headed the municipal symphony orchestra from 1856 to 1861. Sweden produced a number of internationally known singers, among them Jenny Lind, nicknamed the Swedish Nightingale, C. Nilsson, E. Gulbranson, and J. Björling.

A national school of composition was founded in the first half of the 20th century by W. Peterson-Berger, who wrote Wagnerian music dramas, five symphonies, and vocal and instrumental pieces; W. Stenhammar, known for his instrumental chamber works, operas, and symphonies; H. Alfvén, who produced orchestral compositions (*Swedish Rhapsodies*) and choral works; and D. I. Wirén, noted for his symphonies, concerti, and music for the theater and cinema. The works of these composers have a nordic coloring typical of Scandinavian romanticism. Other distinguished musicians included the violinist, conductor, and composer T. Aulin, who founded a quartet, and the composers E. Sjögren (romances and other works), N. Berg, E. Kallstenius, and T. Rangström.

Several talented composers came to prominence in the 1930's and 1940's: K. M. Atterberg, who wrote operas, ballets, and symphonies; G. Nystroem, a composer of instrumental works who lived in Paris for many years; H. Rosenberg, many of whose works are performed outside of Sweden; and M. Pergament, who employed the serial technique. Another important new composer was K. B. Blomdahl, whose best-known work was the opera *Aniara*, staged in 1959. Among eminent composers of the 1950's were D. I. Wirén, L. E. Larsson, and E. von Koch. They were soon joined by the younger composers I. Lidholm, S. E. Bäck, and H. Eklund. A number of composers of the 1960's and 1970's were strongly influenced by the avant-garde movement. The Society for Contemporary Music (Samtida Musik) was founded in 1960, and electronic music studios were established in Stockholm (1964) and Malmö (1966). Experimental music has been written by A. Mellnäs, K. E. Welin, J. Bark, B. Nilsson, and J. Morthenson.

Sweden has ten professional symphony orchestras, the best known of which are the Swedish Radio Symphony, the Stockholm Philharmonic (directed by G. N. Rozhdestvenskii in 1974–76), and the Göteborg Symphony Orchestra. The leading choral groups are the Swedish Radio Choir and the Stockholm Chamber Choir. There are opera theaters in Stockholm (Swedish Royal Opera), Göteborg, and Malmö; musicals and operettas are performed at Oscar's Theater in Stockholm. The country's vigorous musical life owes much to the activity of the Concert Association in Stockholm (founded 1902), the Orchestra Association in Göteborg (1905), the Society of Swedish Composers (1918), the Choral Union (1925), and various amateur music organizations. Musical training is given at the State Academy of Music in Stockholm, the Conservatory in Malmö (1907), the Institute of Music in Göteborg (1932), and numerous music secondary schools. In 1963 a concert organization was founded to sponsor performances by soloists and chamber ensembles; prior to the 1960's, chamber music concerts were much less popular than performances of symphonic works.

Among the leading performing artists of the 1970's were the conductors S. Ehrling, S. Westerberg, and H. Blomstedt; the pianists H. Leygraf and S. Ericsson; the violinists L. Berlin and E. Wolf; the cellist E. Bløndahl-Bengtsson; and the singers N. Gedda, B. Nilsson, L. Andersson, E. Söderström, K. Meyer, and M. Hallin. The foremost musicologists are L. A. D. Fryklund and I. Bengtsson.

Ballet

Ballet performances by French artists were regularly staged at the royal court in Stockholm from 1638. The first permanent company, directed by L. Gallodier, was created under the auspices of the Swedish Royal Opera, founded in 1773. Ballets were staged by the Danish ballet masters Antoine Bournonville and L. Delande, who worked in Sweden from 1785 and 1809, respectively. In 1843 the first Swedish ballet master, A. Selinder, acquainted Swedish audiences with F. Taglioni's romantic ballet *La Sylphide*, set to the music of J. Schneitzhöffer. Selinder also introduced Swedish folk dances into operatic productions. The most famous 18th-century ballerinas were G. Bassi and H. Hjortsberg; the mid-19th century produced the outstanding ballerina C. Norberg and the premier danseur C. Johansson, who worked primarily in Russia. Danish ballet greatly influenced the subsequent development of Swedish professional ballet, whose repertoire featured ballets choreographed by August Bournonville. Despite the appearance of such luminaries as the ballet master S. Lund and the ballerina H. Lund in the second half of the 19th century, Swedish ballet stagnated down to the second decade of the 20th century.

The arrival of M. M. Fokine in 1913 gave impetus to a resurgence of the ballet; among Fokine's most popular productions were *Cleopatra*, based on the music of A. S. Arenskii with inserted numbers by other composers, and *Les Sylphides*, based on the music of F. Chopin. The Swedish Ballet, established in the 1920's, gave performances in Paris from 1920 to 1925. Many of its productions were choreographed by J. Börlin, who favored ballets by French composers (D. Milhaud, E. Satie) and stage designs by French artists (F. Léger). Börlin also produced several ballets by Swedish composers, including H. Alfvén's *St. John's Eve*, which incorporates Swedish folklore. The leading dancers of this period were C. Ari and J. Hasselquist. In the 1930's Swedish ballet was strongly influenced by expressionist dance, popularized by J. Algo.

In the 1940's and 1950's the ballet company of the Royal Opera revived a number of classical ballets, among them P. I. Tchaikovsky's *The Sleeping Beauty*, staged by the Finnish choreographer G. Gé (Grönfeldt) during World War II and by the English choreographer M. Skeaping from 1953. At the same time, Swedish choreographers continued to use modern dance extensively, as evidenced by I. Cramér's staging of A. Granström's *The Girl Who Trampled Bread* (1945), S. S. Prokofiev's *The Prodigal Son* (1958), *The Water Sprite*, based on the music of R. Lundsten (1973), and *Peter and the Wolf*, based on the music of Prokofiev (1976). Since 1967, Cramér has headed the Cramér Ballet, whose productions are largely inspired by folklore.

The choreographer B. Cullberg is known for her productions of *Miss Julie* by T. Rangström (1950), *Adam and Eve* by H. Rosenberg (1967), and *Revolt*, based on the music of B. Bartók (1973)—ballets performed at the Swedish Royal Opera, by the Cullberg Ballet (founded 1967), and on television. B. Äkesson has mounted fine productions of *Sisyphus* by K. B. Blomdahl (1957), *Icarus* by S. E. Bäck (1963), and *Nausikaa Alone* by I. Lidholm (1966). The repertoire of the Swedish Royal Opera has also included productions by a number of foreign choreographers who worked there in the 1960's, notably A. Tudor, B. MacDonald, J. Limón, and J. Cranko. There are permanent companies in Göteborg (director, E. M. von Rosen) and Malmö (director, C. Borg).

The leading dancers of the 1940's and 1950's were B. Appelgren, E. Rasch, G. Lindgren, T. Rhodin, J. Mengarelli, and his brother M. Mengarelli; of the 1950's and 1960's, von Rosen, M. Orlando, G. Anderson, C. Selling, and W. Sandberg; and of the 1960's and 1970's, Y. Brosset, M. Lang, K. Lidström, B. Skold, N. Håggbom, V. Klavsen, P. A. Segerström, N. Winqvist, and J. Kåge.

The magazine *Dans* has been published in Stockholm since late 1973. E. IA. SURITS

Theater

School theaters flourished in Sweden in the 15th and 16th centuries, and theatrical performances were given in the royal castles from the late 16th century. The first court theater, which opened in Stockholm in 1649, relied on foreign companies—Italian opera and commedia dell'arte troupes and German and French troupes—down to the early 19th century. The French troupes, in particular, greatly influenced theatrical life in Sweden, molding its taste to conform to the canons of the French classical theater. The first permanent national theater was the Uppsala Student Theater, which existed from 1682 to 1691. The Royal Swedish Theater was founded in 1737 by an amateur company of young noblemen and civil servants; from 1753 the amateur company was largely displaced by French and Italian troupes. The first public theaters were founded under Gustavus III, first in Göteborg in 1779 and then in Stockholm, where the Swedish Royal Dramatic Theater opened in 1788. Down to the 1870's the stage was dominated by French musical comedy and by the pseudohistorical tragedies of A. von Kotzebue and his imitators, acted in a heavy declamatory style.

The social, economic, and cultural upsurge of the 1870's brought the "new drama," including the plays of H. Ibsen and B. Bjørnson, to the stage of private and state theaters. The ascendancy of realism was assured by A. Strindberg, the great playwright and theoretician of the theater. Although many of Strindberg's historical dramas gained a firm place in the repertoire of European theaters, the majority of his boldly innovative works did not achieve recognition on the national stage. In 1907, Strindberg and the director A. Falck opened the Intima Theater in Stockholm, which staged most of his plays before it closed in 1910. The tours of the German Chamber Theater, M. Reinhardt's production of Strindberg's *A Dream Play* (1921) on the stage of the Royal Dramatic Theater, and the tours of the Moscow Art Theater in 1921–22 had a profound impact on Swedish directors and performers. The principles of psychological realism were firmly established on the Swedish stage in the first quarter of the century through the brilliant performances of N. Personne, H. Bosse, T. Teje, V. Sjöström, E. Hillberg, I. Hedqvist, and A. de Wahl. Another master of characterization was J. Ekman. The foremost director of the first half of the 20th century was O. Molander. Two eminent men of the modern Swedish theater, A. Sjöberg and I. Bergman, began their careers in the 1930's and 1940's, respectively.

During World War II, the Royal Dramatic Theater showed a lack of principle in staging predominantly light plays of entertainment. At this time, only the City Theater of Göteborg, under the direction of T. Hammarén, openly opposed Nazism, staging such antiwar plays as Ahlström's *Readiness* (1941), Moberg's *Ride This Night!* (1942), and Munk's *Niels Ebbesen* (1944). One of the most powerful condemnations of fascism was Bergman's production of A. Camus's *Caligula* in 1946. In the 1950's a number of private theaters sought to popularize the "theater of the absurd." But in the state-supported theaters preference was given to the classics and to plays by foreign playwrights, notably J.-P. Sartre, J. Anouilh, A. Miller, T. Williams, and J. Osborne. Swedish theaters gave fine performances of the plays of A. P. Chekhov, L. N. Tolstoy, N. Gogol, M. Gorky, V. V. Mayakovsky, and V. P. Kataev.

A heightened political awareness marked the Swedish theater of the 1960's, when B. Brecht's works were among those most frequently performed. Another new development was the creation of theater groups—communities of actors, directors, and playwrights who staged plays that reflected their common political and artistic views. Such groups generally arose within theaters, for example, in connection with the staging of *They*, a play about the Vietnam war, by the Royal Dramatic Theater in 1967. Some of the groups evolved into "free theaters," which proliferated rapidly in the late 1960's and 1970's. The productions of these theaters tend to be highly political and frequently take the form of revues incorporating music, singing, and pantomime. The entire company participates in writing the script. The best-known group of this kind is the traveling Stockholm Free Professional Theater, which champions the economic and political demands of the working class.

Outstanding performers of the contemporary Swedish theater include I. Tidblad (died 1975), E. Josephson, G. Wållgren, A. Ek, E. Adolphson, E. Dahlbeck, G. Rydeberg, H. Löw-

enadler, T. Pawlo, S. Ruud, U. Palme, K. Kavli, J. Kulle, A. Tretow, S. Fürst, and P. Oscarsson.

In addition to the Royal Dramatic Theater and the City Theater, Stockholm has several private theaters. There are drama theaters in Göteborg, Malmö, and other cities. The state-supported Riksteater was formed to tour the smaller towns; each year it gives as many as 700 performances in more than 100 population centers.

Circus. Itinerant circuses, such as those directed by Orlando, the Miares brothers, and B. Schreiber, regularly toured Sweden. The founder of a remarkable circus dynasty was G. L. Housske, whose wife, the trick rider Rénee Léonard, headed the Stockholm Circus in the 1860's. Among the larger circuses of the 1920's were the Scott Circus, directed by Kate Bronett, and the Skala Circus, headed by Harry and Helén Johansson. In the 1940's and 1950's the Trolle Rodin Circus combined traditional circus acts with variety shows.

Motion pictures

Sweden's first documentary, consisting of short sequences, was made by the German cinematographer M. Skladanowsky. In 1897 several documentary and entertainment shorts were produced by the Swede N. Peterson. Regular film production began in 1907. The classical film school that flourished between 1910 and 1930 substantially influenced world cinematography through such fine films as V. Sjöström's *Strike* (1914), *Terje Vigen* (1916, after H. Ibsen), and *The Sons of Ingmar* (1918, after S. Lagerlöf) and M. Stiller's *When Love Kills* (1913) and *Song of the Scarlet Flower* (1918). In the 1930's the film output was largely restricted to salon melodramas and comedies, best represented by G. Molander's *On the Sunny Side* (1935) and *One Single Night* (1939).

Films denouncing fascism were produced in the 1940's; among the most memorable were Molander's *There Burned a Flame* (1943), H. Ekman's *His Excellency* (1944), and A. Sjöberg's *The Royal Hunt* (1943). The first of H. Faustman's films about the working class, affirming proletarian solidarity, appeared in the late 1940's (*Foreign Harbor*, 1948; *Night Journey*, 1955). Several protest films made by young directors attacked the petit bourgeois ideals that dominated society. Among the best of these films were Sjöberg's *Miss Julie* (1951, after A. Strindberg) and A. Mattsson's *One Summer of Happiness* (1951). The great director I. Bergman won international acclaim for his brilliant portrayal of the tragic contradictions, spiritual emptiness, and inhumanity of capitalist society in such films as *The Naked Night* (1953), *Wild Strawberries* (1957), *The Face* (1958), *The Silence* (1963), *Persona* (1966), *Cries and Whispers* (1972), and *Face to Face* (1976). In 1977 he filmed the anti-Nazi *Serpent's Egg* in Munich.

In the 1960's and 1970's a group of young directors emerged whose films dealt with vital social and economic issues. B. Widerberg dealt with the plight of workers in *Raven's End* (1965), *Ådalen 31* (1969), and *Joe Hill* (1971), and J. Troell showed the fate of the peasantry in *Here Is Your Life* (1967), *The Emigrants* (1970), and *The New Land* (1972), the last two based on novels by V. Moberg. Problems confronting young people are explored in J. Halldoff's *Ola and Julia* (1967) and *A Dream of Freedom* (1969), Widerberg's *Elvira Madigan* (1967), and R. Andersson's *A Love Story* (1970). Swedish children's films have become famous throughout the world; among the finest are O. Hellbom's series of films based on A. Lindgren's books about Pippi (1968–71) and *Karlsson on-the-Roof* (1974). Concurrently, a number of directors have been substituting frankly naturalistic depictions of sexual relations for an exposure of the causes of the spiritual degeneration of Swedish society. This approach is characteristic of V. Sjöman (*I Am Curious*, 1967–8), T. Wickman, B. Forslund, and B. Torn.

The leading film stars are B. Andersson, H. Andersson, I. Thulin, L. Ullmann, M. von Sydow, and G. Björnstrand. A joint Soviet-Swedish film *Man From the Other Side*, was issued in 1971. Although about 15–20 feature films are released each year, film distribution is dominated by American pictures filled with violence and brutality. Attendance at movie theaters has declined sharply, and the number of theaters has dropped accordingly from about 2,500 in the mid-1950's to 1,200 in the second half of the 1970's. The Swedish Film Institute, established in 1963, has operated a film school since 1965. Eminent film critics and theoreticians include B. Idestam-Almquist, R. Waldekrantz, L. Bergström, and H. Schein. The leading film magazines are *Chaplin* (since 1959) and *Film och bio* (since 1967).

SWEDES, the main inhabitants of Sweden, accounting for about 96 percent of the population and numbering 7.9 million persons in 1975 (estimate). They speak Swedish and profess Lutheranism. More than a million Swedes, descendants of immigrants, live in the USA and Canada, and about 370,000 reside in Finland. Small numbers of Swedes are also found in other countries.

The Swedish nationality evolved during the formation of the early medieval Swedish kingdom between the ninth and 11th centuries—the Viking age—through the unification of the northern Germanic tribes, principally the Svear and Götar, who inhabited Scandinavia in the first millennium A.D. The Finns and Lapps also played a definite role in the ethnogenesis of the Swedes. The struggle of the Swedes against German and Danish domination in the Middle Ages, the wars for supremacy on the Baltic, the rapid growth of the country's economy and trade, and the formation of a national market promoted the emergence of capitalist relations and the amalgamation of the Swedes into a modern nation in the 17th and 18th centuries.

Today, most Swedes are employed in industry; only 6 percent of the population is engaged in agriculture. Traditional occupations are still followed, namely, the production of agricultural equipment and fishing nets, pottery, coopering, and the artistic working of wood, leather, and bone. Popular handicrafts include spinning and weaving, lace-making, and fur dressing. The old dwellings and clothing have been preserved in the folk culture. Swedish folklore includes tales, legends, and ballads.

M. N. MOROZOVA [29–936–1]

SWEDISH, the language of the Swedes; the official language of Sweden and one of the two official languages of Finland. According to a 1975 estimate, Swedish is spoken in Sweden, Finland, the USA, and Canada by 10 million people. It belongs to the Scandinavian group of the Germanic languages.

Swedish, which emerged as an independent language from the Common Scandinavian parent language between the ninth and 11th centuries, has six dialect groups: the South Swedish dialects of the Skåne region, the Göta dialects of southwestern Sweden, the Svea dialects of central Sweden, the Norrland dialects of northern Sweden, the East Swedish dialects of the eastern coast of the Gulf of Bothnia, and the Gutnish (Gotlandish) dialect of the island of Gotland. The modern literary language evolved in the 16th and 17th centuries as a result of a complex interaction of several dialects (the Svea dialects playing a major role) with the Old Swedish written language, which had developed in the 14th century from the Göta dialects.

In Swedish, sounds are distinguished as short or long; there are no diphthongs. Other phonological features include a musical word accent and a phonemic balance within syllables. Nouns, which are divided into six classes, are marked for gender (common or neuter), number (singular or plural), and case (common or genitive). The definite article may be added, in the form of a suffix, to the noun. Verbs, which are generally not inflected for

person and number, fall into four conjugational paradigms. The verb system includes several forms of the infinitive and an uninflected form—the supine.

The earliest written texts in Swedish are runic inscriptions on stone and date from the ninth to the early 12th century. The oldest surviving manuscripts are a fragment from the legal code known as the *Västgötalagen* (The Law of West Gotland; mid-13th century), a manuscript of the code (1280), and 14th-century legal, religious, and poetic texts. The Swedish writing system uses the Latin alphabet with four additional letters. In Swedish, the spelling of a word is not a precise guide to its pronunciation.

SWEDISH-DANISH WAR OF 1813–14, a war waged by Sweden against Denmark to compel it to relinquish Norway, which had been ruled by the Danish monarchy since the late 14th century. By joining the anti-Napoleonic coalition in 1813, Sweden gained the support of Russia, Prussia, and Great Britain. On Nov. 28, 1813, the Swedish Army (60,000 strong including Russian and Prussian units) under G. B. Bernadotte entered Denmark, an ally of Napoleon I, from the south. On December 7, during the battle of Bornhöved, south of Kiel, the Swedish cavalry forced the Danish Army, numbering only 10,000 men, to retreat. Denmark was unable to offer resistance on the sea, which was controlled by the British Navy. After suffering a series of defeats, Denmark signed the Treaty of Kiel with Sweden on Jan. 14, 1814, ceding Norway to the Swedish crown.

SWEDISH-NORWEGIAN UNION OF 1814–1905, the legal merger of the Swedish and Norwegian states on the basis of an actual union. Sweden imposed the union on Norway by force of arms. The union went into effect on Nov. 4, 1814, with the election of the Swedish king Charles XIII as king of Norway.

The relations between the parties in the union were regulated by the Riksakt (Act of State) adopted by the parliaments of both countries on Aug. 6, 1815. Sweden and Norway had a common foreign office, but each country retained its own laws, administration, courts, and church. The Norwegian Army, all of whose officers were Norwegians, was under the command of the king but could not be used outside Norway without the approval of the Norwegian Storting. A law passed by three convocations of the Storting went into force despite the king's veto. The king appointed the members of the Norwegian government on recommendation from the Storting, which also retained the right to manage the country's finances and to grant Norwegian citizenship.

The Storting became the focal point of Norwegian resistance to the union. Russian and British support for Norway was another factor promoting the annulment of the union. On June 7, 1905, the Storting passed a resolution abolishing the union. In a plebiscite held in Norway on Aug. 13, 1905, about 369,000 persons voted to sever the union and 184 to preserve it. The union was formally dissolved that year by the Karlstad Treaty, concluded between Sweden and Norway.

SWEDISH-NORWEGIAN WAR OF 1814, a war waged by Sweden against Norway to compel it to acknowledge the Swedish-Danish treaty of Jan. 14, 1814. Naval operations began on July 28, and on July 30 (or July 26, according to some sources) 45,000 Swedish troops under G. B. Bernadotte invaded southeastern Norway. The Norwegian army of 33,000 men retreated fighting beyond the Glomma River. On August 14 an armistice and the Moss Convention were concluded, establishing the conditions for Norwegian recognition of the union with Sweden. Confirmation of the convention by the Norwegian Storting on Oct. 20, 1814, officially ended the war.

SWEDISH ROYAL DRAMATIC THEATER, opened May 17, 1788, in Stockholm. Until the 1870's the theater cultivated a declamatory acting style and staged chiefly tragedies by A. von Kotzebue, bourgeois plays, and French vaudevilles. In the 1870's the works of B. Bjørnson and H. Ibsen were introduced into the repertoire, but A. Strindberg's plays were initially banned from the state-supported theater. The staging of Strindberg's *Master Olof* in 1908 was followed by the presentation of plays by B. Shaw, P. Lagerkvist, A. Schnitzler, and H. Bergman. From 1933 to 1938 the theater was headed by the director O. Molander, who fostered the intellectual, psychologically subtle style of acting that distinguishes the theater to this day.

In the 1940's and 1950's, under the direction of A. Sjöberg, the theater staged plays by Shakespeare, F. García Lorca, and Strindberg (*Miss Julie*, 1949). Its company has included the distinguished players G. Broström, A. Björk, I. Thulin, M. Krook, U. Palme, and M. von Sydow. From 1963 to 1966 the theater was headed by the director I. Bergman, who mounted fine productions of Albee's *Who's Afraid of Virginia Wolf?* (1963) and Ibsen's *Hedda Gabler* (1964). The actor E. Josephson was appointed principal director and manager in 1966. Outstanding productions of the 1970's include Strindberg's *The Ghost Sonata* (1973) and *To Damascus* (1974), Erdman's *The Mandate* (1974), Chekhov's *Uncle Vanya* (1974), and Sternheim's *The Burgher Schippel* (1976).
O. V. GARIBOVA [29–933–3]

SWEET CHERRY (*Cerasus avium*), a deciduous tree of the family Rosaceae. The crown is ovate with sparse branches. The trunk measures 50–60 cm across and reaches a height of 35 m. The long petioled leaves are ovate, obovate, or elliptical; their margins are deeply double-serrate. The large flowers are initially white but turn pink toward the end of blossoming. The stipules are reddish. The fruit is a dark red drupe.

The sweet cherry is distributed in Central and Southern Europe and in Iran. In the USSR it is found in the Caucasus, the Crimea, the southwestern Ukraine, and Moldavia. The sweet cherry occurs as a solitary tree principally in mixed broad-leaved and coniferous–broad-leaved forests.

The cultivated form of sweet cherry is raised for its drupaceous fruit. The trees are long-lived (100 or more years). They are shade-tolerant but not very winter-hardy. Fruiting begins in the seventh or eighth year. The juicy fruits, which are pink, red, yellow, or almost black, mature from late May to early September. They contain 7–15 percent sugars (glucose, fructose, and sucrose) and 0.36–1.1 percent acids (malic and others); vitamin C is present. The fruits are eaten fresh or processed into compote, jam, candied peel, juice or wine. Freezing is also possible. The kernel of the stone contains as much as 30 percent oil, which is used in perfumery.

The sweet cherry is a nectar-bearer. Its wood is used in carpentry and in the manufacture of musical instruments. The tree is raised in Europe, as well as in Turkey, Iran, Afghanistan, China, and Japan. In the USSR it is most widely cultivated in the Crimea, the Caucasus, the southern Ukraine, and Middle Asia; it is also grown in Latvia and Kaliningrad Oblast. The best varieties are Deiber Black, Drogan Yellow, Gedelfinger, Franz Josef (Francis), Napoleon Pink, and Early Kassena.

The sweet cherry is propagated mainly by grafts on stocks of

wild sweet cherry in the southern zone and Mahaleb cherry in more northerly regions. The feeding area of sweet cherry is 8 × 6 m. The best crown shape for cultivated trees is circled. Care entails loosening the soil, the application of organic and mineral fertilizers, watering, and pruning. The interrow areas are usually kept fallow.

[29–219–3]

SWISS, a general term designating the principal nationalities of Switzerland, who have merged into a single nation (*natsiia*, nation in the historical sense) as a result of prolonged existence in a unified state, the development of economic, political, and cultural ties, and the widespread practice of bilingualism and trilingualism. [29–995–3]

SWISS ALPS, the ranges and massifs of the Alps that lie within Switzerland. The Swiss Alps include all or part of the Bernese, Glarus, Pennine, Lepontine, and Rhaetian Alps. [29–990–2]

SWISS CAMPAIGN OF SUVOROV (1799), the movement of Russian troops commanded by Field Marshal A. V. Suvorov from Italy across the Alps to Switzerland between Sept. 10 (21) and Sept. 27 (Oct. 8), 1799, during the War of the Second Coalition (Great Britain, Austria, Russia, Turkey, the Kingdom of the Two Sicilies, and others) against France.

Almost all of Italy was liberated from French troops as a result of Suvorov's Italian campaign [*see* ITALIAN CAMPAIGN OF SUVOROV (1799)] and Ushakov's Mediterranean campaign [*see* MEDITERRANEAN CAMPAIGN OF USHAKOV (1798–1800)]. The French Army under General J. V. Moreau, defeated at Novi, retreated toward Genoa. Only the forts of Tortona and Coni remained in French hands in northern Italy. Suvorov laid siege to Tortona. By this time, the Anglo-Austrian leadership of the coalition had developed a new plan for military operations. As early as July 1799, the British cabinet suggested to Emperor Paul I that a joint Anglo-Russian expedition be sent to Holland, thus altering the entire plan of the war. After changes were made by the Austrian command, the following plan was adopted. The Austrian Army under the command of Archduke Charles would march from Switzerland to the Rhine, lay siege to Mainz, occupy Belgium, and establish contact with the Anglo-Russian corps in Holland. At the same time, the Russian forces commanded by Suvorov would march from Italy to Switzerland, where they would meet the Russian corps of General A. M. Rimskii-Korsakov and the corps of *émigré* Frenchmen of Prince L.-J. Condé, after which all these forces, under the command of Suvorov, would invade France through Franche Comté. The Austrian army under Field Marshal M. von Melas was to advance on Savoy from Italy.

The plan adopted served the expansionist interests of Great Britain and Austria. Great Britain sought to gain control of the Dutch fleet and thus gain supremacy at sea; Austria wanted to get Russian troops out of Italian territory and strengthen its own domination in Italy.

Paul I agreed to the plan with the condition that the Austrian forces would clear French troops from Switzerland before the Russian troops arrived. Suvorov received the order from the Austrian emperor Francis to cross into Switzerland on August 16 (27), but he did not hasten to carry it out because he believed it was first necessary to take the French forts in Italy. Meanwhile, despite its promises to Paul I, the Austrian command began withdrawing the army of Archduke Charles from Switzerland, which left the Russian corps of Rimskii-Korsakov, which had arrived in the Zürich area, under attack by the French Army under General A. Masséna. Despite Suvorov's vigorous protests, Archduke Charles agreed to leave only 22,000 men in Switzerland, under the general command of General F. Hötze. On August 31 (September 11) immediately after Tortona's surrender, Suvorov's forces, totaling 21,000, marched north, from Alessandria and Rivalta. Suvorov sent the field artillery and supply trains through Austria, taking with him only 25 mountain guns.

By early September, the forces of the allies were deployed in Switzerland in the following primary groupings: Rimskii-Korsakov's corps (24,000 men) on the Limmat River, near Zürich; Hötze's detachment (10,500) along Lakes Zürich and Wallenstadt and on the Linth River; F. Jelačić's detachment (5,000) near Sargans; Linken's detachment (4,000) near Ilanz; and Auffenberg's detachment (2,500) at Disentis. The Austrian detachments of G. Strauch, W. L. Rogan, and K. Hadik, numbering about 11,500 men, were situated on the southern approaches to Switzerland. General Masséna's main forces, totaling 38,000 men, were deployed opposite Rimskii-Korsakov's corps. N. Soult's division and G. J. Molitor's brigade, numbering 15,000 men, were opposed by Hötze's detachment, C. J. Lecourbe's division, with 11,800 men, was deployed in the Rhine River valley at the St. Gotthard Pass, while L. M. Turreau's detachment, totaling 9,600, stood west of Lake Maggiore, opposite Rogan's detachment. Thus, the French forces outnumbered the coalition forces and occupied advantageous positions.

To join up with Rimskii-Korsakov, Suvorov chose the shortest but also the most difficult route, across the St. Gotthard Pass, which was occupied by the enemy. He set September 8 (19) for the attack on the pass. Simultaneously with the attack on St. Gotthard by Suvorov, the troops of Rimskii-Korsakov and Hötze, supported by the Austrian detachments of Strauch and Auffenberg, were to pass to the offensive on the Limmat and Linth rivers.

Suvorov arrived in Taverne on September 4 (15) but found neither the supplies nor the pack mules that the Austrian commissariat promised to have ready. Five days were lost assembling pack animals and supplies. On September 10 (21), the Russian troops approached St. Gotthard, which was occupied by Lecourbe's French detachment, numbering 8,500 men. Suvorov directed General A. G. Rozenberg's column to circumvent the pass from the right through Disentis to reach the enemy rear at Devil's Bridge, while he himself attacked the pass with the main forces on September 13 (24). Two attacks were driven back, but during the third attack, the detachment led by General P. I. Bagration reached the rear French positions, forcing the enemy to withdraw. On September 14 (25), the French tried to stop the Russian troops at the Urnerloch tunnel and at Devil's Bridge, but they were enveloped from the flanks and withdrew.

Suvorov's troops arrived in Altdorf on September 15 (26), only to learn that there was no road from there to Schwyz (the Austrian command had not informed Suvorov of this) and that the ships needed to cross the Lake of Luzern had been seized by the enemy. Suvorov decided to cross the Rosstock Range and travel down the Muota River valley to Schwyz. The Russian troops completed the difficult 18-km march to the Muota River valley in two days, but there they received the news that Rimskii-Korsakov and Hötze had been defeated on September 15 (26) in the battle of Zürich and on the Linth River. The Austrian detachments of Jelačić and Linken had retreated, and Schwyz had been seized by the French. Suvorov's forces were trapped in the Muota valley without food and with little ammunition.

At a war council held on September 18 (29), it was decided to break through to Glarus. Bagration's advance party drove back Molitor's brigade and opened the way to Glarus. On September 19–20 (September 30–October 1), Rozenberg's rear guard waged a desperate battle against Masséna's detachment, numbering 10,000, and repulsed all attacks, driving the enemy back to Schwyz and taking 1,200 prisoners. On September 23 (October 4), the rear guard joined the main forces in Glarus. However, there were no Austrian troops in Glarus, since Linken's detachment had already left. Auffenberg's detachment also separated from Suvorov and left the area. To save his troops, Suvorov decided to withdraw to Ilanz. After a very difficult passage over the Ringenkopf (Panixer) Range, the Russian forces reached Ilanz on September 26 (October 7), and by September 27 (October 8) they were in the vicinity of Chur. From there they withdrew to winter quarters at Augsburg.

Suvorov's Swiss campaign failed to achieve its objective because of the essentially treacherous actions of the Austrian command, the defeat of Rimskii-Korsakov's troops, the failure of the Anglo-Russian expedition in Holland, and the extreme exhaustion of Suvorov's forces and large losses (more than 4,000 killed

and wounded). Nonetheless, the Russian Army accomplished an extremely difficult, historically unprecedented mountain march, drove back the attacks of superior enemy forces, escaped from encirclement, and even took 1,400 prisoners. The events in Switzerland exposed Austria's two-faced policy with respect to Paul I, and consequently, on October 11 (22), Paul broke off relations with Austria and ordered Suvorov to return to Russia with his army.

Suvorov's Swiss campaign showed the courage, endurance, and heroism of Russian soldiers and Suvorov's skill as a military leader. F. Engels called this march "the most outstanding crossing of the Alps accomplished to that time" (K. Marx and F. Engels, *Soch.*, 2nd ed., vol. 13, p. 243). Suvorov set an example of how to conduct military operations in the mountains under unfavorable conditions and demonstrated procedures for capturing mountain summits and passes by combining frontal attacks with envelopment, thus making a valuable contribution to the theory of the art of war.

SWISS JURA, the part of the Jura Mountains situated in Switzerland. The range extends approximately 200 km, with elevations to 1,679 m (Mont Tendre). [29–990–1]

SWISS LABOR PARTY (SLP; Parti Suisse du Travail; Partei der Arbeit der Schweiz; Partito Svizzero del Lavoro), a political party established by a constituent congress held in Zürich on Oct. 14 and 15, 1944; successor to the Communist Party of Switzerland. The SLP united primarily members of the Communist Party of Switzerland and the Swiss Socialist Federation. The congress declared the thoeretical foundation of the party to be scientific socialism: Marxism-Leninism. The party took its place at the vanguard of the struggle to defend the interests of working people. The Fourth Congress of the SLP in 1949 ratified the first party bylaws.

During the years of the cold war, the SLP was in effect a semilegal organization in several cantons, and party members were prohibited, under an occupational blacklist (*Berufsverbot*), from occupying government posts. Led by such figures as E. Woog and J. Vincent, the party waged a struggle against right and left opportunist deviations in its ranks. In the late 1950's the party overcame its difficulties, and its influence in the working-class movement increased. The National Conference of the SLP in 1971 ratified new bylaws based on the principles of democratic centralism, as well as a program which had been adopted in 1959.

The program declares the party's principal objective to be the construction of a socialist, and eventually communist, society in Switzerland. The transition to socialism in Switzerland can be achieved by peaceful means as a result of a broad national movement, and the working class will be the decisive force in accomplishing this goal. The SLP has called for the united action of "all the forces of peace and labor, which are, in any way, the victims of exploitation and domination by big capital." At the same time the SLP declares the socialism in Switzerland to be "pluralistic."

The Tenth Congress of the SLP (June 1974) and particularly the Eleventh Congress of the SLP (May 1978) have marked a major step in consolidating the Marxist-Leninist international stand of the party. The Eleventh Congress confirmed the party's loyalty to Marxism-Leninism and declared its goal to be large-scale cooperation with all political forces that struggle against the policies of monopolies and the government and for radical transformations in the country's economic and political system. The party's principal aims will be to increase its influence on the broad masses, improve the living conditions of the working people, and protect the democratic rights of the workers. The congress has stressed the necessity for further organizational and ideological consolidation of the party's ranks and deeper fraternal ties with communist and workers' parties.

The practical activity of the party is concentrated on the basic socioeconomic demands of the working people: a better social insurance system, higher wages and salaries, higher pensions at a lower pension age, the construction of housing for working people, legally guaranteed three-week holidays, a reduction in military expenses, and the preservation of democratic rights. Much attention is paid to coordinating the activities of the Swiss working people with the foreign workers, who constitute a considerable part of the country's working force. The SLP is the only party that fights for real rights for foreign workers.

Table 1. Congresses of the Swiss Labor Party

Congress	*Place*	*Date*
Constituent	Zürich	Oct. 14–15, 1944
Second	Geneva	Oct. 6–7, 1945
Third	Zürich	Nov. 30–Dec. 1, 1946
Fourth	Basel	June 4–6, 1949
Fifth	Geneva	May 31–June 2, 1952
Sixth	Geneva	May 28–30, 1955
Seventh	Geneva	May 16–18, 1959
Eighth	Geneva	May 16–18, 1964
Ninth	La Chaux-de-Fonds	Nov. 1–3, 1968
Tenth	Basel	June 1–3, 1974
Eleventh	Geneva	May 13–15, 1978

In foreign policy the SLP concentrated its attention on the struggle for peace, for a genuine Swiss neutrality, and for the development of political, economic, and cultural ties with socialist countries; it also opposed the arms race.

In the 1979 parliamentary elections the party entered candidates in only one-third of the country's cantons; it received 2.1 percent of the vote and gained three seats out of 200 in the National Council. In the 1975 elections the party won four seats.

Delegations of the SLP have taken part in the international conferences of Communist and workers' parties in 1957, 1960, and 1969 in Moscow and the Conference of European Communist and Workers' Parties held in Berlin in 1976. The party approved the documents adopted by these conferences.

In accordance with its bylaws, the SLP is organized on a territorial-production basis. The territorial or production units are united in local sections, which are united in cantonal sections. The highest body is the party congress. Between congresses, the highest body is the Central Committee, which elects the Politburo, Secretariat, and general secretary of the SLP. A. Magnin became general secretary of the party in May 1978. In the same year J. Vincent was named honorary chairman. The party publishes the weeklies *Voix ouvrière*, *Vorwärts*, and *Il lavoratore*. (See Table 1 for Congresses of the SLP.)

SWISS NATIONAL BANK (Banque Nationale Suisse), Switzerland's central bank and sole bank of issue. Established in Zürich in 1905, the bank is a joint-stock company, with 58 percent of its shares held by the cantons, cantonal banks, and other state institutions and 42 percent by private shareholders.

The Swiss National Bank issues bank notes, regulates the supply of money and credit, and organizes the operations of payment. In the 1970's, when the currency crisis became acute and foreign capital poured into Switzerland, the Federal Council adopted decrees to protect the currency (October 1971 and June 1974) and to regulate domestic credit (December 1972).

In accordance with the two decrees on currency, the Swiss National Bank canceled the payment of interest on foreign deposits in Swiss banks and introduced a system by which interest may be charged, rather than paid, on such deposits; among other mea-

sures, the bank imposed restrictions on the sale of Swiss francs for future delivery. The decree on domestic credit authorized the imposition of mandatory minimum bank reserves in the Swiss National Bank. As of 1954 bank notes were no longer redeemable for gold, although a 40 percent gold cover of bank notes in circulation was maintained; in June 1977 the actual gold cover was 62 percent.

As of June 1977 the Swiss National Bank had total assets of 35 billion Swiss francs, with 19.1 billlion francs' worth of bank notes in circulation. Banks and companies had accounts in the bank totaling 10.8 billion francs, and capital and reserves totaled 70 million francs. The bank held 27.4 billion francs in gold and foreign currency and 4.6 billion francs in foreign treasury notes.

SWISS PLATEAU (also Mittelland), a plateau in Switzerland, between the Alps and the Jura. The Swiss Plateau extends 240 km, from Lake Geneva to Bodensee (Lake Constance), and is approximately 50 km wide. Elevations decrease from 1,000–1,200 m (maximum elevation, 1,408 m at Mount Napf) in the southeast to 400–500 m in the northwest. The plateau has a hilly relief with numerous lakes. On the Swiss Plateau are fields, orchards, and tracts of oak, ash, and beech forest. [29–995–2]

SWITCHBOARD INSTRUMENT, a measuring instrument that is designed to be mounted on, for example, a traffic-control panel, a control console, a control switchboard, or a cabinet of an

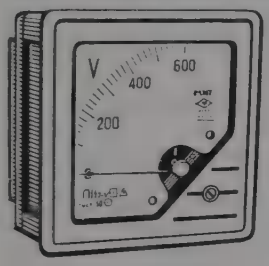

Figure 1. A switchboard voltmeter

electrical installation. A switchboard instrument may be an indicating instrument or a recording instrument. As a rule, switchboard instruments have a low class of precision, usually 1.0–5. [29–1612–3]

General information

Switzerland is a Central European state located in the Alps and bordered by France, the Federal Republic of Germany, Austria, Liechtenstein, and Italy. Area, 41,300 sq km. Population, 6.3 million (1977). The capital is the city of Bern. The Swiss Confederation comprises 23 cantons (as of Jan. 1, 1979), three of which are divided into demicantons (see Table 1).

Constitution and government

Switzerland is a federal republic. The present constitution was adopted in 1848 and revised in 1874. The federal government has jurisdiction over such matters as war and peace, foreign relations, the army, railroads, communications, the minting of coins, and approval of the federal budget.

The head of state is the president, elected from among the members of the Federal Council for a one-year term by the Federal Assembly. Legislative power is vested in the bicameral Federal Assembly, which comprises a lower house—the National Council—and an upper house—the Council of States. The National Council is made up of 200 deputies popularly elected by a system of proportional representation for four-year terms. The Council of States is made up of 46 deputies, two from each canton and one from each demicanton, popularly elected for four-year terms (three-year terms in certain cantons). All citizens who have reached the age of 20 are eligible to vote.

Executive power resides in the Federal Council, comprising seven members, each of whom heads a department. The members of the Federal Council are elected at a joint session of the legislature; all the members of the council take turns occupying the posts of president and vice-president.

Each canton and demicanton has its own constitution; legislative and executive authority are exercised by a great council (*Landrat*) and a cantonal council, which are popularly elected for terms ranging from one to five years. The districts, which are headed by a prefect appointed by the cantonal council, and the communes have two forms of self-government: in the German cantons, citizens gather together and vote in a general assembly known as the *Landsgemeinde*; in the French cantons, the body of local government is the commune council. The executive bodies in the communes are the lesser councils, headed by mayors or syndics.

Table 1. Administrative-territorial divisions of Switzerland (1976)

Cantons and demicantons[1]	*Area (sq km)*	*Population*	*Capital*
Zürich	1,700	1,120,000	Zürich

[1]Cantons are given in the official order, which in most cases corresponds to the entry of the canton into the Confederation [2]In 1979 the demicanton of Jura, which had been formed from the canton of Bern, was made a canton [3]Demicanton

Switzerland's judicial system includes federal and cantonal courts. The supreme judicial body is the Federal Tribunal, its members are elected by the Federal Assembly for six-year terms, and it comprises ten sections. Justice is administered in the cantons through a three-level court system made up of local, district, and cantonal courts.

D. I. VASIL'EV

Natural features

Terrain. Most of Switzerland is occupied by the Alps. In the south lie the Pennine Alps, which rise to an elevation of 4,634 m at Dufourspitze, the highest point in Switzerland; also in the south are the Lepontine Alps and the Rhaetian Alps, which include the Bernina Massif. Deep longitudinal valleys of the upper Rhône and middle Rhine separate the Pennine and Lepontine Alps from the Bernese Alps (highest point, the Finsteraarhorn, approximately 4,274 m) and the Glarus Alps, which form a system of mountain ranges that runs southwest to northeast through the entire country. Ranges of peaked mountains, formed primarily of crystalline rocks and deeply eroded, predominate; there are numerous glaciers and glacial landforms. The principal passes—the Great St. Bernard, Simplon, St. Gotthard, and Bernina—are at elevations above 2,000 m.

In the north and the northwest, where the Alps decrease in elevation, gentler landforms prevail; glaciers are encountered in the area, and karst has developed.

Approximately one-third of Switzerland, the area northwest of the Alps, is occupied by the Swiss Plateau, which gradually descends from 1,000–1,200 m to 400 m in the Rhine and Aar valleys. The plateau is characterized by piedmont shingle plains, outwash plains, basket-of-eggs topography, terminal moraines, and deep lake basins. In the northwestern part of the country are the folded Jura Mountains, which rise to an elevation within Switzerland of 1,679 m at Mont Tendre; the Jura give way in the west to tableland karst plateaus of the same name.

Climate. Switzerland's proximity to the Atlantic Ocean and its complex orographic structure account for its predominantly wet, temperate climate and clearly demarcated altitudinal zones. In the plateau regions the average January temperature is approximately 0°C in Geneva, −1.5°C in Zürich, −7°C at elevations of about 1,500 m (Davos), and −14°C at elevations of 2,500 m (the foot of Mount Jungfrau). The average July temperature is 19°C in Geneva, 17°C in Zürich, 12°C in Davos, and 0°C at the foot of Mount Jungfrau.

Annual precipitation is 800–1,200 mm in the Swiss Plateau, 2,500 mm on the windward slopes of the Alps (3,000 mm on certain summits), and 1,000–1,500 mm on the leeward slopes and in the deep valleys of southern Switzerland (500–600 mm in certain areas of the upper Rhône valley). At lower elevations the snow cover is not permanent: snow covers the ground for about 3 months at 700 m, 4.5 months at 1,000 m, 8 months at 1,880 m, and 10.5 months at 2,500 m. The snow line is at an elevation of 2,800–3,300 m. The characteristic mountain and valley winds and foehns cause sharp drops in temperature and avalanches.

The total area covered by glaciers is approximately 2,000 sq km; there are about 140 large valley glaciers, notably the Aletsch Glacier, as well as numerous cirque and hanging glaciers.

Rivers and lakes. Switzerland has a dense network of deep rivers that includes the Rhine, which flows for 375 km within the country's borders, and its tributary the Aare, as well as the upper courses of the Rhône, Inn, and Ticino rivers; all rise in the Alps and are fed by melting snow and rain. High water is in spring. Intensive glacial melting causes summer freshets, and flooding occurs during winter thaws. The rivers descend abruptly, forming numerous waterfalls. Extensive use is made of the country's considerable hydroelectric potential: many rivers have hydroelectric power systems.

The largest of Switzerland's many lakes are Lakes Geneva, Constance (Bodensee), and Maggiore (part of which lies in Italy), as well as the western part of the Lake of Neuchâtel. The lakes, most of which lie in depressions scoured by ancient glaciers, are elongated and quite deep. At high elevations in the Alps are numerous cirque lakes. The Rhine and Aare rivers and the large lakes are used for navigation.

Soil and flora. Switzerland has a predominance of mountain brown forest and mountain-meadow soils, often coarsely textured; rendzinas are encountered in the Jura Mountains and in those areas of the Alps where flysch prevails. Forests cover more than one-fourth of the country. On the Swiss Plateau, where up to an elevation of 800 m cultivated vegetation predominates, modest tracts of broad-leaved forests—oak, beech, ash, elm, maple, and linden—have been preserved on brown forest soils.

At elevations ranging from 500–600 m to 1,000 m, the most common tree is the beech; in some areas, notably in the Jura, beech trees are found at 1,500 m. At 1,000–1,500 m mixed forests of beech, spruce, fir, and pine predominate; at higher elevations (1,800–2,400 m) there are coniferous forests of spruce, fir, pine, and larch. The valleys have thickets of alder. At still higher elevations (up to 2,800 m), there are found subalpine and alpine meadows, along with thickets of rhododendron, azalea, and juniper.

Fauna. Mammals encountered in the mountains include the chamois, marten, blue hare, alpine marmot, ibex, and fox. Birds include the golden eagle, capercaillie, thrush (*Turdus*), creeper, red-billed chough, snowy reel, and swift; gulls are found along the riverbanks and lakeshores. The rivers and lakes are inhabited by such fish as trout, whitefish, grayling, and char.

Population

Switzerland's indigenous population is made up of four ethnic groups: the German Swiss, French Swiss, Italian Swiss, and Rhaeto-Roman Swiss (Rhaeto-Romance–speaking peoples).

The German Swiss, who number 4.3 million (figures here and below are 1975 estimates), inhabit the central and eastern cantons; they speak Upper German dialects, and their literary language is German. The majority are Protestants, though some are Roman Catholics.

The French Swiss, who number 1.3 million, live in the western cantons; they inhabit the canton of Bern together with the German Swiss. They speak southern French (Provençal) dialects, and their literary language is French. They are Protestants (Calvinists) and Roman Catholics.

The Italian Swiss, who number 200,000, live in the southern cantons of Ticino and Graubünden; they inhabit certain regions together with the German Swiss. They speak Italian and profess Roman Catholicism.

The Rhaeto-Roman Swiss, who number 50,000, comprise the Ladins and the Romansh-speaking peoples; they inhabit the high-mountain regions of Graubünden Canton. They speak their own languages, as well as German and Italian. They are Protestants and Roman Catholics.

Approximately 1 million foreigners live in Switzerland, including Italians, Spaniards, Germans and Frenchmen. The official languages are German, French, and Italian. The Gregorian calendar is used.

Until 1975, increases in population resulted from natural growth (about 0.5 percent annually) and immigration, primarily the influx of foreign workers. In response to the economic crisis, the number of foreign workers has been reduced, from 676,000 in 1965 to 425,000 in 1975. The proportion of the population under 15 years of age is 23.4 percent; 15.1 percent are over 60.

The average population density is about 152 persons per sq km. Four-fifths of the population live on the Swiss Plateau, where nearly all the major cities are located. The population of the Alpine mountain regions is decreasing. According to the 1970 census, the economically active population numbers 2,995,800, including 2,683,100 wage earners (89.6 percent), of whom approximately one-fourth are foreign. In 1975, 2.7 million persons were employed, 15 percent of whom were foreign.

The breakdown of employment according to sectors of the economy in 1975, with the figures for 1965 given in parentheses, is as follows: industry, construction, and handicrafts employed 44.4 percent (51.2 percent); agriculture, 6.2 percent (9 percent); transportation, 5.7 percent; commerce, banking, and insurance, 16.2 percent, and the hotel industry, 4.5 percent. Overall, 49.4 percent (39.8 percent) of the economically active population is employed in the service sector.

In 1970 approximately 77.7 percent of the population was urban, a city being defined as a community of more than 2,000 inhabitants. The principal cities are Zürich, Basel, Geneva, Bern, and Lausanne.

Historical survey

Numerous habitation sites of the earliest settlers in Switzerland have been preserved, including the Paleolithic caves of Drachen-

loch and Birseck, Mesolithic sites, and pile dwellings. The first written references to the inhabitants of Switzerland date from the second century B.C., when most of Switzerland was inhabited by a Celtic tribe, the Helvetians; the eastern part of the country was inhabited by the Rhaetians. The Helvetians, who had been defeated by Julius Caesar at Bibracte, became *foederati* in 58 B.C. and were eventually completely subjugated by Rome; the Rhaetians were conquered in 15 B.C. Switzerland then entered a period in which it underwent considerable romanization.

Feudal period (fifth century to the end of the 18th century). In the fifth century most of Switzerland was conquered by the Alamanni (406–407); western Switzerland was conquered by the Burgundians circa 450, and southeastern Switzerland by the Ostrogoths in 493. In the part of the country seized by the Alamanni, the language and social system that had existed among the Germans became established. The southeastern and the western parts of the country remained Roman in language and culture.

In 496 the Alamanni were conquered by the Franks, who defeated the Burgundian kingdom in 534 and the Rhaetian kingdom in 536; thus, nearly all Switzerland became part of the Frankish state. During the late sixth and seventh centuries the population was converted to Christianity. Under the Treaty of Verdun of 843, the southern and western parts of the country were given to the emperor Lothair, and the eastern part to Louis the German. Eastern Switzerland became part of the duchy of Alamannia (Swabia), formed in the tenth century within the Kingdom of Germany; both the duchy and the Kingdom of Germany became part of the Holy Roman Empire in 962. Between 1032 and 1034 western Switzerland was annexed by the empire as part of the Burgundian kingdom.

Feudal relations developed in Switzerland. The country was divided into numerous counties, seignories, ecclesiastical principalities, rural communities (*Länder* and cantons), and urban republics. The most important feudal lords were the dukes of Zähringen, who ruled at the end of the 11th and the beginning of the 12th centuries, and the counts of Kyburg, Savoy, and Hapsburg. The Hapsburgs, after inheriting the lands of the extinct Kyburg family in 1264, became the most important rulers in Switzerland.

The Hapsburgs sought to gain complete control of the forest cantons (Schwyz, Uri, and Unterwalden), which controlled the Alpine mountain passes connecting Central Europe with Italy. During the struggle against the Hapsburgs that developed in the mid-13th century, the forest cantons in August 1291 formed a perpetual alliance, which laid the foundation of the Swiss Confederation as a de facto independent state within the Holy Roman Empire; on August 1, Independence Day, the Swiss celebrate the founding of the confederation. The Holy Roman emperors kept the cantons within the empire but freed them from the control of the Hapsburgs through charters granted in 1291, 1297, and 1309. The Hapsburgs' attempts to subjugate the forest cantons ended in the utter defeat of an army of Austrian knights at Morgarten in 1315, after which the forest cantons reaffirmed their alliance in a new treaty signed at Brunnen.

In the 14th and 15th centuries the Swiss Confederation increased its territory and developed as a military and political power. Luzern, which had been ruled by the Hapsburgs, joined the confederation in 1332; Zürich in 1351; Glarus and Zug, which had been wrested from the Hapsburgs, in 1352; and Bern in 1353. The confederation waged continual war with the Hapsburgs, who renewed their efforts to exert control over the liberated lands. The Hapsburgs, defeated by the confederation at Sempach in 1386 and at Näfels in 1388, were compelled to recognize the independence of the eight confederated cantons in 1389.

As allies of the French king Louis XI, the Swiss took part in the Burgundian Wars of 1474–77, in which their victory over the duke of Burgundy, Charles the Bold, enhanced the military reputation of the Swiss infantry. In 1481 the confederation was joined by Fribourg and Solothurn. The Swabian War of 1499 ended in the establishment of Switzerland's de facto independence from the Holy Roman Empire. In 1501, Basel and Schaffhausen were admitted into the confederation and accorded the rights of cantons. In 1513, Appenzell joined, thereby creating the Federal Union of the Thirteen Cantons, which existed until 1798.

In addition to the cantons, which exercised complete independence in domestic matters and in foreign policy, the confederation included allied districts, such as St. Gallen, Graubünden, and Geneva, whose autonomy was restricted, particularly in the area of foreign policy. The confederation also included subject districts, such as Aargau, Thurgau, and Vaud, which had no rights. Until 1798, Switzerland had no permanent central government: confederation-wide diets, known as *Tagsatzungen*, were convened periodically; only the cantons enjoying full rights were allowed to vote. There was no confederation-wide administrative body, army, or financial system.

Switzerland has undergone a unique socioeconomic development. Throughout the Middle Ages, large areas of the cantons did not experience the development of feudal relations; communes, or marks, were preserved for a long period, as was a peasantry that was free in terms of both personal bonds and ties to the land. The economy was agricultural and patriarchal. Many cantons, especially the backward cantons with a relative surplus rural population, developed mercenary armies as part of the economy.

In the urban cantons of Zürich, Basel, and Bern, and in such allied districts as St. Gallen and Geneva, the economy was based on handicrafts and trade. The cities of Bern, Geneva, Basel, and Zürich were important centers of handicraft production and banking, and the fairs at Basel and Geneva were known throughout Europe. In certain instances, land cultivation in the rural areas of the urban cantons assumed highly developed commodity forms. Serf and semiserf relations were steadfastly maintained in the subject districts.

Beginning in the late 15th and early 16th centuries, feudal relations disintegrated, primarily in the most developed urban cantons and in certain allied territories. Capitalist manufacture developed in textile production, book printing, and papermaking in Basel, Geneva, Bern, and Zürich. Wine growing was organized in several areas as a commodity enterprise. Dairyfarming was organized on a commercial basis. The development of new socioeconomic relations was hindered, however, by Switzerland's division into numerous political units, by the lack of protection for industry from the patricians and the guild leaders in the cities, by the mercenary system, which diverted the population from productive labor, and by the existence of feudal landholding.

In the cities, a struggle was waged between the urban landowners and patricians on the one hand and the craft guilds and the rising bourgeoisie on the other. The peasantry opposed not only the feudal lords, but also the cities, which exploited the rural areas. The social struggle, exacerbated in the early 16th century, set the stage for the Reformation, which in Zürich was initiated by H. Zwingli. Between 1523 and 1525, Zwingli instituted a series of religious reforms: clerical property was secularized, the monasteries were closed down, and images and pictures were removed from the churches. At the same time, usury was outlawed, as was the mercenary system. The patricians and gentry were almost completely forced out of municipal government, and the newly created church organization was made subordinate to the municipal magistrates.

The Reformation, which spread to St. Gallen, Basel, Schaffhausen, Solothurn, and Bern, was accompanied by antifeudal peasant uprisings in 1524 and 1525, notably in the areas of Zürich, Bern, and Basel and in Schaffhausen, St. Gallen, Solothurn, Thurgau, and Aargau. Nearly everywhere the peasant revolts were supported by the urban lower classes, which were often led by the Anabaptists. The defeat of the peasants in the Peasant War in Germany made it easier for the Swiss authorities to subdue the peasantry and urban lower classes, which they were able to crush almost completely by 1526.

Zwinglianism continued to spread and became established in Bern, St. Gallen, Schaffhausen, Glaurus, Biel, and Basel at the end of the 1520's and in Geneva between 1532 and 1535. The Protestant cantons formed an alliance, and Zwingli evolved a plan to propagate the Reformation throughout Switzerland, which was to be united under Zürich's leadership. Zwingli was opposed by the economically backward cantons, which had remained Roman Catholic, and by Bern, which itself laid claim to hegemony in Switzerland. The Wars of Kappel, waged between the Protestant and Catholic cantons in 1529 and 1531, ended in the defeat of the Protestants and Zwingli's death.

In the mid-1530's the center of the Reformation shifted to Geneva, where J. Calvin became active in 1536; he took up permanent residence in the city in 1541. At the beginning of the 1540's, Calvinism was introduced into Geneva, which became the center of the Calvinist Reformation in Europe. During the second half of the 16th century, Calvinism supplanted Zwinglianism in the other Protestant cantons.

During the second half of the 16th and in the 17th century, the Protestant cantons experienced an economic upsurge, which encouraged an influx of Protestant emigrants from Catholic countries, especially France, into Switzerland. This wave of immigration led to the development of new branches of industry, notably the production of clocks and watches, and lay behind Switzerland's refusal to take part in the ruinous Thirty Years' War of 1618–48. Under the Treaty of Westphalia of 1648, the Swiss Confederation was formally recognized as an independent state by the rest of Europe.

The country was torn by internal religious and political differences. In 1586 the Catholic cantons of Schwyz, Uri, Unterwalden, Luzern, Freibourg, Zug, and Solothurn formed an alliance for the protection of Catholicism, thereby essentially dividing the country into Catholic and Protestant blocs. The conflicts between the two blocs reflected in religious form the efforts of the bourgeois elements in the economically developed cantons to change Switzerland's outmoded governmental system, which ensured that the backward Catholic cantons would remain dominant. Rivalry soon took the form of open warfare, notably in the First and Second Villmergen wars in 1656 and 1712.

Oligarchies of patricians and guild leaders had seized power in many urban magistracies and sought to maintain the backward sociopolitical system. They were opposed by the exploited peasants of the urban districts, notably in the Peasant War of 1653, who were supported by the urban lower classes and the bourgeois townspeople. The struggle against the urban oligarchic regimes became particularly intense in the 18th century, which witnessed such manifestations of unrest as the uprising of 1707 in Geneva, led by P. Fatio, and the Henzi conspiracy of 1749 in Bern.

Late 18th century and early 19th century; the rise and establishment of capitalism and the creation of a centralized bourgeois state. By the end of the 18th century, industry—the production of cotton in Zürich, silk in Basel, and clocks and watches in western Switzerland—had undergone considerable development in Switzerland, as had trade. The French Revolution encouraged the bourgeoisie in Switzerland to put an end to feudal relations and oligarchic government. The revolutionary struggle was given further impetus by the Club of Swiss Patriots, formed in Paris in 1790 (*see* HELVETIAN CLUB).

In 1792 revolutionary disturbances took place in Geneva, Valais, and Vaud; in Basel the Rauracian Republic was formed, only to be annexed by France in May 1793. The French Army entered Switzerland in spring 1798 and captured Bern on March 5; the Federal Confederation of the Thirteen Cantons collapsed. With the support of France, the Helvetian Republic was proclaimed on April 12 in Aargau; it included, in addition to the 13 cantons, Valais, Léman, Aargau, Bellinzona, Lugano, Rhaetia, Sargans, Thurgau, and St. Gallen. A constitution modeled after the French Constitution of 1795 was introduced, and Switzerland became a centralized, unitary state.

A defensive and offensive alliance concluded with France in August 1798 involved Switzerland in a war against the Second Coalition, during which Switzerland became a battlefield (*see* SWISS CAMPAIGN OF SUVOROV). A struggle developed in Switzerland between the Unionists, who emphasized the indivisibility of the republic, and the Federalists, who favored local self-government. In February 1802 the Constitution of Malmaison was adopted. The new constitution, named after the city of Malmaison, where negotiations between the Unionists and Federalists had taken place, granted self-rule to the cantons. On Feb. 19, 1803, Napoleon I issued the Act of Mediation, which restored (with certain changes) the governmental structure of Switzerland as it had existed before 1798. Six new cantons were added to the former 13: Graubünden, Aargau, Thurgau, St. Gallen, Vaud, and Ticino.

After the defeat of the Napoleonic empire, the Confederation of Switzerland abrogated the Act of Mediation and proclaimed on Dec. 29, 1813, that Switzerland intended to observe strict neutrality. The new constitution, drafted in September 1814 and ratified by the Diet in August 1815, was approved by the Congress of Vienna (1814–15), which also recognized in a special declaration on Mar. 20, 1815, Switzerland's eternal neutrality. To Switzerland was joined, in addition to Valais and Geneva, Neuchâtel, which until 1857 formally had been a personal possession of the king of Prussia; all became cantons. Switzerland was now an association of 22 independent, loosely interconnected cantons; supreme authority was vested in the Diet.

At the turn of the 1830's a movement headed by liberal bourgeois groups developed that sought to completely eliminate feudal relations, democratize the political system, and centralize the country. The revolutionary events of 1830 in France led to increased demands in Switzerland for a review of the Federal Pact of 1815, and in March 1832 seven cantons in which the liberal bourgeoisie was in power formed the Concordat of Seven. In response, six cantons in which the clerical faction was dominant created the League of Sarnen in November 1832. A plan for a new federal treaty was worked out by the Diet in 1832 but was rejected by a majority of the economically backward cantons. Between 1843 and 1845 seven Catholic cantons established a reactionary bloc, the Sonderbund.

In the civil war provoked by the leaders of the Sonderbund in 1847, the federal army was victorious. The military and political victory of the bourgeoisie was affirmed in the Constitution of 1848. A unified, federal state was established, with a central legislative body, the Federal Assembly, consisting of two houses: the National Council and the Council of States. Executive power was vested in the Federal Council, which was empowered to represent Switzerland in dealings with foreign states, to mint coins, and to collect customs duties. The post office and the customs office were combined, and systems of measures, weights, and money were standardized. Bern was named the national capital.

The constitution adopted on May 29, 1874, which remains in effect today, extended the jurisdiction of the central government to such areas as the armed forces, established the principle of the referendum, placed limitations on the church's activities, and created a federal court in Lausanne.

Once accomplished, centralization facilitated the country's economic development and the establishment of capitalism. An important prerequisite of industrialization was the accumulation of capital, which was made possible by Switzerland's role as a middleman in international trade and by the development of the resort and hotel industry, which became a separate sector of the economy in the 19th century. Light industry underwent substantial development in the 1840's and 1850's, and agricultural production became more specialized: Swiss butter and cheeses became important export products. Between 1825 and 1874 the length of the railroad system increased from 25 km to 1,500 km; the opening of the St. Gotthard Tunnel in 1882 led to an increase in freight and passenger traffic through Switzerland. At the end of the 1890's many branches of the manufacturing industry were established; in 1898 a law was passed under which the railroads were bought up by the state from private companies.

In the course of industrialization, an industrial bourgeoisie and a factory proletariat were formed. During the 1860's and 1870's the Geneva section and other sections of the First International were created. As early as 1858, craft organizations were founded, and in 1880 the Federation of Swiss Trade Unions was created. In 1888 the Social Democratic Party of Switzerland (SDPS) was founded. Political émigrés from the Russian Empire, Italy, France, and other countries found refuge in Switzerland, where the Russian Section of the First International was created in 1870 and the Liberation of Labor group in 1883.

The period of monopoly capital. END OF THE 19TH CENTURY TO 1918. At the end of the 19th century various new industries underwent development in Switzerland, including machine building and the chemical and electrical-engineering industries. Industry became oriented toward machine-tool building and the production of pharmaceuticals, watches, dyes, and toxic chemicals. Between 1888 and 1910 the number of persons employed in industry rose from 543,000 to 811,000; the influx of foreign manpower increased substantially, from 100,000–150,000 persons in the 1890's to 300,000–500,000 in the period 1910–14.

By the beginning of the 20th century banking capital had become highly concentrated, and the Swiss National Bank was founded in 1905. Switzerland became a major exporter of capital in the world market: at the beginning of the 20th century the annual export of capital from Switzerland was more than 3 billion francs, and by 1914, Swiss assets abroad amounted to 7.5 billion francs. By the beginning of the 20th century, monopoly capitalism had become firmly entrenched in Switzerland.

The first mass expressions of working-class discontent occurred in Switzerland, the largest being the general political strike in Zürich in 1912. Under pressure from the working-class movement, the country's first law insuring workers against work-related diseases and accidents was adopted in 1911. The SDPS divided into a right wing and a revolutionary wing, led by F. Platten.

On Aug. 3, 1914, at the beginning of World War I, Switzerland declared its neutrality. The monopolistic Swiss bourgeoisie took advantage of the war to reap profits by providing war matériel to both sides. A decline in the workers' standard of living (real wages fell by almost 30 percent during the war years) led to an increase in strikes during the summer and autumn of 1917 in such cities as Bern, Zürich, and Geneva. International socialist conferences were held on Swiss territory in Zimmerwald in 1915 and Kiental in 1916. The revolutionary wing of the SDPS took part in the Zimmerwald Left, which was directed by V. I. Lenin, who lived in Switzerland off and on for a total of about seven years.

FROM 1918 TO 1939. The strike movement grew in Switzerland under the influence of the October Socialist Revolution in Russia. From Nov. 12 to 14, 1918, a general political strike took place; involving about 400,000 persons, it was suppressed by the army, which was called in by the government. The government, however, met some of the workers' demands: proportional representation in the assembly and a 48-hour workweek were introduced. In March 1921 the revolutionary wing, which had left the SDPS, merged with communist groups that had been founded in Switzerland in 1917 and 1918 to form the Communist Party of Switzerland (CPS).

In March 1918 the government of Switzerland established diplomatic relations with Soviet Russia, and in June a Soviet diplomatic mission headed by Ia. A. Berzin arrived in Bern. On Nov. 12, 1918, however, the mission was expelled from Switzerland on the false charge that it had taken part in demonstrations by Swiss working people; the Swiss government then broke off diplomatic relations with Soviet Russia. On May 10, 1923, White Guards assassinated V. V. Vorovskii, the general secretary of the Soviet delegation to the Lausanne Conference; owing to the anti-Soviet policy of the country's ruling circles, Switzerland did not resume relations with the USSR until 1946.

In 1920, Switzerland joined the League of Nations, having stipulated that it would take part only in the economic and financial sanctions outlined in the league's Covenant. In 1923 it signed an agreement creating a customs union with Liechtenstein, which Switzerland has represented in dealings with foreign states ever since.

In 1931 the Swiss economy was gripped by the world economic crisis of 1929–33. In 1932 about 2,500 bankruptcies were recorded in Switzerland, and there were 124,000 unemployed. The class struggle became exacerbated, with strikes in such cities as Basel, Zürich, and Geneva. On Nov. 9, 1932, troops put down a demonstration in Geneva in which 13 workers were killed and 39 wounded. There followed a wave of arrests of Communists and left-wing Socialists; the task of combatting "subversive" activity was entrusted to the federal police, established in 1935. Fascist groups became active in the 1930's, the largest of which, the National Front, had some 10,000 members. Membership in the Swiss branches of German and Italian fascist organizations, which operated legally among the Germans and Italians living temporarily in Switzerland, numbered in the tens of thousands. The CPS helped the left-wing forces set up antifascist committees, which resisted the attempts of the National Front to hold marches in Zürich and Basel in 1938.

The Swiss economy experienced an upsurge between 1936 and 1939, brought on, for the most part, by prewar world market conditions. Swiss industry filled the orders of the fascist German and Italian war machines. Swiss trusts and concerns established branches abroad: in 1937 the Nestlé trust had 86 branches. The trade unions, influenced by the SDPS, cooperated with the bourgeoisie. In 1937 the entrepreneurs and the trade unions in the metalworking industry signed an agreement calling for an industrial peace under which, among other provisions, the workers agreed not to strike and arbitration was recognized as the sole means for resolving labor conflicts; similar agreements were soon signed in other industries. In 1938 the government proclaimed the doctrine of "integral neutrality," which in fact signaled Switzerland's refusal to take part in economic and financial sanctions against fascist Germany and Italy.

FROM 1939 TO 1945. On Aug. 31, 1939, Switzerland reaffirmed its neutrality. Measures were nevertheless taken to strengthen the country's defenses: a system of fortifications was built along the borders and, especially, in the heartland, the National Redoubt. In 1939 rationing of food and industrial raw materials was introduced, and emergency laws were passed: freedom of assembly was abolished, censorship was established, and the right of political asylum for foreigners was restricted.

On June 25, 1940, a policy was announced by which Switzerland would adapt to the "new order" in Europe. The government banned the CPS in 1940 and the organization of the left-wing socialists—the Swiss Socialist Federation—in 1941. Meanwhile, fascist groups continued to operate legally; the National Front, which had disbanded in March 1940, was revived in June as the Rassemblement Federal and remained in existence until the second half of 1943.

Switzerland supplied fascist Germany with strategic raw materials, equipment, weapons, war matériel, and electric power; German and Italian military freight was transported on the country's railroads. Fascist Germany and Italy, as well as the USA and Great Britain, set up intelligence services on Swiss territory, notably the American espionage center headed by A. Dulles.

When fascist Germany was on the brink of defeat, profascist groups were disbanded in Switzerland, and the CPS was legalized in 1944. On Oct. 14 and 15, 1944, the Constituent Congress of the Swiss Labor Party (SLP), which included members of the CPS and the Swiss Socialist Federation, was held in Zürich. In February 1945, Switzerland cut off supplies to fascist Germany and ceased providing transit for German and Italian war matériel; it also froze German assets in Swiss banks, although not the private accounts of the fascist leaders.

SINCE 1945. During World War II, Switzerland's industrial capacity increased, and gold reserves in the Swiss National Bank rose from 2.2 billion francs in 1940 to 4.8 billion francs in 1945. Increases were registered in capital investment, construction, production, level of employment, commodity turnover, and credit operations; capital became further concentrated. To a considerable extent, the growth of Swiss industrial production has been achieved by exploiting the workers, notwithstanding the reduction of the workweek from 47.5 hours in 1950 to 43.2 hours in 1975. This is especially true with regard to foreign workers, who numbered 215,000 in 1950, 435,000 in 1960, 659,000 in 1970, and 342,000 in 1976.

Exploitation and the drop in the standard of living, which declined during the war years by 10–13 percent, led to renewed strikes in 1946 and 1947. Under pressure from the workers, Switzerland enacted in 1947 its first law providing for old-age and disability pensions. Government pensions represented approximately 20 percent of wages, and although a small increase was passed in 1972, the Swiss pension system remains one of the least generous in the capitalist world.

In the atmosphere of the cold war a campaign was launched to harass activist members of the working-class movement and the Swiss Labor Party; it reached its peak in 1956 and 1957, when the occupational blacklist (*Berufsverbot*) was introduced. In order to ensure domestic political stability, Switzerland's bourgeois parties sought to broaden their cooperation with the reformist leadership of the SDPS. As of 1959, pursuant to an agreement reached by the various Swiss political parties, the Federal Council was to comprise two representatives from the Radical Democratic Party of Switzerland, which had sat on the council since 1848; two from the Christian Democratic Party, which had sat on the council since 1891; two from the SDPS, which had sat on the council from 1943 to 1953; and one from the Party of Peasants,

Artisans, and Burghers, which had sat on the council since 1929 (in 1971 it was renamed the Swiss People's Party). This coalition was supported by approximately 80 percent of the deputies in the Federal Assembly.

In the mid-1960's the nationalist groups renewed their activities; organizations such as the Republican Movement, led by J. Schwarzenbach, and the National Campaign for People and Homeland staged demonstrations in 1970 and 1974 demanding restrictions on the number of foreigners living in Switzerland. At the end of the 1960's the labor peace that had been concluded between the trade unions and the entrepreneurs was renewed. The working-class movement experienced an upsurge in 1971 (there had been a rash of strikes in 1952 and 1953 and in 1963) and gathered momentum in 1973 and 1974.

In the 1970's *Berufsverbot* was, in effect, lifted, and political restrictions on foreign workers were removed. In 1971 women were granted equal civil rights with men, including the right to vote and to be elected to the Federal Assembly; women continued to receive lower wages than men, however. From 1974 to 1976 the Swiss economy suffered a severe crisis. In 1977 about 25,000 persons were registered as unemployed (between 1945 and 1973 there had been virtually no unemployment), and 136,000 persons were underemployed. From 1974 to 1976 more than 200,000 foreign workers who had lost their jobs left the country. In 1974 the Swiss Labor Party proposed the imposition of controls on prices and capital investment and urged the adoption of various measures, including a proposal to limit the unrestricted power of the monopolies. In 1975 approximately 100,000 signatures were gathered in support of the Labor Party's program.

In foreign policy, in 1945 the Swiss Political Department proclaimed the principle of "active," or "solidary," neutrality; this meant that Switzerland would not formally join the military and political blocs of the imperialist states but would express solidarity with their policies. On Mar. 18, 1946, diplomatic relations with the USSR were resumed. The first Soviet-Swiss trade agreement was concluded on Mar. 17, 1948, but Soviet-Swiss relations developed little until the end of the 1960's.

Since the late 1960's the principle of universal neutrality has been central to Swiss foreign policy; although it considers its political and economic relations with the leading capitalist states to be of primary importance, Switzerland has, at the same time, actively pursued relations with the socialist and developing countries. Since the late 1960's Soviet-Swiss trade has increased, government officials of both countries have exchanged visits, and scientific, technical, and cultural cooperation has developed. In 1974 a consulate general of the USSR was opened in Geneva. As of 1976, Switzerland maintained diplomatic relations with all the socialist countries.

Switzerland joined the Organization for European Economic Cooperation (since 1961, the Organization for Economic Cooperation and Development) in 1948, the European Free Trade Association in 1959, and the European Council in 1963. In 1972, Switzerland signed an agreement with the European Economic Community (EEC) concerning the reciprocal elimination of tariffs on industrial goods by 1977 but refused to join the EEC on the grounds that participation in the EEC would compromise its neutrality.

Switzerland has not joined the United Nations, stating that its neutral status is incompatible with articles in the UN Charter that oblige member states to join forces to repel aggression and, in some instances, to apply economic sanctions. At the same time, Switzerland is a member of almost all the specialized organizations of the UN, and various international organizations are located on Swiss territory; many international conferences are held in Switzerland. Switzerland signed the Nuclear Test-Ban Treaty in 1963 and the Nuclear Nonproliferation Treaty in 1969 (ratified 1977). In 1972 it signed a convention banning the development, production, and stockpiling of bacteriological (biological) and toxic weapons and calling for their destruction. Switzerland took part in the Conference on Security and Cooperation in Europe, whose Final Act it signed on Aug. 1, 1975. As of 1981, Switzerland maintained diplomatic relations with almost 140 states.

Political parties, trade unions, and other public organizations

Political parties. The Radical Democratic Party of Switzerland (Radikal-Demokratische Partei der Schweiz; Parti Radical Démocratique Suisse), founded in 1848, had about 120,000 members in 1976. The party represents the interests of the big bourgeoisie.

The Christian Democratic People's Party of Switzerland (Christlich-demokratische Volkspartei der Schweiz; Parti Démocrate-Chrétien Suisse) was founded in 1881 and until 1970 was called the Conservative Christian Social Party; it had about 60,000 members in 1976. It represents the interests of the big and middle bourgeoisie, as well as clerical groups.

The Social Democratic Party of Switzerland (Sozialdemokratische Partei der Schweiz [SPS]; Parti Socialiste Suisse), founded in 1888, had about 60,000 members in 1976. It includes workers, white-collar employees, and part of the petite and middle bourgeoisie; it is a member of the Socialist International.

The Swiss People's Party (Schweizerische Volkspartei; Parti Suisse de l'Union Démocratique du Centre), founded in 1971 as a result of the merger of the Party of Peasants, Artisans, and Burghers (founded 1919) and the Democratic Party of Switzerland (founded 1941), had approximately 50,000 members in 1976. It includes peasants, artisans, and part of the petite and middle bourgeoisie.

The Independent Party (Landesring der Unabhängigen; Alliance des Indépendants), founded in 1935, had about 10,000 members in 1974. It is a right-wing, petit bourgeois party. The Liberal Democratic Union of Switzerland (Liberalne Partei der Schweiz; Parti Libéral Suisse), founded in 1913, had about 10,000 members in 1976: it is a bourgeois party.

The Swiss Labor Party (Partei der Arbeit der Schweiz; Parti Suisse du Travail), founded in 1944, is the successor to the Communist Party of Switzerland.

In addition to the groups mentioned above, Switzerland has numerous small parties and political factions.

Trade unions and other public organizations. The Swiss Federation of Trade Unions, founded in 1880, comprises 19 affiliated

trade unions and has 455,000 members; if the membership of seven unions that belong to both the SFTU and the Federal Union of Employees of State Institutions and Enterprises is counted, the organization has 562,000 members (1974). It is influenced by the SDPS and is a member of the International Confederation of Free Trade Unions. The Federal Union of Employees of State Institutions and Enterprises includes ten affiliated unions, seven of which also belong to the SFTU; it had 122,000 members in 1974. It is influenced by the SDPS.

The Federation of the Swiss Unions of Salaried Employees includes 12 affiliated unions that represent white-collar workers and technical personnel employed in the private sector; it had 128,000 members in 1974. It is influenced by the SDPS.

The Federation of Christian Trade Unions includes 11 affiliated unions and had 99,800 members in 1974; it is influenced by the Christian Democratic People's Party. In addition to the groups listed above, there are numerous national independent professional organizations.

The Swiss Communist Youth League operates under the auspices of the Swiss Labor Party. The Swiss Young Socialist Association operates under the auspices of the SPS. The Swiss Peace Movement is part of the World Peace Council. The Swiss Council of Peace Associations unites 15 pacifist organizations. The Swiss Women's Federation for Peace and Progress belongs to the Women's International Democratic Federation. The Association for the Development of Cultural Ties between Switzerland and the USSR (the Switzerland-USSR Society) was founded in 1945.

Economic geography

General state of the economy. Switzerland, a developed capitalist country, is highly industrialized and has an intensive agriculture. Trade, finance, and tourism play an important role in the economy.

In 1976, Switzerland accounted for about 1 percent of the capitalist world's industrial production and 1.7 percent of its exports. The country occupies a leading position in the world in terms of foreign trade generated per capita ($4,628 in 1976) and per capita gross national product. In 1976 the gross national product was $148 billion, with exports accounting for about 25 percent of the total.

Switzerland has long made use of its traditional neutral status; it has assumed the role of a middleman in international trade, a role for which it is suited by virtue of its location in central Europe. Other sources of Switzerland's considerable capital include a constant influx of foreign capital, foreign tourism, and the health-resort industry. The guaranteed secrecy of Swiss bank accounts and the country's neutral status have attracted capital from many foreign countries to Swiss banks; foreign depositors often circumvent the laws of their own countries.

In 1976, Switzerland had direct investments abroad of an estimated 45.5 billion Swiss francs and was among the world's leaders both on a per capita basis and in absolute volume. Two-thirds of the direct investments abroad are controlled by seven large concerns. The country exports most of its capital in the form of loans, 80–85 percent of which go to the developed capitalist countries, primarily the USA, Canada, and the countries of Western Europe (especially the Federal Republic of Germany).

Although the Swiss economy is notable for the extent to which capital is centralized, production is relatively little concentrated. In a number of industries, such as the textile, clock and watch, and clothing industries, there is a numerical predominance of medium-sized and small enterprises. In 1975 the country had 9,989 industrial enterprises, with a total of 715,000 employees; enterprises with fewer than 100 employees, or 85 percent of all enterprises, employed about 35 percent of the labor force, and enterprises with 1,000 or more employees, or 0.6 percent of all enterprises, employed 20 percent of the labor force. Most small enterprises are controlled by large concerns.

In 1976 more than half the joint-stock capital of 32,005,600,000 Swiss francs was controlled by 699 joint-stock companies, each of which owned capital of 10 million Swiss francs or more; these companies constituted 0.7 percent of all joint-stock companies. Concerns are the principal form of monopolistic association, many of which have become multinational firms with numerous enterprises outside Switzerland. Leading concerns are Nestlé Alimentana, a food-processing concern with 127,800 employees; Brown Boveri, an electrical equipment concern with 95,500 employees; and the Ciba-Geigy and Hoffmann-La Roche, chemical and pharmaceutical concerns with 73,300 and 35,000 employees, respectively.

Switzerland's numerous banking monopolies include the Swiss Bank Corporation (Schweizerischer Bankverein), the Union de Banques Suisses (Schweizerische Bankgesellschaft), and the Schweizerische Kreditanstalt (Crédit Suisse); leading insurance monopolies are the Zürich Versicherungs-Gesellschaft and the Schweizerische Rückversicherungs-Gesellschaft.

In the mid-1970's, Switzerland's economic situation deteriorated, and industrial production declined. The crisis of 1974–75, the gravest since 1949, led to a decrease in the total number employed in the manufacturing industry from 879,900 in 1970 to 714,900 in 1975; industrial production fell by 13 percent in 1975. In 1976 there was a slowdown in industrial production.

Industry. Swiss industry specializes in the manufacture of high-quality products, often of unique type. The leading branches of industry are machine building and the chemical industry; however, basic branches have been insufficiently developed (see Table 2).

Table 2. Percentages, for each industry, of those employed in manufacturing, excluding handicrafts

Industry	*1966*	*1970*	*1976*
Food processing (including tobacco products)	6.7	7.0	7.7
Textiles	7.8	6.8	6.0
Clothing, footwear, and leather goods	8.7	7.6	6.4
Wood products	5.0	4.8	4.2
Toys, sports equipment, and musical instruments	0.2	0.2	0.2
Paper	2.5	2.3	2.5
Printing	5.6	6.0	6.1
Chemical (including the production of rubber, the processing of synthetic materials, and petroleum refining	7.6	9.0	11.2
Building materials	3.4	3.2	2.7
Metallurgy and metalworking	13.8	13.8	13.5
Machine building	30.0	30.4	32.1
Clocks and watches	8.2	8.3	7.0
Jewelry	0.5	0.5	0.4

Almost all raw materials and mineral fuels, especially petroleum, are imported. The leading branches of industry produce primarily for export.

A steady decline in the proportion of the labor force employed in the textile, clothing, footwear, wood-products, and building-materials industries and an increase in the proportion in the machine-building, chemical, and pharmaceuticals industries reflect structural changes in Swiss industry brought about by the scientific and technological revolution. The reduction of the proportion of employees in the clock and watch industry has been caused primarily by stiffer competition on the world capitalist clock and watch market.

MINING AND POWER ENGINEERING. Switzerland's industrially useful minerals are rock salt, of which 311,600 tons were extracted in 1976 in the Basel area, and building materials. Switzerland produces substantial electric power, primarily hydroelectric power. Less than one-fifth of the country's energy needs are met by domestic sources; the remainder is met through imported fuel, chiefly petroleum (4 million tons in 1976), petroleum products (8 million tons), coal, and natural gas. Nuclear fuel is taking on increasing importance. Petroleum refineries in Aigle and Cressier, with a total installed capacity of about 8.5 million tons, are supplied by international pipelines from the ports of Genoa (Italy) and Marseilles (France). Natural gas is transported via gas pipeline from the Netherlands through Basel.

In 1976, Switzerland had 435 hydroelectric power plants in operation with a total installed capacity of 10.5 million kW. The share of electricity produced by the hydroelectric plants has declined from 98 percent of the total in 1965 to 74 percent in 1975–76. Atomic power plants and fossil-fuel-fired steam power

plants produce about 26 percent of the total electricity. The most important atomic plants are in Mühlenberg (effective capacity of more than 300,000 kilowatts [kW]) and Beznau (effective capacities of 300,000 kW and 1.2 million kW, respectively). In 1975, Switzerland imported 7.4 billion kilowatt-hours (kW-hr) of electricity and exported 9.6 billion kW-hr.

MANUFACTURING. Switzerland does not have a large iron and steel industry. The aluminum industry, with plants in the Rhône valley and in Steg and Chippis, uses imported bauxites. Ferrous and nonferrous metals, with the exception of aluminum, are for all practical purposes totally imported.

Machine building specializes in the production of precision metalworking machine tools and forging and pressing equipment (Switzerland ranks third among the capitalist world in exports in this area, behind the Federal Republic of Germany and the USA), electrical equipment, textile machinery, printing machinery, equipment for the chemical industry, internal-combustion engines, transportation equipment, and measuring instruments. The major centers of the machine-building industry are the cities of Zürich, Winterthur, Baden, Geneva, Basel, and Schaffhausen.

Switzerland is known throughout the world for its watches and clocks, produced primarily in western Switzerland—in the cities of Biel, La Chaux-de-Fonds, Le Locle, Grenchen, and Geneva and in several small towns. Watches and clocks are produced, for the most part, at medium-sized enterprises that are controlled by the monopolistic groups ASUAG, or Allgemeine Schweizerische Uhren (General Society of the Swiss Watch Industry), and SSIH, or Société Suisse Pour l'Industrie Horlogère (Association of the Swiss Watch Industry); the latter group includes the firms Omega and Tissot. About 95 percent of the clock and watch industry's output—clocks, watches, and parts—is exported. Switzerland accounts for more than one-fifth of the world clock and watch production.

The chemical industry uses domestic rock salt and imported organic intermediates. Development has been concentrated on the pharmaceutical industry and the production of dyes, synthetic fibers, and plastics. The principal centers of the chemical industry are the cities of Basel and Visp.

Light industry is represented by various branches. The textile industry produces fine cottons, silk fabrics and ribbons, various types of knitwear, and embroidery. Among other light industries are the clothing industry and the footwear industry, which includes the Bally concern. The main center of the cotton industry is the city of St. Gallen; silk production is concentrated, for the most part, in the cities of Zürich and Basel.

The food-processing industry is heavily dependent on imported raw materials. Swiss cheeses, chocolate, and food concentrates are known throughout the world. Other well-developed branches of Swiss industry are the wood-products, paper and printing, and building-materials industries.

Figures on the output of principal industrial products are given in Table 3.

Table 3. Output of principal industrial products

	1955	1965	1975
Electric power (billion kW-hr)	15.6	25.3	43
Steel (thousand tons)	—	347	420
Primary aluminum (thousand tons)	—	67.2	79
Metal-cutting and press-forge equipment (million dollars)	—	132	494
Textile equipment (million dollars)	—	200	660
Wrist and pocket watches, including mechanisms (million units)	34.4	54.7	65.8
Dyes and paints (million francs)	—	—	1,193
Organic chemical products (million francs)	—	—	2,818
Pharmaceuticals (million francs)	—	—	1,655
Paper and paper-board (thousand tons)	345	610	600
Cotton fabrics (million meters)	151	146	115
Woolen and mixed fabrics (million tons)	31.5	5.9	5.8[1]
Cement (million tons)	2.2	4.0	3.9
Footwear (million pairs)	11.1	15.4	8.1
Chocolate (thousand tons)	31.1	58.0	58.5
Sugar (thousand tons)	301.2	409.9	594.4

[1]1974

Agriculture. Agricultural holdings have gradually become concentrated in large capitalist farms, each with an area of more than 20 hectares (ha). Between 1955 and 1975 the number of farms declined from 206,000 to 133,000, primarily at the expense of small farms of less than 5 ha. The country is nearly self-sufficient in livestock production, but it produces only one-third of the required breadgrains. More than 50 percent of the land is used for agriculture: 9 percent, or 366,000 ha, is plowland; 41 percent, or 1,630,000 ha is meadows and pastures; and about 0.5 percent, or 18,000 ha, is set aside for perennial plantings.

Livestock raising, the principal branch of agriculture, accounts for 80 percent of the value of agricultural output; crop cultivation accounts for 20 percent. Agriculture is highly intensive; in 1975, Swiss farms had 83,900 tractors, 122,000 electric motors, and 5,000 combines. In 1977 there were 2,004,800 head of cattle (including about 900,000 dairy cows), 2,065,000 swine, 368,400 sheep, and more than 6 million chickens. The cattle are mainly of the Simmental and Schwyz breeds; the average annual milk yield per cow is 3,890 kg. Milk production accounts for about 40 percent of the output produced by livestock raising (3.5 million tons of milk, 35,000 tons of butter, and 111,000 tons of cheese in 1976), beef for 27 percent, swine raising for 24 percent, and poultry farming more than 5 percent.

Grain farming accounts for about 30 percent of the value of the total crop (half the grain produced is for fodder), fruit growing for 25 percent, viticulture for about 20 percent, and vegetable growing for about 16 percent, 10 percent of which is accounted for by the potato crop (see Table 4 for the principal crops).

Table 4. Area and yield of major crops

	Area (thousand hectares)		Yield (thousand tons)	
	1961–65[1]	1975	1961–65[1]	1975
Grains	178	182	583	842
wheat	109	82	355	320
barley	31	48	102	180
Potatoes	46	21	1,145	907
Sugar beets	7	11	270	480
Grapes	12	13	122	109[2]

[1]Annual average [2]Wine production totaled 77,200 tons

Transportation. Switzerland's complex road system, a necessary consequence of the mountainous terrain, includes numerous tunnels, bridges, and viaducts. The railroad system, which has a total track length of about 5,000 km, is entirely electrified. Mountain aerial cableways total 617 km in length, funiculars 55 km, and cog railways 97 km. Switzerland has 18,500 km of highways. As of 1976 there were 1,864,000 passenger cars, 43,000 trucks, and 4,338 buses.

There is navigation on the Rhine (from Basel) and on the lakes. The country's river fleet has a cargo capacity of 558,000 tons. More than one-fifth of Switzerland's foreign cargo passes through the major river port of Basel, which handled 8.2 million tons of cargo in 1975. In 1976 the merchant fleet had a total tonnage of 243.4 gross registered tons (Swiss ships are registered in the ports of other countries). Swissair provides service primarily on international routes; the principal airport is at Zürich. About one-fourth of the freight transported consists of transit goods. Switzerland has approximately 240 km of pipelines.

Foreign trade. In 1976 imports amounted to 36.2 billion Swiss francs, and exports totaled 36.4 billion francs; for the first time since 1953 the country enjoyed a favorable balance of trade. Deficits are covered by income from the export of capital, the import of foreign capital, revenues from foreign tourism, customs duties, and services provided to foreigners working in international organizations.

In 1976 raw materials and semifinished products, including foodstuffs requiring further processing, made up 41.5 percent of imports and 41.3 percent of exports; energy sources accounted for 10.3 percent and 0.1 percent respectively; machinery, equipment, and vehicles were responsible for 14.9 percent and 34.6 percent; consumer goods, including food commodities, beverages, and tobacco, accounted for 33.3 percent and 24.0 percent.

In 1976 trade with Europe accounted for 79.7 percent of imports and 67.2 percent of exports; trade with the member nations of the European Economic Community made up 66.5 percent and 45.1 percent, respectively. The socialist countries accounted for 3.7 percent of imports and 6.7 percent of exports, Asia for 7.9 percent and 14.3 percent, Africa for 2.3 percent and 4.7 percent, and North America for 7.8 percent and 8.5 percent. Switzerland's principal trading partners are the Federal Republic of Germany (FRG), France, Italy, the USA, Great Britain, and Austria. Trade with the USSR has increased: imports from the USSR rose from 24.6 million rubles in 1970 to 108 million rubles in 1976; in the same period exports to the USSR rose from 70.5 million rubles to 263 million rubles.

The monetary unit of Switzerland is the Swiss franc. According to the rate of exchange set by the State Bank of the USSR in March 1978, 100 Swiss francs equal 35.53 rubles.

Foreign tourism. The provision of services to tourists, sportsmen, and patients at health resorts constitutes a special branch of the economy: the tourist industry. Switzerland has more than 8,000 hotels and numerous pensions, sanatoriums, automobile service stations, and camping sites. As a source of foreign currency, tourism ranks third, after the export of machine-building products and of chemicals and pharmaceuticals. In 1976, Switzerland provided services to 5.9 million foreign tourists and earned 5.5 billion Swiss francs. The climatic health resorts in the mountains are renowned throughout the world.

A. I. MUKHIN

Armed forces

The armed forces consist of an army and an air force, which includes an antiaircraft force. The post of commander in chief is held by the president. The head of the Military Department, the chief of the General Staff (who is also the commander of the army), and the commander of the air force and antiaircraft force are in direct command. In 1977 the armed forces numbered about 46,500 men, who are called up under the law on compulsory military service in accordance with the territorial-militia system. Conscripts undergo basic training for a four-month period, after which they are transferred to the reserves. Reservists are called up for annual three-week repetition courses over the next eight years, two-week courses for the following three years, and one-week courses for the following two years.

The army of about 37,500 men includes an alpine corps, comprising three mountain infantry divisions, and three army corps, each consisting of two infantry divisions and one tank division. In addition, the army is made up of 23 detached frontier brigades, a detached armored regiment, three detached heavy-artillery regiments, two detached engineer regiments, two communications regiments, and other units and subunits concerned with combat security and services.

The air force of about 9,000 men comprises 24 squadrons, with a total of 345 combat aircraft; two helicopter squadrons; an antiaircraft missile regiment, consisting of two antiaircraft missile battalions, with a total of 64 launching installations for Bloodhound surface-to-air missiles; and seven antiaircraft artillery regiments.

Health and social welfare

Medicine and public health. In 1976, Switzerland had a birth rate of 11.7 per 1,000 inhabitants and a death rate of 9 per 1,000 inhabitants; the infant death rate was 11 per 1,000 live births. For the period 1968–73 the average life expectancy was 70.3 years for men and 76.2 years for women. Among the principal causes of death are cardiovascular diseases, malignant tumors, accidents, and diseases of the respiratory organs. The most common infectious diseases are influenza, children's infectious diseases, tuberculosis, and infectious hepatitis.

The administration of health care is decentralized: the federal government, through the Federal Office of Public Health (Bundesamt für Gesundheitswesen) of the Interior Department, merely monitors morbidity (for example, the incidence of infectious diseases and rheumatism), the training of physicians, and environmental protection; it also directs the campaign against alcoholism and the narcotics trade. The cantonal health care agencies are directly responsible for such areas as the management of hospitals, the organization of nonhospital care, and the administration of health services in the schools. Switzerland's social insurance system covers 90 percent of the population.

In 1975 there were 474 hospitals, with a total of 72,400 beds (11 beds per 1,000 inhabitants), of which more than 43,000 beds were in state medical institutions. Nonhospital care is provided, for the most part, by private physicians working with the social insurance agencies, as well as by the polyclinic divisions of certain hospitals. In 1976 there were 10,400 physicians (one physician per 680 inhabitants), 2,600 dentists, and about 17,000 secondary medical personnel. Doctors are trained at the medical schools of five universities; secondary medical personnel receive their training at 80 schools.

Switzerland has climatic health resorts in the mountain cities of St. Moritz, Davos, Leysin, and Vevey, balneological health resorts at Aigle, Weggis, Bad Ragaz, and Baden, and peloid health resorts at such cities as Acquarossa and Lavey-les-Bains.

In 1976, expenditures on health care made up 10 percent of the state budget.

O. A. ALEKSANDROV

Veterinary services. In 1976 there were two new cases of anthrax, 1,761 of rabies, two of Newcastle disease, three of cattle brucellosis, 18 of bovine and sheep tuberculosis, 159 of acariasis of bees, and 21 of blackleg. Cases of enterotoxemia and braxy of sheep, infectious agalactia of sheep and goats, malignant catarrhal fever of cattle, and myxsomtosis have also been reported. Veterinary services are directed by the Veterinary Administration, subordinate to the Federal Council. The network of veterinary services encompasses all cantons; the country has a unified code of veterinary laws. In 1976, Switzerland had 1,100 veterinarians, who trained at the veterinary schools of the universities of Zürich and Bern. Research in veterinary medicine is carried on at the two schools and at other veterinary institutions.

M. G. TARSHIS

Education and cultural affairs

Switzerland has no standardized system of public education. Each canton has its own educational legislation and administration. In all cantons education is compulsory for children from 6–7 to 15–16 years of age. There are kindergartens for children from 3–4 to 6–7 years of age. The primary school offers a period of instruction that ranges from seven to nine years and comprises two levels; depending on the canton, primary education lasts four years plus three years, four years plus four years, or four years plus five years. At the first level of instruction all pupils receive the same general-education training. In the senior grades of the primary school, the pupils are given, in addition to a general education, specialized vocational training for entry into vocational-technical schools or trade schools and for work in agriculture. In the 1972–73 academic year, primary schools had an enrollment of more than 526,100 pupils: the various vocational-technical schools had more than 165,200 pupils.

Switzerland's secondary schools vary widely in type and curriculum. They may be divided, nevertheless, into two basic categories: general-educational and specialized. The secondary schools, like the primary schools, have two levels: junior and intermediate. The junior level is a four-year *pregymnasium*, which accepts pupils who have completed four grades of primary school and have passed entrance exams in their native language (German, French, or Italian) and mathematics. The senior level is a four- or five-year *Gymnasium*, which has three divisions: classical lan-

guages, modern languages, and natural sciences and mathematics; upon graduation, the student may enter a technical higher educational institution or the law school or school of economics at a university, provided that the student has passed an additional exam in Latin. The junior level of a specialized secondary school, which has a two-year course of study, prepares students to work in various branches of the economy. In the 1972–73 academic year, 344,000 students were enrolled in secondary schools of all types, including 300,700 at the junior level and 43,300 at the senior level.

Higher educational institutions offer courses of instruction that range in length from three to five years (in some departments, six years). The system of higher education includes the universities of Basel (founded 1460), Lausanne (founded 1537), Geneva (founded 1559), Zürich (founded 1833), Bern (founded 1834), Neuchâtel (founded 1909), and Fribourg (founded 1889), as well as such institutions as the federal institutes of technology in Zürich and Lausanne and the Hochschule for Economics, Business, and Public Administration in St. Gallen. In the 1974–75 academic year, approximately 45,000 students were enrolled in higher educational institutions.

The largest of Switzerland's 33 libraries and archives are the Public Library of the University of Basel (more than 2 million volumes in 1977) and the Swiss National Library in Bern (1.5 million volumes). Museums include the Historical Museum, the Museum of Art, and the Museum of Natural History in Bern; the Public Art Collection, the Museum of Ethnography, and the Historical Museum in Basel; the Museum of Art and History in Geneva; the Cantonal Museum of Fine Art in Lausanne; and the Museum of Art and History in Fribourg. Z. K. NAVOKINA

Science and scientific institutions

Natural and technical sciences. NATURAL SCIENCES PRIOR TO THE 1840's. From the ninth through 11th centuries, the center for the study of natural sciences was the Abbey of St. Gallen, which was the most important cultural center in Switzerland during the Middle Ages. In 1465 the first printing press in the country began operating in the city of Muri. The first universities appeared during the 15th and 16th centuries—in Basel, Lausanne, and Geneva.

Paracelsus and M. Servetus influenced the development of biology and medicine in Switzerland during the Renaissance, and K. von Gesner wrote *A History of Animals* (vols. 1–5, 1551–87). The development of mathematics and mechanics was largely due to the Huguenots, who emigrated to Switzerland at the end of the 16th century; the Huguenots also fostered the local manufacture of watches and precision instruments. At the beginning of the 17th century, the Swiss mathematician J. Burgi invented logarithms independently of J. Napier. Another Swiss mathematician, P. Guldin, is credited with developing theorems on the volumes and surface areas of bodies of revolution. In botany, J. Bauhin is important for his work (published 1650–61) describing 5,000 plants. His brother G. Bauhin was one of the first to apply binary nomenclature in the systematic classification of plants. The anatomical works of T. Bonet and J. Wepfer were noteworthy contributions to 17th-century medicine.

During the first half of the 18th century, international recognition was accorded to the works of Swiss mathematicians. The brothers Jakob and Johann Bernoulli laid the foundations for the calculus of variations. Jakob Bernoulli was also one of the founders of the theory of probability, and he discovered the simplest form of the law of large numbers. Johann Bernoulli, who was made a foreign honorary member of the St. Petersburg Academy of Sciences in 1725, created the first systematic textbook of differential and integral calculus. In algebra, G. Cramer laid the foundations of the theory of determinants.

The work of Swiss mathematicians in other countries, including Russia, facilitated recognition of Swiss mathematical achievements. In 1725, J. Hermann (Ia. German) became the first professor of the St. Petersburg Academy of Sciences. In the same year, Johann Bernoulli's sons Daniel and Nikolaus also became professors at the academy, as did Daniel's nephew Jakob in 1787. Daniel became a foreign honorary member of the academy in 1733. Another Swiss mathematician, L. Euler, gained worldwide recognition through his work at the St. Petersburg Academy; named an adjunct in 1726, he was appointed a professor in 1731 and 1766 and was a foreign honorary member of the academy from 1742 to 1766. Also elected as foreign honorary members of the St. Petersburg Academy of Sciences were J. Gessner (1764), E. Develey (1808), and S. A. l'Huilier (1782).

J. Mallet-Favre founded the department of astronomy at the University of Geneva and established an observatory there. He carried out a number of projects in Russia and in 1776 became a foreign honorary member of the St. Petersburg Academy of Sciences. On I. F. Kruzenshtern's round-the-world expedition from 1803 to 1806, meteorological studies were conducted by J. K. Horner, who became a foreign corresponding member of the St. Petersburg Academy of Sciences in 1808. G. L. le Sage the Younger, P. Prévost, and A. de la Rive contributed to the development of physics.

The study of the Alps gave rise to a number of branches of science in Switzerland. As a result of travel and exploration in the mountains, J. J. Scheuchzer was able to publish descriptions of many types of fossil animals and plants between 1731 and 1735. M. Kappeler was the author of several works on general crystallography. H. B. de Saussure was the first to study the geologic structure of the Alps; he laid the foundations of descriptive geology and of glaciology. The foundations of the study of glacial epochs were laid by J. L. R. Agassiz' works on glaciology (published 1840–47). Agassiz moved to the USA in 1846. In 1835, J. Thurmann identified the Neocomian stage in the Cretaceous system. Between 1786 and 1802, J. R. Meyer compiled the first geographic atlas of Switzerland.

Biology in the 18th century developed under the influence of the doctrine of preformation. A. Haller, one of the founders of experimental physiology, was the first to devote detailed research to the phenomena of excitability and sensitivity; Haller became a foreign honorary member of the St. Petersburg Academy of Sciences in 1776. The science of entomology was furthered by C. Bonnet, who became a foreign honorary member of the St. Petersburg Academy of Sciences in 1764. F. Huber's studies contributed to the formation of a scientific approach to beekeeping. The works of A. Trembley aided the acceptance of the experimental method in biology. Discoveries made by J. Senebier and N. T. de Saussure led to the beginning of the study of plant physiology in the 19th century and to an understanding of photosynthesis. A. P. de Candolle, who became a foreign honorary member of the St. Petersburg Academy of Sciences in 1835, was the founder of comparative plant morphology. In 1804, J. P. E. Vaucher became the first to study algae through a microscope.

Contributions to medicine were made in the 18th century by T. Tronchin in therapy and J. G. Zimmermann in medical diagnosis; in the first half of the 19th century, F. K. Stadlin's work on physiology and surgery was important. The research of C. Schönbein at the University of Basel beginning in 1828 aided the development of modern chemistry in Switzerland.

FROM THE LATE 1840's TO THE FIRST HALF OF THE 20TH CENTURY. After Switzerland adopted a federal constitution in 1848, a number of educational institutions were opened, including federal institutes of technology in Lausanne and Zürich (1853 and 1855, respectively), universities in Fribourg and Neuchâtel (1889 and 1909, respectively), and a college in St. Gallen (1898). The Geneva National Institute was founded in 1853.

The works of J. Tralles on mathematics and its applications to astronomy gained widespread recognition; A. Speiser made important contributions to group theory, and L. Schläfli founded multidimensional geometry. The research of J. J. Balmer on atomic spectroscopy and the experiments of R. P. Pictet, who obtained liquid oxygen in 1877, made a great contribution to physics in the second half of the 19th century. Also of importance were C. E. Guillaume's inventions and theoretical works on metrology; Guillaume received a Nobel Prize in 1920 and became a foreign corresponding member of the Academy of Sciences of the USSR in 1924.

An enormous influence was exerted on modern science by A. Einstein, who was a professor at the University of Zürich from 1909 to 1911 and from 1912 to 1914. Einstein formulated the special theory of relativity, the quantum theory of light, and the theory of Brownian movement. Beginning in the late 1920's the development of physics in Switzerland was associated with the re-

search of W. Pauli, who helped develop quantum mechanics and the relativistic quantum field theory; Pauli received a Nobel Prize in 1945. R. Wolf established a connection between solar activity and variations in the Earth's magnetic field.

In chemistry, A. Werner received a Nobel Prize in 1913 for his investigation of inorganic-complex coordinated compounds. C. E. Guye and his brother P. A. Guye, who became a foreign corresponding member of the St. Petersburg Academy of Sciences in 1913, laid the foundations of electrochemical research in Switzerland. An important contribution to organic chemistry was made by A. Pictet, who carried out research on heterocyclical compounds. In 1934 and 1935, L. Ružička synthesized androsterone and testosterone; he received a Nobel Prize in 1939 and became a foreign member of the Academy of Sciences of the USSR in 1958. H. Staudinger, one of the founders of macromolecular chemistry, was a professor in Zürich from 1912 to 1926. The fundamentals of the stereochemistry of crystalline compounds and a genetic classification for magmatogenic ores were worked out by P. Niggli, who became a foreign corresponding member of the Academy of Sciences of the USSR in 1924. A major school of chemistry was founded by P. Karrer; in 1937, Karrer shared a Nobel Prize with W. Haworth for his studies on carotinids, flavins, and certain vitamins. Biochemical research advanced under the direction of E. Abderhalden, who became a foreign corresponding member of the Academy of Sciences of the USSR in 1925. P. H. Müller studied the insecticidal properties of DDT and received a Nobel Prize in 1948.

Niggli, F. de Quervain, and R. Winterhalter compiled a survey, published in 1930, of the chemical compositions of the rocks found in Switzerland. Important figures in minerology were U. Grubenmann, L. Duparc, and G. A. Kenngott; Kenngott became a foreign corresponding member of the St. Petersburg Academy of Sciences in 1884, and Duparc, in 1912. In the mid-19th century, A. Gressly set forth the principles of facies analysis, and at the end of the 19th century, F. A. Forel laid the foundations of limnology. A. Heim, who was a foreign honorary member of the Academy of Sciences of the USSR from 1925, studied the tectonic structure and glacial history of the Alps. C. W. M. Dorno conducted the first research in Switzerland in bioclimatology and radiation climatology. In 1931 and 1932, A. Piccard carried out flights for scientific purposes in a stratosphere balloon of his own design.

During the second half of the 19th century, the traditions of excellence in Swiss botany were continued by P. E. Boisier and A. de Candolle, who became a foreign corresponding member of the St. Petersburg Academy of Sciences in 1858. Noted botanists in the early 20th century included J. Briquet, C. de Candolle, E. Cramer, and R. Chodat, who became a foreign corresponding member of the Academy of Sciences of the USSR in 1924. *Fossil Flora of the Arctic* (1868–83) by O. Heer laid the foundations for the systematic study of the extinct vegetation of the arctic regions; Heer became a foreign corresponding member of the St. Petersburg Academy of Sciences in 1876. One of the first palcontologists to adopt the Darwinian point of view was L. Rütimeyer, who became a foreign corresponding member of the St. Petersburg Academy of Sciences in 1882.

A milestone in biology was F. Miescher's discovery of nucleic acids in 1868, and a considerable influence on biology and medicine in Switzerland was exerted by A. H. Forel, who wrote works on psychotherapy, sexology, entomology, and the anatomy and physiology of the nervous system. An important role in Swiss medicine was also played by M. Schiff, who became a foreign corresponding member of the St. Petersburg Academy of Sciences in 1895, and by H. Sahli; both Schiff and Sahli studied clinical physiology and diagnosis. F. de Quervain and C. Roux made notable contributions to surgery, and E. Bleuler, to psychiatry. Widespread recognition was gained by T. Kocher's achievements in the study and treatment of diseases of the thyroid gland; Kocher received a Nobel Prize in 1909. In the late 19th and early 20th centuries, health resort science, balneology, and physiotherapy began developing, and during the first half of the 20th century, a Swiss school of ecology took shape; the foremost scientists of the school were J. Braun-Blanquet, E. Rübel, and E. Schmid.

Progress in the technical sciences in Switzerland was fostered by widespread transportation construction and industrialization. In 1852, J. D. Colladon proposed a design for a pneumatic drill, and in 1862, J. Lechaux invented the diamond drill bit. To help with the driving of tunnels, such engineers as A. Heim, K. Brandau, and R. Meyer studied problems of the strength of various types of tunnels. Geodetic surveys were conducted under the direction of C. Guillaume, and outstanding works on the technology of tunnel construction were contributed by L. Favre, C. Baeschlin, and C. Koppe. The St. Gotthard Tunnel was opened in 1882, and the Simplon Tunnel, the longest in the world, was opened in 1906; a second tunnel, parallel to the first was completed in 1922.

Such Swiss engineers as R. Abt and N. Riggenbach occupied a prominent place in the design and construction of cog railways; Swiss engineers also made important contributions to the design and construction of mountain cableways. J. Ackeret built one of the first supersonic wind tunnels. T. Turrettini, E. Bürgin, and V. Boveri formed a Swiss school of electrical engineering.

SECOND HALF OF THE 20TH CENTURY. In 1944 a governmental commission was organized in Bern to encourage scientific research and coordinate research in the applied sciences. In 1952, the Swiss National Science Foundation was established, and during the 1960's the National Research Council was founded under its auspices. In 1969 a science division was organized in the Interior Department.

In basic research in Switzerland, mathematics occupies a prominent place, with recognition being accorded to J. Burckhardt, E. Trost, and G. de Rham, as well as to R. Wavre and his school. Research in physics has been continued by W. Pauli and his school; in 1955, Pauli formulated the *CPT* theorem. Major studies on antibiotics and other physiologically active compounds have been carried out by V. Prelog, who became a foreign member of the Academy of Sciences of the USSR in 1966. A broad program of scientific research is being conducted in the interests of the chemical and pharmaceutical monopolies.

In geology and geography, an important role has been played by the deep-sea studies begun in the 1940's by A. Piccard and continued since 1966 by his son J. Piccard; the Piccards designed new bathyscaphes. Research is also being carried on in volcanology, alpine geology, tectonics, geodesy, geophysics, and meteorology; A. Rittmann has performed especially valuable investigations in volcanology, R. Staub in alpine geology, and E. Begman in tectonics.

In biology, great achievements have been made by W. R. Hess in the physiology of the nervous system, by T. Reichstein in endocrinology, and by G. Aebi in biochemistry; Hess and Reichstein both received ■ Nobel Prize—in 1949 and 1950, respectively. G. Zop, E. Müller, and C. Baehni have made important contributions to botanical taxonomy, and the works of A. Frey-Wyssling on plant physiology have gained recognition. Experimental embryology has been developed by E. Hadorn and his school. Important medical research is being conducted in neurophysiology by K. Akert, and in neuropathology and psychiatry by scientists at the C. G. Jung Institute in Zürich. In the agricultural sciences, outstanding works have been contributed by the Lausanne school of agronomy, especially R. Halle and F. Ober.

Research and development technology have mainly been connected with the manufacture of precision instruments, machine tools, and turbines. Important studies have been carried out by such engineers as R. Braun in an attempt to develop safeguards against landslides and avalanches. Among Switzerland's major achievements in engineering are the Mauvoisin Dam (237 m; constructed 1950's), the Great St. Bernard Tunnel (opened 1967), and a system of freight-bearing cableways (some of them up to 200 km long).

B. A. STAROSTIN

Social sciences. TO THE MID-18TH CENTURY. In the ninth and tenth centuries *The Encyclopedia of Literary Sciences*, the anony-

mous *Life of Charlemagne*, and the *Chronicle of the Abbey of St. Gallen* by Ratpert and Ekkehard were compiled at the Abbey of St. Gallen, where the scholar-monks Notker Balbulus ("the Stammerer") and Notker Labeo ("the Thick-lipped") were active. A prominent representative of the ecclesiastical and monastic culture of a later period was the mystic nun Elizabeth Stagel (14th century), a disciple of H. Suso's.

The principal achievements of medieval Swiss social science came with the development of an urban culture in the 14th and 15th centuries. Numerous urban chronicles were written, chiefly in Bern, where the Bern chronicles of K. Justinger and D. Schilling were compiled in the 15th century. The development of the social sciences and the dissemination of knowledge was facilitated by the establishment of printing houses and universities. At the University of Basel jurisprudence underwent considerable development as early as the second half of the 15th century; a leading figure in this field was P. von Andlau.

In the 16th century numerous scholars and thinkers were associated with the Swiss universities, notably Erasmus of Rotterdam, who from 1521 to 1528 lived in Basel, where many of his works were published by J. Froben. Other important figures included J. Sichardt, the founder of the Basel school of historical textual criticism, and K. von Gesner, the author of the *Universal Library* (1545–55). The Swiss humanists continued the tradition of compiling local chronicles; noteworthy examples are the *Bern Chronicle* of Valerius Anselmus and the *Geneva Chronicles* of F. Bonivard. The first attempts to write a systematic history of Switzerland were made by J. Stumpf and A. Tschudi.

During the 16th century Switzerland became a leading center of Protestant theology, primarily through the work of H. Zwingli and his followers Vadianus (J. von Watt), J. Oecolampadius, and H. Bullinger, as well as J. Calvin and his successor T. Bèze. The Reformation sparked an awakening of interest in the historical and legal questions of the confederative state structure, which were dealt with by J. Simmler in the second half of the 16th century.

Many French Protestant scholars and journalists who had fled religious persecution were active in Switzerland, notably M. Cordier, S. Castalion, and F. Hotman. In the first half of the 18th century the ideas of natural law as advanced by H. Grotius and S. von Pufendorf were disseminated by J. Barbeyrac, J.-J. Burlamaqui, and E. Vattel. Philosophical problems of scientific cognition were dealt with by G.-L. Lesage, who was influenced by B. Pascal, and by J.-P. Crousaz, who subscribed to a late Cartesianism. The work of J.-J. Rousseau, a native of Geneva who lived in Switzerland until 1741 and during the 1760's, and later of Voltaire, who lived in Switzerland from 1754 to 1758, played a major role in spreading the ideas of the Enlightenment in Switzerland.

SINCE THE MID-18TH CENTURY. *Philosophy, pedagogy, and law.* Swiss social thought, whose development has been closely connected with the philosophy and culture of neighboring countries, chiefly Germany and France, is characterized by a particular interest in problems of education and of social and legal systems. In the mid-18th century attempts were made to put pedagogy and Enlightenment aesthetics, as seen from a Wolffian standpoint, on a rationalist basis; prominent in these efforts were J. G. Sulzer, as well as J. J. Bodmer and J. Breitinger, the teachers and predecessors of J. H. Pestalozzi. The democratic theory and practice of education developed by Pestalozzi, which was based on visual instruction, gained international recognition. K. von Bonstetten, who was active in the late 18th and early 19th centuries, studied the role that differences in geographic environment and in systems of public education play in the formation of individual and national character.

After Switzerland's neutral status was formally recognized in 1815, there was an increased interest in philosophical and legal questions, reflected in the works of K. L. von Haller, I. Troxler, O. Huber, and J. K. Bluntschli, a theorist of the organic school of law. Such figures as C. Secrétan, J.-E. Naville, and K. Hebler discussed the issues of liberal reform, the democratization of the electoral system, and the emancipation of women. Several social and ethical problems pertaining to relations among states were posed by J. H. Dunant, who was the founder of the International Red Cross, E. Ducommun, and A. Gobat. In the 20th century the theory of the state and the law has been studied by C. Borgeaud, K. Dürr, U. Lampert, and E. Ruck.

In the first half of the 19th century, Swiss philosophy was dominated by German idealism. Secrétan and Troxler further developed Schelling's philosophy of nature and put forward a spiritualistic concept of freedom. The end of the 19th century was marked by the influence of positivism, particularly in the works of H. Naville, and neo-Kantianism.

In the early 20th century the neo-Fichtean philosophy of activism, as elaborated by R. Eucken, gained popularity; it was applied to ethics and aesthetics by E. Grisebach and P. Häberlin and to pedagogy by A. Ferrière and Grisebach. E. Jaques-Delacroze developed a pedagogic system based on a wide-ranging interpretation of rhythm as an educative principle that permeated all areas of life and art.

From 1910 through the 1930's religious and mystical trends became increasingly influential, notably in the anthroposophy of R. Steiner, which was applied to various disciplines, including pedagogy, and in the dialectical theology of K. Barth. Neo-Thomism, represented by J. Bochénski and the Fribourg group, which was associated with the journal *Divus Thomas* (1923–53), gained a certain influence, as did the existentialism of H. Barth.

An important school developed in the philosophic analysis of works of literature and art; its representatives—J. Gebser, E. R. Curtius, W. Muschg, K. Schmid, and E. Staiger, the principal exponent of the "school of interpretation"—were influenced primarily by phenomenology and, to a degree, by German existentialism.

Of some importance in the history of psychology in the second half of the 18th century were J. Zimmermann and J. Lavater; the latter attempted to revive the science of physiognomy. In the 19th century valuable work was done by P. Scheitlin in animal psychology, A. Forel in hypnotism, and E. Bleuler in psychiatry. H. Rorschach's test for use in the study of personality, first presented in 1921, gained widespread acceptance. From the 1920's to 1940's work in military psychology was done by E. Bircher and U. Wille. K. G. Jung, the founder of the trend in depth psychology known as analytic psychology, developed a classification of psychological types and a methodology for the associative experiment. Another school of depth psychology is the existential analysis of L. Binswanger, F. Kaune, and W. Keller.

Important work in experimental psychology was carried out by E. Claparède, who wrote on child psychology and occupational psychology; his version of functional psychology greatly influenced J. Piaget's genetic epistemology and operational conception of the intellect.

Marxist philosophy gained currency in Switzerland in the second half of the 19th and the early 20th centuries, particularly after the founding of the Social Democratic Party of Switzerland in 1888 and the Communist Party of Switzerland in 1921; of major importance were the contacts of the Swiss socialists with V. I. Lenin and G. V. Plekhanov when the two lived in Switzerland. The works of Swiss Marxists of the 1920's to 1940's, notably S. Bamatter, J. Mimiola, F. Platten, and W. Trostel, expressed the ideas of internationalism and dialectical and historical materialism. After the founding of the Swiss Labor Party in 1944, its leaders, who included E. Woog, J. Vincent, and K. Farner, actively disseminated the teachings of Marxism-Leninism.

In Switzerland, research in philosophy, psychology, pedagogy, and law has traditionally been carried out at the universities.

Swiss philosophical journals include *Freidenker* (since 1918), *Studia philosophica* (since 1941), *Dialectica* (since 1947), and *Freiburger Zeitschrift für Philosophie und Theologie* (since 1954). The major psychological journals are *Archives de psychologie* (since 1902), *Action et pensée* (since 1925), *Schweizerische Zeitschrift für Psychologie und ihre Anwendungen* (since 1942), and *Der Psychologe* (since 1949).

Historical scholarship. The development of Swiss historical scholarship in the second half of the 18th century is closely linked with the ideas of the Enlightenment. The members of the Helvetian Club (founded 1761), notably I. Iselin and F. Balthasar, developed the notion of bourgeois civilization as the summit of human progress. J. von Müller's *A History of the Swiss Confederation*, which was influenced by Enlightenment ideas, provided a heroic view of the history of the Swiss people and long remained

the principal textbook on medieval Swiss history; it was continued by various historians, including R. Glutz-Blotzheim and L. Vuillemin, who imparted a romantic coloring to the work.

In the first half of the 19th century the ideas of German romanticism were reflected in historical works that supported the Restoration, notably those of F. D'Ivernois and H. Zschokke, and in a new interest in local history. The first historical societies were established at this time. In the 1830's, J. Kopp became the first to critically study the chronicles and other Swiss historical sources; he showed that much of their information was based on legends.

The development of European history of culture was considerably influenced by J. Burckhardt, who specialized in the culture of ancient Greece and the Renaissance and founded the cultural-historical school, and later by H. Wölfflin. A major figure in the development of cultural anthropology was J. J. Bachofen, whose works initiated the study of the matriarchal system and the evolution of the family. In the mid-19th century F. Keller was the first to study systematically Swiss pile dwellings.

The information accumulated throughout the 19th century on all periods of Swiss history made it possible to write, at the end of the 19th and the beginning of the 20th centuries, large, comprehensive works covering the entire course of Swiss history (K. Dändliker, J. Dierauer, T. van Muyden, and E. Gagliardi), as well as survey works dealing with Swiss military history and with the study of sources (W. Oechsli). Notable studies on the medieval period were written during this period by R. Wackernagel and by G. Caro, who conducted a polemic with the adherents of the patrimonial estate theory. The works of E. Fueter constitute an important contribution to European historiography.

The history of the working-class movement and socialist ideas in Switzerland was dealt with by R. Grimm, the leader of the Social Democratic Party of Switzerland. Important works in the fields of ethnography and archaeology, both those limited to Switzerland and those of a broader purview, were written by such scholars as E. Pittard, H. Bechtold, E. Baechler, and O. Tschumi.

Dominant among the trends in Swiss historiography is the liberal school, which indiscriminately applies the historical methodologies of such trends as neopositivism, phenomenology, and the historiography of A. Toynbee to issues in Swiss and world history; representatives of this school include P. Bessire, P. Dürrenmatt, V. Martin, E. Müller-Büchi, L. Binz, E. Gruner, and W. Hofer. The most important studies on Swiss history are those of H. Nabholz, who wrote on the medieval and modern periods, and K. Meyer, who revealed the historical basis of a number of legends pertaining to the formation of the Swiss Confederation whose authenticity had been cast into doubt by 19th-century historians.

Several historians, notably H. Weilemann, E. Bonjour, and R. Feller, subscribe to the notion of Helvetianism; they have attempted to put forward the social and political structure of the Swiss Confederation as the ideal organization of the state. A sociological school has been developed that relies primarily on the comparative historical method, as in the works of S. Stelling-Michaud, in *An Economic and Social History of Switzerland* (1961), and in studies on patterns of migration carried out in the late 1960's by H. Hoffmann-Nowotny; in a number of instances the works of this school lean toward an approach in which ethnology plays an important role.

The materialist interpretation of history is represented by a relatively small number of works of a Marxist tendency, such as those by M. Bodenmann, M. Pianzola, K. Farner, and H. Egger, which study specific and general phenomena in the historical development of Switzerland, as well as the history of the class struggle and working-class movement. The works of the progressive Swiss scholar A. Bonnard on the history of Greek civilization have gained widespread recognition.

The departments of philosophy and history, as well as the departments of political and social sciences, at various universities, including those at Basel, Bern, Geneva, Lausanne, and Zürich, are the principal centers of historical scholarship. Historical studies are published in the proceedings of historical societies; these organizations exist in all cantons and belong to the Swiss Historical Society (founded 1841), which publishes the *Schweizerische Zeitschrift für Geschichte*. Problems of domestic history are treated in such journals as *Beitrage zur Heimatkunde* (since 1927), *Blätter zur Heimatgeschichte* (since 1963), and *Bollettino storico della Svizzera italiana* (since 1879). The leading journal dealing with problems of world history is *Schweizer Beitrage zur allgemeinen Geschichte* (since 1943).

ECONOMICS. Economics emerged as an independent discipline in Switzerland in the second half of the 18th century, when the Swiss economist J. Waser set forth his theory of prices and price formation. A prominent representative of Swiss economics of the first half of the 19th century was J. C. L. S. de Sismondi, a seminal figure in petit-bourgeois political economy.

In the first half and beginning of the second half of the 19th century, W. Schulz-Bodner studied the role of the labor force in an economy based on free competition. In the same period, A. E. Cherbuliez subjected capitalism to a petit bourgeois critique similar to that of Sismondi's: he proposed that the state abolish private ownership of the land and appropriate rent, which would be used to replace taxes. Despite these radical demands, Cherbuliez was a fierce opponent of socialism. In the second half of the 19th century, L. Walras founded the mathematical school of political economy, which saw in mathematics the basic means of comprehending economic phenomena.

At the beginning of the 20th century Swiss economists attached great importance to the study of trade, money circulation, and the banking system. A prominent Swiss economist of the 20th century, W. Röpke, studied problems of international commercial and currency-credit relations, economic crises, market conditions, and inflation. Röpke, who helped create the theory of the social market economy, was an advocate of neoliberalism.

Most modern Swiss economists are Keynesians and concentrate in their works on questions of economic statistics and the construction of economic models. Since the late 1950's econometrics has undergone considerable development in Swiss economic scholarship. Many Swiss economists work on a continuing basis with the international organizations located in Switzerland and take part in the research sponsored by these organizations.

The chief centers of economic science in Switzerland are the universities of Geneva, Bern, Zürich, and Fribourg and their affiliated scientific research institutes.

The principal Swiss economics journals are *Wirtschaft und Verwaltung* (since 1942), *Revue économique et sociale* (since 1943), *Gewerbliche Rundschau* (since 1956), *Archiv für schweizerische Wirtschaft und Wirtschaftspolitik* (since 1960), *Aussenwirtschaft* (since 1946), and *Schweizerische Zeitschrift für Volkswirtschaft und Statistik* (since 1865).

LINGUISTICS. Beginning in the 19th century, linguistic science developed in three areas: Indo-European linguistics, general linguistics, and linguistic geography. Indo-European studies have been represented by works on general problems, Celtic linguistics (A. Piktet), Indic linguistics (J. Wackernagel and A. Debrunner), Baltic linguistics (M. Niedermann), and classical languages (Debrunner and Niedermann). Piktet wrote on problems of linguistic paleontology.

The contributions to general linguistics by the Geneva school, primarily F. de Saussure, and by C. Bally and A. Séchehaye greatly influenced the development of linguistics in many countries throughout the world. The ideas of the Geneva school were further developed by S. O. Kartsevskii, O. Frei, and R. Godel. The study and publications of Saussure's manuscripts is proceeding under the direction of Godel and R. Engler. In 1941 the Geneva Linguistic Society initiated the occasional publication *Cahiers F. de Saussure*, of which 30 volumes had appeared as of 1976.

The foundations of linguistic geography were laid at the end of the 19th century. J. Gilliéron, K. Jaberg, and J. Jud, all of whom took a historical approach to the study of linguistic geography, compiled *A Dialect Atlas of Italy and Southern Switzerland* (1928–40). In 1932, Jud founded the journal *Vox romanica*, an organ of the Society of Romance Languages in Basel. W. von Wartburg also dealt with problems of linguistic geography.

Dialectology has undergone development by H. Morf and L. Gauchet; the latter published *A Dictionary of the Dialects of French Switzerland* (1924–25). Dictionaries of German dialects have appeared since 1873 and of Rhaeto-Romance dialects since

1904. H. Baumgartner and R. Hotzenköcherle initiated the publication of *An Atlas of the German Dialects of Switzerland* in 1962. Applied linguistics has undergone development in Basel, Zürich, and Neuchâtel.

The principal linguistic societies are the Geneva Linguistic Society (1940–57), the Swiss Linguistic Society (Basel, founded 1947), the Society for the Study of German Language and Literature (Zürich, founded 1894), and the Rhaeto-Romance Society (Chur, Graubünden Canton; founded 1870).

Scientific institutions. The Geneva National Institute (founded 1853) coordinates scientific research in Switzerland. An important role in organizing scientific research is played by the Swiss National Science Foundation (1952), which includes the National Research Council, an organization made up of scientists. Most scientific work is carried out at the universities and polytechnic institutes. A number of research programs are sponsored by various governmental institutions, such as the Science Division (1969) of the Interior Department and the Study Commission for Atomic Energy (1945). The state finances the work of the Swiss Federal Institute for Snow and Avalanches Research (1942), certain observatories, scientific stations, and some scientific research institutes under the jurisdiction of the Federal Institute of Technology in Zürich, including the Swiss Reactor Center (1955) in Würenlingen.

Private research institutes and planning and design organizations are generally run by the large monopolies in such branches of industry as machine building (Brown Boveri and others) and the pharmaceutical industry (Ciba-Geigy, Hoffman–La Roche, and Sandoz). Research in the humanities is conducted, for the most part, at the universities.

In the mid-1970's about 22,000 persons, including approximately 16,000 scientists and engineers, were employed in research and development. Expenditures on science totaled some 3 million Swiss francs (about 2.5 percent of the gross national product), of which one-fifth comes from the state budget.

B. A. STAROSTIN

Press, radio, and television

As of 1980, 115 newspapers, with a total circulation of approximately 2.5 million, were being published in Switzerland. The most important German-language newspapers are *Blick* (published since 1959 in Zürich; circulation in 1980, 272,000), *Tages Anzeiger* (since 1893 in Zürich; circulation 261,000), *Neue Zürcher Zeitung* (since 1780 in Zürich; circulation 115,000), *Berner Zeitung* (since 1979 in Bern, the result of a merger of *Berner Nachrichten* and *Berner Tagblatt*; circulation 120,000), *Basler Zeitung* (since 1977 in Basel, the result of a merger of Basler Nachrichten, since 1845, and *National Zeitung* since 1842, circulation 110,000), *Vaterland* (since 1833 in Luzern; circulation 68,000), and the weekly *Die Weltwoche* (since 1933 in Zürich; circulation 127,000).

The most important French-language newspapers are *Journal de Genève* (published since 1826 in Geneva; circulation 18,700), *La Suisse* (since 1898 in Geneva; circulation 64,500), the evening newspaper *La Tribune de Genève* (since 1879 in Geneva, circulation 70,700), and *La Tribune–le matin* (since 1862 in Lausanne; circulation 49,700).

The most important Italian-language newspapers are *Corriere del Ticino* (published since 1890 in Lugano; circulation more than 27,000) and *Giornale del popolo* (since 1926 in Lugano; circulation 18,000).

The organs of the Swiss Labor Party are the daily French-language newspaper *Voix ouvrière* (published since 1944 in Geneva; circulation 8,000), the weekly German-language newspaper *Vorwärts* (since 1920 in Basel; circulation 12,000), and the weekly Italian-language newspaper *Il lavoratore* (Lugano; circulation 1,000).

The Swiss Telegraph Agency is a joint-stock company, founded in Bern in 1894. The Swiss Society for Radio and Television Broadcasting, which is also based in Bern, is a commercial organization, but it is controlled to a considerable extent by the government. Radio broadcasting was begun in Switzerland in 1923; as of 1980, programs were being broadcast in nine languages. There have been regular television broadcasts since 1958.

I. N. LOBASHEVA

Literature

The literature of the Swiss people has developed in the German, French, Italian and Rhaeto-Romance languages. The literature of each linguistic region of Switzerland, except the Rhaeto-Romance–speaking area, is linked with that of the neighboring country of the same language.

German. A literature that was distinctly Swiss began emerging at the end of the 13th century, when the forest cantons of Schwyz, Uri, and Unterwalden concluded a perpetual alliance. This literature, which featured historical chronicles and folk songs glorifying the struggle for independence, made use of legends about William Tell and Arnold von Winkelried (14th century). The minnesingers B. Steinmar (13th century) and J. Hadlaub (died c. 1340) combined traditional motifs of courtly love with realism. From the 14th through 16th centuries, poetry that was both satirical and didactic enjoyed popularity, most commonly taking the form of a fable. A unique encyclopedia of medieval life is H. von Wittenweiler's comic narrative poem *The Ring* (c. 1410), which makes use of elements of the grotesque.

By the end of the Middle Ages, Switzerland had made its final political break with the Holy Roman Empire, but intellectual ties with Germany remained the most important influence in the literary life of the German-speaking cantons. During the Reformation, religious drama was the most popular literary genre, and the works of N. Manuel (1484–1530) and P. Gengenbach (1480–c. 1525) were especially important.

The first Swiss Enlightenment figure was the patrician B. L. de Muralt (1665–1749), who lived in Bern; his *Letters About the English and the French* (in French; written 1698, published 1725) had an influence on A. von Haller and J.-J. Rousseau. An important place in the Swiss Enlightenment is also occupied by the literary critics J. J. Bodmer (1698–1783) and J. J. Breitinger (1701–76), who together founded one of the first German-language Enlightenment weeklies, *Die Diskurse der Mahlern*, in 1721. The ideas of the scholar and poet A. von Haller evolved from an enlightened opposition to the oligarchic regime (*Swiss Poems*, 1732) to a defense of orthodox religiosity and a social structure that had outlived its time (the historical novels *Usong* [1771] and *Fabius and Cato* [1774]). Sentimentality and moderate conservatism marked *The Idylls* by S. Gessner (1730–1788).

The interests of the democratic strata were expressed by the outstanding pedagogue J. H. Pestalozzi (1746–1827), the author of the novel *Leonard and Gertrude* (1780–87). *The Life and Adventures of a Poor Man in Tockenburg*, the autobiography of U. Bräker (1735–98), shows that the ideas of the Enlightenment penetrated the consciousness of the peasantry; the book is permeated with hatred for the feudal order and capitalist exploitation.

Neither romanticism nor classicism took root among the Swiss petite bourgeoisie. Although not distinguished by depth or originality, the works of G. G. de Salis-Seewis (1762–1834), M. Usteri (1763–1827), H. Zschokke (1771–1848), and J. Stutz (1801–77) laid the foundations for the realism of J. Gotthelf (1797–1854), G. Keller (1819–90), and C. F. Meyer (1825–98). These three Swiss writers were the first to be widely read outside of Switzer-

land; their works were a realistic embodiment of the growing conflict between a rejection of capitalist development and the faith of the humanist writers in the limitless potential of the people. Particularly noteworthy are Keller's novel *Martin Salander* (1886) and Gotthelf's novel *Uli the Tenant Farmer* (1849). The poems of H. Leuthold (1827–79) and F. Dranmor (real name, L. F. Schmid, 1823–88) were also marked by pessimism and a lack of faith in the bourgeois path of development. In his epic narrative poems *Prometheus and Epimetheus* (1880–81) and *Olympian Spring* (1900–07), C. Spitteler (1845–1924) attempted to create a type of modernized, humanist myth, in which ancient mythology was interwoven with modern cosmic images.

At the beginning of the 20th century, the idyllic works of J. V. Widmann (1842–1911), the Alpine romanticist E. Zahn (1867–1952), J. Heer (1859–1925), and H. Federer (1866–1928) were popular. A form of *pochvennichestvo* (a "grass-roots" literary and social movement in Russia) also appeared in Swiss literature; it is exemplified by M. Lienert and R. von Tavel, both of whom made use of local dialects. The "intellectual defense of the fatherland," which was essentially a reaction against the expansionism of fascist Germany in the sphere of culture, aided the growth of regional literature.

The rejection of Swiss reality was continued by R. Walser (1878–1956), A. Zollinger (1895–1941), and J. Schaffner (1875–1944), all three of whom revealed the contradictions within society and its lack of historical perspectives. Especially important are Walser's novels *The Assistant* (1907) and *Jakob von Gunten* (1908) and Zollinger's *Half a Man* (1929) and *Great Unrest* (1939). J. Bührer (1882–1975) was associated with the socialist movement; in his novels *Kilian* (1922) and *It Is Impossible* (1932) and his drama *Galileo Galilei* (1933), he asserted the need for a radical restructuring of the unjust social system.

After World War II, M. Frisch (born 1911) and F. Dürrenmatt (born 1921) created in their dramas and comedies readily understandable "models of the world," thus leading Swiss literature out of the dead end of regionalism and isolationism. Their best works are marked by a strong interest in sociopolitical problems, social criticism, and an unceasing quest for the human in men. Most noteworthy are Frisch's novels *Stiller* (1959) and *Homo Faber* (1957) and Dürrenmatt's dramas *The Visit* (1956) and *The Meteor* (1965).

During the 1950's and 1960's, Swiss literature witnessed an increase in social criticism, political themes, and stated rejections of petit bourgeois society. In such novels as *The Interrogation of Harry Wind* (1964) by W. M. Diggelmann (born 1927), *The Weaver of Wreaths* (1964) by H. Loetscher (born 1929), *The Mute* (1959) and *Herr Tourel* (1962) by O. F. Walter (born 1928), and *Antidotes to Enchantment* (1967) by A. Muschg (born 1934), the traditions of realism are combined with a use of modern descriptive techniques. The short stories of such authors as P. Bichsel, (born 1935), F. Federspiel (born 1931), U. Eggli, and F. Hohler show that these writers have studied motives of social behavior in a changing world; through the use of irony, skepticism, and elements of the irrational and fantastic, they undermine faith in the stability of the existing system. The novels *The Discovery Place* (1974) by W. Schmidli (born 1939) and *The Nightmare* by W. Kauer (born 1935) testify to a revival of interest in the life and struggle of the Swiss working class.

French. The beginnings of the intellectual and literary life of the French-speaking cantons—Genève, Neuchâtel, Vaud, and Valais—coincide with the Reformation. The most prominent writer in French during the 16th century was F. Bonivard (1493–1570), who is known for his *Geneva Chronicles*. Ties with the progressive wing of the Huguenots had a favorable effect on T. de Beze (1519–1605), who wrote the tragedy *Abraham's Sacrifice* (1550). During the 17th century, Swiss literature written in French, or *romande* literature, was entangled in religious controversies and was propagandistic in nature. *Les Tragiques* (parts 1–7; 1616) by T. A. d'Aubigné (1552–1630), who had come from France, reflected the age of Calvinism.

From the Protestant camp came the first signs of the intellectual awakening that weakened the hold of Calvinist dogma and paved the way for the Enlightenment. A bourgeois-democratic patriotic movement arose; the belief in a vital link between the German and French cantons of Switzerland was affirmed in the activities of the Helvetian societies. Nevertheless, the humanist traditions that were espoused by J.-J. Rousseau (1712–78) and B. Constant (1767–1830) and that grew out of ties with French culture did not find the necessary ground for development. Moral-philosophical literature of a religious nature prevailed. Of the 19th-century writers, only R. Töpffer (1799–1846) was a literary artist in the proper sense of the term; Töpffer was known for such works as *Geneva Short Stories* (1841).

In the 20th century, such writers as P. Budry (1883–1948), C. A. Cingria (1883–1954), R. de Traz (1884–1951), and A. Spiess (1876–1940) continued the process of liberating literature from religious moralizing. The most talented writer of this group was the novelist, poet, and essayist C. F. Ramuz (1878–1947), whose influence is still seen in such contemporary writers as G. Haldas, M. Dentan, J. Chessex, and M. Chappaz. Because of close contacts between literary developments in France and French-speaking Switzerland, *romande* literature was influenced by the Resistance. Thus, such Swiss poets as G. Trollier, P. L. Matthey, and J. Cuttat exhibited social concerns and enriched Swiss literature with civic motifs.

Since the early 1950's, active humanism has again given way to traditional, abstract humanism, as seen in G. Roud and M. Raymond and later in P. Jacotte and V. Godel. The change is also clearly noticeable in the novel *I* (1959) by Y. Veland (born 1925), the collection of poems *Freedom at Dawn* (1967) by A. Voisard (born 1930), the drama *Captain Karagheuz* (1967) by L. Gaulis (born 1932), and the play *Sun and Death* (1966) by B. Liegme (born 1927).

Italian. Swiss literature in the Italian language has developed in the canton of Ticino. Beginning in 1803, when Ticino joined the Swiss Confederation with the rights of an independent canton, the themes of national uniqueness and Swiss patriotism appear in its literature; the leading writers using these themes include G. Zoppi (1869–1952), V. Abbondio (1891–1958), and G. Motta (1871–1940). The literary tastes of several generations in Ticino have been molded by F. Chiesa (1871–1973), who wrote the collection of poems *Calliope* (1907), the collection *Children's Stories* (1920), and the novel *March Weather* (1925).

Fidelity to the realistic traditions of Italian-language literature has been preserved by P. Bianconi (born 1899), P. Scanziani (born 1908), and A. Jenni (born 1911); the influence of modernism is seen in such works as the novels *Evening Spider* (1950) by F. Filippini (born 1917) and *The Hostages* (1954) by G. Bonalumi (born 1920). Noteworthy poets include F. Menghini (born 1909), G. Orelli (born 1909), A. Nessi, R. Fasani, and G. Mascioni.

Romansh. Rhaeto-Romance languages are spoken in less than one-third of the canton of Graubünden; the principal Rhaeto-Romance language is Romansh. The first works of literature in the language date from the 16th century and include *The Song of the Battle of Müs Castle* (1527) by J. Travers. During the 17th and 18th centuries, didactic works of a religious and political nature appeared.

The pride of Romansh literature is its folkloric works—folk songs, folktales, legends, proverbs, and sayings that have been collected and reworked by the canton's professional writers. Calls for the preservation of the individuality of the Romansh language and literature were made by such poets as G. C. Muoth (1844–1906). Of the writers and poets from the turn of the 20th century, P. Lansel (1863–1943) is particularly noteworthy. Since 1938, Romansh has been Switzerland's fourth official language.

Enjoying renown among contemporary writers are the prose writers T. Halter (born 1914) and C. Biert (born 1920), the dramatist T. Murk (born 1915), the poet A. Peer (born 1921), and the author of children's stories S. Chönz (born 1911). Romansh is gradually being supplanted by German.

The Society of Swiss Writers, which was founded in 1912, includes representatives from all the linguistic regions. In 1969, 22 writers, including Frisch and Dürrenmatt, left the organization in a protest against its lack of political activity; they subsequently formed the Olten Group, which exists alongside the reformed Society of Swiss Writers.

Literary theory and criticism. The most important Swiss literary critics of the 18th century were J. J. Breitinger and J. J. Bodmer, who argued against the normative poetics of classicism. Breitinger was the author of *A Critical Examination of the Miraculous in Poetry* (1740; preface by Bodmer). In the mid-19th century, such critics as J. K. Mörikofer and J. Bächdold began showing an interest in Swiss literature. A prominent representative of the intellectual-historical school was E. Ermatinger (1873–1953), who wrote *Poetry and the Intellectual Life of German Switzerland* (1933). In the 20th century, Switzerland has had many comparative philologists, including F. Ernst (1889–1958), who distinguished Helvetian studies from the general field of Romance and Germanic philology; Ernst saw Swiss culture essentially as an intermediary between the German, French, and Italian cultures.

By the early 1940's, the Zürich school (also known as the school of interpretation) had been formed, including such scholars as E. Staiger (born 1908), who wrote *The Art of Interpretation* (1955), M. Wehrli (born 1909), who wrote *General Literary Theory and Criticism* (1951), and W. Kaiser. Members of the Zürich school analyze literary works outside the social and historical contexts in which the works were written. In his *Tragic History of Literature*, W. Muschg contrasted a romantic longing for the "old" Europe to his view of the disintegration of contemporary bourgeois culture.

V. D. SEDEL'NIK

Architecture and art

The art of Switzerland, although it has developed in close connection with that of France, Germany, and Italy, has nevertheless retained a distinctive national style. The earliest works of art found on the territory of Switzerland date to the period of the La Tène culture and to Roman times. The oldest monuments of Switzerland's architecture are linked with the art of the Merovingians, for example, the baptistery at Riva San Vitale (fifth–sixth centuries). Structures of the Carolingian Renaissance, including the Abbey of St. Gallen (founded seventh century, retains the plan of the ninth century), are impressive in size and tend toward a complex reworking of architectural forms.

In the monumental art of the Carolingian period, artists revived certain devices of visual illusion from classical painting, for example, the frescoes from the Church of St. Johann in Münster (ninth century). Structures in the Romanesque style include the Grossmünster in Zürich; the transitional Romano-Gothic style is represented by the cathedrals in Basel (mainly 1185–1200), and in Chur (1171–1282). These buildings closely resemble the architecture of France and Germany. Gothic structures from the 13th through the 15th centuries are marked by weak articulation of mass and restraint in the use of sculptural decoration, for example, the cathedral in Lausanne (1175–1275). From the late 13th through 15th centuries, Gothic sculpture and painting developed. Important examples are the fresco cycle of the church in Winterthur (c. 1336), book miniatures executed at the school of St. Gallen, and stained-glass windows, including those of the church in Königsfelden (1325–30). Easel painting was represented by the works of K. Witz.

In the 16th century, the Renaissance style reached Switzerland, as seen in the arcaded street in Lugano (16th century) and the city hall in Basel (1504–14). Decorative painted facades were typical of urban architecture during the 16th and 17th centuries, for example, the paintings on the Knights' House in Schaffhausen by T. Stimmer (1557). The traditions of the Renaissance were maintained in 17th-century architecture, notably in the town hall in Zürich (1694–98).

Painting and the graphic arts reflected the everyday life of the Swiss, especially the works of U. Graf and N. Manuel Deutsch. H. Holbein the Younger, who worked in Basel, had a considerable influence on 17th-century Swiss portrait painting. The baroque style predominated in the religious architecture of the 17th and 18th centuries, one good example being a church in St. Gallen (begun 1755).

Of special interest in 18th-century art are the pastels of J.-E. Liotard, the landscapes and engravings of S. Gessner, and the portraits of A. Graff and I. G. Füssli, which combine classicist austerity with romantic fantasy. The Swiss minor masters, who produced genre scenes, landscapes, and historical paintings, included I. L. Aberli and S. Freidenberger. Classicism prevailed in Swiss architecture at the end of the 18th century. The facades of public and residential buildings were modeled on the classical structures of France. Typical examples are the town hall in Neuchâtel (1782–90, architect P. A. Paris) and the railroad station in Zürich (1847). Eclecticism took root in the mid-19th century, and *art nouveau* became popular toward the end of the century. Neither classicism nor romanticism attained any significant development in the representational art of the early 19th century. Working in the mainstream of German romanticism were G. L. Vogel and H. Hess, as well as the graphic artists R. Töpffer and M. Disteli. The painter L. Rober belonged to the romantic school, while C. Gleyre belonged to the academic trend; both worked in France.

In the mid-19th century, Switzerland's artists turned to subjects from the life of the people and strove to convey the beauty of the Swiss countryside. Realistic landscapes were painted by A. Calame, and genre scenes by F. Buchser, A. Anker, and B. Vautier, the last of whom worked in Germany. At the turn of the 20th century, Swiss painting was strongly influenced by the works of A. Boecklin. F. Hodler depicted scenes from Swiss history in the style of national romanticism. Beginning in the late 19th century, impressionism, postimpressionism, and symbolism developed in Swiss painting. Outstanding painters included F. Vallotton, T. Steinlen (both of whom worked in France), C. Amiet, R. Auberjonois, and A. Giacometti.

At the beginning of the 20th century, Swiss architects employed new materials while retaining traditional architectural forms, for example, in the University of Zürich (1911–14, architect K. Moser). In the mid-1920's a renewed interest in folk architecture was reflected in urban and suburban buildings modeled after the traditional chalet. During the 1920's, the devices and methods of functionalism were introduced in the designs of O. Salvisberg and A. Meili, and in the 1930's elements of rationalism took hold. Le Corbusier was a native of Switzerland.

Residential districts of the major Swiss cities, built during the 1950's, 1960's, and 1970's, were situated among greenery, far from main roads and industrial enterprises. Such settlements include Letzigraben, near Zürich (1952–55, architects A. H. Steiner and others), and Halen, near Bern (1959–61, architects S. Gerber and others). The growth of industrial centers in various regions of Switzerland created a need for satellite cities, such as Le Ligon, near Geneva (1962–70, architects H. Ammann, P. Ammann, and others). In Switzerland's mountain regions, terrace apartments have been built on the sunny slopes of the mountains, for example, the cities of Klingnau and Brugg.

During World War I (1914–18), dadaism arose in Switzerland, and expressionism was represented in the works of P. Klee. In monumental painting, prominence was gained by a group of masters of religious church paintings, headed by H. Altherr and A. Cingria. The monumentalist A. Blansch turned to subjects drawn from the labor and life of the Swiss people. Abstractionism was the predominant trend in Swiss painting from the 1930's to the 1950's, particularly in the sculptures of Taeuber-Arp and the paintings of J. Arp and R. P. Lohse. Swiss pictorial art of the 1960's and 1970's has reflected the basic trends and schools of European art. Of special note is the painter and graphic artist H. Erni, a representative of the progressive wing of Swiss art. In 20th-century sculpture, O. C. Bänninger and J. Probst have created psychologically complex works, while H. Haller is known for his impressionistic pieces.

Swiss folk art is renowned for its carved wooden articles, often decorated with ornamental or narrative paintings. Ceramics, woven goods, and leather and metal articles are also of high quality.

Music

The music of Switzerland is based on various national traditions. Both folk and written music manifest, in addition to traits that are common to other national traditions, characteristics that are distinctive of Swiss music as a whole. Important folk-song genres include the songs that developed in various regions of the country between the 13th and 16th centuries, which were patriotic, primarily antifeudal, in nature, and a genre peculiar to the Alpine mountaineers—the yodel. Related to the folk song are the calls performed by herdsmen on alpenhorns. Swiss folk dances include the *Vögelschottisch* and round dances.

The musical art that emerged in the medieval monasteries was connected with liturgical music. The monk Notker Balbulus ("the Stammerer"), who wrote on music theory, introduced sequences in the tenth century; Tuotilo introduced tropes. Glareanus (16th century), in his treatise *Dodecachordon*, classified the 12 basic church modes. Secular music was represented by the minnesingers U. von Singenberg and B. Steinmar in the 13th century and by J. Hadlaub in the beginning of the 14th century.

Notable figures of the 16th century included the masters of choral polyphonic church music L. Senfle, who lived for a time in Munich, L. Bourgeois of Geneva, J. Wannemacher of Bern, and G. Meyer of Basel. In addition to J. U. Sulzberger, important composers of the 17th century included V. Molitor, who also wrote secular music. In the 17th century a type of musical association known as the *collegium musicum* was established in the cities.

In the 18th century a variety of genres underwent development. Instrumental music and music for the theater were represented by the Singspiels of J. Meyer von Schauensee, which were staged in Luzern. Overtures and trio sonatas were written by H. Albicastro (H. Weissenberg), and piano compositions by J. K. Bachofen and J. H. Egli.

The first operas—German and Italian—were staged in Zürich in 1788. Operas by such Swiss composers as F. Schnyder von Wartensee and H. Götz were staged periodically in the 1820's in Zürich and on a regular basis beginning in 1834. Beginning in the mid-19th century the operas of R. Wagner dominated the stage. In the late 19th century the operas of H. Huber (five operas) and O. Schoeck were staged; both composers also wrote symphonies and other works.

In the 19th century a music education movement, inspired by the educational theories of J. G. Pestalozzi (late 18th to early 19th centuries), became widespread; several choral societies and music educational institutions were established. Prominent Swiss composers of this period were also teachers or served as the directors of choral societies or schools; in addition to F. Hegar, they included E. Jaques-Delacroze, who devised an educational system based on rhythm.

The leading Swiss musical figures of the early 20th century were G. Doret, V. Andreae, E. Bloch (later a resident of the USA), H. Gagnebin, H. Suter, and E. Ansermet, who in 1918 founded and became director of the Orchestre de la Suisse Romande. The music of this period combined the traditions of the late German romantics, notably R. Wagner and R. Strauss, with the musical devices of C. Debussy and M. Ravel; this synthesis is especially evident in F. Martin's work, in a variety of genres, in the 1920's and 1930's. A. Honneger, also active in this period, was of Swiss origin. Musicologists included M. Lussy, K. Nef, A. Moser, and J. Handschin.

Prominent composers of the mid-1930's were W. Burkhard, P. Müller, C. Beck, and A.-F. Marescotti. In the 1940's, W. Vogel became the first Swiss composer to use serial technique; he was followed by various composers, including R. Liebermann, in such works as the opera *Leonora 40/45* and the *Concerto for Jazz Band and Orchestra*, and H. Sutermeister, in the operas *The Enchanted Isle* and *Raskolnikoff* and in instrumental and choral works. Musicologists of this period included W. Schuh and A.-E. Cherbuliez.

The most widely known musical figures since the 1950's have been A. Schibler, J. Wildberger, K. Huber, and R. Kelterborn. The latest experimental music has been written by such composers as H. Holliger, J. Wittenbach, U. P. Schneider, and R. Moser. Certain types of jazz have made inroads in Switzerland, and folk-influenced light music is performed, notably by the singer and yodeler F. Liechti.

The musical life of Switzerland's cities has been shaped, since the first decade of the 20th century, by the presence of some of Europe's greatest musical figures, notably F. Busoni, S. V. Rachmaninoff, I. V. Stravinsky, R. Strauss, P. Hindemith, B. Martinů, and E. Petri. Major international music organizations are located in Switzerland, which is the site of music festivals, symposia, and competitions, including the international Concours d'Exécution Musicale.

In the 1970's, Switzerland, in addition to more than ten symphony orchestras, had chamber orchestras and ensembles (notably Basel's chamber orchestra and string quartet), opera companies, and choral societies. Prominent Swiss performers include the conductors E. Appia and N. Aeschbacher, the pianists E. Fischer and N. Magaloff, the violinists A. Pochon and F. Hird, the singers E. Haefliger, H. J. Rehfuss, L. Della Casa-Debeljevic, and E. Mathis, and the church organists K. W. Senn, E. Kaufmann, and H. Funk.

Learned societies and educational institutions include the Association of Swiss Musicians and Composers, the Union of Swiss Musicians, the Basel Academy of Music, the Conservatory and Higher School for Music in Zürich, and conservatories in Geneva and Lausanne. The universities, as well as many municipal and church schools, have music departments. The major Swiss music publications are the *Schweizerische Musikzeitung* and *Acta musicologica*, an international scholarly journal.

Theater

The theater in Switzerland developed simultaneously in French, German, and Italian. The traditions of folk amateur productions are still drawn upon and stem from the mystery plays, Shrovetide plays, and other dramatic forms of the Middle Ages; in the 16th century, folk drama became the leading genre, and from the time of the Reformation it gave voice to popular movements. Owing to persecution by the church in the 17th century for its use of political satire and for the secular themes and farcical nature of its productions, the theater lost ties with reality.

The first professional troupes in Switzerland appeared at the turn of the 19th century—in St. Gallen and later in such cities as Lausanne and Geneva. They staged primarily plays by German and French authors. Until the late 1930's, the abundance of foreign touring companies retarded the development of Switzerland's own companies. In the 1940's, however, the Swiss theater, which for the most part used the German language, experienced a rebirth, largely as a result of an influx of actors from Nazi Germany and countries occupied by the Nazis. After World War II, the works of the playwrights M. Frisch and F. Dürrenmatt brought new life to the Swiss theater.

Among individual theaters, one of the most important was the Schauspielhaus in Zürich (founded 1908). Another Zürich theater, the Theater am Neumarkt, was noted for dealing with the political problems of the day and for experimenting with new forms of communication with the audience. Under the direction of W. Duggelin, the theater in Basel became a bastion of progressive ideas during the 1960's. In addition to works by such established authors as B. Brecht, J. Anouilh, and Dürrenmatt, it staged plays by the younger generation of Swiss playwrights; the theater also arranged discussion sessions dealing with political topics, such as the general strike of 1918.

Other cities with professional troupes include St. Gallen, Luzern, Chur, Biel, and Solothurn. Many of the medium-sized amateur theaters stage productions that are notable for their innovations and originality. In the French-speaking cantons, there are five major theaters—the drama center in Lausanne, the theater in Carouge, the folk theater in La Chaud-de-fonds, La Comédie in Geneva, and the Nouveau Theatre de Poche in Geneva. Many professional troupes originated as amateur groups.

International theater festivals are held in June in Lausanne.

V. D. SEDEL'NIK

Circus. For generations, tightrope walkers have performed at fairs in Switzerland, and there have been traveling troupes of various kinds. The brothers Friedrich, Rolf, Karl, and Eugen Knie, who were members of the oldest family of tightrope walkers in Switzerland, opened a big top circus in Bern in 1919. The Knie Brothers' Swiss National Circus is a traveling circus, and for part of the year it appears in countries other than Switzerland; foreign performers also appear with the company. The Knie Circus is noted for its exotic animal acts and for the quality of its equestrian acts.

Motion pictures

The first full-length dramatic film made in Switzerland was *The Origins of the Confederation* (1924), directed by E. Harder. Until the 1960's, Swiss motion pictures were primarily in German. In addition to drawing-room comedies, melodramas, short scenic films, and advertising pictures, Switzerland produced films of greater merit, such as the works of the progressive documentary film-makers L. Wechsler and E. Leiser, as well as the patriotic dramatic films *The Archer Wipf* (1938) and *The Last Chance* (1945) by L. Lindtberg. Among the best-known French-speaking film-makers are the documentary directors C. Duvanel and H. Brandt, who began directing political documentaries in the 1950's.

In 1967 the young directors C. Champion, F. Reusser, J. Sandoz, and Y. Yersin created the film *Four Women*, which comprised four stories describing the destinies of four simple women of various ages. In 1968 the directors A. Tanner, C. Coretta, J. L. Roys, M. Soutter, and J. J. Lagrange (later replaced by Yersin) formed the Group of Five, which opposed the aestheticizing of reality practiced by many directors. Tanner depicted ordinary people and the difficulties of real life in films such as *Salamander* (1971), *Return From Africa* (1973), and *The Middle of the World* (1975), as did Goretta in *The Invitation* (1972) and *Not as Wicked as That* (1976). Among the noteworthy German-speaking directors of the 1970's were R. Lyssy, who directed *The Confrontation* (1975), T. Koerfer, and D. Schmid.

Between 16 and 18 dramatic films are produced annually in Switzerland. The Swiss cinema centers in Zürich and Lausanne are popular, and there is a motion-picture department in the Schauspiel Academy. Since 1946, international film festivals have been held in Locarno.

M. G. MARETSKAIA [29–942–2]

SZAFER, WŁADYSŁAW. Born July 23, 1886, in Sosnowiec; died Nov. 16, 1970, in Kraków. Polish botanist and public figure. Member of the Polish Academy of Learning in Kraków from 1920 and of the Polish Academy of Sciences from 1952 (vice-president from 1957 to 1961).

Szafer studied at the universities of Vienna and Lwów (L'vov). He was a professor at the University of Kraków and became director of the Botanical Garden in 1917. During the fascist occupation he was the rector of an underground university. Szafer was the organizer and first director of the Institute of Botany of the Polish Academy of Sciences (1951–63) and of the academy's Institute of Nature Conservation (1951–60). He was chairman of the State Council on Nature Conservation from 1919 to 1949.

Szafer's main works were on the systematics and ecology of vascular plants, botanical geography, geobotany, paleobotany, and conservation. He was the organizer and editor of *Flora of Poland* (vols. 1–9, 1919–60), *Vegetation of Poland* (vols. 1–2, 1959), and *Nature and Resource Conservation* (vols. 1–2, 1965). He was the author of *Memoirs of a Naturalist* (1973).

Szafer received the State Prize of the Polish People's Republic in 1949. He was a member of many foreign academies of sciences.

SZAJNOCHA, KAROL. Born Nov. 20, 1818, in Komarno, near Sambor; died Jan. 10, 1868, in L'vov. Polish historian, publicist, and writer.

In the 1830's, Szajnocha took part in the activities of clandestine patriotic organizations in Galicia. He was the author of works on the history of Poland from ancient times to the 17th century. Szajnocha's glorification of the national past and his skillful exposition ensured the popularity of his historical works.

SZCZECIN, a city and port in Poland. Situated on the lower course of the Odra River, 65 km from the Baltic Sea. Administrative center of Szczecin Województwo. Population, 376,000 (1976). Szczecin is the "gate to the sea" of the Upper Silesian coal field, with which the city is connected by an electrified railroad and by river. Coal, general cargo, and imported iron ore and grains are transshipped at the port. Szczecin is Poland's principal port for international transit; its freight turnover in 1975 amounted to 16 million tons. More than one-half of the country's merchant marine and a considerable portion of its fishing fleet are registered in the city.

Szczecin is a center for shipbuilding, metallurgy, and the production of construction cranes, cable, and automotive parts. It also produces viscose fiber, superphosphate, paper, and cement. Other branches of industry are food processing, woodworking, the manufacture of clothing, and ferrous metallurgy. The city has polytechnical, medical, and agricultural institutes, as well as a higher maritime school.

Szczecin, which was mentioned for the first time in the ninth century, was once a settlement of the Pomeranians and had a temple to the Slavic god Triglav. In the late tenth century it became part of the old Polish state, and later it was the administrative and trade center of the principality of Western Pomerania. In 1121 it was again united with the Old Polish lands. In the late 12th century it became part of the Holy Roman Empire. By the late 13th century the city was known under its German name, Stettin, and had become a member of the Hanseatic League. In 1648 it was taken by Sweden, and in 1720, by Prussia. Despite prolonged germanization, Szczecin developed as a Polish city. After its liberation by Soviet troops on Apr. 26, 1945, it again became part of Poland.

Modernized in the late 19th century, Szczecin is now a system of star-shaped public squares connected by streets and boulevards. Remains of the city fortifications (13th–14th centuries) have been preserved, as well as a baroque gate (18th century). Other structures of interest include the Gothic city hall (13th century), the Church of St. Peter and St. Paul (second half of the 15th century), and the Renaissance castle (begun 14th century, rebuilt 15th–early 17th centuries), as well as numerous houses and palaces in the Gothic, baroque, and classical styles.

[29–1602–4]

SZCZECINEK, a city in northwestern Poland, in Koszalin Województwo. Population, 34,000 (1976). Szczecinek is a railroad junction. It manufactures metal fittings, fiberboard panels, furniture, chemicals, food products, and linen. [29–1603–1]

SZCZECIN WOJEWÓDZTWO, an administrative and territorial unit in northwestern Poland, located near the Baltic Sea. Area, 10,000 sq km. Population, 854,000 (1976), including more than 70 percent urban dwellers.

Szczecin Województwo, the administrative center of which is the city of Szczecin, is an industrial and port region with a heavy agricultural sector. Approximately 100,000 persons are employed in industry (1974), three-fifths of whom are concentrated in Szczecin, the *województwo's* chief industrial center and port. The region produces ships, locomotives, various machines, cast-iron goods, and chemicals, mainly phosphate and other fertilizers and sulfuric acid. Food-processing enterprises produce sugar and fish, and wood products are manufactured. Industrial centers in addition to Szczecin include the cities of Police, Świnoujście Międzyzdroje, and Stargard.

More than one-fourth of the region's territory is covered with forest, predominantly pine and beech; 40 percent of the land is cultivated, and an additional 10 percent is used for growing hay. Crops include wheat, sugar beets, barley, rye, potatoes, and rape. Meat and dairy cattle are raised, as well as swine. Fishing is also important.

In 1976 the freight turnover of the seaports, Szczecin and Świnoujście Międzyzdroje, was 24.3 million tons. Coal is exported, while iron ore, phosphates, and grain are imported. Shipping is important along the Odra River and on the Stettin Lagoon, an inlet of the Baltic Sea. [29–1603–3]

SZCZEPAŃSKI, JAN. Born Sept. 14, 1913, in Ustroń. Polish sociologist. Member of the Polish Academy of Sciences (1964).

Szczepański became a professor at the University of Łodź in 1951. He was director of the Institute of Philosophy and Sociology from 1968 to 1975, and he became vice-president of the Polish Academy of Sciences in 1972. He was president of the International Sociological Association from 1966 to 1970.

Szczepański's principal works deal with the history and theory of sociology, the social structure of Polish society, and the sociology of higher education. Beginning in 1958 he directed the publication of *A Study of the Position of the Working Class and the Intelligentsia* (vols. 1–28, 1959–67). Szczepański received the State Prize of the Polish People's Republic First Class in 1974.

SZENWALD, LUCJAN. Born Mar. 13, 1909, in Warsaw; died Aug. 22, 1944, near Garwolin. Polish poet. Joined the Communist Party of Poland in 1932.

Szenwald studied at Warsaw University. He was first published in 1925. In 1926 he joined Kwadryga, a literary group whose poetic practice was characterized by social awareness, a tendency toward reflectiveness, and fidelity to the traditions of C. Norwid. In his works, which include poems, the narrative poem *Scene By a Brook* (1936), and radio dramas, Szenwald dealt with the social and political problems of his day. His literary manner reflected the traditions of the classics. Szenwald translated works by Shakespeare, P. B. Shelley, M. Gorky, and V. V. Mayakovsky.

SZERMENTOWSKI, JÓZEF. Born Feb. 16, 1833, in Bodzentyn, near Kielce; died Sept. 6, 1876, in Paris. Polish painter; representative of democratic realism.

Szermentowski studied in Warsaw with F. Kostrzewski in 1851 and 1852, at the School of Fine Arts from 1852 to 1857, and at J. Kossak's studio. He moved to Paris in 1860. Szermentowski painted melancholy, softly colored landscapes and genre landscape compositions marked by the influence of the Barbizon school; of particular interest are *Polish Village* (c. 1868, National Museum, Kraków) and *Village Church* (1870, National Museum, Poznań).

SZLACHTA, in several Central European countries, especially Poland and Lithuania, the principal segment of the ruling class in the feudal period. Originally the *szlachta* was a knighthood that constituted the lowest group of secular feudal lords. As it became consolidated into an estate between the 14th and 16th centuries, the lowest stratum of secular feudal lords, or nonheraldic *szlachta* (the *włodycy* in Poland and the *pantsirnye boiare*, or armored boyars, in the Grand Duchy of Lithuania), was excluded from it (*see* KOSZYCE PRIVILEGE OF 1374, NIESZAWA STATUTES OF 1454, RADOM CONSTITUTION OF 1505, and LITHUANIAN STATUTES).

As the *szlachta* gained political strength, the highest group of secular feudal lords, the magnates, was legally incorporated into it. Between the 16th and 18th centuries the state structure of the Polish-Lithuanian Commonwealth became that of a *szlachta* republic. The Polish *szlachta*, which included the categories of "land-starved" and "landless" *szlachta*, was relatively large in size: in the 16th century it made up 8 percent of the population as a whole and more than 20 percent of the population in Mazovia and Podlasie. The estate enjoyed a privileged and dominant status and was by tradition forbidden to engage in certain occupations, such as handicrafts and trade.

After the partitions of the Polish-Lithuanian Commonwealth in the 18th century, the *szlachta* was, as a rule, granted equal status with the nobility of Russia, Austria, and Prussia. Among the measures implemented by the tsarist government after the suppression of the Polish Uprising of 1830–31 was the "sorting out" of the *szlachta*, by which the members of the petty *szlachta* became *odnodvortsy* (single-homesteaders). The term *szlachta* (*šlechta*) is sometimes applied in historical literature to an estate of feudal lords in the Czech lands, in which the highest level was made up of the *páne* and the lowest consisted of the *zemane*.

I. S. MILLER [29–1308–4]

SZUBRAWCY (the Rogues), the humorous self-appellation of a literary and social circle of the Polish intelligentsia in Vilnius from 1816 to 1822.

The Szubrawcy published the satirical weekly *Wiadomości Brukowe* (Street News), in which, in the spirit of liberal enlightenment, they criticized obscurantism, the arrogance of the Polish gentry, and the blind imitation of foreign fashion. The circle adopted a ritual that parodied the rites of the Masons. The Szubrawcy maintained ties with the Philarets and Philomats, which were patriotic youth groups. The Szubrawcy disbanded after the authorities closed down their journal and as a result of persecution by the Masons and other organizations. [29–1519–1]

SZUJSKI, JÓZEF. Born June 16, 1835, in Tarnów; died Feb. 7, 1883, in Kraków. Polish political figure and historian.

Szujski was a member of an insurgent organization in Galicia in 1863; after the defeat of the Polish Uprising of 1863–64, he condemned the national liberation movement. One of the ideologists and leaders of the conservative party known as the Stańczyks, he became a deputy to the Galician *sejm* in 1867 and a member of the House of Lords of the Viennese Reichsrat in 1879.

Szujski became a professor of Polish history at the Jagiellonian University in 1869. In 1872 he was made secretary of the Academy of Sciences in Kraków. In his historical works Szujski was an apologist for strong monarchical authority and for the Catholic

Church; he glorified the expansionist policy of the feudal Polish-Lithuanian Commonwealth.

WORKS
Dzieła, vols. 1–20. Kraków, 1885–96. [29–1523–2]

SZUMKA (also *shumka*), a merry folk song and dance popular in Poland and in the western Ukraine. The *szumka* is performed in 2/4 time, in a tempo close to that of the *kolomyika*. It is also played as an instrumental piece, for instance, M. Zawadzki's piano arrangements. [29–1542–3]

SZWARCE, BRONISŁAW ANTONI. Born Oct. 7, 1834, on the estate of Lôchrist, near Dinan, France; died Feb. 18, 1904, in L'vov. Figure in the Polish and Russian revolutionary movements; journalist.

Szwarce, the son of an émigré who fought in the Polish Uprising of 1830–31, graduated from the Ecole Centrale des Arts et Manufactures in Paris in 1855; in 1860 he began working on the construction of the St. Petersburg-Warsaw railroad. In the summer of 1862 he embarked on a course of illegal activity. He became a member of the Central National Committee, the organization of the Reds, in which he sided with the left revolutionary-democratic wing as an advocate of radical agrarian reform and the establishment of an alliance with Russian revolutionaries.

On Dec. 11 (23), 1862, in Warsaw, Szwarce was placed under arrest, after having offered armed resistance. On May 19, 1863, he was condemned to death, a sentence that was commuted to life at hard labor. He spent about 30 years in prisons and in exile; until 1870 he was incarcerated at the Shlissel'burg Fortress. In 1881 he took part in the work of the Red Cross of the People's Will in Tomsk. In 1892, Szwarce went to Galicia, where he contributed to the democratic press and carried on a polemic with proponents of a conservative historical interpretation of the Polish Uprising of 1863–64.

SZYFMAN, ARNOLD STANISŁAW. Born Nov. 23, 1882, in Ulanów; died Jan. 11, 1967, in Warsaw. Polish stage director and theatrical figure.

Szyfman organized and headed the first literary cabaret in Warsaw, the Momus, in 1908. In 1913 he founded the Teatr Polski, serving as administrative director during the years 1915–18, 1939–45, and 1949–55 and as honorary director from 1957. He simultaneously headed Warsaw's Teatr Mały from 1918 to 1939 and directed the restoration of the Teatr Wielki from 1950 to 1965. His productions included Krasiński's *Iridion* (1913) and *The Undivine Comedy* (1920), Shaw's *Pygmalion* (1914), Shakespeare's *Hamlet* (1922, 1947), and Aeschylus' *Oresteia* (1947).

Szyfman staged scrupulously faithful versions of the classics, creating an artistic whole by harmoniously integrating all the expressive elements of a play. Szyfman brought together the best Polish actors in the companies he directed. He was the author of scholarly works and reminiscences about the theater.

SZYMANOWSKA, MARIA (née Wołowska). Born Dec. 14, 1789, in Warsaw; died July 25, 1831, in St. Petersburg. Polish pianist and composer.

Szymanowska studied piano under A. Lissowski and G. Gremm, and possibly composition under F. Lessel, in Warsaw. In the second decade of the 19th century she began giving concerts and composing. Beginning in 1815 she toured numerous Western European cities and Russia, where in St. Petersburg she received the title of court pianist in 1822; she subsequently appeared in Kiev, Moscow, L'vov, and Kremenets. In 1828 she took up residence in St. Petersburg, where she taught, composed music, and gave concerts; among those who visited her home were A. S. Pushkin and A. Mickiewicz, who was later to marry her daughter. Goethe, L. Cherubini, J. N. Hummel, and J. Field dedicated works to her.

A precursor of F. Chopin, Szymanowska contributed to the formation of a Polish national style. In her compositions, she made use of the musical idiom and rhythms associated with folk dances, and she created works in a variety of miniature piano genres: preludes, nocturnes, études, and dances. In her songs set to the lyrics of Polish and French poets, Szymanowska combined features characteristic of Polish music with the Western European lyric song, whose traditions she transformed to suit her purposes.

SZYMANOWSKI, KAROL. Born Oct. 6, 1882, in Timoshovka (Tymoszowka), in the Ukraine; died Mar. 29, 1937, in Lausanne. Polish composer, pianist, teacher, music critic, and figure in the music world.

Until 1900, Szymanowski studied at the school of his uncle G. V. Neigauz (Gustaw Neuhaus) in Elizavetgrad (now Kirovgrad). From 1901 to 1905 he studied music theory under M. Zawirski and composition under Z. Noskowski in Warsaw. In 1905 he became a member of the Publishing Society of Young Polish Composers, which was shortly thereafter renamed Young Poland in Music.

Szymanowski's oeuvre is divided by convention into periods that coincide roughly with World War I and with the establishment of the Polish state. His work was influenced not only by the musical cultures of Poland and Russia, particularly by F. Chopin, A. K. Liadov, and A. N. Scriabin, but by his encounters at various periods of his career with the music of R. Wagner, R. Strauss, C. Debussy, G. Mahler, and I. F. Stravinsky and with the culture of the Near East during trips to Algeria and Tunisia in 1914. In the first two decades of the century he gave concerts abroad, performing his own works for piano in composer's recitals; many of these piano pieces gained renown, notably the three poems for piano entitled *Métopes* (1905) and the Sonata No. 2 for Piano, both of which were also performed by G. G. Neigauz (Harry Neuhaus).

Other important works from Szymanowski's first, longest, and stylistically most diverse creative period are the *Concert Overture* (1905; revised version, 1912), the Symphony No. 2 (1910), several compositions for violin and piano, and songs set to the words of German and Polish poets and ancient poets of the Near East. He lived in Vienna from 1911 to 1914, when he undertook a journey through Italy and Sicily.

During his "war period," Szymanowski lived mainly in Timoshovka, which he left occasionally to give concerts in Kiev, Moscow, and Petrograd. The works from these years reflect his interest in Near Eastern poetry and philosophy. Using the coloristic discoveries of the French impressionist composers, he created a personal style that combined a rich tonal color and sumptuous orchestration with an ecstatic emotional expressiveness that recalls the music of Scriabin; these qualities are most evident in the Symphony No. 3 (*Song of the Night*; 1916), scored for solo voice, chorus, and orchestra and set to the words of the medieval Persian poet Rumi; *Mythes* (1915); *Masques* (1916), for violin and piano; the Sonata No. 3 for Piano (1916–17); the Concerto No. 1 for Violin (1916); the String Quartet No. 1 (1917); and the opera *King Roger* (1918–24; staged 1926 in Warsaw). In 1917 and 1918 he took part in concerts for workers and soldiers in Elizavetgrad.

In late 1919, Szymanowski took up residence in Warsaw, where he wrote a series of articles on the role of aesthetics and music criticism and on such composers as Chopin, Scriabin, Stravinsky, and M. Ravel. In 1920 and 1921 he toured the USA (including Florida) and Cuba with the violinist P. Kochański. In 1922 he took up residence in Zakopane, where he lived off and on for many years and where he studied the local musical folklore of the Podhale region.

In his last creative period, the "folkloric period" (1920–37),

Szymanowski made extensive use of national, primarily Góral, folk music, notably in the symphonic poem with singing and dancing *Harnasie* (1923–31; staged 1934 in Prague), which is based on the music of the Górals, and in the 20 mazurkas written between 1924 and 1926. From 1927 to 1929 and from 1930 to 1933 he taught; as rector of the Warsaw Conservatory he carried out a reform of music education. From 1933 to 1936 he toured Scandinavia and Europe and appeared in Moscow and Leningrad. From 1928 to 1930 and in 1936 and 1937 he underwent medical treatment in Austria and Switzerland.

Szymanowski's late works exhibit a marked tendency toward greater melodic and harmonic clarity, simplicity of style, and transparency of orchestration; at the same time the composer achieved original harmonic and tonal effects by combining modern compositional techniques with elements of national folk music. Works of this final period include the *Stabat Mater* (1926), the Concerto No. 2 for Violin (1933), *Six Kurpian Songs* (1929 and 1932), and the *Symphonie Concertante for Piano* (1932).

Szymanowski, the greatest Polish composer of the 20th century, laid the foundations of the modern Polish school of composition.

SZYMONOWICZ, SZYMON (also Szymonowic; in Latin, Simonedes). Born Oct. 24, 1558, in Lwów; died May 5, 1629, in Czarnięcin, near Zamość. Polish poet.

Szymonowicz studied at the Kraków Academy (the University of Kraków). His works, which are in Polish and Latin, include panegyrics, dramas, odes, hymns, and epithalamiums. His cycle *Eclogues* (*Sielanki*; 1614, reprinted 1626, written in the form of a dialogue), imitated classical models to a certain extent; however, they are filled with references to everyday Polish life and reveal the influence of local oral folk poetry. In the idyll *The Reapers*, which A. Mickiewicz considered typically Polish and highly truthful, Szymonowicz portrayed the burden of forced peasant labor.

SZYSZKOWSKI, BOGDAN. Born June 20, 1873, in Tribukhi, in what is now the Ukrainian SSR; died Aug. 13, 1931, in Myślenice. Polish physical chemist. Member of the Polish Academy of Sciences (1929).

Szyszkowski graduated from the University of Kiev in 1896 and joined the staff of the university in 1907. In 1920 he became a professor at the Jagiellonian University in Kraków. Szyszkowski's principal works deal with colloidal chemistry and the theory of solutions. In 1908 he experimentally established the connection between surface tension and the concentration of aqueous surfactants. This relationship is expressed by the Szyszkowski equation.

[29–1249–4]

TAMPING MACHINE, a track machine for tamping the ballast layer of a track superstructure. There are both cyclic and continuous-action types. Cyclic tampers, mounted on railroad car frames, pack the ballast layer separately beneath each tie. They operate by means of 16 or 32 vertical tamping arms that oscillate simultaneously through the action of an eccentric shaft and that close and open by pairs through the action of a squeezing mechanism (see Figure 1). An internal-combustion engine with a hydraulic drive is used to turn the eccentric shaft and squeezing mechanism. The oscillating arms of the machine dig into the ballast layer beneath the tie being tamped and close, thus pressing the ballast underneath; they then draw apart and lift up, and the machine moves on to the next tie. The tamping cycle takes 6–8 seconds. Such machines can tamp up to 700 ties per hr. Cyclic tamping machines that tamp two ties simultaneously have also been developed. They can handle up to 2,000 ties per hr.

Modern tamping machines are equipped with automatic aligning systems. The system consists of a spotlight or laser and a photodetector. The spotlight or laser is mounted on a cart up to 150 m in front of the tamping machine and directs a beam of light toward the machine; the photodetector is connected to the track being aligned. The rails and ties are raised until the beam strikes the photodetector.

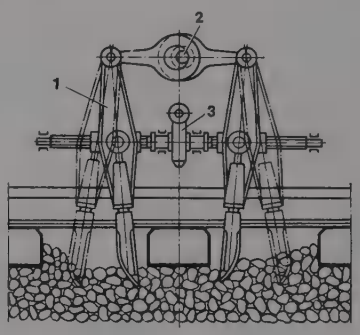

Figure 1. Diagram of the working element of a tamping machine: (1) tamping arm, (2) eccentric shaft, (3) squeezing mechanism

The working elements of a tamping machine designed for continuous operation are mounted on a railroad car frame or crawler chassis; they consist of wedge-shaped tamping plates equipped with internal vibrators and suspended on springs. The ballast layer is tamped by the vibration and by the wedge shape of the plates moving parallel to the faces of the ties. Aligning-tamping-finishing machines operate on the same principle to perform the entire cycle of jobs automatically—aligning the tracks, tamping the ballast layer, and grading and packing the ballast slopes. Such machines have electromagnets and hydraulic cylinders that grab, raise, and shift the rails and ties in order to lay them in the necessary position. The model VPO-3000 aligning-tamping-finishing machine can work up to 3 km of track per hr.

Manual tamping machines with pneumatic or electric vibrators are used for small jobs. S. A. SOLOMONOV [29–1387–1]

TAXIC COLLECTOR (Russian, *eklektor*), a device designed to collect and count invertebrates (mainly, small arthropods) that inhabit the soil or other substrate. The working principle is based on the use of the various taxes characteristic of the animals.

A taxic collector consists of a sieve located inside a funnel. Soil is placed in the sieve, and a vessel is positioned below the funnel. Animals moving downward from the upper soil layers fall into the vessel as a result of their response to light, desiccation, or elevated temperature. Taxic collectors may be designed specifically to operate on the principle of phototaxis, hydrotaxis, thermotaxis, or all three. They are used both in laboratories and in the field, especially in investigations conducted at a fixed location. A phototaxic collector in the shape of a box is used for the collection and counting of insects on the surface of the soil and on plants; the insects crawl into an illuminated test tube attached to the box.

[29–1767–3]

TCHADANTHROPUS, the name of a fossil primate, the bones (skull fragments) of which were discovered in 1961 by

Y. Coppens in the Djourab Desert in the northern part of the Republic of Chad. The position of *Tchadanthropus* in the classification of primates is unclear; some anthropologists classify it as *Australopithecus*, while others classify it as *Pithecanthropus*. *Tchadanthropus* is possibly about 1.5 million years old.

TCHAIKOVSKY, PETR IL'ICH. Born Apr. 25 (May 7), 1840, in a settlement by the Kamsko-Votkinsk Plant, Viatka Province (now the city of Votkinsk, Udmurt ASSR); died Oct. 25 (Nov. 6), 1893, in St. Petersburg. Russian composer.

The son of a mining engineer, Tchaikovsky studied at the St. Petersburg School of Jurisprudence from 1850 to 1859 and served in the Ministry of Justice from 1859 to 1863. In 1861 he began attending the music classes at the St. Petersburg branch of the Russian Society of Music; the classes were reorganized as the St. Petersburg Conservatory in 1862. Tchaikovsky studied theory under N. I. Zaremba and composition under A. G. Rubinstein and graduated with honors from the conservatory in 1865.

From 1866 to 1878, Tchaikovsky was a professor at the Moscow Conservatory, where he taught composition, harmony, and orchestration; among his students was S. I. Taneev. Needing instructional materials, he translated several works on music theory and wrote a textbook, *Guide to the Practical Study of Harmony* (1872).

Tchaikovsky's first works of music criticism were published in 1868. As music reviewer for the Moscow newspapers *Sovremennaia letopis'* and *Russkie vedomosti* from 1871 to 1876 he fought in behalf of realism in Russian music. Tchaikovsky's artistic and social interests led to friendships with N. G. Rubinstein and the critics N. D. Kashkin and G. A. Larosh; he also became acquainted with L. N. Tolstoy, A. N. Ostrovskii, and actors at the Malyi Theater, notably P. M. Sadovskii. His links with progressive artistic and ideological trends of the 1860's were fostered by contacts with members of the Russian Five during private trips to St. Petersburg.

Tchaikovsky began to flourish as a composer in his Moscow period, from 1866 to 1877, during which he composed the Symphony No. 1 (*Winter Daydreams*, 1866), the Symphony No. 2 (1872; revised version, 1879), and the Symphony No. 3 (1875) and began work on the Symphony No. 4. In addition, he composed several program works for orchestra, including the fantasy overture *Romeo and Juliet* (1869; second version, 1870; third version, 1880) and the symphonic fantasies *The Tempest* (1873) and *Francesca da Rimini* (1876).

During this period Tchaikovsky also wrote the Concerto No. 1 for Piano (1875); *Sérénade mélancolique*, for violin and orchestra (1875); *Variations on a Rococo Theme*, for cello and orchestra (1876); and three string quartets (1871, 1874, and 1876). Other important works from the Moscow period are the operas *The Voyevoda* (1868), *Undine* (1869, destroyed by Tchaikovsky in 1873), *The Oprichnik* (1872), and *Vakula the Smith* (1874; second version entitled *Cherevichki*, 1885), the ballet *Swan Lake* (1876), incidental music to A. N. Ostrovskii's play *The Snow Maiden* (1873), art songs, and compositions for piano, including the cycle *The Seasons* (1876). In addition between 1868 and 1872 he transcribed for piano duet 50 Russian folk songs from the collections of K. P. Vil'boa and M. A. Balakirev and edited a collection of Russian songs compiled by V. P. Prokunin.

In the fall of 1877, Tchaikovsky traveled abroad, where he continued to work on the Symphony No. 4 (1876–77) and the opera *Eugene Onegin* (1877–78), which was staged at the Moscow Conservatory in 1879 through the efforts of the conservatory's students and at the Bolshoi Theater in 1881. The financial support of N. F. von Meck, whom Tchaikovsky never met but with whom he carried on an extensive correspondence between 1876 and 1890, enabled him to devote full time to composition. Until 1885 he lived alternately abroad—in Switzerland, Italy, and France—and in Russia, usually with his sister A. I. Davydova at the estate of Kamenka in the Ukraine.

Works of this second period include the operas *The Maid of Orleans* (1879) and *Mazeppa* (1883), the cantata *Moscow* (1883), the *1812 Overture* (1880), *Capriccio italien* (1880), three orchestral suites (1879, 1880, and 1883), the Concerto for Violin (1878), the Piano Trio (1882, dedicated to the memory of N. G. Rubinstein), the Piano Concerto No. 2 (1880), and the Piano Sonata in G major (1878). These works show the diversity of Tchaikovsky's creative interests and his mastery of a wide range of styles and genres.

After 1885, Tchaikovsky took up residence near Moscow, moving to Klin in 1892. Once again he became active in the music world. He was often in Moscow and St. Petersburg, and he took part in the musical life of those cities, especially in the activities of the Russian Society of Music—he was elected director of the society's Moscow branch in 1885—and the Moscow Conservatory. The premiere of the opera *Cherevichki* in 1887 at the Bolshoi Theater marked the beginning of his career as a conductor, which lasted until 1893. Although he conducted mainly his symphonic works, he also conducted his operas in Russia and abroad. His work was highly regarded; in 1892 he was elected a corresponding member of the French Académie des Beaux-Arts, and in 1893 Cambridge University awarded him an honorary doctorate in music.

Tchaikovsky composed a number of remarkable works between 1885 and 1893 in which tragic themes, as in the operas *The Sorceress* (1887) and *The Queen of Spades* (1890), the program symphony *Manfred* (1885), the Symphony No. 5 (1888), and the Symphony No. 6 (*Pathétique*, 1893), alternate with scores in which light and joy triumph, as in the ballets *The Sleeping Beauty* (1889) and *The Nutcracker* (1892), the opera *Iolanta* (1891), and the orchestral suite *Mozartiana* (1887).

Tchaikovsky's music, a landmark in realistic art, constitutes together with the works of A. S. Pushkin, L. N. Tolstoy, and A. P. Chekhov one of the supreme achievements of Russian culture. Tchaikovsky and the leading members of the Russian Five make up the pleiad of classic Russian composers who are the legitimate successors to the traditions of M. I. Glinka. Central to Tchaikovsky's work, which often reached genuinely tragic heights, was the theme of man's fierce struggle for the right to happiness. A sensitive lyric psychologist, he offered profound insights into man's inner world.

Tchaikovsky was deeply interested in the masterpieces of Dante, Shakespeare, Pushkin, Byron, N. V. Gogol, and A. N. Ostrovskii, as well as the events and color of various historical periods; he also found his subject matter in scenes from the life of the people, a wide variety of human characters, images of nature, the romantic atmosphere of fairy tales, and the child's view of the world. At the same time, he always concentrated on his own feelings, which he expressed with unparalleled accuracy.

Tchaikovsky made use of the rich store of artistic devices to be found in the great musical classics, but the primary source of his richly melodic musical language, which was not only strikingly democratic but innovative in its lyric and dramatic power, was the Russian folk song—particularly the folk chorus—and the Russian popular art song. Tchaikovsky embodied moods, characters, and philosophic reflections in their dialectically complex, and often contradictory, continuous unfolding and development against a broad, pictorial background suffused with a life-affirming enthusiasm.

One of the greatest of symphonic composers, Tchaikovsky is a worthy successor to L. van Beethoven. His symphonic thought is clearly revealed in a variety of works in his extensive and multifaceted legacy, in which vocal and instrumental genres continually enrich one another, especially the operas and symphonies. Of the ten operas, those based on the works of Pushkin deserve a special place. In *Eugene Onegin*, which contains lyric scenes and constitutes a new type of opera, the composer realized his ideal of an "intimate but powerful drama." *The Queen of Spades*, a vocal-symphonic tragedy, is matchless in its psychological profundity.

Tchaikovsky's orchestral works, both program and nonprogram compositions, are distinguished by their significant content and, at the same time, accessibility of expression. The last three symphonies are true "instrumental dramas." Tchaikovsky's three ballets, into which he introduced the principles of the symphonic drama, mark a new stage in the history of the ballet. His concerti

(particularly the First Piano Concerto), chamber works, and numerous (104) art songs have achieved popularity.

The great humanistic art of Tchaikovsky, which has inspired many composers of the late 19th and the 20th centuries, has been an inexhaustible source of lofty realistic traditions for progressive musical art. The music of Tchaikovsky has achieved world renown. The Moscow and Kiev conservatories, the theater of opera and ballet in Perm', and a concert hall in Moscow have been named in honor of Tchaikovsky. The international Tchaikovsky Competition has been held in Moscow since 1958. There are Tchaikovsky museums in Klin and Votkinsk; a museum of Pushkin and Tchaikovsky is located in Kamenka.

TEA AND SUBTROPICAL CROPS, INSTITUTE OF (full name, All-Union Research Institute of Tea and Subtropical Crops; VNIIChiSK), the center for the coordination of work on the technology of the cultivation of tea, citrus fruits, and other tropical crops in the USSR. The institute is under the jurisdiction of the Ministry of Agriculture of the USSR. It was founded in 1930 in the settlement of Anaseuli, Makharadze Raion, Georgian SSR.

As of 1976 the institute included departments of breeding, agrochemistry, agronomy, pedology, reclamation and microbiology, mechanization, the economics and organization of production, plant protection and agroecology, and agrometeorology. There is also a department of standardization, patenting, and scientific and technical information. The institute has laboratories of the physiology and biochemistry of plants, industrial biochemistry, radioactive research, and vegetative propagation of tea. There are branches in Sukhumi, Chakva, and Zugdidi. Also affiliated with the institute are the Kolkhida Experiment Station and the Imeretin, Adygei, and Adzhar experimental fields.

The Institute of Tea and Subtropical Crops develops and perfects the cultivation and propagation of tea and subtropical crops. It also develops new varieties. As of 1976 the following tea varieties developed at the institute were regionalized: Gruzinskii 1, Gruzinskii 2, Zimostoikii, Urozhainyi, and Kolkhida. Graduate courses are offered both at the institute and through the mail. The institute has published the journal *Subtropicheskie kul'tury* (Subtropical Crops) since 1939.

The Institute of Tea and Subtropical Crops was awarded the Order of the Red Banner of Labor in 1967.

V. E. DZHAKELI [29–113–3]

TEA-CLEANING MACHINE, a stationary machine that is used to remove foreign matter from harvested tea leaves.

The ChP-300 tea-cleaning machine is used on tea plantations in the USSR. In the machine, tea leaves from a hopper are fed by a loading conveyor to a cleaning conveyor. Foreign matter is then removed by an airflow produced by a fan and is dumped into a waste bin. The remaining mass is conveyed to mesh drums and, after sifting, is packaged. Unsifted tea leaves are conveyed from the drums to another waste bin.

The ChP-300 tea-cleaning machine is driven by a 1.5-kilowatt electric motor and a 1.7-kilowatt electric motor. It has an output of 0.3 ton/hr and is operated by one worker. [29–15–2]

TEA INDUSTRY, a branch of the food-processing industry for the production of loose and pressed teas from leaves of the tea plant.

The cultivation of tea was introduced into Russia in the 1840's in Georgia. In 1913, five tea factories were operating in Georgia and produced 131 tons of loose tea. The tea industry underwent considerable development in Georgia after the establishment of Soviet power. A large number of tea factories were constructed in the period of the five-year plans prior to World War II. In addition to loose black tea, the major product, the production of loose green and brick green teas was initiated.

The tea industry in the USSR maintains plants for the primary processing of tea leaves and for the packaging and pressing of natural tea. Factories for the primary processing of tea leaves are concentrated in three Soviet republics, namely, the RSFSR (Krasnodar Krai), the Georgian SSR, and the Azerbaijan SSR. In 1975, Georgia accounted for up to 95 percent of the total tea leaf harvest (see Table 1).

Table 1. Development of the tea industry in the Georgian SSR

	Number of primary processing plants	*Tea production (thousand tons)*
1940	34	8.8
1950	42	20.2
1960	65	38.2
1970	77	63.9
1975	84	82.5

Packaged tea under brand names is produced at 11 tea-packaging plants in the USSR (see Table 2). Tea production in 1975 at the largest plants was (in thousand tons) 16.5 at the Lenin Moscow Tea Factory, 13.4 at the Riazan' plant, 13.6 at the Irkutsk plant, 20.0 at the Samarkand plant, and 19.8 at the Tbilisi plant.

In 1975 loose black tea accounted for 90,000 tons of the total tea production, loose green tea accounted for 31,170 tons, and black brick tea accounted for 7,970 tons. In addition, 10,000 tons of green brick tea were produced. The annual per capita production of tea grew significantly between 1965 and 1975: from 366 g to 580 g, including an increase in packaged brand tea from 312 g to 507 g.

Table 2. Production of packaged brand-name tea in the USSR
(thousand tons)

1940	21.95	1970	87.50
1960	62.40	1975	129.18

An important feature of the tea industry in the USSR is the high degree of mechanization (80 percent in 1975) of the primary processing of tea leaves, especially in the drying and rolling stages, which require the most labor. Labor productivity in the industry increased by 25 percent during the ninth five-year plan

(1971–75). The first stage in developing production lines for rolling tea leaves was completed, and a radically new technology for processing tea leaves by rapid freezing—which significantly reduces the production cycle time—was developed. Technologies for the production of black and green instant teas and tea dyes and a stalk-removal machine for improving the appearance and quality of tea were developed. Tea-packaging factories were equipped with highly efficient, new automatic tea packers. The production of tea in packages for single-cup brewing has been introduced. The production of a yellow-colored tea with enhanced physiological benefits was begun in 1977. The average unit output of a tea-leaf-processing factory has reached 5,000 tons per year of raw material.

The world production of tea (excluding the USSR) in 1974 was more than 1.5 million tons. In addition to the leading tea-producing countries, such as India, Sri Lanka, and the People's Republic of China—where tea has been a traditional export item for many centuries—tea production developed rapidly in the 1970's in the African countries of Kenya and Uganda and in Vietnam, where tea factories have been built with the assistance of the USSR.

In 1974 tea production (in thousand tons) was 492 in India, 318 (estimate) in the People's Republic of China, 204 in Sri Lanka, 102 in Japan, 53 in Kenya, and 51 in Indonesia.

L. A. GOLUBEVA [29–30–3]

TEAL, the common name of about 20 species of small river ducks of the genus *Anas*. Teals are found everywhere except the polar regions. Many species are migratory.

There are four species in the USSR. The best known are the common, or green-winged, teal (*Anas crecca*) and the garganey, or garganey teal (*A. querquedula*). The Baikal teal (A. formosa), which is hunted intensively during its period of migration, is found in Siberia east of the Enisei, while the marbled teal (*A. angustirostris*) is found only in Middle Asia and Transcaucasia. All teals prefer shallow standing waters. They nest in meadows and forest clearings. The female lays eight or nine eggs, which are incubated for about three weeks. [29–616–6]

TEA-LEAF PLUCKER, MECHANICAL, a mounted or self-propelled machine that is used to pick mature flushes of leaves from rows of tea plants.

In the USSR, efforts at the development of mechanical tea-leaf pluckers were begun in 1930. The first Soviet mechanical tea-leaf plucker, which had a mower-type cutting bar, was drawn by a tractor or a horse. A trailer-type pneumatic tea-leaf plucker, which was powered by a motor mounted on it, was developed in 1951. Lot production of the ChSN-1.6 mechanical tea-leaf plucker, or the Sakartvelo, was inaugurated in 1963.

Intended for use in level areas or on slopes of up to 8°, the ChSN-1.6 mechanical tea-leaf plucker moves along rows of tea plants. The operating elements of the plucking device, which are controlled by an hydraulic servomechanism, are inserted into the crown of a tea bush to the required depth. Elastic inserts of blades that move back and forth "feel" for shoots and find the most brittle place for breaking off the shoots. The shoots to be picked are bent between the rigid supports of fixed blades and the elastic inserts of the moving blades and are plucked. Highly developed shoots, whose brittle part lies above the zone in which the inserts operate, are cut by pruners. The plucked leaves are fed through an air duct and flexible tubing to screen conveyors by means of an airflow produced by a fan and are discharged into receiving bins. The operating elements are driven by a power take-off shaft and by the hydraulic system of the tool carriage. The ChSN-1.6 mechanical tea-leaf plucker picks up to 90 percent of a mature flush. Its operating capacity is 0.2 hectare/hr at a speed of 1 km/hr.

The ChA-650/900 mechanical tea-leaf plucker is used on steep slopes (up to 16°). The plucking device is mounted on a tricycle carriage so that the device remains upright when it moves across a slope; it is equipped with a reel having rubber vanes. The rubber vanes bend the shoots under the cutting blade. The shoots are then pressed against picking rollers and are cut, fed to a conveyor, and discharged into a bin. Pins equipped with capron threads are fastened beneath the cutting blade. The pins deflect immature shoots so that they are not cut. The ChA-650/900 mechanical tea-leaf plucker picks up to 98 percent of a mature flush. Its capacity is 0.2 hectare/hr. [29–16–2]

TEA MOTH (*Parametriotes theae*), a moth of the family Eupistidae (according to other classifications, Coleophoridae or Tineidae).

The moths have lanceolate wings with pointed tips. The front wings have two round dark brown spots, and the hind wings are edged with a long fringe. The wingspread is 9.5–11 mm. The moths fly in July and August. They are active at night; during the day they rest immobile on the shoots of the tea plant. The eggs (60 or 70) are deposited in groups of two to five on leaf stalks or in cracks in the branches. The larvae hatch in ten to 15 days, gnawing their way into the cortex of the tea shrub and making tunnels through it. They feed on the parenchyma, and in the winter they live in the leaves. In the spring the larvae crawl out onto the shoots and gnaw passageways in them. Pupation occurs in late May.

Tea moths are found in Transcaucasia. They are harmful to the tea plant, causing infested shoots to die. Control measures include removing and burning the affected leaves and shoots.

[29–30–2]

TEA PRUNER, a machine that is used to prune tea plants in order to promote the development of shoots and to form rows of plants that are suitable for the mechanical picking of tea leaves.

Mounted tea pruners equipped with a pruning device having a segmented cutter are used on tea plantations in the USSR. Such a tea pruner may be mounted on a tractor, on a tool carriage, or on a mechanical tea-leaf plucker. Three types of tea pruners are used in the USSR. The first type, such as the ADV-1.3, cuts the tips of the shoots, shortening height by 5 cm. The second type—for example, the BShP-1A—forms rows 60–80 cm wide and 50–70 cm high and shapes the crowns of tea bushes into semiovals by cutting the bushes from the top and the sides. The third type, such as the APP-600A, is used to condition tea plantations by pruning tea plants to a height of 40–45 cm from the root collar.

Tea pruners can prune 0.08–0.13 hectare of tea plants per hour. [29–16–1]

TECHNICAL DRAWING (in Russian, *chertezh*), a scale projection of objects presented on some information carrier, such as standard or tracing paper, film, or a type of veneer, by means of graphic forms—points, segments of straight and curved lines, symbols, standard designations, and the like. Technical drawings may be used as illustrations to a text (to explain material to be learned) or as documentation for the manufacture of goods. They may be accompanied by explanatory notes, specifications, and instructions for manufacture of the article (when necessary) and may take the form of mechanical drawings, sketches, or diagrams. [29–327–1]

TENEBRIONIDAE, a family of beetles of the suborder Polyphaga. Members of the family may be tiny (body length, 2 mm) or quite large (50 mm). They are usually black, sometimes brown or brightly striped or spotted; in rare cases they may be white or have a metallic sheen. The body may be spherical or rod-shaped. The feet of the anterior and median legs are five-segmented, and those of the posterior legs are four-segmented. The beetles do not fly, and most species lack a posterior pair of wings. Because the larvae are cylindrical, hard, and usually yellow, resembling wireworms, they are referred to as false wireworms. They feed on the rootlets of plants. The adult beetles are polyphagous. Many species of Tenebrionidae excrete pungent defensive fluids. They are usually nocturnal or crepuscular.

The family consists of approximately 17,000 species, which are distributed over the entire globe except the polar regions. They are especially numerous in steppes and deserts, as well as in forests. The USSR has more than 1,000 species, which are mainly encountered in Middle Asia, Kazakhstan, and the Caucasus. Larval and adult representatives of some species damage crops and

pasture plants. Others damage food stores, developing in grain, flour, and flour products; these include the darkling beetles *Tenebrio molitor* and *T. confusum*.

REFERENCE

Medvedev, G. S. *Zhuki-chernotelki (Tenebrionidae). Podsemeistvo Opatrinae*. Leningrad, 1968 (*Fauna SSSR. Zhestkokrylye*, vol. 19, no. 2.) O. L. KRYZHANOVSKII [29–303–4]

TENON (in Russian, *ship*), a projection on the end or lateral surface of a part, designed to be inserted into a recess or groove of corresponding shape and dimensions in another part. It can be used to effect a permanent or temporary joining of the parts. A tenon may be in one piece with an article, or it may be a separate insert (as a dowel). Joints made by a mortise and tenon are most often used in the manufacture of wooden structural elements (windows, doors, and the like), furniture, crates, and casting patterns. In machine building, end and face journals (pivots) are analogous to tenons; they usually have a cylindrical, conical, or spherical shape. [29–1214–3]

TENONING MACHINE, a woodworking machine for making tenons and lugs on parts to be joined in woodworking enterprises.

Machines may be designed to fashion frame or box tenons. On some machines the tenons are cut on one end of the workpiece with each operating cycle (single-side machines); in others tenons are cut simultaneously on both ends during one cycle (double-side machines). Machines of the first type operate in steps; those of the second type feature straight-through operation. Machines for fashioning box tenons can form both straight-sided and dovetail tenons. Straight-sided tenons are formed by ordinary milling-type planers mounted on the machine spindle; dovetail tenons are formed by end-milling planers mounted on vertical spindles. On double-side box-tenoning machines, the operating cycle is a combination of the step and straight-through formats: the ends of the workpieces are filed to size as the workpiece is moved, and the tenons are formed as the workpiece is held stationary. Frame tenons are cut on both types of machines.

On a single-side tenoning machine the workpiece is secured to the machine table, which executes a reciprocating motion; on double-side machines the workpiece is held by special chains and supports that execute continuous translatory motion. The workpiece is first cut to the necessary dimensions, and then the tenons or lugs are fashioned.

Tenoning machines have rigid, cast frames, tables with clamping mechanisms, and special columns on which are mounted tool heads with saws, milling-type cutters, or lug-cutting disks. The spindles rotate at speeds ranging from 3,000 rpm (on machines for straight-sided and frame tenons) to 9,000 rpm (on machines for dovetail box tenons).

REFERENCE

Derevoobrabatyviushchee oborudovanie: Katalog-spravochnik. Moscow, 1972. N. K. IAKUNIN [29–1218–4]

TENTACLE, a movable outgrowth on the bodies of coelenterates, mollusks, annelids, bryozoans, brachiopods, pogonophores, pterobranchs, and other invertebrates. Tentacles are usually located at the front end of the body and serve to capture food; sometimes they are involved in respiration and palpation. In coelenterates the tentacles abound in stinging cells. In gastropods they are used for palpation and olfaction, while in cephalopods they are used for capturing prey and for locomotion. [29–1620–1]

TENTACULATA (also Lophophorata or Podaxonia), a phylum of invertebrates. The Tentaculata are predominantly sessile marine animals. They are characterized by bilateral symmetry of the body, a secondary body cavity divided into two or three sections, a U-shaped intestine, and a highly developed tentacular apparatus that directs food particles to the mouth. The phylum comprises three classes: Phoronidea, Bryozoa, and Brachiopoda, which are considered by some taxonomists as independent phyla (*see* PHORONIDAE; BRYOZOA; and BRACHIOPODA). [29–1620–2]

TESTUDINATA, a subclass of reptiles. Testudinates are characterized by a body covered with a shell consisting of a convex dorsal portion (carapace) and a flat ventral portion (plastron). The two portions are rigidly connected on either side by a bridge of bone or freely connected by skin. The shell consists of dermal ossifications, as well as of enlarged ribs and riblike processes of the vertebrae. The clavicles and sternum are part of the plastron. The bony elements of the shell are called plates. In most testudinates they are covered with horny scutes and only in soft-shelled turtles and in the leatherback are they covered with skin.

In land tortoises the carapace is highly arched (rounded or parabolic in cross section) and can bear substantial loads, either evenly distributed or concentrated and percussive. In freshwater and marine species, it is flattened (elliptical) and "streamlined." The plastron in these testudinates is partially reduced or is segmented into mutually mobile parts, which increases the freedom of movement of the legs, head, and tail. The flattening and lightening of the shell is often compensated by the proliferation of nodular protrusions and "stiffening ribs" on the surface of the carapace, which strengthen it. The cranium is of the armored type (pseudostegalian structure) in living marine species; in the rest of the testudinates it has a false temporal arch (pseudapsidal type).

The testudinates have no teeth; the jaws are covered with horny plates, which form a semblance of a bill. The unique structure of the cervical vertebrae, which differ in shape, ensures great mobility of the neck. When a testudinate hides its head under the shell, the neck retracts either in a vertical plane (S-necked type) or in a horizontal plane, that is, sideways (side-necked type). There are usually few caudal vertebrae (the tail is somewhat longer in freshwater species). Development of the shell has resulted in the transfer of the girdles of the extremities beneath the ribs, an exceptional occurrence in vertebrates. In freshwater species the extremities are more mobile and have webbed digits. In sea turtles the legs have been modified to flippers, with the anterior ones being longer than the posterior ones.

The presence of a shell has considerably affected the internal structure of testudinates. The musculature of the trunk is partially reduced, while on the extremities and in the neck region it is considerably developed. Owing to the absence of costal respiration, air is "swallowed" by means of the sublingual apparatus, partially owing to movements of the extremities. In freshwater species gas exchange is partially effected by means of special anal sacs opening into the cloaca. Soft-shelled turtles have cutaneous respiration, a rare phenomenon in reptiles. The level of basal metabolism is low, and the intensity of metabolism is weak. In excretion, urea is principally discharged, and consequently the urinary bladder is large (in most other reptiles uric acid is primarily excreted; the urinary bladder is absent in many). The brain and the principal receptors are poorly developed.

Testudinates vary considerably in size. The largest living representatives are the sea turtles (the leatherback is up to 2 m long). In more ancient times, testudinates attained a length of 3 m.

Testudinates are descended from one of the branches of the oldest terrestrial reptiles—Cotylosauria. In the course of evolution, many became adapted to life in continental waters and seas. Testudinates are reliably known from the Triassic, although their appearance as early as the end of the Paleozoic cannot be excluded. They flourished from the second half of the Mesozoic to the end of the Neogene. Many genera and families were distributed more widely in past geological eras than today. For example, soft-shelled turtles, side-necked turtles, snapping turtles, and elephant tortoises once inhabited Europe; today they are preserved only on other continents. The majority of living testudinates inhabit tropical and equatorial latitudes.

Living testudinates are classified in five orders: Cryptodira, Pleurodira, Trionychoidea, Chelonioidea, and Dermochelidae. The order Dermochelidae has one species, the leatherback, which is sometimes classified in the order Chelonioidea. There are more than 210 species of living testudinates; terrestrial and freshwater species are found on all continents except Antarctica and on many large islands. There are seven species in the USSR: the European pond tortoise (*Emys orbicularis*), *Mauremys caspica*, the spur-thighed tortoise (*Testudo graeca*), *Agrionemys horsfieldi*, and the spiny soft-shelled turtle (*Trionyx sinensis*),

which are land tortoises, and the loggerhead (*Caretta caretta*) and the leatherback (*Dermochelys coriacea*), which are sea turtles.

Some testudinates live only on land (43 species), where some have adapted to digging burrows. Sea turtles, of which there are five species, live in the ocean, except during the reproductive period. The majority of living testudinates are semiaquatic, inhabiting rivers, lakes, marshes, and desalinated bays. During the cold or dry seasons, testudinates may fall into a torpor (winter and summer hibernation), enabling them to survive unfavorable weather conditions. Terrestrial species are basically herbivorous, while marine species are primarily so. Freshwater species feed mainly on other animals, such as fish, amphibians, and invertebrates. Testudinates can do without food for several months at a time. They usually mate on land, where they also lay their eggs (one to several hundred), which are buried in the ground. Some species lay eggs up to three or more times a year. The spherical or elliptical eggs are covered in most species with a limestone shell; in marine and some freshwater species they are covered with a leathery shell. The incubation period is two to three months. Sexual maturity is attained not earlier than two to three years of age. The males are usually smaller than the females; they have a slightly concave plastron, which may be a little higher than the carapace. Growth in testudinates is unlimited, slowing down considerably with the onset of sexual maturity. The life-span is several decades, with some species living more than 100 years.

A number of species are hunted; these are mainly sea turtles and a few freshwater species, more rarely terrestrial species. The flesh, fat, eggs, and sometimes the horny scutes are used, the last for various clothing accessories. There are farms for breeding and fattening turtles. Some freshwater species cause minor damage to the fishing industry; land tortoises damage agricultural crops. Many species are protected; in the USSR all land-tortoise species and the freshwater spiny soft-shelled turtle are protected. (*See* CRYPTODIRA; PLEURODIRA; TRIONYCHOIDEA; CHELONIOIDEA; and LEATHERBACK.)

TETRAODONTIDAE (puffers), a family of fish of the order Plectognathi (or Tetraodontiformes). The fused jaw bones form plates that resemble four teeth. The skin is covered with spines or is naked. The pelvic fins are absent, and the pectoral fins are well developed, allowing the Tetraodontidae to move backward as well as forward. The stomach has saclike outgrowths that, when filled with air or water, make the fish resemble prickly balls.

The family comprises 19 genera, with more than 90 species. The Tetraodontidae are distributed in subtropical and tropical seas. There are four freshwater genera, including the most common genus *Tetraodon*. The meat of the Tetraodontidae is very tasty and is highly prized in the countries of the Far East. The skin, peritoneum, liver, and gonads are poisonous.

TETRAXONIDA, an order of marine sponges of the class Demospongiae. The Tetraxonida live in colonies or singly in oceans of primarily the temperate and warm belts at depths of about 100–400 m. The body is spherical, oval, or pillow-like; sometimes it is in the form of a shallow goblet. Frequently it is very strong and rigid and is 0.5 m and more in height. The skeleton usually consists of four-rayed siliceous spicules distributed radially within the body of the sponge, with an angle of 120° between the rays. The canals penetrating the walls of the body (canal system) are of the leuconoid type. There are about 1,500 known species of Tetraxonida, of which more than 50 are found in the seas of the USSR. The most common representatives are members of the genera *Suberites, Polymastia, Tetilla*, and *Geodia*.

V. M. KOLTUN [29–361–4]

TEUFELSBRÜCKE, a bridge over the Reuss River in Switzerland across which Russian troops fought their way on Sept. 14 (25), 1799, in the course of Suvorov's Swiss Campaign of 1799. The road that ran along the Reuss from the village of Urseren to the bridge passed through a narrow (about 3 m) tunnel about 60 m long that was defended by a French detachment. Russian chasseurs were able to bypass the tunnel in a flanking movement, proceeding along the mountains and through the river gorge. They then repulsed the enemy and broke through to the Teufelsbrücke. Braving enemy fire, the Russian troops crossed the narrow, half-destroyed bridge, which was 22–23 m high, and reached the left bank of the river, thereby opening the way to the north.

[29–331–2]

THEA (tea), a genus of tropical perennial evergreen plants of the family Theaceae; some botanists place the plants in the genus *Camellia*. There are two species: *T. sinensis* and *T. assamica*. The former, which is divided into Chinese and Japanese varieties, is a shrub reaching 3 m in height; it grows in mountainous regions of Southeast Asia. *T. assamica*, a tree measuring as much as 10–15 m in height, occurs in the forests of Assam, India. Varieties of *T. assamica* include Assam, Lushai, Naga Hills, Manipuri, and Burma. *T. assamica* also includes a natural hybrid of *T. sinensis* and *T. assamica*, which is known as Ceylon tea. Both species are widely cultivated.

In the USSR local hybrids of the Chinese variety of *T. sinensis* are most commonly cultivated; *T. assamica* and the Japanese variety of *T. sinensis* are added to the principal plantings. Sometimes a third species, *T. maliflora* from China, is designated.

T. sinensis is densely branched. The oval or elongate-oval leaves are slightly narrowed at the base; they measure 60–70 mm long and 35–40 mm across. The leaves are dark green above and light green beneath. The primary root extends 2–3 m into the soil; the lateral roots lie in the surface layer of soil. The fragrant white or pink flowers are solitary or in groups of two, three, or four in the leaf axils. The fruit is a capsule with one to five dark brown hard-shelled seeds, which are rich in oil; the capsule dehisces upon maturation. One thousand seeds weigh about 1 kg.

The tea plant is thermophile and hygrophilous. It grows and develops well when the sum of average daily temperatures during the vegetative period is no less than 4,000°C. The plant tolerates brief frosts to −12°C without a snow cover (some varieties withstand temperatures as low as −14°C). In tropical areas the tea plant yields a harvest throughout the year. In the humid subtropics of the USSR vegetation begins in March or April, when the average daily temperature is higher than 10°C. Intensive shoot formation begins at temperatures no lower than 17°C. A harvest of 4,000 kg of leaf per hectare (ha) depletes 150 kg of N, 23.9 kg of P_2O_5, and 47.8 kg of K_2O from the soil. The best soils for tea cultivation are red and yellow soils that are highly permeable by air and water.

Tea is propagated by seeds or by vegetative methods. One- or two-year-old plants raised from seed in nurseries are set out in

the fields, or the fields are planted with seeds or cultivated with semilignified grafts and cuttings. The tea plant flowers in the fourth or fifth year and forms fruits annually. In the USSR the flowering season is from September until the onset of frost. Cross-pollination is by bees, flies, or other insects. The plant is fully formed by the seventh or eighth year. Productive shoots form annually from the growth buds in the leaf axils; it is the apices of these shoots—two or three leaves and the bud—that are harvested for the manufacture of tea. (The leaves harvested for tea are called the flush.) The growing period of productive shoots is 35 to 65 days. Under favorable conditions the shoots grow continuously. In the USSR two periods of intensive growth are observed: the spring period in May and the summer period in July and August. A tea plant lives 100 or more years; it is most productive from the tenth to 70th year.

Tea was first cultivated in China in the fourth century A.D.; the use of tea as a beverage is mentioned in manuscripts of 2700 B.C. The cultivation of tea in Japan and Korea dates to the ninth century. Tea cultivation was introduced to Indonesia in 1824, to India in 1834, and to Ceylon in 1842. The world area of tea plantations was 1.298 million ha in 1961–65 and 1.502 million ha in 1974. In 1974 the principal tea producers abroad were India (360,000 ha), China (336,400 ha), Sri Lanka (240,000 ha), Indonesia (102,400 ha), and Japan (63,000 ha). The plant is also grown in Africa (Kenya and other countries) and South America (Argentina).

In Russia tea was first used as a beverage in 1638, when the Mongol Altyn Khan sent Tsar Mikhail Fedorovich a gift of four poods of tea leaves. In 1679 an agreement was concluded with China for regular deliveries of tea to Russia. In the 18th century tea imports increased, and the popularity of the beverage rose. The appearance of Russian samovars dates from this period. The botanist N. A. Gartvis planted the first tea shrub in Russia in 1814 in the Nikita Botanical Garden, but the natural conditions of the Crimea proved unfavorable for growing tea. In 1847 tea cuttings acclimatized well at the Ozurgety Experiment Station (now the city of Makharadze) in Georgia. At the All-Russian Exposition of 1864, M. Eristavi demonstrated Georgian tea prepared from leaves gathered from a small tract in Gora-Berezhauli in Ozurgety District. In 1885, A. A. Solovtsev founded Russia's first commercial tea plantation in Chakva (Adzharia). The plant has been cultivated in what is now Krasnodar Krai since 1901 and in Azerbaijan since 1912. In 1913 the area of tea plantings in Russia was less than 900 ha, the gross yield of leaf was 550 tons, and the average yield was 6.1 quintals per ha.

After the October Revolution of 1917 tea cultivation developed rapidly. New plantations were established in Georgia, Azerbaijan, and Krasnodar Krai. In 1965 tea plantations in the USSR occupied 71,000 ha, the gross harvest of leaf from commercial plantations was 197,000 tons, and the average yield was 33.8 quintals per ha; in 1976 the corresponding figures were 76,800 ha, 375,000 tons, and about 50 quintals per ha.

Soviet plant breeders have developed—for the first time in the history of tea cultivation—local varieties of tea. The varieties Gruzinskii 1, Gruzinskii 2, Zimostoikii, and Kolkhida (a clonal variety) were developed by K. E. Bakhtadze at the All-Union Research Institute of Tea and Subtropical Crops. These local varieties yield 25 to 60 percent more than nonvarietal plantings. The establishment of new plantations and the replacement of old ones have been achieved with vegetatively propagated homogeneous varietal plant material. In 1976 nine varieties of tea were regionalized in the USSR.

Forest or shrub areas are used for tea plantations. Forest belts are planted around the plantation, overly moist lands are drained, and terraces are constructed on steep slopes. Autumn plowing is done to a depth of 45 cm. Inorganic fertilizers (150–200 kg/ha P_2O_5 and 100–140 kg/ha K_2O) are applied to exhausted or eroded soils, and then the fields are planted with legumes and cereal grasses. The field is plowed in the second or third year to a depth of 20–25 cm. On fertile lands no sodding is provided; manure (40–50 tons/ha) and inorganic fertilizers (up to 300 kg/ha P_2O_5) are applied before plowing. Green manuring is effective: lupine, serradella, and other plants are set out in summer and plowed under in early spring.

In the USSR espalier planting in dense rows is the most common method of planting tea. The distance between espaliers is 1.25 to 2.05 m. The young plants must be kept shaded, and the soil between rows must be loosened several times throughout the summer. Before the annual autumn shallow plowing, manure (40–50 tons/ha), phosphorus (100–150 kg/ha P_2O_5), and potassium (150–250 kg/ha K_2O) are applied. In the summer nitrogenous fertilizers (50 to 400 kg/ha N—depending on the age of the planting) are administered. Pruning and espalier formation by means of special pruning apparatus ensure maximum shoot formation and the formation of a broad semioval crown 60–80 cm in width and 50–70 cm tall. Withered and diseased branches must be removed regularly, and the fields must be irrigated. In the USSR the flushes are gathered manually or with tea-harvesting machines from late April or early May to October. After gathering, the tea leaf is cleaned with a special machine.

The most harmful diseases of the tea plant are bacterial wart, brown and gray leaf spot, and cercoseptoriosis. Pests include the cushion scale (*Pulvinaria floccifera*), armored scales (*Diaspididae*), the tea aphid (*Aphis theae*), and the tea moth (*Parametriotes theae*).

The tea industry of the USSR produces black and green loose teas with rolled leaves and green and black pressed, or brick, teas. In India, China, and Japan yellow and red oolong teas are also manufactured. Caffeine, vitamin preparations (for example, a preparation of vitamin P in tablet form), and various medicinal preparations are produced from the by-products of the tea leaf. The oil from tea seeds is used in the cosmetic industry and the canning industry (as a substitute for olive oil); it is also used as a lubricant for precision instruments and in soap manufacture. The leaves are used as a seasoning in China and Japan and as salad greens in Burma.

In the USSR loose black tea is produced by curing, or withering, the leaf at temperatures of 40°–50°C. The decrease in water content makes the leaf pliable. The dried leaf is then rolled and fermented. Enzyme action oxidizes the bitter fractions of tannin, thereby forming pleasantly astringent tannin, as well as essential oils (with the aroma of rose, lemon, orange, or vanilla) and other substances that determine the taste, color, and aroma of the tea. After drying, the tea is graded into groups according to size of particles. The finished product, composed of a mixture of teas from the various groups, is packaged in 25-, 50-, 75-, 100-, and 125-gram sizes and is wrapped. Loose green tea is prepared almost the same way as black tea, but before drying the leaf is treated with live steam at a temperature of 100°C to destroy the enzymes and preserve the green color.

Black brick tea is made by pressing the dust and siftings from the grading of loose tea into bricks of 125 or 250 g. Green brick tea is produced from coarse leaf gathered in autumn after the principal harvest of flushes or in spring during pruning. The raw material is roasted to preserve the green color, rolled, stored in piles for fermentation, and then dried and pressed into 2-kg bricks.

A technique for producing yellow tea has been developed: A mixture of two parts raw material for loose black tea after fermentation and one part raw material for green tea after curing are dried, graded, and packaged. The first batch was released for sale in 1977. Tea grades are named for their place of manufacture. The following loose black teas are popular in the USSR: Buket Gruzii, Krasnodarskii Buket, Gruzinskii, Krasnodarskii (extra, first, and second grades). Imported teas from India and Sri Lanka are sold under the names Indiskii and Iseilonskii.

To prepare tea as a beverage, dry tea (approximately one teaspoon per glass) is poured into a teapot (preferably porcelain) that has been rinsed with boiling water. The pot is filled two-thirds full with freshly boiled water (white with bubbles but not rolling) and then covered with a napkin to minimize escape of aromatic substances. After steeping (3½ to 5 minutes for black tea, 8 to 10 minutes for green), the remaining third of the teapot is filled with boiling water. Properly brewed tea from loose black tea is golden in color and has a specific aroma (without the odor of steamed leaves); there is brown foam on the surface.

Tea contains caffeine, essential oils, and tannins, which account for its tonic and stimulating effect. Tea tannins have some vitamin-P activity and a slight bactericidal effect. Consumption of strong tea is not recommended for persons suffering from insom-

nia, hypertension, heart disease, gastric and duodenal ulcers, or neuroses.

Certain tea substitutes from plant material (linden, carrot, and fruit teas) and mixtures of medicinal herbs (diuretic teas and others) are also called teas.

THEACEAE (Camelliaceae, Ternstroemiaceae), a family of dicotyledonous trees and shrubs. The evergreen leaves are alternate, simple, mostly leathery, and exstipulate. The regular flowers are usually bisexual, often solitary, and axillary or apical. Many species have large red, white, or, less frequently, other colored flowers. There are five or, less commonly, six or seven sepals; there are five or, rarely, four or more than five petals. There are usually numerous stamens. The gynoecium consists of three to five carpels (rarely two or ten). The ovary is usually superior. The fruits may be capsules, dry indehiscent fruits, drupes, or berries.

There are approximately 550 species, belonging to about 30 genera, distributed mainly in the tropics and subtropics of both hemispheres. The tea plant has great commercial importance, and the camellia is grown as an ornamental. Some species are grown for their wood. [29–32–2]

THOROUGHBRED, the fastest breed of horse in the world. The Thoroughbred was developed in Great Britain in the late 17th and early 18th centuries by crossing local breeds with Oriental breeds (the Barb, Turk, Arabian, and Turkmen) and European breeds (Neapolitan and Spanish). It has been improved strictly through pure breeding. The Thoroughbred is bred for speed and efficiency on racetracks. In the late 18th century the breed was imported by many countries, including Russia. In the USSR, it is one of the main breeds used in improving saddle horses.

The Thoroughbred is a large horse with a harmonious conformation. The head is delicate, the withers are high and long, the back is relatively short, and the legs are slender, with well-defined tendons. The coat is chestnut, bay, roan, black, or gray. The average measurements are as follows: height at the withers, 161 to 162 cm; chest circumference, 182 to 186 cm; and circumference of the front cannon bone, 19 to 20 cm. Thoroughbreds are used for sport and to improve saddle-horse breeds, including the Trakehner, Hanoverian, Budennyi, and Kustanai breeds. The world record for 1,200 m is 1 min 07.4 sec; for 2,400 m, 2 min 23 sec; and for 3,200 m, 3 min 19 sec. The countries of Europe and the USA have the greatest number of Thoroughbreds. In the USSR, Thoroughbreds are raised in stud farms in the RSFSR, Ukrainian SSR, Georgian SSR, Azerbaijan SSR, Kirghiz SSR, and Kazakh SSR. A continuous exchange between countries of purebreds is conducted to improve the breed. The USSR imports sires from Great Britain, France, and the USA and exports its horses to Italy, France, the Federal Republic of Germany, the German Democratic Republic, Czechoslovakia, Hungary, Bulgaria, and Poland.

E. M PERN [29–643–1]

THYROID CARTILAGE, the large unpaired cartilage of the larynx, which first appeared in vertebrate evolution in mammals.

The thyroid cartilage develops from the second and third gill arches. In cloacal animals the arches retain their independence, being joined to the copula, while in marsupial and placental animals they are fused, forming two quadrilateral lamellae that are united at an angle on the ventral side (in humans on the anterior side). In children and women these lamellae are united at an obtuse angle; in men they form an angular projection, known as the Adam's apple. From the thyroid cartilage there pass the anterior cornua (in humans the superior cornua), in the direction of the hyoid bone (they are absent in pigs), and the posterior cornua (in humans the inferior cornua), which form a movable articulation with the cricoid cartilage. [29–1611–1]

THYROID GLAND, a specialized endocrine organ in vertebrate animals and man that manufactures and stores iodine-containing hormones that help regulate metabolism and the production of energy in the organism.

Anatomy. The thyroid gland develops in embryos from the epithelium of the branchial (pharyngeal) pouches embedded in the pharyngeal floor as a result of the transformation of the hypobranchial groove (endostyle) in lower chordates. The unpaired thyroid of cyclostomes is situated under the inferior wall of the gill part of the gut, while that of fishes is situated at the anterior margin of the branchial arteries (in bony fishes it includes the ventral aorta near the anterior gill arches, and in dipnoan fishes it is divided into two parts).

The paired thyroid gland of amphibians is situated near the sublingual apparatus (behind the second arch in caudates and under the posterior cornua in tailless amphibians). The unpaired thyroid of reptiles, often divided into two lobes, is situated under the trachea. The paired thyroid of birds lies at the base of the bronchi. The thyroid of mammals consists of two lobes connected by the isthmus, but in some animals it is divided into two separate parts. In lower vertebrates, the last (fifth) pair of gill arches gives rise to the ultimobranchial bodies (*see* ULTIMOBRANCHIAL BODIES), which secrete the hormone thyrocalcitonin (*see* THYROCALCITONIN). In mammals, this tissue is represented by the C cells of the thyroid. In man, the gland is completely formed by the eighth or ninth month of development of the fetus. It consists of two lateral lobes and a transverse isthmus, connecting the lobes near the lower ends. Sometimes a third lobe, the pyramid, arises from the upper part of the isthmus. The thyroid gland is situated in the neck, in front of the trachea and on the side walls of the larynx next to the thyroid cartilage (hence the name of the gland). The lateral lobes abut the walls of the pharynx and esophagus in back.

The external, or superficial, surface of the thyroid is convex, while the internal, or deep, surface, facing the trachea and larynx, is concave. The gland is about 50–60 mm in diameter; at the isthmus, it is 6–8 mm in diameter. It weighs 15–30 g (somewhat more in women). It is abundantly supplied with blood vessels, including the inferior and superior thyroid arteries. The superior cervical and stellate sympathetic ganglia provide sympathetic innervation, while branches of the vagus nerve provide parasympathetic innervation.

The main structural and functional units of the thyroid gland are the thyroid follicles (spherical or of irregular geometric shape) filled with a colloid substance having an iodine-containing protein, thyroglobulin (*see* THYROGLOBULIN). The follicles are very close to one another. Their walls are lined with a single layer of glandular epithelium. The structure of the gland also includes connective-tissue stroma, which are adjacent to the follicular wall and consist of collagenous and elastic fibers interspersed with blood vessels and nerves. The shape, volume, and height of the follicular epithelial cells vary with the functional condition of the gland: the epithelium is normally cuboidal, high and columnar (or cylindrical) when very active, and flat when inactive. The size of Golgi's complex and the number of mitochondria and secretory drops contained in the thyroid cells increases when secretion is active. The number and length of the microvilli arranged on the apical surface of the epithelium and facing the follicular cavity also increase when the gland is very active. The density, size, number, and location of the cytoplasmic (or albuminous) granules characterize both the process of biosynthesis and the secretion of specific products.

Physiology. Such basic biological processes as growth, development, and tissue differentiation depend on the normal functioning of the thyroid gland, which secretes two hormones—thyroxine and triiodothyronine (*see* THYROXINE and TRIIODOTHYRONINE). The biological effects of normal levels of the thyroid hormones are reflected in the maintenance of the organism's en-

ergy and biosynthesis processes at an optimal level. The action of the hormones on the process of biosynthesis and, consequently, on the body's growth and development, is mediated by the regulation of tissue respiration. Excessive amounts of the hormones intensify all types of metabolism, with catabolic processes, expenditure of substances and energy in the form of heat, and products of incomplete and incorrect metabolism predominating. The mode of action of the thyroid hormones entails stages of "recognition" and perception of cell signals and generalization of the molecular processes responsible for the nature of the response. Specific protein receptors in the cells of the various tissues "recognize" a hormone and trigger a biochemical reaction. The growth-stimulating action of the thyroid hormones, associated with the intensification of protein biosynthesis, is realized through the formation in the nuclei of the cells of the hormone-receptor complex that activates the synthesis of messenger RNA and the subsequent stages in the synthesis of structural proteins and protein enzymes.

Thyroid function is regulated by the central nervous system. When external and internal factors are constantly changing, the cerebral cortex plays the major role in regulating the hypothalamus-hypophysis-thyroid system. The thyroid also interacts with other endocrine glands. The hypophysis is an important factor in the regulation of thyroid activity; it produces thyrotropin (*see* THYROTROPIN), which stimulates the development and functioning of the thyroid gland (*see* NEUROSECRETION).

Thyroid diseases in man. Thyroid diseases—inflammations (*see* THYROIDITIS), tumors, injuries, and congenital anomalies—may cause the thyroid to enlarge (*see* GOITER) and function pathologically. They may also lower the production of hormones (hypothyroidism to the point where myxedema develops) or increase them (*see* GOITER, DIFFUSE TOXIC; HYPOTHYROIDISM; and MYXEDEMA).

V. G. BARANOV and G. S. STEPANOV [29–1610–1]

THYSANURA, the order of primitive wingless insects most closely related to winged insects in regard to their development. The spindle-shaped body is usually covered with thin, shiny scales and in some cases is naked. It measures 10–20 mm in length. The insects have long, filamentous antennae, a mouth apparatus of the chewing type, and two compound eyes with two to three simple occelli between them. The thorax is continuous with the 11-segmented abdomen, which ends in a long, segmented axial filament and paired cerci. Fertilization is external and internal.

The order embraces approximately 360 species, which are encountered on all continents, predominantly in warm areas. The Thysanura live under rocks, in rock crevices, and in plant remains. The USSR has about ten species, including the silverfish. The insects have not been studied thoroughly.

Certain more primitive insects bearing a superficial resemblance to the Thysanura have been assigned to an independent order, Archeognatha, which was earlier considered the suborder Machiloidea of Thysanura. There are about 220 species of Archeognatha, fewer than ten of which inhabit the USSR.

[29–1602–1]

TIE, a support for rails in the form of a beam laid on top of the ballast layer of the roadbed. Ties ensure that the positions of the two rails do not change with respect to each other. They accept pressure from the rails and transmit it to the ballast layer. In the USSR ties are made of reinforced concrete (270 cm long) or wood (primarily softwoods) impregnated with antiseptics (275, 280, and 300 cm long); some foreign ties are made of metal. One kilometer of railroad track requires 1,600, 1,840, or 2,000 ties.

[29–1388–2]

TIE-SAWING MACHINE, a woodworking machine that makes ties by sawing logs longitudinally. Such machines may be equipped with circular saws or band saws.

In tie-sawing machines with circular saws, the feed motion may be accomplished by the moving log, which is fastened on a special carriage, or by the rotating saw, in which case the log being cut is held by clamps in a fixed position. In tie-sawing machines with band saws, a securely fastened log is fed to the saw. Circular-saw machines may have one or two saws; the upper, supplementary saw is mounted in the same vertical plane as the lower, primary one. Saw blades 4–6 mm thick with diameters of 1–1.6 m are used on circular-saw machines; the saw blades of band-saw machines are approximately 1.2 mm thick. Both types of machines make longitudinal cuts, and the short cutting edges of the saw teeth make the end cuts; the sawdust that forms is waste.

In some band-saw machines, the movement of the band saw is parallel to the grain of the log, and the short cutting edge cuts along the grain; instead of sawdust, a shaved strip is formed that is marketable as packing or for the production of Fibrolit.

N. K. IAKUNIN [29–1388–1]

TIME-FREQUENCY-DIVISION MULTIPLEXING, a method of transmitting electric telegraph signals over communications lines, in which a combination of frequency- and time-division multiplexing is used. The technique was proposed and demonstrated by a group of Soviet specialists under the direction of V. I. Kirsanov in the 1960's. During the next ten years it came into wide use.

Time-frequency-division multiplexing is used mainly in the switching telegraph networks of teletypewriter exchange services and direct circuits that use start-stop telegraphs as terminal equipment. The channel-forming equipment contains devices for creating within one standard telegraph channel up to four grouped frequency-division-multiplexed channels, in each of which 12 individual channels are created by means of time-division multiplexing. The transmission rate is 50 bauds for each time-division-multiplexed channel and 600 bauds for each frequency-division-multiplexed channel.

Time-frequency-division multiplexing combines the advantages of the synchronous and start-stop telegraphy systems. Its advantages include high noise immunity; the efficient use of the frequency spectrum in a standard telegraph channel, especially for the creation of a large number of channel groups; the possibility of extracting a portion of the channels at intermediate points along a communications line; and the ability to correct for envelope delay distortions in discrete signals. The principal operating disadvantage of time-frequency-division multiplexing is the necessity of using start-stop telegraphs having a closely controlled telegraph speed.

M. I. MUSHKAT [29–85–4]

TINNITUS, a noise in the ears, a sensation arising in the absence of external acoustic stimuli. Tinnitus can occur in one ear or both ears.

Physiological tinnitus sometimes occurs under conditions of complete silence; it is due to the sensation of blood flowing in the small capillaries of the inner ear. In contrast, pathological tinnitus, usually accompanied by impairment of hearing, is caused by diseases of the middle or inner ear or auditory nerve, by intoxication with an industrial chemical (mercury, arsenic, phosphorus, lead), or by some drugs. Differences in the intensity and nature of the noise (buzzing, ringing, whistling) are diagnostic clues.

[29–1532–2]

TIRE, PNEUMATIC. In motor vehicles and other wheeled vehicles, pneumatic tires create the necessary adhesion (traction) between the wheels and the surface of the road and cushion the dynamic loads on the wheels that result from the motion of the vehicle. The tires ensure vehicle control, traction under difficult road conditions, stability, and riding comfort. They substantially affect the braking distance, fuel consumption, and many other performance and economic characteristics of the vehicle.

Pneumatic tires are classified according to purpose as passenger-car tires (for passenger cars and light trucks), truck tires (for all other trucks, buses, trolleybuses, and trailers), agricultural tires (for tractors and other agricultural vehicles), off-the-road tires (for construction, roading, and hoisting and conveying machinery), motorcycle tires (for motorcycles, motor scooters, and mopeds), and bicycle tires. Special-purpose tires include those for aviation, monorail transportation, and so on.

Pneumatic tires are multilayer rubber-and-textile products. Their manufacture accounts for about 50 percent of the rubber consumed and a substantial portion of chemical fibers and other reinforcing materials. In 1976 approximately 7 million tons of rubber was used to produce 780 million tires throughout the world.

Construction. The common element in all tires is the casing (Figure 1), which maintains a specific shape for the tire under the influence of the internal (inflation) pressure. The carcass, or body, plies are the foundation of the tire; they impart strength and resilience. They consist of several layers of rubberized textile or, in some cases, metal cord (cord fabric). In bias-ply tires the cords in adjacent plies cross one another, and the angle between the direction of the cords and a plane passing through the axis of rotation is 50°–55°; in radial-ply tires the cords of all the plies lie in this plane. The number of plies in radial-ply tires is about half that of bias-ply tires, so that the carcass is more flexible.

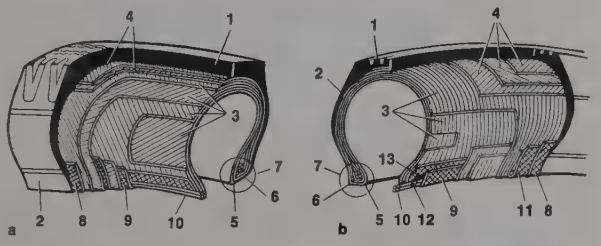

Figure 1. Diagrams of tire casings: (a) bias ply, (b) radial ply; (1) tread, (2) sidewall, (3) carcass plies, (4) breaker, (5) bead toe, (6) bead heel, (7) bead, (8) chaffer, (9) flipper, (10) bead wires, (11) supplementary metal-cord ring, (12) strip for wrapping bead wires, (13) rubber cord

The breaker is designed to provide a strong bond between the carcass plies and the outermost rubber layer (the tread); it is made of several layers of rubberized textile or metal cord (less often, of rubber). In bias-ply tires the cords of the breaker run at the same angle as the carcass plies; in radial-ply tires they run at an angle of 70°–85°, thus forming an inextensible belt that carries the major portion of the forces acting on the tires as a result of inflation pressure and external loads. Because of the combination of flexible carcass plies and a stiff breaker, radial-ply tires have a longer life, consume less power in overcoming rolling friction, and possess other service advantages over bias-ply tires.

The tread, which is formed as a single unit with the sidewalls, protects the carcass plies from mechanical damage and the effects of moisture. The thickest part, the section in contact with the road, has patterned projections and recesses of various sizes and shapes; the tread pattern determines the adhesion between the tire and the road, rolling resistance, resistance to abrasion, performance under difficult road conditions, running noise, and ease of control. The bead of the casing ensures that the tire is firmly seated on the wheel rim. The carcass plies are secured by bead wires.

An important construction feature is the method used to seal the tire, illustrated by tube-type and tubeless tires. The cavity of tube-type tires contains a ring-shaped inner tube with a valve, which retains the compressed air in the tire. In tubeless tires the air is retained by using chafers, by seating the tire on the rim under great tension, and by applying a rubber sealing layer to the inside of the casing. The advantages of tubeless tires are the high operating safety resulting from insignificant air leakage from a puncture, low weight, and ease of maintenance and repair. However, the necessary airtight fit on the rim requires special mounting equipment and greater precision in the fabrication of rims. The choice of tire construction depends on the application: for example, tubeless tires are best for passenger cars, where operating safety and a comfortable ride at high speeds must be ensured.

Operating characteristics. When stationary, a tire is subjected to the forces of the inflation pressure and the static load on the wheel; a rolling tire is additionally subjected to dynamic loads and loads arising from the redistribution of the vehicle's weight between the axles and wheels. Under the influence of these forces, a rolling tire undergoes continuous cyclical deformations that differ in magnitude and direction in the various zones of the tire. The total number of deformation cycles that occur during the life of a tire may reach several million. Such deformations cause spontaneous heating (heat buildup) in the tire to temperatures of 60°–90°C.

The most important service characteristics of tires are load-carrying capacity, service life, traction, rolling resistance, and shock-absorbing capacity.

The load-carrying capacity (the maximum permissible static vertical load on the tire) depends mainly on the tire's dimensions, inflation pressure, number and type of carcass plies, and operating conditions. The service life is defined as the tire mileage accumulated until the projections on the tread pattern become worn (for safe driving and for protection of the carcass from damage, the minimum height of the projections should be 0.5 mm for truck tires and 1.5 mm for passenger-car tires). The service life is reduced when road and climatic conditions are more severe, the load-carrying capacity is exceeded, the speed is increased, or the inflation pressure deviates from the optimum value for a given set of operating conditions (the inflation pressure ranges from 0.1 meganewtons per m^2, or 1 kg/cm^2, for automobile tires to 2 meganewtons per m^2, or 20 kg/cm^2, for aircraft tires). When the inflation pressure is reduced, the amplitude of the tire's deformations and the heat buildup are increased, which accelerates the onset of fatigue failure. When the pressure is increased, the stresses in the tire are increased, the danger of a rupture (blowout) in the carcass when driving over an obstacle is greater, and the tread wear is accelerated because of the higher contact pressure on the road. The average mileage for passenger-car tires ranges from 40,000 to 60,000 km, and for truck tires, from 60,000 to 100,000 km.

Traction is one of the most important factors affecting the driving safety of a motor vehicle. Inadequate traction is the cause of 25–40 percent of highway transportation accidents on wet roads and 5–10 percent on dry roads. The properties of the rubber in the tread as well as the tread pattern affect this characteristic.

The rolling resistance determines to a significant degree the fuel consumption in vehicular transportation and also affects the dynamic characteristics. It depends appreciably on the weight and construction of the tire and on the materials used in manufacture. The shock-absorbing capacity establishes a tire's properties as an element of the vehicle's suspension, which damps dynamic loads. Optimum shock-absorbing capacity in an automobile depends on the proper combination of tire shock absorption and shock-absorption characteristics of the other suspension elements.

Materials and production technology. General requirements for the rubber used in tires include long fatigue life and low heat buildup; in addition, the rubber used for treads must resist abrasion and weathering. Tire carcass must be very resilient, breakers must be heat resistant, and inner tubes must be airtight. The principal types of raw rubber used for tires are styrene-butadiene, stereoregular butadiene, synthetic isoprene, and natural rubber; the most important reinforcing materials are polyamide and rayon cords.

Tire manufacture includes the following production processes: preparation of the rubber stocks in mixers, processing of the cords (impregnation with synthetic latexes, heat stretching, stabilization, and coating with rubber on calenders), preparation of components (cutting out the rubberized cord, assembling the pieces, coating the pieces with layers of rubber, shaping the tread stock with extruders, making the sidewall components), assembly of the casing on special machines, shaping and vulcanization of the casings on a single machine, and processing of stock for inner tubes with extruders and vulcanization in compression molds. Many of the operations are performed on automatic transfer lines, including preparation of the rubber stocks and assembly

and vulcanization of the casings. (*See also* RUBBER, SYNTHETIC; RUBBER, NATURAL; and RUBBER, VULCANIZED.)

V. F. EVSTRATOV [29–1210–1]

TJOKROAMINOTO, OMAR SAID. Born 1882 in the village of Desa Bakur, Java; died Dec. 17, 1934, in Jogjakarta. One of the leaders of the national and Muslim movement in Indonesia. Participant in the Budi Utomo.

In 1912, Tjokroaminoto founded the Sarekat Islam (Islamic Union), which he headed until his death. His skillful combining of Muslim goals with nationalistic and anticolonial goals and his talent as an orator furthered his popularity with the masses. Together with the other petit bourgeois leaders, Tjokroaminoto fought the Communist influence within Sarekat Islam, which led to a schism in 1923 and the collapse of the organization. In his struggle to influence the masses of workers and to counterbalance Marxism, Tjokroaminoto advanced the theory of Muslim socialism. Although he was in favor of class peace based on Islam in Indonesian society, he simultaneously denounced the domination of "criminal" (that is, foreign) capitalism in Indonesia. [29–679–5]

TRAN CAO UPRISING, a peasant uprising from 1516 to 1524 in the central regions of northern Vietnam, named for one of its leaders, Tran Cao, an important Vietnamese civil servant. The uprising, which was directed against the later Le dynasty (1428–1789), was also led by Phan At, originally from Champa and a servant of one of the members of the feudal house of Trinh. Supported by the townspeople, the rebels seized the capital, Hanoi, and proclaimed Tran Cao emperor. After a stubborn struggle with government troops, Tran Cao gave up the capital and commenced a guerilla war. After the death of Phan At, Tran Cao transferred power to his son, Qungu, and took monastic vows. The uprising was continued in the mountains until 1524, when it was suppressed by government troops. [29–42–3]

TRAN DAI NGIA. Born Sept. 13, 1913. Vietnamese scientist specializing in mechanics. Hero of Labor of the Socialist Republic of Vietnam.

From 1935 to 1945, Tran Dai Ngia lived in France, where he studied at the Higher School of Electrical Engineering, the Aeronautics Institute, and the Higher Construction School. From 1946 to 1954 he headed the artillery directorate of the People's Army of Vietnam. He served as deputy minister of industry and commerce from 1950 to 1960 and minister of heavy industry from 1960 to 1962.

In 1965, Tran Dai Ngia became chairman of the State Committee for Science and Technology. His works deal chiefly with mechanics. Tran Dai Ngia became a foreign member of the Academy of Sciences of the USSR in 1966. [29–39–3]

TRAN HUNG DAO (also Tran Quoc Tuan). Born 1226; died 1300. Vietnamese general who organized the Vietnamese people's struggle during the triple incursion of the Mongol feudal lords into Dai Viet (Vietnam) in 1257–58, 1284–85, and 1287–88. Commander in chief of the Vietnamese armed forces (1283).

On Apr. 9, 1288, Vietnamese forces under Tran Hung Dao won a major victory in a battle on the Bach Dang River that proved decisive in the expulsion of the Mongols from Dai Viet. In the struggle against the superior forces of the Mongol conquerers, Tran Hung Dao made extensive use of guerilla tactics, combined with concentrated attacks by the regular army. April 9, the day of Tran Hung Dao's victory over the Mongols in 1288, is celebrated as a national holiday in the Socialist Republic of Vietnam.

Tran Hung Dao wrote several works on the art of war, notably *An Elementary Manual on the Military Art.* [29–43–4]

TRAN PHU. Born 1901 in Quang Ngai Province; died September 1931. Seminal figure in the Vietnamese communist movement.

Tran Phu was a teacher by profession. In 1918, while still in secondary school, he founded the Society of Progressive Youth for Struggle Against the Colonialists. In 1925 he helped create the Hoi Phuc Viet (Society for the Renewal of Vietnam), later renamed the Tan Viet Cach Menh Dang (Revolutionary Party of New Vietnam).

In July 1927, Tran Phu conducted negotiations that led to the merger of the Tan Viet Cach Menh Dang with the Fellowship of Revolutionary Youth of Vietnam, thereby helping to establish the nucleus of the Communist Party of Vietnam (CPV), founded in February 1930 and renamed the Communist Party of Indochina (CPI) in October of that year. Later, as a member of the Fellowship of Revolutionary Youth of Vietnam, he studied in Moscow at the Communist University for Workers of the East. He was sentenced to death in absentia by a royal court.

Beginning in July 1930, Tran Phu, as a member of the Provisional Central Committee of the CPV, did important work toward convening a plenum of the committee. He was the author of the political theses for the first and second plenums, held in October 1930 and March 1931. The theses, based in part on the program of the Comintern, became the first program of the Communists of Vietnam. In October 1930 he became secretary general of the CPI. Tran Phu was arrested in Saigon on Apr. 18, 1931, and after five months of torture died in a prison hospital.

S. A. MKHITARIAN [29–43–2]

TRANSFER MECHANISM, a mechanism in rolling mills that is used to move rolled stock—such as billets, rails, or beams—in the lateral direction, for example, from one roller conveyor to another parallel to it. A transfer mechanism consists of a system of guide rails and endless chains or cables, to which special swinging fingers equipped with catches are fastened. When the catches encounter a rolled item, they grab and transfer it. In the reverse operation, the catches are retracted and pass freely under the rolled item. [29–1288–1]

TRANSFORMATION TEMPERATURE (also critical point; in Russian, Chernov point), any one of several specific critical temperatures at which a change in the phase and structure of steel occurs during heating and cooling. The most important are the two discovered by D. K. Chernov in 1868, which he called points *a* and *b*; the determination of their values and relative positions on the temperature scale marked the beginning of the scientific heat treatment of steel and was of enormous practical value.

According to Chernov the significance of point *a* (dark cherry temperature color) is that when steel is heated to a temperature below point *a*, it cannot be hardened no matter how rapidly it is cooled. For point *b* Chernov gave the following evaluation: when steel is heated to a temperature below point *b*, its structure does not change and a fracture retains its earlier form. According to Chernov, point *a* is the temperature above which steel must be heated in order to be hardened, and point *b* is the temperature above which heating tends to refine a coarse-grain structure. Later, in 1878, Chernov proposed point *d* (he defined point *c* as the melting point of steel), with a value of approximately 200°C, as the temperature to which steel must be rapidly cooled in order to achieve full hardening.

In modern representations, point *a* (now designated as A_1) corresponds to the eutectoid temperature. Point *b* is usually identified with the temperature, now designated as A_3, at which the dissolution of ferrite in austenite is completed when steel is heated. According to Chernov, steel heated above point *b* acquires after cooling a fine-grain structure, which thus determines the value of the point for the heat treatment of steel. Since in a number of cases heating above A_3 is not followed by the refinement of a coarse crystalline structure, the unqualified identification of point *b* with A_3 is apparently incorrect. Point *d* is now known as the temperature of martensitic transformation when steel is hardened, usually designated by M_S.

TRANS-KAMEN' ROUTE (Russian, Cherezkamennyi Put'; also Pechora Route), a route to Siberia used in the 16th and 17th centuries. The Trans-Kamen' Route passed through the Northern Urals, which at that time were known as the Kamen'. The route led from the Pechora River along a tributary called the Usa. After journeying a short distance overland to reach the Sob' River, travelers proceeded along the Sob' to the Ob' Valley and the city of Berezov. [29–193–2]

TRANSPORTATION ECONOMICS, in the USSR, the branch of economic science that studies patterns in the development and in the operations of transportation, which is regarded as a distinct sphere of material production.

Transportation economics, which includes the economics of railroad, maritime, river, motor-vehicle, air, and pipeline transportation, studies the engineering economics specific to each type of transportation as a part of the integrated transport network of the USSR. It studies operations, management organization, principles and methods for making optimal technological and organizational decisions, the economics of freight and passenger transportation, efficiency in developing a material and technical basis for transportation, the scientific organization of labor and wages, and categories and methods for measuring expenditures and results in transportation production.

Transportation economics, which is related to such branches of knowledge as national economic planning, industrial economics, agricultural economics, labor economics, statistics, economic geography, and the engineering sciences, develops scientific recommendations aimed at the improvement of transportation. These recommendations are used extensively in solving such important problems of the national economy as the proper locating of production throughout the various regions of the USSR, the selection of the proper dimensions of enterprises, and the provision of a viable economic basis for specialization and cooperation in production. Such recommendations help to relieve the transportation system of excessive work, to improve the system of material and technical supply in the national economy, to satisfy more completely the demand for shipping, and to reduce losses of industrial and agricultural output during transport. Research on the improved planning of passenger transport makes it possible to meet more fully the needs of the population in this area and to develop tourism.

Problems in transportation economics are studied at such institutions as the transportation economics subdepartment of the Moscow Institute of Transport Engineers, the Central Scientific Research Institute of the Ministry of Railroad Transport, and the Institute for Problems of Integrated Transport Systems. The present state and the development of transport economics are discussed in the publications *Zheleznodorozhnyi transport, Morskoi flot, Rechnoi transport, Avtomobil'nyi transport,* and *Grazhdanskaia aviatsiia.*

TRUNG BO (also Trung Phan, Trung Ky), the central part of Vietnam, comprising ten provinces. Area, 146,000 sq km. Population, 12.5 million (1975). The largest cities in Trung Bo, which is primarily an agricultural region, are Da Nang, Qui Nhon, Nha Trang, Cam Ranh, Phan Rang, and Phan Thiet. From the seventh to tenth centuries the kingdom of Annam occupied what is now Trung Bo. [29–767–2]

TRUNG TRAC AND TRUNG NHI, Vietnamese national heroines. The two sisters Trung Trac and Trung Nhi were descended from the noble family of Trung. The rebellion that they raised and led from A.D. 40 to A.D. 43 developed into the first national war of the Vietnamese people against the Han Dynasty of China (*see* TWO SISTERS' REBELLION). [29–782–2]

TRUONG CHINH. Born Feb. 9, 1907, in the village of Hanh Thien, Nam Dinh Province. Vietnamese political and state figure.

Truong Chinh joined the Fellowship of Revolutionary Youth of Vietnam in 1927 and the Communist Party of Indochina (CPI) in 1930. He was a member of the editorial board of the newspapers *Bua liem* (Hammer and Sickle) and *Cong doan bo* (Red Trade Union). He was imprisoned from 1931 to 1936 for revolutionary activities.

From 1936 to 1939, Truong Chinh directed the party's publications in Hanoi. He became a member of the Central Committee of the CPI in 1940 and a member of the Politburo and general secretary of the Central Committee of the CPI in 1941. He became a member of the Politburo of the Central Committee of the Workers' Party of Vietnam (WPV) in 1951 and served as the general secretary of the Central Committee until October 1956.

Truong Chinh was a secretary of the Central Committee of the WPV from 1956 to 1959 and deputy premier of the Democratic Republic of Vietnam (DRV) from 1958 to 1960. He was chairman of the Standing Committee of the National Assembly of the DRV from 1960 to 1976, a post he retained when the Socialist Republic of Vietnam was formed in 1976. In 1976 Truong Chinh became a member of the Politburo of the Central Committee of the Communist Party of Vietnam.

WORKS

In Russian translation:

Avgustovskaia revoliutsiia vo V'etname. Moscow, 1954. [29–782–3]

TSCHERMAK, GUSTAV (also Gustav Tschermak von Seysenegg). Born Apr. 19, 1836, in Littau, near Olomouc; died May 4, 1927, in Vienna. Austrian mineralogist and petrographer. Member of the Academy of Sciences in Vienna (1875).

Tschermak graduated from the University of Vienna. In 1860 he received the Ph. D. degree from the University of Tübingen. In 1861 he began teaching at the University of Vienna, where he was a professor from 1868 to 1906. From 1868 to 1877 he was director of the imperial mineral collection at the University of Vienna. Tschermak's major works dealt with the mineralogy of complex silicates, including feldspars, pyroxenes, amphiboles, chlorites, and micas. Tschermak clarified the dual role of aluminum in silicates and studied the phenomenon of isomorphism. He investigated meteorites and proposed a theory of their origin, according to which meteorites were formed during volcanic eruptions on asteroids. Tschermak was the author of *Lehrbuch der Mineralogie* (1881) and the founder of a journal later named after him, *Tschermaks mineralogische und petrographische Mitteilungen*, first published in 1871.

Tschermak was an honorary member of the St. Petersburg Academy of Sciences (1912). A hypothetical silicate found in pyroxenes (augites) has been named after him.

TSCHERNING, ANTON FREDERIK. Born Dec. 12, 1795, in Frederiksværk, on Sjælland (Zealand) Island; died June 29, 1874, in Copenhagen. Danish state and political figure.

The son of a colonel, Tscherning took part in the Napoleonic Wars as a lieutenant. He taught at the Higher Military School in Copenhagen from 1830 to 1833. An opponent of absolutism and a left-wing liberal, Tscherning was chairman of the bourgeois-democratic Society of Friends of the Peasant from 1846 to 1856. From March to November 1848 he was minister of war and held the rank of colonel; he organized the Danish Army, which took part in the Danish-Prussian War (German-Danish War) of 1848–50.

In the period from 1849 to 1866, Tscherning was a deputy to the Constituent Assembly and the Folketing. Tscherning opposed the reactionary revision of the constitution in 1866.

[29–251–2]

TSCHUDI, AEGIDIUS (also Gilg Tschudi). Born Feb. 5, 1505, in Glarus; died there Feb. 28, 1572. Swiss historian.

From 1558 to 1560, Tschudi was chief magistrate of Glarus. A Catholic, he persecuted the followers of H. Zwingli. His main historical work was *Chronicon Helveticum* (Swiss Chronicle; vols. 1–2, 1734–36), which dealt with the period from 1000 to 1400; he incorporated many sources in this work, including some that he was the first to use. In the 19th century, historians identified as legendary much of the information contained in Tschudi's chronicle, such as the story of William Tell. [29–736–2]

TSWANA (also Chuana, Western Sotho), a language of the Sotho group of the southeastern Bantu languages. According to a 1970 estimate, Tswana is spoken in Lesotho, as well as in the western Transvaal and in northern Cape Province in the Republic of South Africa, by more than 1 million people.

The system of 9 vowels in Tswana exhibits the opposition open-closed in the phonemes [I], [e], [o], and [u]. Consonants include voiced and voiceless alveolar fricatives and affricates. Clicks, which occur only in ideophones, form a peripheral phonetic subsystem. Nasalization, palatalization, and alveolarization of consonants occur at morpheme boundaries.

Nouns are arranged in 18 categories, or noun classes, that form a system of concordances; there are two special classes made up of proper names, kinship terms, and totemic animals, and locative classes, which are weakly expressed in the other languages of the Sotho group. Classes are marked by monosyllabic prefixes. Verbs are conjugated by means of affixes; the diminutive aspect is formed by full reduplication of the verbal root.

The lexicon of Tswana abounds in ideophones. Sentences observe the following pattern: subject-predicate-object.

TUNNELING SHIELD, a movable prefabricated metal structure that provides for the safe driving of an underground excavation and makes it possible to install a lining in the excavation. A tunneling shield was first used in 1825 in Great Britain by M. I. Brunel to build a tunnel under the Thames River. In the USSR, tunneling shields have been used since 1932. They were used to build most of the subway tunnels in Moscow, Leningrad, Kiev, and other cities. Tunneling shields are used in the building of various types of tunnels and in the underground mining of mineral deposits.

Unmechanized tunneling shields are classified according to the shape and size of the cross section and the method used to separate the face from the rest of the tunnel. The cross section may be circular, elliptical, horseshoe-shaped, or rectangular. The size of the cross section may be 8.5–9.75 m (large), 5.7–6.7 m (medium), or 2.6–3.6 m (small). The face may be separated from the rest of the tunnel with or without the use of a cutoff wall, by means of dividing walls, or by means of a watertight bulkhead.

In an unmechanized tunneling shield (see Figure 4 in TUNNEL), the cutting edge of the shield prevents cave-ins and is used for the partial cutting of soft or friable rock. Propelling jacks, face jacks, piping, and controls are located on the shield's support ring. The overhanging part of the shield protects the site where the lining is erected. Horizontal and vertical bulkheads divide the shield into work compartments, which are required for tunnel driving by the full-face method. The shield is moved by means of the propelling jacks, which push against the forward end of the lining. The face jacks support the face; jumbo jacks advance the jumbo, or drill carriage.

Mechanized tunneling shields are used throughout the world. They are classified according to the area of application, the method used to break the rock, and the type of tool employed. Mechanized tunneling shields may be used in unstable, weak, or stable rock of varying hardness. The rock may be broken by means of shaving, rotary cutting, drilling, or spalling. The tool may be of the rotary, swinging, planetary, or combined type. The main dimensions of a mechanized tunneling shield depend on the diameter of the lining, geological conditions, and the type of mechanized equipment used.

The rate of advance depends on the type and cross-sectional size of the tunneling shield used. Under favorable conditions, the rate of advance may be as high as several hundred meters per month. For example, during the construction of the Leningrad Metro, tunnels were driven at a rate of 600 m/month.

The designs of tunneling shields may be improved by developing both interchangeable tools and standardized cutting tools and loading buckets.

TURBAN, a type of man's headgear that was once widely worn by Muslims of North Africa, Southwest Asia, South Asia, Middle Asia, and, sometimes, the Caucasus.

The turban is a length of fabric that is wound around the head. It is usually worn over a cap, fez, or skullcap, although it is sometimes worn—in India and Pakistan, for example—without any other head gear. It used to have ceremonial significance; for a Muslim who died on a journey, it served as a shroud. Among different peoples, the turban varies in color, quality of material, size, and method of winding, thereby indicating not only the nationality but also the social position of the wearer; for example, green turbans were worn by descendants of a prophet or by people who had been to Mecca, and white turbans were worn by other Muslims. [29–36–1]

TWINE, a twisted or spun yarn used to tie up small packages and sew soft containers, such as bags, in industry, agriculture, and trade. Twines are classified primarily by length-to-weight ratio (thickness), which lies in the range 800–8,500 tex, and by the material from which the twine is made, such as bast fiber, paper, and polypropylene. Twine is manufactured with a single-, double-, triple-, or six-thread structure. Some twines may be polished.

[29–1384–3]

TWINE PRODUCTION, the aggregate of manufacturing processes necessary to make twine.

Twine from bast fibers (hemp and flax) is manufactured by spinning and twisting. Manufacture begins with emulsification of the fiber to soften the plant gums, after which the material is carded to break up large complexes of fibers and remove trash. Sliver is then prepared on a system of drawing frames, with from two to three machine transfers. The spinning is done from the sliver; yarn up to 800 tex is produced on ring spinning frames, and yarns of 1,000 tex and more are spun on flyer spinning frames. The twine is then twisted from the resulting yarn and finished (sized and polished). Single-thread twine is manufactured only by sizing the yarn. Industrial twine is not finished. Double- and triple-thread twine is twisted from single-thread twine on twisters in double and triple structures, respectively, and then rewound into yarn packages. Six-thread twine is twisted in a triple structure from polished double-thread twine. It is then polished again and rewound onto spools or bobbins.

Paper twine is produced from special twine paper cut into strips in widths appropriate to the weight of the twine. The strips are twisted on twisters, and the twine is then polished with paraffin and rewound onto bobbins. Polypropylene twine is made by twisting flat polypropylene threads together.

V. A. ZABELIN [29–1384–4]

TYPECASTING, the fabrication by casting of type and other composing materials for hand composition. Handcasting of type for composition and printing was originally developed by J. Gutenberg circa 1440. In 1838, D. Bruce, Jr., of the USA built the first manually driven typecasting machine, and in 1862, I. Johnson of Great Britain proposed a universal typecaster with a mechanical drive. Type and other composition materials are usually made at type foundries or sometimes at large printing enterprises. However, the production of conventional type is declining because of the increasing use of typecasting compositors and phototypesetting machines.

The preparation of new type consists of the following principal processes: development and approval of the type designs, fabrication of type matrices, casting of characters, and preparation of full sets of characters (fonts). The matrix is needed to form the casting mold and consists of a metal bar, usually of copper, carrying a recessed, nonreverse image of the character. Punches are first fabricated in order to make the matrix; they carry a mirror image of the character in relief and are produced on steel blanks by hand or machine engraving from designs, one for each letter, supplied by the artist. Under pressure in a press, the punch forms a depression in the matrix. The matrix may also be made directly by machine engraving through use of a metal template of the character design.

Typecasting is carried out on automatic typecasting machines. The matrix is placed in the machine, where it forms the end wall of the casting mold. Molten type metal is forced into the mold automatically under pressure. The alloy hardens to produce a piece of printing type. The cooled piece of type is forced from the mold and machined to remove burrs and the tongue. It then goes to the receiving table of the machine. The conditions of casting and processing on the machine must ensure accurate height (25.1 mm) and other casting dimensions as well as a smooth and clean surface. After casting of the required number of examples of a single letter (one matrix will withstand from 20,000 to 80,000 castings), the type matrix is replaced, and the other characters are cast. Depending on the type size, a typecasting machine may produce from 2,000 to 11,000 pieces of type an hour.

The type font is compiled from the cast pieces of type according to special tables that take into account the frequency of use of each letter in texts. The font includes a specific number of uppercase and lowercase letters and the numerals and symbols needed to compose texts in the given language.

The spacing material used to produce spaces within a line is cast on the same machines by using smooth plates instead of matrices. Rules and larger spacing materials are cast on special automatic machines that continuously cast a metal strip, which is automatically cut into pieces of the necessary length. Plastics, such as a copolymer of styrene with acrylonitrile or a polycarbonate, have also been used since the 1940's to cast large type and spacing materials. The use of plastics lowers the cost of composing materials, reduces weight, increases the life of the materials, and improves working conditions.

UI BYONG, in medieval Korea, a people's militia, made up primarily of peasants, organized to repulse foreign invaders The *ui byong* first appeared in the late tenth century, during the invasion of the Khitans. In modern times the *ui byong* consisted of armed detachments of Korean patriots who fought against the Japanese aggressors. The partisan struggle waged by these detachments took on a wide scope in Korea between 1905 and 1908, after the establishment of a Japanese protectorate in 1905. Only by routing the main forces of the *ui byong* and driving them to remote regions were the Japanese imperialists able to annex Korea in August 1910.

ULCHI MUNDOK. Born second half of the sixth century; died first half of the seventh century. Military leader of the Koguryo state and organizer of a victory over the Chinese invaders.

In 612 the Sui emperor Yang Kuang (Yang-ti) equipped an army of several million men and launched a campaign against Koguryo. The Korean troops, led by Ulchi Mundok, won a series of victories over the enemy, which was lured, through skillful maneuvering, into the interior as far as Pyongyang. The Sui army, now without food, was forced to retreat and was destroyed while crossing the Salsu (now the Chongchon) River.

UNDERGROUND MINE CONSTRUCTION, the construction of enterprises, such as coal and ore mines, for the subsurface extraction of minerals. The construction of underground mines encompasses the digging of vertical, inclined, and horizontal underground mining excavations and the erection of buildings and structures on the surface. The surface structures and buildings include headframes, hoisting-machine buildings, buildings used for both administrative and general service purposes, machine repair shops, cooling towers, compressor houses, stores, and spur tracks. In underground mine construction, more than 60 percent of the total amount of construction and installation work is performed underground.

In prerevolutionary Russia, underground mines were constructed mainly in the Donets Coal Basin (the Donbas) and the Krivoi Rog Iron Ore Basin. In the USSR, underground mine construction experienced rapid development during the prewar five-year plans (1929–40). Large underground coal mines were constructed in the Donbas, in the Kuznetsk Coal Basin (the Kuzbas), and in Karaganda in Kazakhstan. Underground metal mines were constructed in, for example, the Krivoi Rog Basin and Perm' Oblast.

During the Great Patriotic War of 1941–45, the construction of underground mines was intensified in the eastern regions of the USSR. In the Kuzbas alone, 24 underground mines were put into operation during the war.

Between 1943 and 1950, the bulk of the work in underground mine construction was devoted to the reconstruction of wrecked or flooded mines in the Donbas, the Moscow Coal Basin, the Krivoi Rog Basin, and the Nikopol' Manganese Ore Basin.

The further development of underground mine construction was characterized by a greater reliance on specialized equipment and an improvement in the organizational forms of management. Between 1950 and the late 1970's, numerous underground mines were constructed or under construction in the USSR. They included coal mines (such as the Raspadskaia No. 1 Mine in the Kuzbas, the Krasnoarmeisk-Kapital'naia Mine in the Donbas, and the Vorga-Shor No. 1 Mine in the Pechora Coal Basin), potassium-salt mines (for example, those serving the Fourth Berezniki Potassium Combine in the Urals and the Fourth Soligorsk Potash Combine in Byelorussia), and iron mines (such as the Oktiabr'skaia-Saksagan' and Gigant-Glubokaia mines in the Krivoi Rog Basin and the Iakovlevo Mine in the Kursk Magnetic Anomaly).

As a rule, underground mines are constructed under complex mining and geological conditions at depths that reach 1,000 or more m. Such depths are characterized by high temperatures of the enclosing rock, elevated rock pressure, and gas emission. A substantial amount of excavation work is carried out to renovate existing underground mines and to prepare new levels in such mines.

The sinking of shafts is fully mechanized. BUKS-1m drilling rigs are used to drill blastholes. Loading machines are employed to load the bulk rock, and heavy-duty self-unloading buckets with a capacity of up to 5 m^3 are used to deliver the rock to the surface. Shafts are usually reinforced with cast-in-place concrete by pouring the concrete mix, through pipes, behind a movable metal formwork.

To put a modern underground mine into operation, 40 to 80 km of mining excavations are made. Every year, construction workers dig more than 360 km of mining excavations, including 25 km of vertical shafts. In 1976, the average shaft-sinking rate with the use of rock-loading complexes was 55 m/month in the coal industry and 43.6 m/month in the ore mining industry. The USSR is first in the world with respect to both the volume and the rate of sinking vertical shafts; a total of 401.3 m of finished shafts are sunk per month. Drilling rigs, rock-loading machines, and entry-driving machines are used to drive horizontal excavations. In 1975, about 15 percent of all excavations at underground mines constructed by the coal industry were made with cutting-loading machines; about 20 percent of all such excavations—that is, 1.5 times more than the planned standard—were made by high-speed techniques. In 1976, the average monthly excavation rate was 59.7 m of crosscuts and drifts in coal mines and 69.6 m in ore mines. The volume of ground removed per month in making excavations of large cross section—for example, pit bottoms and chambers—ranges from 300 to 460 m^3.

Underground mines are constructed by mine-construction organizations that are specialized in the type of work performed. The organizations include trusts that sink shafts, make horizontal or inclined excavations, install mining equipment, or construct buildings and structures on the surface. Such organizations belong to mine-construction combines or associations, for example, the Soiuzshakhtstroi All-Union Association of the Ministry of the Coal Industry of the USSR and the Tsvetmetshakhtstroi All-Union Association of the Ministry of Nonferrous Metallurgy of the USSR. The specialized Shakhtspetsstroi All-Union Trust of the Ministry of Installation and Specialized Construction Work of the USSR sinks shafts with the use of special methods, such as the freezing or grouting of rock.

Scientific research in underground mine construction is carried out by such research institutes as the All-Union Scientific Research Institute for the Organization and Mechanization of Underground Mine Construction (Kharkov), the Kuzbas Scientific Research Institute of Underground Mine Construction (Kemerovo), and the Donetsk State Institute for the Planning and Organization of Underground Mine Construction (Donetsk). Cutting-loading machines are developed by the Central Scientific Research Institute of Underground-mining Machine Building in Moscow.

In other socialist countries, large underground coal mines have been constructed in the Polish People's Republic, underground potassium-salt mines have been constructed in the German Democratic Republic, and large underground mines for the extraction of complex ores are under construction in the Mongolian People's Republic. Scientific and technical councils for the planning and construction of mining enterprises have been established in the framework of the Council for Mutual Economic Assistance (COMECON).

In capitalist countries, including the USA, the Federal Republic of Germany, Belgium, Great Britain, France, the Republic of South Africa, and Canada, underground mines are constructed, as a rule, by specialized firms.

UNION DE BANQUES SUISSES (also Union Bank of Switzerland), a major Swiss commercial bank, formed in 1912 when the Bank von Winterthur (founed 1862) and the Toggenburger Bank (founded 1863) merged. The bank expanded until 1969 by absorbing smaller banks.

The Union de Banques Suisses, whose headquarters are in Zürich, carries out a variety of banking transactions. It has a confidential investment company that invests depositors' capital in securities in Switzerland and abroad. The bank maintains 91 branches, 110 agencies, and eight subsidiary financial concerns in Switzerland and 30 branches and offices and four subsidiary financial concerns in foreign countries. It works with several multinational banking groups that invest in Latin America and the Far East and manages, with the Deutsche Bank, a bank in New York.

As of June 1977 the Union de Banques Suisses had total assets of 54.2 billion Swiss francs and capital and reserves of 3.4 billion francs; current accounts and deposits of other banks totaled 16.8 billion francs, and those of other clients, 25.5 billion. The bank had discounted notes and loans of 18.5 billion francs, accounts in other banks of 21.4 billion francs, and mortgages and securities of 10.1 billion francs. [29–995–1]

UNION JOINT, a detachable joint, formed by means of a union, that is used to connect the parts of a piping system to various tanks or machines. Besides a union, a union joint consists of a gasket, a locknut, and a reducer, such as an elbow or a coupling (Figure 1). The pipe to be connected is screwed into the reducer.

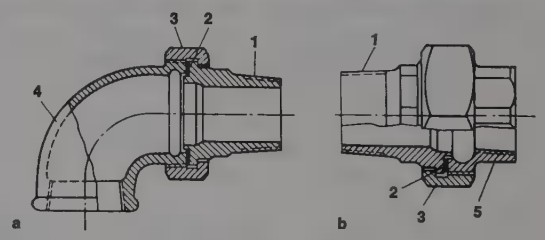

Figure 1. Union joints: (a) with an elbow, (b) with a coupling; (1) union, (2) gasket, (3) locknut, (4) elbow, (5) coupling

When the locknut is loosened, the reducer, together with the pipe screwed into it, may be turned relative to the axis of the union. A rigid, airtight joint is obtained by tightening the locknut. [29–1507–2]

UNIONS AND NIPPLES (in Russian, *shtutser*). A union or a nipple is a pipe fitting that is used to attach piping or a pipe joint to various tanks or pipelines. A union is a sleeve, while a nipple is a short piece of tubing. One of the ends of a union or a nipple has an internal or external screw thread; the shape of the other end depends on the method used to connect the fitting to adjoining parts.

The term "nipple" is also applied to a short piece of tubing of small diameter (10–20 mm) that is used to draw off water or air or to tap a liquid from piping in order to measure the pressure of the fluid. [29–1507–1]

UNITY OF BRETHREN (Unitas Fratrum), a religious sect that arose in Bohemia and Moravia in the mid-15th century after the defeat of the Taborites and formed itself into a church organization independent of papal Rome.

The first communities of the Unity of Brethren were established in 1457 in Kunvald in Bohemia by the followers of P. Chelčický. The sect was originally composed primarily of people from the peasant and artisan classes. It preached poverty, rejection of worldly concerns, humility, and passive resistance to evil. Later, the community accepted prosperous city dwellers and even members of the knightly and noble classes. In the late 15th century, the sect concentrated on education, and it founded

schools and printing shops. From this milieu came many scholars, including Jan Blahoslav and J. A. Comenius. The sect was persecuted by the authorities; after the defeat of the Czech uprising of 1618–20, the community was broken up and was banished from Bohemia and Moravia. In the 18th century, successors to the Unity of Brethren founded the Herrnhut communal movement in Germany, the Baltic region, and North America. [29–524–5]

UROMASTYX, a genus of lizards of the family Agama. The head is short and slightly flattened. The upper part of the body is covered with identical tiny scales, among which some species have irregularly placed enlarged tubercles with small spines. The short, slightly flattened tail is covered on top with large spiny scales, which are gathered into regular transverse spiny rings. The total length may reach 80 cm. Adults are a monotone gray or brown, sometimes with tiny dark spots, and the young have light transverse stripes and spots.

The genus embraces 13 species, which are distributed in North and East Africa and in Southwest Asia as far east as western India. They inhabit arid rocky and desert areas. They dig deep burrows, which in the case of some species attain a length of 4 m. The animals have an increased resistance to high atmospheric temperatures, remaining active when soil temperatures are 53°–57°C. The young feed on tiny invertebrates, while adults are mainly herbivorous. The females deposit up to 20 eggs. The flesh and fat of the animals are eaten in some countries. [29–1219–1]

UROPELTIDAE, a family of reptiles. The brightly colored body may reach a length of 35 cm. The tail is short, sometimes appearing to be chopped off, with the surface of the "chopped-off" part covered with carinal scales or with a single large shield. It serves as a source of support when the animal digs tunnels in the soil.

The family embraces eight genera, comprising 44 species, which are found in the southern part of the Hindustan Peninsula and in Sri Lanka. The Uropeltidae are burrowing animals. They live under rocks, under fallen tree trunks, and in the soil, frequently at high mountain elevations. They feed on worms and insects. The females are ovoviviparous, with three to eight young per litter. [29–1614–1]

VENEER, wood in the form of thin sheets obtained by peeling off short logs on veneer peeling machines (rotary-cut veneer), slicing logs on veneer-cutting machines (sliced veneer), and sawing on veneer-sawing machines or gang mills (saw cut veneer).

Saw cut veneer (1–10 mm thick) is made from spruce, Nordmann's fir, and Siberian stone pine. The highest quality veneer, it is used to make the soundboards of string instruments. The production of saw cut veneer entails substantial losses of wood in saw dust; the usable output of veneer is not more than 40 percent of the raw material.

Rotary-cut (0.1–10 mm thick), the most common variety of veneer, is made from birch, beech, oak, spruce, alder, aspen, pine, and other tree species. It is widely used to make plywood, plywood sheets, laminated wood plastics, and other types of laminated wood. Other uses include the decoration of cabinetwork, the production of matches and matchboxes, and the manufacture of separators for lead electrical accumulators.

Sliced veneer (0.2–5 mm thick) is produced from acacia, beech, oak, elm, chestnut, walnut, yew, ash, Karelian birch, mahogany, and other fine woods that have attractive grain. The desired decorative effect of the grain exhibited by different sections of the wood determines the direction of slicing. Several types of sliced veneer are distinguished on this basis, with radial, radial-tangential, tangential, and tangential-face cuts. Sheets sliced from one log in sequence are packed in bundles in the order of slicing to help select veneer by color and grain. Sliced veneers are used in cabinetwork.

The growing scarcity of fine wood and the difficulty of artificially reproducing a texture equivalent in decorative effect to natural wood grain have encouraged the development of thin and ultra-thin (0.08–0.15 mm) veneers of fine woods and the improvement of the natural grain of the wood of ordinary species by special treatment (slicing on an angle to the longitudinal axis of the trunk, wavy slicing and peeling, conical peeling).

VERATRUM (false hellebore), a genus of large perennial herbs of the family Liliaceae. The rootstock is short and thickened. The leaves are plicate; the lower ones are broad and amplexicaul. The bisexual and staminate flowers are in a panicled inflorescence. The stellate perianth is corolliform and six-parted to the base. The fruit is a capsule that is segmented into three fruitlets.

There are about 25 species, distributed in the temperate and, less commonly, cold zones of the northern hemisphere. The USSR has nine species. *V. lobelianum*, which has yellowish green flowers, grows in the forest and forest-steppe zones in moist (often floodplain) meadows, in sparse forests, and amid shrubbery. *V. nigrum*, which has black-purple flowers, is found mainly in the steppe zone on slopes, in forest meadows (rarely in floodplain meadows), and amid shrubbery. The white-flowered *V. album* is found in the Carpathians on mountain meadows.

All species of *Veratrum* are poisonous. Alkaloids are present throughout the plant but mainly in the rootstocks and roots. Particularly poisonous are *V. lobelianum* and *V. album*, which produce severe poisoning and death of horses, cattle, and domestic fowl. These two species are most toxic when they are young. An infusion of their rootstocks and roots is used as an insecticide against skin parasites, for example, scabies. In veterinary medicine preparations obtained from the plants are used to improve digestion, to induce vomiting in pigs and dogs, and to treat hypodermosis in cattle.

VERMES (worms), a heterogeneous group of invertebrates that includes about 46,000 species. As a general rule, worms have an elongated body whose walls consist of a cutaneous covering and musculature (the musculocutaneous sac). Locomotion is mainly peristaltic. Together with mollusks and arthropods, the Vermes belong to the group Protostomia. They cover an extensive morphophysiological range in the evolutionary series of invertebrates.

In the 19th century, the Vermes were regarded as a separate phylum. Scientists now consider that they constitute several independent phyla: Plathelminthes (flatworms), Nemathelminthes (nematodes), Nemertini, Echiurida, Sipunculida, and Annelida. The first three phyla are often united under the designation Scolecida. The remaining phyla are usually united with mollusks and arthropods in the higher group of trochophores (Trochozoa). Some zoologists consider Annelida and Arthropoda as subphyla of an extensive phylum known as Articulata.

VESPA, a genus of stinging hymenopterous insects of the family Vespidae (true wasps), belonging to the group of social wasps. The body reaches 3.5 cm in length, the females being larger than the males and the workers. The body is usualy brownish with yellow patterns or dressings; the wings are brownish yellow, and the thorax and abdomen are sometimes black. The insects build relatively large nests in the form of horizontally arranged honeycombs in hollow trees or abandoned burrows. Each nest contains up to 500 cells. As they build their honeycombs, the insects eat away at the bark of trunks and branches of various trees and shrubs, frequently causing them to dry out. They feed mainly on other insects, including honeybees; they also suck sap from tree wounds and nectar from flowers and eat fruits and berries.

Members of the genus carry dysentery and other infectious diseases. A sting from these wasps can be very dangerous, resulting

in edema, fainting, and general asphyxia. The genus embraces approximately 20 species, which are distributed in Eurasia and North Africa. Eight of these are found in the USSR. *Vespa crabro* is found in the European section of the USSR and in Siberia, *Vespa orientalis* in the Transcaucasus and Central Asia, and several species, including the largest, *Vespa mandarina*, in the Far East.

WALKING CONVEYOR, a conveying machine for the periodic movement of piece cargo in a straight line, used in assembly plants, foundries, and other industrial enterprises. It simultaneously transports from four to 70 loads with a total weight from 3 to 400 tons and with a step from 0.4 to 6 m. The length of a walking conveyor assembled from identical sections may reach 150 m; the conveying speed is from 1 to 20 m/min, and the duration of one cycle ranges from 0.2 to 10 min. The walking conveyor was introduced in the USSR in the 1960's. It has since been used in other countries as well because of its simplicity, low cost, and low weight.

A walking conveyor (Figure 1) has a stationary frame with guide rollers, a mobile frame resting on lift wheels, and a drive. Mechanical, pneumatic, or hydraulic devices are used for the drive and lift. In the starting position the mobile frame is lowered, and the loads are set on the stationary frame. At the start of each cycle, the mobile frame lifts the loads above the stationary frame (position I) by means of hydraulic cylinders and moves them forward by one step with the advance of the drive piston (position II). The hydraulic cylinders then lower the mobile frame and place the loads onto the stationary frame with a displacement of one step (position III). In the lowered position, the mobile frame, which is now without loads, returns to the starting position (position IV). The loads are placed and removed at the beginning and end of the conveyor. The conveyor may be automatically controlled. The period between movement cycles is determined by the nature of the production process. The principal disadvantage of walking conveyors is the need to overcome the inertia of the weight of the load and the frame in starting and stopping the drive.

WALL TAPESTRY, a pileless wall rug with a figured or ornamental design, made by hand in a filling rib weave.

To form the design, a weft of colored threads (usually wool or silk, but sometimes metallic gold and silver threads) is densely woven on a uniformly colored warp (wool or linen). A characteristic ribbed texture results. In tapestry weaving each thread of the weft is used only in the area in which its color is desired; this technique was known in antiquity and was used by the Copts. Two types of tapestries may be distinguished according to the type of loom used; high-warp is made on looms on which the warp is fastened vertically, and low-warp on looms with a horizontal warp. A cartoon, or painted sketch, the size of the tapestry serves as a model for the design.

Tapestry-making in Western Europe developed in the 12th and 13th centuries; in the Middle Ages wall tapestries were widely used to decorate dwellings and public buildings. Wall tapestries are examples of monumental decorative art. Particularly noteworthy is the Angers *Apocalypse*, which consists of seven huge tapestries depicting 105 scenes, of which 77 have been preserved (c. 1380, by the Paris studio of Nicolas Bataille, from cartoons by Jean of Bruges). Also well known are the six allegorical *Lady With the Unicorn* tapestries (late 15th to early 16th century, Paris, Cluny Museum), which are in the *millefleur* style; that is, their backgrounds consist of bunches of flowers.

The chief centers of medieval tapestry weaving were Paris, Arras, Tournai, and, beginning in the late 15th century, Brussels. In Brussels in the early 16th century the *Acts of the Apostles* tapestry series was executed for the Vatican from cartoons by Raphael; in the 17th century a tapestry series was produced in Brussels from cartoons by P. P. Rubens. In the mid-17th century large tapestry factories were founded in France under the direction of great artists, such as the Gobelins's royal factory in Paris and factories in Beauvais and Aubusson. The favorite themes for tapestries in the 17th and 18th centuries were mythological and historical scenes, allegories, hunting scenes, pastoral scenes, and landscapes (*verdures*).

In the 18th and 19th centuries tapestry weaving became completely dominated by the cartoon, and consequently many of the artistic qualities present in the older tapestries were lost. The decorative principles of tapestry weaving were revived in the mid-20th century by J. Lurçat.

In Russia, tapestry-making began during the reign of Peter I. A tapestry factory established in St. Petersburg in 1717 existed until 1859. One of the first works executed at the factory was *The Battle of Poltava*, from a cartoon by L. Caravaque (Hermitage, Leningrad). The factory reached the height of its activity in the

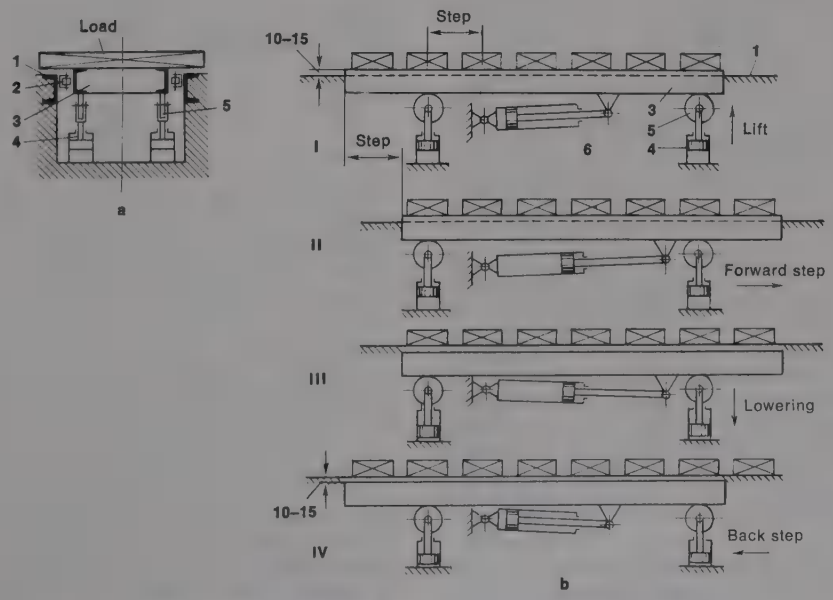

Figure 1. Walking conveyor: (a) end view, (b) side views of operating positions; (1) stationary frame, (2) guide roller, (3) mobile frame, (4) lift, (5) wheel, (6) drive

second half of the 18th century and the early 19th century. The decorative principle dominated Russian tapestry weaving in the classicist age, and many of the tapestries of this era, such as *Diana* and *Saturn* from the Gur'ev suite (1805–06, museums in Pavlovsk and Gatchina), were an integral part of architectural interiors.

The principal collections of tapestries in the USSR are located in Leningrad at the Hermitage and the Russian Museum and in Moscow in the museums of the Kremlin.

WAR ECONOMY. (1) In capitalist countries, a specific part of the national economy that is responsible for the financing of the preparation and conduct of war; in socialist countries, the part of the national economy that strengthens defensive capability.

(2) A branch of knowledge (military economic science) that studies the economic aspects of national defense and warfare.

The war economy as a part of the national economy includes the production of various types of military products, as well as the distribution, exchange, and consumption of the products. Proponents of mercantilism and later scholars of classical bourgeois political economy wrote of the existence of a close interrelationship between war and economics. It remained for the founders of Marxism, however, to provide a scientific substantiation of the dependence of war on economics and the influence of economic conditions on the change in modes of warfare. "Nothing is more dependent on economic prerequisites than precisely the army and the navy. Armament, composition, organization, tactics, and strategy depend above all on the stage reached at the time in production and on communications" (F. Engels, see K. Marx and F. Engels, *Soch.*, 2nd ed., vol. 20, p. 171).

The history of war shows that military spending increases in absolute and relative terms with the development of the productive forces and with the improvement of the means of combat. Military spending reached its high point in the age of imperialism. The laws of development inherent in imperialism and the struggle for the redivision of the world have twice plunged mankind into bloody world wars and have caused numerous local wars. Two world wars have shown that success in war depends to a great degree on the quantity and quality of economic resources and on the effective mobilization and utilization of these resources. In the wars of the 19th century, the military spending of the warring nations accounted for between 8 and 14 percent of national income on the average, whereas in World War I this indicator was 24.2 percent in Austria-Hungary, 36.9 percent in Great Britain, 31.6 percent in Germany, 19.2 percent in Italy, 24.1 percent in Russia, 25.6 percent in France, and 15.5 percent in the USA. During World War II the corresponding figure was 43.4 percent in the USA, 55.7 percent in Great Britain, and 67.8 percent in Germany. In order to satisfy the enormous military requirements brought on by World War I and especially by World War II, it was necessary to place a significant part of the national economy of the warring nations on a military footing. Thus, according to some estimates, the share of military production in total US industrial production was 60.6 percent between 1941 and 1945.

With the worsening of the general crisis of capitalism, imperialist countries are increasingly resorting to the use of military force as an instrument of policy. Immediately after World War II, the imperialist countries—under the leadership of the USA—began preparing for a new world war by pursuing a "cold war" policy and forming aggressive military and political alliances directed against countries in the socialist community, the labor movement, the national liberation struggle of peoples, and other revolutionary forces of modern times. An arms race without precedent in history has come into being. The total annual sum of direct military spending throughout the world has increased from $120 billion in 1962 to more than $400 billion in 1977. While in the past the war economy developed appreciably immediately before and during wars, after World War II the prolonged and intensive arms race has led to the formation of a permanently active, ramified military sector of the economy.

The war economy is not separate from the civilian economy: a large number of branches and enterprises manufacture both civilian and military products or else produce items that can be used in the civilian and military sectors of the economy (footwear, fabrics, clothing, food, and the like). At the same time, there are certain features in the development of the war economy that stem from the character of military requirements, the purpose and specific properties of military products, and the existing mode of production. The state has a decisive influence on the development of the war economy. The state is the exclusive or principal purchaser and consumer of military products manufactured in the nation, and hence the scale and structure of the war economy are determined specifically by the demands of the state. "When capitalists work for defense, i.e., for the state, it is obviously no longer 'pure' capitalism but a special form of national economy. Pure capitalism means commodity production. And commodity production means work for an *unknown* and free market. But the capitalist 'working' for defense does not 'work' for the market at all—he works on government *orders*, very often with money loaned by the state" (V. I. Lenin, *Poln. sobr. soch.*, 5th ed., vol. 32, pp. 318–19).

The development of state-monopoly capitalism is most clearly manifested in the war economy. In addition to legislative, administrative, and political measures, bourgeois states make broad use of economic levers—in particular, all manner of financial incentives for military-industrial corporations—for the purpose of state-monopoly regulation of the war economy.

Data on the share of the gross national product (GNP) accounted for by the direct military expenditures of a country provide some idea of the relative size of the war economy, that is, the degree of militarization of the economy (see Table 1). However, this general indicator understates the actual level of military consumption, since officially published data on military expenditures do not include all types of military expenditures and data on the GNP may be considerably exaggerated if identical items are listed in two different reporting categories.

Table 1. Official figures for military expenditures of major imperialist countries

	1970		1976	
	(million dollars)	(percent of GNP)	(million dollars)	(percent of GNP)
USA	77,854	7.4	102,691	6.0
Great Britain	5,850	4.9	10,734	5.1
Federal Republic of Germany	6,217	3.3	15,220	3.6
France	6,014	3.3	12,857	3.7
Italy	2,599	2.8	3,821	2.6
Canada	2,061	2.4	3,231	1.9
Japan	1,592	0.8	5,058	0.9

The boundaries of maximum development of the war economy are determined by the war economy potential of a country. The defense industry is a basic link in the war economy. Its nucleus is the armaments industry: the aerospace and nuclear industries, military shipbuilding, and the manufacture of military electronic products, armored equipment, ammunition, artillery, and small arms weaponry.

A dominant position in the war economy of modern capitalism is occupied by the USA, which produces approximately three-fourths of all the aircraft, missiles, artillery, and small arms and two-thirds of the warships (mid-1970's) produced in all NATO (North Atlantic Treaty Organization) countries.

West European NATO countries constitute the second major center of the capitalist war economy. The ruling circles in these countries try to expand the coordination of the war economy and to make it more effective. Integrative processes encompass the development and production of armaments.

Both government and private enterprises participate in the manufacture of military products. In the USA and in West Euro-

pean countries, however, private capital occupies the major place in the war economy. The leading role is played by a few large corporations. In fiscal year 1974–75, 100 large American companies received 68.7 percent of government defense contracts; ten of the largest received 31.4 percent of the orders. Lockheed Aircraft Corporation occupied first place in total military contracts received ($2.1 billion), and the Boeing Airplane Company was second ($1.6 billion). Major suppliers of military products, which constitute the nucleus of the military-industrial complex, hinder détente and try to step up the arms race for the sake of higher profits.

The war economy in socialist countries is created for the purpose of protecting the interests of the working people and their revolutionary attainments. From its very inception, the first socialist country had to organize military production in order to defend itself against internal counterrevolution and military intervention.

After the Civil War of 1918–20, the Communist Party and the Soviet state—in addition to restoring the national economy and implementing a program of all-out socialist construction—devoted a good deal of attention to the development of the aircraft, tank, artillery, and other branches of the defense industry. The prewar creation of the war economy potential of the USSR served as the material basis for the accelerated development of the war economy and for the production of all types of armaments and combat matériel during the Great Patriotic War of 1941–45. Material, labor, and financial resources were mobilized to the utmost for the maximum possible satisfaction of the needs of the front. There was a sharp increase in absolute and relative military spending in the state budget of the USSR: the share of national income used for military purposes rose from 15 percent in 1940 to 55 percent in 1942. The selfless labor of the Soviet people, the major organizational effort of the Communist Party, and the advantages of socialist society and the socialist state system made it possible to increase the output of military products at a rapid rate, to surpass fascist Germany in all indicators of armaments production during the war years, and to outfit the army with sufficient quantities of highly effective types of weapons and combat matériel, all of which was of decisive importance in defeating the enemy.

In the face of the ever growing military economic preparations of imperialism and especially of NATO member nations in the postwar years, countries in the socialist community were compelled to develop and produce modern weapons and war matériel in order to strengthen their defensive capability. The USSR and other countries that are parties to the Warsaw Treaty of 1955 took measures to strengthen the defensive might of countries in the socialist community. The forms of military economic cooperation were expanded and improved among fraternal socialist countries that were compelled to spend considerable sums on military purposes in order to defend their attainments. Thus the defense spending of the USSR was 17.6 billion rubles in 1974 and 17.2 billion rubles in 1977 (the share of defense spending in the state budget of the USSR declined from 11.5 percent in 1970 to 7.2 percent in 1977). The CPSU and the Soviet state are concurrently engaged in a major effort to implement the program of the Twenty-fifth Congress of the CPSU (1976) on the further struggle for peace and international cooperation and for the freedom and independence of peoples. The USSR and other socialist countries are stepping up the struggle to halt the arms race, to reduce armaments and the armed forces, and to achieve genuine success in disarmament.

War economy as a branch of knowledge is a component of military science. It studies the interrelationships between war and the economy and the problem of evaluating and comparing the war economy potential of opposing countries and their coalitions. It defines the forms and methods for mobilizing the national economy and for placing it on a military footing in the case of necessity. It ensures the effectiveness of the system for the functioning of the war economy and the use of resources earmarked for military purposes. War economy theory is of a class nature.

Bourgeois military economic science was formed in the imperialist era. World War I and II exerted a significant influence on its development. The postwar arms race has promoted the further development of the war economy theory, especially in the USA. Works by bourgeois authors attempt to investigate economic preparations for modern war on the one hand and to justify and conceal the class and aggressive character of the unprecedented arms race and the development of militarism in capitalist countries on the other.

The military economic science of socialist countries investigates the patterns of development of the socialist military economy in the interests of warding off the menace of war and of frustrating imperialist aggression. It studies and substantiates ways and means of managing and strengthening the economic basis of national defense and the effective use of resources allocated for defense purposes, for the reliable protection of the attainments of socialism, and for the preservation of universal peace.

WASHER, a machine part mounted under a nut or bolt head. Plain washers (Figure 1,a) are used to increase the load distribution where the load-bearing surface is uneven or of a soft material, where the bolt hole is elongated, or where the hole diameter is enlarged. Bevel washers (Figure 1,b) and spherical washers (Figure 1,c) are used to prevent the nut or bolt head from warping during tightening. Open, or C, washers (Figure 1,d) are quick-release types used in fixtures to save time in removing a used part and mounting a new one. Packing washers made of a soft material are mounted under the heads of threaded plugs to provide a hermetic seal. Spring lock washers (Figure 1,e) reduce the likelihood that a bolt or nut will loosen since the elastic force of the compressed washer acts on the connection. Tab lock washers have sections that can be bent (Figure 1,f) to prevent a nut or bolt from turning with respect to a load-bearing shaft or other part. End plates (Figure 1,g) prevent axial displacement of parts mounted on a shaft (such parts may be held fixed or rotate on the shaft). [29–808–3]

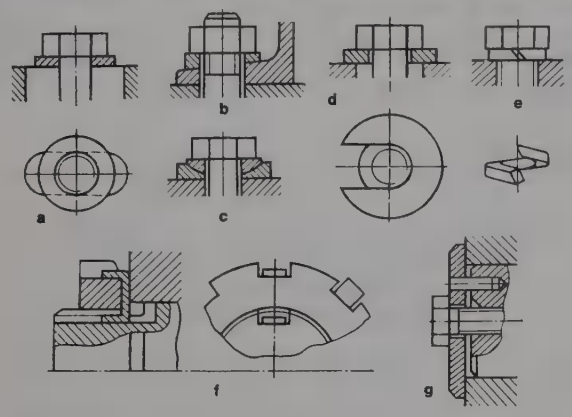

Figure 1. Washers: (a) plain, (b) bevel, (c) spherical, (d) open, (e) spring lock, (f) tab lock, (g) end plate

WATER HYACINTH (*Eichornia crassipes*; formerly *E. speciosa*), a perennial herbaceous aquatic plant of the family Pontederiaceae. The stem is short, with rosettes of oval leaves. The leaf petioles are filled with air and inflated like bubbles to ensure that the plant floats on the water surface. The rhizomes are long, so that if the water dries out, the plant takes root in the muddy bottom. The flowers are in a spicate inflorescence with a funnelform lilac perianth of six lobes and six stamens. The fruit is a capsule.

The water hyacinth is native to tropical and subtropical regions of North and South America. It has spread to the fresh waters of all tropical lands. A pernicious aquatic weed, it forms dense thickets in rivers, obstructing navigation and contaminating drainage and irrigation systems. The water hyacinth is controlled by mechanical and chemical methods; in some countries it is used as fertilizer or livestock feed. [29–1735–4]

WEST SPITSBERGEN CURRENT, a branch of the warm Gulf Stream current along the western shores of Spitsbergen, a continuation of the Norwegian Current. The mean annual temperature of the water is 1°–3°C, and the velocity of the current reaches 5.5 km/day. Water salinity is about 34.5%. When the current submerges north of Spitsbergen, it gives rise to a stream of warm intermediate waters in the Arctic Ocean. [29–1401–1]

WHAT IS TO BE DONE? (full title, *What Is to Be Done? Burning Questions of Our Movement*), a book by V. I. Lenin in which he comprehensively substantiated the need to create a new kind of proletarian party that would be fundamentally different from the reformist parties of the Second International—the party of the socialist revolution and of the dictatorship of the proletariat. In this book Lenin ideologically demolished "economism," showing it to be a variant of international opportunism, or Bernsteinism. The book was written between the fall of 1901 and February 1902 and was first published in Stuttgart in March 1902. It is part of Lenin's collected works (*Poln. sobr. soch.*, 5th ed., vol. 6, pp. 1–192).

The first chapter of the book, constituting a defense of the revolutionary Marxist trend in the working-class movement, showed that the Bernsteinians used the slogan "freedom of criticism" as a cover for their proposed revision of all the basic tenets of Marxism; for example, they advocated "class cooperation" and rejected the idea of the proletarian revolution and dictatorship of the proletariat. In Lenin's view, the creative development of Marxism, which would be enriched by the new experience gained from the class struggle of the proletariat, had nothing in common with the revisionists' attempts to subvert the fundamentals and principles of Marxism. " 'Freedom of criticism,' " wrote Lenin, "means freedom for an opportunist trend in Social-Democracy, freedom to convert Social-Democracy into a democratic party of reform, freedom to introduce bourgeois ideas and bourgeois elements into socialism" (*ibid.*, p. 9).

Economism in Russia was a variant of international opportunism. By worshiping the spontaneity of the working-class movement, stressing above all the economic aspect of the class struggle of the proletariat, and advocating a reformist approach to the political struggle, the Economists minimized in every possible way the role of socialist consciousness and the leading role of the party within the working-class movement; viewed objectively, they were the vehicle of bourgeois influence on the proletariat, inasmuch as they tried to disarm the working class, both ideologically and organizationally, in its struggle against autocracy and against the bourgeoisie. Economism was the chief obstacle on the road toward centralized rule by the revolutionary Marxist party.

Having unmasked the opportunist ideology of economism, Lenin substantiated and emphasized the significance of revolutionary theory and of the Marxist party as the leading force in the mass working-class movement; he showed the ineradicable connection linking all aspects of the class struggle of the proletariat—political, economic, and ideological—and emphasized with special force the significance of the party's theoretical (that is, ideological) work. Indeed, theoretical preparedness was particularly important for Russian Social Democracy, since this was the first time in history that a workers' party had to lead the people in a nationwide struggle for the victory of the bourgeois-democratic revolution.

The party could not have led the struggle for liberation without adopting a creative approach to this task and without independently reviewing the whole experience of the international proletarian movement. The party must march ahead of the spontaneous working-class movement and show it the way, and to this end it must be guided by revolutionary theory. "Without revolutionary theory there can be no revolutionary movement," wrote Lenin, and "the role of vanguard fighter can be fulfilled only by a party that is guided by the most advanced theory" (*ibid.*, pp. 24, 25).

The second chapter of *What Is to Be Done?* deals with the relationship between spontaneity and consciousness within the working-class movement. The Economists claimed that Social Democracy must not try to implant socialist consciousness in the working class; in their judgment, it was necessary to wait for the spontaneous working-class movement to work out a socialist consciousness by its own efforts. Lenin showed that the socialist doctrine is worked out by the ideologists of the working class and is carried over by the working-class party into the class struggle of the proletariat—a struggle that grows spontaneously out of the soil of capitalist relations.

As Lenin pointed out, world history shows that what the working class can work out by its own efforts alone is merely a trade-unionist consciousness. The socialist ideology is introduced into the working-class movement in the course of the complex, continuous, and bitter struggle against the bourgeois ideology. In Lenin's words, "the *only* choice is—either bourgeois or socialist ideology. There is no middle course (for mankind has not created a 'third' ideology, and, moreover, in a society torn by class antagonisms there can never be a non-class or an above-class ideology). Hence, to belittle the socialist ideology *in any way, to turn aside from it in the slightest degree* means to strengthen bourgeois ideology" (*ibid.*, pp. 39–40). In the early 20th century the Marxist party in Russia was faced with the task, as shown by Lenin, of

setting the working-class movement on the path of political struggle against tsarism and capitalism and arming it with the ideas of scientific socialism.

The third chapter of *What Is to Be Done?* throws a light on the relationship between economics and politics—that is, between the economic and the political aspects of the class struggle of the proletariat. Lenin criticized the Economists for their trade-unionist and reformist view of politics and substantiated the revolutionary policy of the Marxist party. The Economists' worship of spontaneity led them to minimize not only the role of socialist theory but also the political tasks of the working class and its party. Lenin showed that limiting the political struggle to a struggle for reforms would condemn the working class to eternal wage slavery; that the only way the proletariat can radically improve its economic position is by overthrowing the rule of the exploiters and struggling for the power of the working class; and that "the fundamental economic interests of the proletariat can be satisfied only by a political revolution that will replace the dictatorship of the bourgeoisie by the dictatorship of the proletariat" (*ibid.*, p. 46, footnote).

The ultimate goal of the struggle of the proletariat is the overthrow of capitalism and the establishment of its own rule for the purpose of building a socialist society. The immediate task of Russia's working class, as Lenin pointed out, was to overthrow the autocracy in order to create the necessary conditions for the struggle leading to the victory of the socialist revolution.

Lenin developed the idea of the hegemony of the proletariat in the impending bourgeois-democratic revolution—the idea of the revolutionary alliance of the working class and the peasantry—which he had first formulated in *What the "Friends of the People" Are and How They Fight the Social Democrats* (1894). In his view, the working class must assume the leadership of the general democratic movement in its role of fighting vanguard for political freedom; its party must therefore "expound and *emphasize general democratic tasks before the whole people*, without for a moment concealing [its] socialist convictions" (*ibid.*, p. 83). In Russia, according to Lenin, the party of the working class must combine the democratic struggle of all the people against autocracy with the socialist struggle of the proletariat against capitalism. Social Democracy, therefore, is obliged to carry out revolutionary propaganda and agitation among all the strata of the population, aiming for the political exposure of autocracy and of the entire sociopolitical system of tsarist Russia.

In the fourth and fifth chapters of his work, Lenin substantiated his plan for building a Marxist party, a rough outline of which he had presented earlier in the article "Where to Begin" (*ibid.*, vol. 5, pp. 1–13). The Social Democratic groups and committees that existed in Russia at the time, being scattered and poorly organized, were not capable of leading the effort to implement the political goals of the proletariat. What was needed was a single organization—that is, a party—and it was the necessity of building such a party that the Economists denied. Lenin addressed this point when he wrote that "the spontaneous struggle of the proletariat will not become its genuine 'class struggle' until this struggle is led by a strong organization of revolutionaries" (*ibid.*, vol. 6, p. 135).

Lenin held that building the party must start with a nationwide Russian political newspaper to disseminate the views of revolutionary Social Democracy. The newspaper's organized network of agents and correspondents was to serve as the skeleton around which the party would be built. Lenin's *Iskra* had become such a newspaper. According to Lenin's plan, the party was to consist of (1) a narrow circle of leading party workers—mainly professional revolutionaries—and (2) a broad network of party organizations.

In his "Conclusion," Lenin answered the question What is to be done? by reiterating the need to overcome the organizational confusion and ideological waverings in the ranks of Russian Social Democracy and to create a militant organization of revolutionaries (*ibid.*, pp. 180–83).

The historical significance of Lenin's book lies in its exposure of the ideological sources of opportunism in the working-class movement—namely, the worship of spontaneity—and its elaboration of the major political and ideological issues and programmatic, organizational, and tactical principles of the Marxist party. These principles constitute the ideological basis of the CPSU and of all communist and Marxist-Leninist parties.

Lenin's book went through 219 editions, with more than 11,918,100 copies printed in 58 languages of the peoples of the USSR and other countries (as of Jan. 1, 1977).

WHAT THE "FRIENDS OF THE PEOPLE" ARE AND HOW THEY FIGHT THE SOCIAL DEMOCRATS (A Reply to Articles in *Russkoe bogatstvo* Opposing the Marxists), the first basic work of V. I. Lenin, dealing with questions of dialectical and historical materialism, political economy, and scientific socialism and the idea of uniting socialism with the working-class movement and creating a Marxist working-class party in Russia. The book is part of Lenin's collected works (*Poln. sobr. soch.*, 5th ed., vol. 1, pp. 125–346).

In this work, Lenin criticized the views of the ideologists of liberal Narodnichestvo (Populism)—those sham "friends of the people," such as N. K. Mikhailovskii, V. P. Vorontsov, S. N. Krivenko, and S. N. Iuzhakov, who argued against Marxism in the magazine *Russkoe bogatstvo*—and formulated the ideological and theoretical principles as well as the basic program and tactics of Russia's revolutionary Social Democracy.

The book was written in 1894 and clandestinely hectographed in three separate issues. The first issue exposed the Populists' philosophical views. The second issue, which dealt with their political and economic theories, has never been found (Lenin reiterated his critique of these theories in *A Characterization of Economic Romanticism*, 1897). The third issue dealt with the Populists' tactics and their economic and political platform. Hectographed copies of the book were read in the revolutionary circles of St. Petersburg, Moscow, Kiev, Kharkov, and other Russian cities. Members of the Liberation of Labor and other Russian Social Democrats abroad were familiar with the book's contents.

In the book Lenin demonstrated the complete unfoundedness of the liberal Populists' philosophical and sociological views and of their subjective-idealist method, which exaggerated the role of ideas and of "critically thinking people" in history and rejected the concept of society's development according to objective laws. Lenin brought to light the dialectic-materialist essence of Marxist philosophy and the materialist conception of history. Refuting the Populist theory of the "active heroes" and the "passive crowd," he showed the people to be the true makers of history—the chief moving force of social progress. He exposed the Populists' attempt to "convict" the Marxists of being caught in the allegedly insoluble "conflict" between historical necessity and individual freedom; he revealed the fallacy of the Populists' assertion that outstanding individuals can successfully oppose the laws of history, and he showed that the power of the individual lies in his acting in accordance with the immediate requirements of social development rather than in opposition to historical necessity.

Approaching this question from a practical point of view, Lenin pointed out that the acknowledgment of historical necessity could not be reduced to passive contemplation of events but presupposed, under the conditions existing in Russia, vigorous action on the part of the Social Democrats aimed at rallying the working class for the struggle against autocracy and capitalism.

Lenin proved that the Populists' economic views were as unfounded as their philosophical tenets. The Populists of the 1880's and 1890's could no longer deny that capitalism was developing in Russia; they believed, however, that it had no future. They defended the concept of Russia's "indigenous" road to noncapitalist development, arguing that Russian capitalism was "artificial" in nature because of the country's lack of a domestic market. The Populists minimized the disintegration of the peasant commune and idealized small-scale commodity production, or "people's industry," holding up the latter in contrast to large-scale capitalist production, which would ruin the peasantry and thereby would allegedly reduce the domestic market.

Lenin showed that capitalism not only ruins the peasantry but also stratifies it, dividing it into the basic classes of capitalist society—the bourgeoisie and the proletariat. The destitute peasant sells his labor power and buys essential consumer goods,

while the rural bourgeoisie buys industrial products, including the tools of production. This means that capitalism creates and expands its own domestic market. The Populists misunderstood the very nature of capitalism, especially in its early stages. They claimed that the specific features of cottage industry—its dispersion over rural areas, the fact that the work was done at home, and the absence of large enterprises and consequently of a permanent labor force completely alienated from the land—made it a "people's industry," as opposed to capitalist industry. On the basis of his analysis of statistical data, Lenin revealed the fallacy of the Populists' assertions about the allegedly noncapitalist nature of the cottage industries.

The liberal Populists, having adopted the old erroneous views of peasant socialism and having fallen into even greater error, tried to shield the "people's industry" from the onslaught of capitalism. Their entire economic program was aimed at smoothing over the country's increasingly acute class antagonisms. What the liberal Populists proposed was a series of petty reforms that would not have affected the foundations of the bourgeois and landowning system. Having rejected the political program of the revolutionary Populists of the 1870's, they became the spokesmen of petit bourgeois and kulak interests.

Lenin described how the peasant's world had split up into rural bourgeoisie and proletariat; in his words, "the old Russian peasant socialism split up with it, making way for workers' socialism, on the one hand, and degenerating into vulgar petty-bourgeois radicalism, on the other" (*Poln. sobr. soch.*, 5th ed., vol. 1, p. 272). Under these conditions, the representatives of the proletarian party—that is, the Social Democrats—had to take upon themselves the defense of the interests of the broad toiling masses in the cities as well as in the countryside.

In his book, Lenin presented his scientific substantiation of the historic role of the proletariat, which was to lead the liberation movement of the toiling masses and throw off the yoke of tsarism, of the landowners, and of the bourgeoisie. He was particularly emphatic in pointing out that the foremost duty of the Russian Social Democrats was to prepare the assault on autocracy—the essential prerequisite for the coming victory of the working class over capital. The peasantry, with its interest in the complete elimination of all vestiges of serfdom, was the proletariat's ally in the struggle against the autocratic landowning system. For this reason, Lenin thought it necessary for the Social Democrats to support the peasants' demands, including "the complete abolition of landed proprietorship" (*ibid.*, p. 299).

Lenin developed the idea of the hegemony of the proletariat formulated by Marx and Engels, showing that the proletariat could play the leading role not only in the socialist but also in the bourgeois-democratic revolution. This was the point of departure for his thesis of the transformation of the bourgeois-democratic revolution into the socialist revolution. Lenin pointed out that the successful struggle of the working class and its allies for the overthrow of tsarism and capitalism was predicated on the existence of an independent proletarian party armed with advanced revolutionary theory. It was essential for the Russian working-class movement to break completely with all forms of Populism and with the theory and practice of petit bourgeois socialism. The Marxists, according to Lenin, must help the proletariat master the theory of scientific socialism and rally into a political force.

Lenin ended his book with the following prophetic words: "the Russian **WORKER**, rising at the head of all the democratic elements, will overthrow absolutism and lead the **RUSSIAN PROLETARIAT** (side by side with the proletariat of **ALL COUNTRIES**) *along the straight road of open political struggle to* **THE VICTORIOUS COMMUNIST REVOLUTION**" (*ibid.*, p. 312).

Lenin's book was the true manifesto of Russia's revolutionary Social Democracy; it dealt a crushing blow to the reactionary and utopian ideology and practice of liberal Populism. The book was important in providing theoretical preparation for the transition from Marxist propaganda of the type engaged in by small study groups to mass agitation carried out among broad strata of the proletariat and to the fusion of scientific socialism with the working-class movement.

As of Jan. 1, 1977, Lenin's book had gone through 123 printings, with 6,744,400 copies published in 33 languages of the peoples of the USSR and foreign countries.

WHIP ANTENNA, an antenna in the form of an asymmetrical dipole made from a rigid metal rod or a large number of metal coils strung on a flexible steel line. The rigid rod may be solid or may consist of several coupled sections. In the USSR, a whip antenna made from metal coils strung on a steel line is known as a Kulikov antenna. Whip antennas made from a shaped metallic strip, a braided wire, or a metal-coated dielectric rod are used less often.

The radiation pattern of a whip antenna in the horizontal plane is circular (see Figure 2 in ANTENNA). Therefore, whip antennas are especially suited for communication between ground-based objects whose relative position changes in time, for example, between mobile radio sets in motor vehicles or tanks.

WHITE NOISE, a generalized stochastic process of the type

$$<X, \phi> = \int_{-\infty}^{\infty} \phi(t)X(t)\,dt$$

where $\phi(t)$ is a finite function and $X(t)$ is a stochastic process with zero mathematical expectation and with the correlation function $B(s, t) = \delta(s - t)$. The generalized function δ is determined by the formula

$$\int_{-\infty}^{\infty}\int_{-\infty}^{\infty} \phi_1(s)\phi_2(t)\delta(s - t)\,dsdt = \int_{-\infty}^{\infty} \phi_1(t)\phi_2(t)\,dt$$

for any finite functions $\phi_k(t)$, where $k = 1, 2$. This process is a stationary stochastic process with a spectral density $f(\lambda) = \frac{1}{2}\pi$, $-\infty < \lambda < \infty$, and with an absolutely continuous spectral measure

$$F(\Delta) = \int_{\Delta} f(\lambda)\,d\lambda$$

White noise is used as a mathematical model in theoretical studies. Noise of any nature that has a uniform spectrum in a finite band of frequencies, such as the noise of electronic tubes, atmospheric noise, and oceanic noise, can be approximated quite well by the white-noise process.

WHORTLEBERRY (*Vaccinium myrtillus*), sometimes called bilberry, a low shrub (15–40 cm tall) of the family Vacciniaceae. The branches are angularly ribbed, and the leaves fall for the winter. The solitary drooping flowers are urceolate-spherical in shape and greenish pink in coloration. The fruit is a nearly round black berry with a blue-gray bloom. The whortleberry occurs in Eurasia and North America, in damp or marshy coniferous and mixed forests (often referred to as whortleberry forests). In the USSR the whortleberry is common in the taiga, the tundra, and high-elevation regions. The berry is edible in fresh and dried form; its juice is used for coloring wines. Infusions, teas, or cornstarch puddings made from the berries are used as binding agents to treat diarrhea. The related species *V. arctostaphylos*, which occurs in the Caucasus, is a tall shrub or small tree (up to 3 m tall) with edible berries. The whortleberry is sometimes assigned to the family Ericaceae, with Vaccinoidea designated as a subfamily. [29–250–1]

WIDE-FILM MOTION PICTURE, a type of motion picture in which films from 50 to 70 mm in width are used for photographing and projecting. Wide-film motion pictures gained acceptance in the mid-1950's, after experience in the filming and exhibiting of 35-mm wide-screen motion pictures using anamorphic optics indicated that the increase in image dimensions was achieved at some cost in image quality. The development of wide-film formats marked a new stage in the progress of motion pcitures, characterized by a substantially increased image size on the screen and improved image quality, which was achieved by the use of

film of twice the width of standard film, improved wide-angle optics, and a six-channel stereophonic system of sound recording and reproduction. Some wide-film systems use anamorphic compression in addition to the wider film.

Beginning in 1955, a number of wide-film systems (Todd-AO, Super Panavision, Ultra Panavision, and a Soviet system) were proposed in the USA and the USSR; they have since become widely used in modern motion-picture photography.

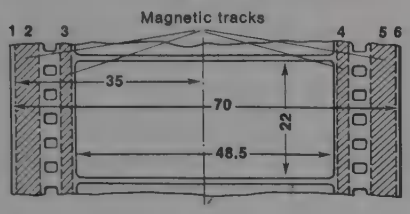

Figure 1. Frame dimensions of the positive film used in the Soviet wide-film system: (1–6) sound tracks

The Todd-AO system was developed jointly by the American Optical Corporation (AO) and the producer M. Todd. The photography uses 65-mm negative film exposed at 24 frames per sec (570 mm/sec). The frame area is calculated for a height of five standard perforations and is approximately 3.5 times greater than the area of standard 35-mm film. Copies are printed on 70-mm color positive film having the same perforations as the negative. The greater size of the positive film accommodates six magnetic sound tracks with no change in the size of the image; five of the tracks are for stereophonic sound reproduction through loudspeakers placed behind the screen, and the sixth is for the production of sound effects in the auditorium. The frame on the integrated film copy has an aspect ratio of 1:2.2. The first US film made with the Todd-AO system was *Oklahoma*, first exhibited in late 1955.

Super Panavision, developed in 1958 by the optical firm Panavision, Inc. (USA), has technical specifications similar to those of Todd-AO. The principal differences are in camera design (both mounted and hand-held) and, in particular, in the selection of high-quality camera optics.

Ultra Panavision, developed jointly in 1962 by the motion-picture studio Metro-Goldwyn-Mayer, Inc. (USA) and Panavision, Inc., uses 65-mm film for cinematography (with the same frame parameters as for Todd-AO) and anamorphic projection optics having a low anamorphic compression of 1.25:1, which makes it possible to obtain wide-film copies with an aspect ratio of 1:2.75. Optical printing is used to derive all types of film copies from the original negative; the copies are printed on 70-mm motion-picture film. The principal merit of Ultra Panavision is that a sense of participation similar to a panoramic motion picture is created without the use of complicated and cumbersome equipment.

The Soviet wide-film system was developed by the Motion Picture and Phototography Institute (NIKFI) and the film studio Mosfil'm. It uses film of the same width (70 mm) for both photographing and copying, thereby substantially simplifying preparation and processing and ensuring compatibility with many foreign systems so that exchange of motion pictures is possible. The Soviet system uses a six-channel magnetic sound track on the integrated film copies (see Figure 1). The first Soviet wide-film feature motion picture, *Tale of Fiery Years* (Mosfil'm), was released in 1961. Universal projection equipment can be used for 70-mm films as well as 35-mm wide-screen and standard films with optical or magnetic stereophonic sound tracks.

The wide-film motion picture has significantly enriched the graphic resources of motion-picture photography, especially for large-scale productions. The increased frame area with the favorable aspect ratio of 1:2.2 makes it possible to maintain the necessary image sharpness for projection on large and extra large screens. The use of an integrated film copy, in which the image is combined with multichannel stereophonic sound, lends verisimilitude to the events shown on the screen.

WIDE-ROW SOWING, planting the seeds of agricultural crops in rows spaced more than 25 cm apart. Wide spacing, usually measuring 60, 70, or 90 cm, is used for raising such crops as potatoes, sugar beets, corn, sunflower, cotton, feed roots, and many other vegetables. Rows set 25 to 45 cm apart are used for beans, millet, buckwheat, and other crops. Wide-row sowing provides an adequate feeding area, thereby ensuring good shoot development. It also makes possible mechanized row space tilling, enabling timely weeding, soil loosening, and fertilizer application. The sprouts are thinned to achieve correct arrangement of plants in each row. [29–1230–3]

WIDE-SCREEN MOTION PICTURE, a type of motion picture in which the standard projection screen is replaced with a wider screen having an aspect ratio from 1:1.66 to 1:2.35. The larger screen size, together with stereophonic sound reproduction, considerably expands the graphic possibilities of the art of motion pictures and increases the impact of the motion picture on the viewer (especially in color feature films during outdoor, crowd, and battle scenes). There are several wide-screen systems presently in use, including those with anamorphic compression, those using a cropped frame (the most common), and Techniscope.

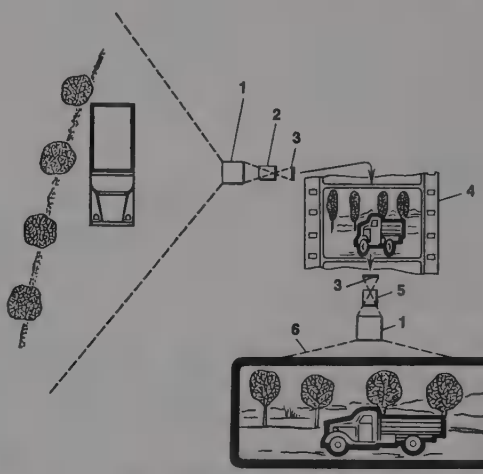

Figure 1. Diagrams of the filming and projection of a motion picture by means of anamorphic optics: (1) anamorphic optics, (2) camera lens, (3) motion-picture film, (4) compressed image on the film, (5) projector lens, (6) image expanded on a wide screen

Systems using anamorphic optics (first proposed by E. Abbe in 1897) compress the frame during filming of the motion picture and expand it during projection. In 1927 the French scientist H. Chrétien designed the Hypergonar anamorphic lens that approximately doubled the horizontal field of view. The CinemaScope system, developed by the US motion-picture company Twentieth Century–Fox Film Corporation under the Chrétien patent, has enjoyed wide use in the USA and other countries. The first motion picture filmed in CinemaScope was *The Robe*, released in the USA in 1953. In the USSR the first wide-screen feature film, *Il'ia Muromets*, was released by the Mosfil'm motion-picture studio in 1956. The anamorphic optical system used for modern wide-screen motion pictures compresses the image in the horizontal by a factor of 2:1, which places it within the confines of a somewhat enlarged, four-perforation frame on standard 35-mm motion-picture film. The usable frame area (Figure 1) is thus increased correspondingly.

The use of a cropped frame in the wide-screen systems that gained wide use abroad in the mid-1950's reduces the height of the standard 35-mm frame to such dimensions that the aspect ratio corresponds to the required aspect ratio of the screen (Figure 2). The frames may be masked in the camera or in the projector. In the latter case the frame is composed during filming so that the most important objects will not be cut off, that is, not masked,

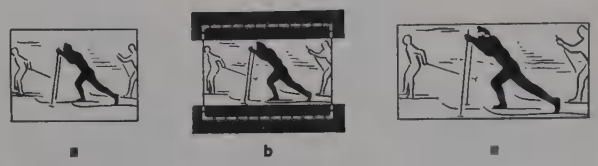

Figure 2. Method of obtaining a cropped frame: (a) standard frame with an aspect ratio of 1:1.37, (b) same frame cropped at top and bottom with an aspect ratio from 1:1.66 to 1:1.85, (c) frame as projected on a wide screen by means of short-focus optics

during projection. In order to accomplish this, two lines are marked (as shown by the broken lines in Figure 3) on the ground glass of the camera viewfinder; they permit the cameraman to restrict the height of the frame section containing the most important visual material. This method of viewfinder cropping is most commonly used when filming wide-screen motion pictures for which frame masking will be done during projection. It makes it possible to use a film copy with an aspect ratio of 1:1.37 for television programs, thus eliminating the need for cropping the image above and below by means of a mask. The principal advantage is that the photographic and projection processes are practically unchanged. However, the technique reduces the useful frame area considerably, thereby requiring additional magnification for projection on a wide screen through the use of close-focus optics. Image sharpness is also somewhat degraded, and graininess is increased. Cropping gives satisfactory results for aspect ratios in the range from 1:1.66 to 1:1.85 when high-quality film, high-quality optical projection systems, and high-power light sources are used.

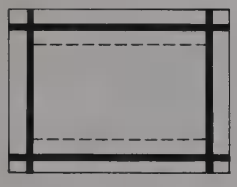

Figure 3. Boundary lines (broken lines) in the viewfinder of a motion-picture camera used in composing for subsequent masking

Techniscope was developed in 1964 by the photographic film company Technicolor Corporation mainly to reduce the costs of producing wide-screen color films. Filming is accomplished with a standard camera equipped with a spherical optical system and a modernized pull-down mechanism that produces a negative frame with a height corresponding to the dimension of two perforations (instead of four as in standard systems). A wide-screen positive copy with anamorphic compression is produced on special equipment by means of optical printing (Figure 4). The system substantially reduces the cost of negative motion-picture film and can provide the film copies required for television programs. However, the resolution is inferior to other wide-screen systems because of the 2:1 reduction in the area of a negative frame compared with the positive obtained by enlargement during optical printing and simultaneous anamorphic compression.

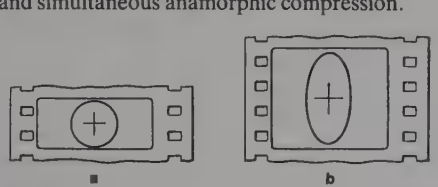

Figure 4. (a) Negative with two perforations per frame as filmed in Techniscope, (b) positive with an aspect ratio of 1:2.35 obtained from the negative

In the USSR the Motion Picture and Photography Institute (NIKFI) and the Mosfil'm motion-picture studio in 1974 jointly developed a wide-screen motion-picture system known as the Universal Frame Format. The system photographs on 35-mm film with a standard optical system and uses the entire area of the frame between perforations. In the printing process, copies can be obtained for practically all formats used in modern theaters—standard 35-mm, 35-mm wide-screen with anamorphic compression, masked 35-mm, 16-mm, and 70-mm (wide-film with stereophonic sound).

WIDE-WEB COAL MINING, an extraction method in which bulk coal is broken up by the working elements of coal-cutting machines to a depth of from 0.8 to 2 or more m. The set of equipment required for wide-web coal mining comprises a wide-web stoping machine (*see* CUTTING-LOADING MACHINE), a scraper face conveyor (*see* CONVEYOR), an individual face support (*see* MINE SUPPORT), and special supports. As a rule, the scraper face conveyor can be dismantled.

Wide-web coal mining includes manual operations, for example, the erection of the face support and the assembly, dismantling, and shifting of the conveyor. The cut coal is partially loaded on the conveyor by hand. The operations are cyclic, that is, are repeated when each strip is extracted.

Wide-web coal mining is not widely used. (*See* NARROW-WEB COAL MINING.) [29–1228–6]

WILD ROSES (in Russian, *shipovnik*), species of wild plants of the family Rosaceae. The plants are usually erect shrubs; there are some arboreal forms of medium height and some almost herbaceous plants. Lianas are rare. The stems and branches usually have thorns. The leaves are usually deciduous and odd-pinnate with paired adnate stipules. Very rarely are the leaves simple and exstipulate. The flowers most frequently are not double, but occasionally they are double to some degree. The inflorescences are corymbose or corymbose-paniculate; the flowers are solitary or, sometimes, in pairs or larger groups. Wild roses occur in the northern hemisphere, mainly in temperate and subtropical regions and in the mountains of the tropics. The plants grow in forest and steppe zones, reaching the alpine belt in the mountains. They usually occur on the edges of forests, in shrubby thickets, along rivers and streams, on damp and steppe meadows, and on slopes and rocky placers.

There are about 350 to 400 species (according to other data, 100 to 250), including 250 (according to other data, 60 to 150) in the USSR. Many species are endemics. Wild roses are a valuable source of vitamins. The fruits of some species accumulate large quantities of vitamin C, together with other vitamins. Particularly large quantities of vitamin C are found in the cinnamon rose (*Rosa cinnamomea*), the prickly rose (*R. acicularis*), and the Japanese *R. rugosa*. Wild roses are used extensively as ornamental hedges and as stock for cultivated roses. The fruit is used as a food in fresh, dry, or canned form.

The dried ripe fruits of various species are used medicinally as raw materials for vitamins. The pulp is used in tincture, syrup, candy, or lozenge form mainly for treating vitamin deficiencies. An oil extract and oil are used externally to treat trophic ulcers and some disorders of the skin and mucous membranes. *Kholosas*, a cholagogous substance, is made from a concentrated water extract of the fruits of *Rosa canina*.

WOOD SCREW, a screw designed to be driven into wood or some other soft material, in which it forms a thread by deforming the material. The threaded section of a wood screw is conical in shape, either over the entire length or only at the end. The head is usually spherical or flat, and the slot may be straight or cruciform, for use with a suitable screwdriver. [29–1551–2]

WOOL, one of the primary natural textile fibers, the raw material of the wool-processing industry. Most of the wool processed industrially comes from sheep; considerably smaller quantities of similar fibers are obtained from goats, camels, yaks, hares, rabbits, horses, cows, deer, dogs, and other animals. Possessed of useful qualities, such as low heat conduction and high moisture absorption, wool is a valuable material for the manufacture of fabrics, knitwear, carpets, and other articles. The world production of wool from sheep totaled 2.6 million tons in 1976. Most was produced by Australia (747,000 tons), New Zealand (311,000 tons), and Argentina (160,000 tons). The USSR produced 432,800 tons in 1976.

Grease, or fleece, wool is obtained from live animals by shearing (sheep, goats, and others), combing (camels, yaks, dogs, goats, and rabbits), or gathering during molting (cows, horses, and yaks). Wool removed from the hides of slaughtered animals is called pulled wool. Wool is a keratinized filament produced by the animal's skin. Animals produce a hairy outer coat and a downy undercoat. In sheep the outer coat consists of guard, transitional, and surface hairs; the downy undercoat is homogeneous. Fibers from the outer coat have a cuticle, a cortex, and usually a medulla; undercoat fibers have a cuticle and a cortex. The cuticle is a thin (0.5–2 micrometers) protective fiber casing. It accounts for the wool's spinning and felting properties. Damage to the cuticle leads to deterioration of the cortical layer and lessens the usefulness of the wool. The condition of the cortical layer, located underneath the cuticle, affects the strength, elasticity, resiliency, and other properties of the wool. The medulla may be solid or porous (with air cavities) and is situated along the fiber axis. Increased medullation lessens the usefulness of the wool.

The guard hairs consist of coarse, usually longer fibers of low crimp whose cuticle scales are not ring-shaped. Their use characteristics are inferior to those of undercoat and transitional hairs. The transitional hairs have a length, thickness, and structure intermediate between guard hairs and fibers from the undercoat. The medullary layer is poorly developed or absent. Transitional hairs have better use characteristics than guard hairs. The undercoat consists of the finest fibers, which are usually shorter than those of the guard and transitional hairs.

Sheep's wool may be classified as uniform or nonuniform depending on the composition of the fibers. In uniform wool the undercoat and transitional fibers are grouped together to form staple fibers (the transitional fibers of wool from long-wool breeds form uniform locks). In nonuniform wool the undercoat, transitional, and guard hairs are formed into locks. Staple fibers and locks are the elements of the fleece—the wool covering of sheep that is removed in one piece by shearing.

The physical properties of wool that determine its use characteristics and market qualities include fineness, crimp, length, strength, elasticity, resiliency, stiffness, flexibility, extensibility, hygroscopicity, color, and luster. The average thickness is 10–25 micrometers (μm) for undercoat fibers, 30–50 μm for transitional fibers, and more than 50 μm for guard hairs. According to the Soviet scale, uniform wool is divided into 13 classes of thickness: from class 32 (55.1–67 μm average thickness) to class 80 (14.5–18.0 μm). Guard hairs usually have little crimp; undercoat fibers of uniform wool have normal crimp, and transitional fibers of uniform wool are flat. Crimp gives fibers additional resiliency. The longest wool—40 cm and longer—is found in sheep of the long-wool meat breeds (Lincoln and others) and some coarse-wool breeds (Highland Carpathian and others). Short wool—4 cm to 7 cm—is found in fine-wool and some coarse-wool breeds (Gissar and others).

The color of wool is determined by the presence of the pigment melanin in the cortex along the entire length or in part of the fiber. The principal colors of wool are white, black, and red-yellow. White wool is the most highly valued because it can be dyed any color. The wool of Lincoln sheep and Angora goats is especially lustrous. The production uses of wool depend to a certain degree on the luster, which affects the external appearance of the article. The yolk, suint, and foreign mineral matter in wool covers and mats the fibers. Washed wool is usually required for commercial processing, with the exception of some types of felting. The ratio in percent of the weight of washed wool, with correction for conditioning moisture, to the original weight of unwashed wool is called the yield.

The production use of wool is determined by the complex of properties inherent in the type of wool. Fine wool is uniform and consists of medium-fine (18–23 μm) and fine undercoat fibers. The staple is of uniform fineness and length, has uniform crimp along the entire length of the fiber, and possesses good physicomechanical properties and use characteristics. Semifine wool is uniform, consisting of coarsened undercoat fibers or transitional hair (average fineness up to 25 μm). It has a larger but less uniform crimp in the staple and lock and sometimes less uniformity of length. This group also includes crossbred and crossbredlike wools, which have good use characteristics, and yak wool, which has poor felting properties and good resiliency. Semicoarse wool is nonuniform and consists of undercoat fibers, transitional hairs, and a small quantity of fine guard hairs. Its fibers are of irregular fineness and length. Coarse wool is nonuniform and consists of undercoat fibers, transitional hairs, and, frequently, dry and dead hair. The nonuniformity of fiber fineness and length is greater than is the case with semicoarse wool. Sheep's wool is used for the production of various fabrics, knitwear, carpets, and felted articles.

Goat's wool is primarily nonuniform. It is characterized by poor use characteristics and spinning and felting properties. Consequently, in goats with nonuniform wool, it is the undercoat that is primarily used, principally for knitted articles. Goats of the Angora and Soviet wool breeds yield uniform semifine wool (mohair) consisting of transitional hairs; such wool is characterized by its luster and strength.

Camel hair is nonuniform. Its color ranges from white to dark brown. It is characterized by great strength and resiliency, good luster, and poor felting properties. It is used to produce high-quality beaver cloth, blankets, rugs, and knitwear. The mane is used to make drive belts and filter cloth used in the extraction of vegetable oils.

Yak wool is nonuniform and is used in cloth manufacture. The coat fibers of hares and rabbits are characterized by fineness, high extensibility, and good felting properties. They are a valuable raw material for the felting industry. Knitwear and felt are manufactured from the undercoats of certain rabbit breeds. Horsehair is a low-quality raw material used for the production of coarse felts. Cow hairs have good felting properties and are used mainly in the felting industry. Deer also provide fibers, large quantities of which consist of dead hair; the fibers are used in the saddlemaking, mattress, and furniture industries and as an insulation material. The hair of some breeds of dogs is used for handmade knitted goods. The wool of llamas, guanacos, alpacas, and other animals is used in small quantities.

WOOL FABRIC, a textile made of all-wool yarn, a combination of wool and other yarns, or yarn made by blending wool with other fibers.

Cottage production of woolen fabrics was practiced in early classical times in the East—in Sidon, Babylon, and Baghdad. The production of woolens developed further during the Middle Ages, during which the greatest production was concentrated in Flanders, Holland, England, France (Sedan), and Saxony; Florence became famous for its fine woolens, the most important items of its trade. During the second half of the 18th century, the appearance of improved cards, roving frames, and spinning frames mechanized the production of wool fabrics.

In Russia, cottage production of wool fabrics existed in Kiev and Novgorod as early as the tenth century. An enterprise for the production of fine woolens was established in Moscow in 1650, but it could not compete with imported goods and soon closed. Concerned about supplying the army, Peter I the Great sup-

ported the creation of factories for producing woolens. The first such factory to supply the army was established in 1698; in the 1720's there were already approximately 15 enterprises weaving wool. However, the production of wool worsteds was begun only in the second half of the 19th century.

In 1977 the USSR produced 800 million sq m of wool fabric in a range of approximately 2,000 articles. All-wool and part-wool fabrics are distinguished by the type of raw material used. All-wool fabrics may contain up to 10 percent chemical fibers, usually introduced to achieve superficial effects. Part-wool fabrics may contain up to 25 percent reclaimed wool and from 10 to 80 percent other fibers. If chemical fibers are blended into the yarn with the wool, the resulting fabrics are termed blended. If the fabric is manufactured from wool yarn interwoven with cotton yarns or chemical fibers, the fabric is called mixed.

Depending on the type of yarn used, wool fabrics may be classified as worsteds, fine woolens, and coarse woolens. Worsted fabrics are from relatively fine and smooth single-ply or twisted yarn that has been combed before spinning. They have a smooth surface and a clearly defined weave pattern. Fine woolens are made from fluffy woolen yarn. They have a surface nap that partially or completely obscures the weave pattern. The nap may be specially combed, cut, or pressed. Coarse woolens are made from coarse-wool woolen yarn and are also felted and napped. They exhibit good wear resistance and resistance to the effects of light and dry cleaning and high resiliency, hygroscopicity, and low thermal conductivity. The adding of synthetic fibers (polyamides and polyesters) to wool increases the wool's wear resistance, but somewhat decreases its hygroscopicity and makes it more susceptible to pilling. The use of viscose fibers and cotton yarn makes wool fabric less expensive, but also renders it less crease resistant. Part of the production of wool fabric is used for industrial purposes, but the majority is used to make clothing—dresses, suits, and coats.

Wool dress fabrics include worsteds and fine woolens. They are manufactured in twill, plain, small-figured, combination, and large-figured weaves. They may be bleached, piece-dyed, yarn-dyed, mélange, or printed fabrics. Worsted dress fabrics are relatively fine and lightweight (150 to 300 g/sq m). Fine woolen dress fabrics are fluffier, softer, and heavier (200–350 g/sq m), and they have a heavier nap. They are manufactured as part-wool fabrics.

Most wool suit fabrics are worsteds (170–340 g/sq m). Some all-wool worsteds are wool serge, wool crepe, and tricot. Part-wool worsted suitings are quite varied; two examples are worsted cheviot and worsted diagonal. Some wool suitings are made of blended two- or three-component yarns; they are usually yarn-dyed and resemble tricot. Fine woolen suitings are heavier (260–520 g/sq m) and fluffier and sometimes exhibit a nap. They provide more warmth and are most often used for everyday winter suits and jackets.

Wool coat fabrics are made as worsteds, fine woolens, and coarse woolens. Worsteds (187–540 g/sq m) with an open weave are piece-dyed. Gabardines and diagonals are made from combed yarn in a twill weave; bouclé is made from fancy yarns in a small-figured weave. Fine woolens also include drab cloth and soft, fluffy coatings usually used mainly in women's and children's coats. Coarse woolens are primarily heavy fabrics made from coarse woolen yarn blends and are used for government and military clothing.

WOOL SPINNING, a group of production processes used to convert wool or a blend of wool with chemical or cotton fibers into yarn.

Wool is blended to reduce the cost of yarn, to improve certain properties (such as wear resistance), and to permit standardization of production processes. Depending on the type of wool being processed, the length-to-weight ratio of the yarn, and the intended use of the yarn, the process used may be French, Bradford, semiworsted, or woolen spinning, which differ mainly in the type of carding.

The French system of spinning wool is used to make yarns with length-to-weight ratios from 15.5 to 42 tex from pure wool and wool blended with chemical fibers. The raw material is opened and blended before being carded. The sliver obtained is then processed by several passes through two-stage drawing frames to prepare it for combing, which is done on a batch-type comber. The sliver is then straightened on drawing frames. In order to remove stresses in the fibers and to fix them in a straightened condition, the sliver is smoothed on a machine; this process may sometimes precede dyeing. Sliver prepared in this manner is aged for several days in a humidified compartment, which helps reduce the static electricity in the fibers. The sliver is sent to a shop to be processed into a spun roving. The roving is again aged, after which it is delivered to ring spinning frames.

The Bradford spinning system produces yarns (usually from coarse and semicoarse wool) having a length-to-weight ratio from 30 to 83 tex. The principal features of the system are the use of continuous combers and roving (fly) frames to produce twisted roving.

Semiworsted spinning is used to make yarns with a length-to-weight ratio of 42 tex or higher from semifine, semicoarse, and coarse wool blended with chemical fibers. Carded sliver is processed in several transfers on drawing frames, one of which has an automatic thickness regulator, and is then sent directly to a ring spinning frame.

Woolen spinning is used to make yarns with a length-to-weight ratio from 42 to 400 tex from grease wool, chemical fibers, and the waste spinning materials from woolen and worsted spinning. Cotton fibers and reclaimed wool obtained by processing all-wool or part-wool rags may also be used. The components are blended on blending machines, after which oil is added and the stock is opened up on a mixing picker. The stock is carded on carding frames that include two or three roller cards. A flyer separates the fibers longitudinally into individual slivers, which are rubbed to form the roving that is sent on to a spinning frame. (*See also* SPINNING.)

V. V. ZHOKHOVSKII [29–1147–2]

WORM GEAR, a mechanical device for transmitting rotation between shafts whose axes cross (usually at right angles) by means of a worm and a mating gear (the worm wheel or worm gear). The worm is a screw having a trapezoidal or nearly trapezoidal thread, and the worm wheel is a gear wheel with special curved teeth. The worm wheel subtends the worm over a specific arc (usually up to 100°). The worm is usually the driving member, and the worm wheel is driven; in rare cases (as in step-up gearing) the worm may be the driven member. Cylindrical worms are used in the most common (single enveloping) worm gearing; worms having threads on a toroidal surface are used in double enveloping worm gearing.

Depending on the number of thread starts, worms may be classified as single-, double-, or quadruple-threaded; depending on the profile of the thread helix, they may be classified as Archimedean, concave, or other type. The helix of an Archimedean worm in an axial cross section is described by a trapezoid and is easily machined on a lathe. Worms with a concave helix profile show promise for offering lower contact stresses and better conditions for the formation of an oil wedge. Involute worms are preferred for power transmissions; the helix profile in a cross section is described by an involute. The gear ratio of a worm gear is $i = z_2/z_1$, where z_1 is the number of starts on the worm and z_2 is the number of teeth on the worm wheel.

Gear ratios for worm gears are usually between 8 and 100 (in a number of cases, for example, the drives for machine-tool tables of large diameter, it may be as high as 1,000). Worm gears are used in machine drives and control devices because they afford high gear ratios in a transmission of relatively small size. The advantages of worm gears include smooth and noiseless operation. They may be irreversible, or self-locking; that is, they may transmit rotation only from the worm to the worm wheel, so that some mechanisms can be made without a locking device. A disadvantage is the substantial slip between the mating members—the worm threads and gear teeth. This results in intense evolution of heat, increased wear, and a tendency to seize; it also accounts for the relatively low efficiency of worm gearing (averaging 0.7–0.75

in single-threaded, 0.8–0.85 in double-threaded, and 0.86–0.92 in quadruple-threaded worm gears).

In order to reduce wear and decrease the chances of seizing, gear wheels are made from materials having excellent antifriction properties—mostly bronzes, such as true bronze (for slip velocities of 5–35 m/sec) and aluminum-iron bronze (for slip velocities up to 10 m/sec). For economy of use of nonferrous metals, worms are made up as composites with a bronze rim mounted on a hub of steel or pig iron. For slip velocities up to 2 m/sec and large diameters, the worm wheels can be made entirely of pig iron. The worm wheels used in instruments and small transmissions can be made of a resin-impregnated plastic laminate or nylon. The worms are usually made of high-grade carbon or alloy steels that are heat-treated to a high degree of hardness. The surfaces are ground and polished to improve the finish.

The low efficiency and substantial heat evolution of worm gears have limited them to low- and medium-power applications (usually up to 50 kilowatts, rarely up to 200 kilowatts). They are used in hoisting and conveying equipment, metal-cutting machine tools, motor vehicles, trolleybuses, metallurgical machinery, and hydraulic engineering installations. Well-lubricated reduction worm gears enclosed in a housing are the most widely used type.

XENOPUS, the genus of tailless amphibians of the suborder Aglossa of the family Pipidae. On the head, next to each eye, there are short feelers. The lateral line organs are located on the sides of the body. There are sharp black claws on the three center toes of the hind feet. The genus comprises eight species, which are distributed in tropical Africa. Its members are aquatic. In tadpoles the external gills and larval teeth are absent. A pair of long sensory tentacles are located near the mouth and there are two gill openings. The most common species is *Xenopus laevis*, which is used as a laboratory animal. [29–1407–6]

XINGU, a river in Brazil, a right tributary of the Amazon. The Xingu is 1,980 km long and drains an area of 513,000 sq km. It rises in the eastern part of the Mato Grosso Plateau, where it is called the Culuene. As it crosses the northern part of the Brazilian Highlands, it is a powerful, torrential stream with rapids and waterfalls. After its last rapids, Cachoeira Grande, the Xingu flows into the Amazon Basin. Its final section, which is accessible to ships, is 160 km long and reaches a width of 8–12 km. The chief tributary of the Xingu is the Iriri, a left tributary. The Xingu is fed by rain; high water occurs from October until April or May. The mean flow rate is 16,000 cu m per sec. The Xingu is navigable for 190 km from its mouth. [29–1206–2]

YGYATTA, a river in the Yakut ASSR, a left tributary of the Viliui. The Ygyatta is 601 km long and drains an area of 11,200 sq km. It rises on the Viliui Plateau and cuts through traprock to form *shivery* (rocky sections with fast-flowing water). The lower course lies in the Central Yakut Lowland. The river is fed by rain and snow and has a mean flow rate of approximately 30 cu m per sec. The Ygyatta freezes over in October, and the ice breaks up in May. [29–1624–3]

YNYKCHANSKII, an urban-type settlement in Ust'-Maia Raion, Yakut ASSR. Ynykchanskii is located 176 km east of the settlement of Ust'-Maia and 471 km southeast of Yakutsk. Gold is mined in the vicinity. [29–1626–1]

YR (also *iyr, zhir*), a general term for songs among a number of Turkic peoples. Among the Kumyks in Dagestan, *iyr* is the name given to men's songs of a declamatory type performed improvisationally by *skaziteli* (singers of epic folk songs) called *iyrchi*. [29–1626–2]

ZAQAZIQ, AL-, a city in Egypt, in the eastern part of the Nile delta; capital of the *muhafazah* (governorate) of Sharqiyah. Population, 173,000 (1970). Al-Zaqaziq is a trade and transportation center and a railroad and highway junction. The city has a food-processing industry and cotton-ginning enterprises. [29–1694–4]

ZARQA, AL-, a city in northern Jordan, on the Amman-Irbid highway. Population, 232,000 (1975). Al-Zarqa has an oil refinery and a cement plant; the city is the commercial center for an agricultural region. [29–1694–5]

ZUBAYR, AL-, a city in southeast Iraq. Population, more than 30,000. The city is a highway junction and has a railroad station. Al-Zubayr is an oil-production center. [29–1694–6]
