Explanatory Notes

BIBLIOGRAPHIES

All bibliographies that appear in the Russian-language edition of the Encyclopedia are fully listed in the English edition. Bibliographic entries follow the same order and are listed in the same language in which they appear in the Russian work. Those works that are written in languages using the Latin alphabet are rendered as they are. Languages in other alphabets are given in the Library of Congress transliteration system for that language or, if there is no Library of Congress system, in the transliteration system used throughout the Encyclopedia.

Names of authors whose works are translated into Russian appear in the original language, not in Russian transliteration.

This method of presentation is such that all entries in the bibliographies can be checked through the National Union Catalog. Therefore, the spelling of an author's name may occasionally differ from text to bibliography; this is because in text the Russian-language edition spells the names of all peoples of the Soviet Union in Russian but in bibliographies sometimes lists their works in the original languages. Insofar as possible, the English edition transliterates names in the bibliographies from the original language into the Library of Congress system (or the system used throughout) and gives this variant transliteration in brackets.

The bibliographies are selective and serve as sources for the authority of the article and for additional information. They contain suggestions for further reading, sources for historical and current data, and sometimes further bibliographies.

Usually the structure of the bibliographies reflects the structure and content of the article. That is, general works are listed first, followed by more specialized references. In long bibliographies for articles dealing with Soviet views on broad subjects, a system is generally followed whereby the classic reference works of Marxism-Leninism are given first, followed by works in Russian or other languages of the Soviet Union, then foreign language publications, and, finally, reading lists. The entries may be arranged alphabetically by author or chronologically; they may also be listed under clearly defined subject fields. On Western subjects, foreign authors are sometimes listed first.

Bibliographies of articles on people are divided into two parts: WORKS—that is, works written by the subject; and REFERENCES—that is, works about the subject. Under REFERENCES, the publications in Russian are listed first, then foreign works in Russian translation, and then foreign works in all other languages. If a publication appeared in several editions, either the first or most valuable edition (from a scholarly point of view) is presented.

ARTICLE NUMBER CODE

To assist those readers who wish to refer to the Russian edition, each article has been coded with a number for easy reference to the *Bol'shaia Sovetskaia Entsiklopediia.* For example, the article "Alexander Nevsky" has the number [1-1199-2]. This means that in the Russian edition the article may be found in Volume 1, column 1199, second article in the column.

ABBREVIATIONS

Following is a list of frequently used special abbreviations

ACP(B)—All-Union Communist Party (Bolshevik)
ASSR—Autonomous Soviet Socialist Republic
CPSU—Communist Party of the Soviet Union
RCP(B)—Russian Communist Party (Bolshevik)
RSDLP—Russian Social Democratic Labor Party
RSDLP(B)—Russian Social Democratic Labor Party (Bolshevik)
RSFSR—Russian Soviet Federated Socialist Republic
SSR—Soviet Socialist Republic
Izbr. proizv. or *soch.*—selected works
Izbr. voen. proizv.—selected military writings
Poln. sobr. soch.—complete collected works
Sobr. soch.—collected works
Soch.—works

TRANSLITERATION

For the languages of the USSR we are using the Library of Congress transliteration system when available and modified to eliminate diacritical marks. Languages for which there is no Library of Congress system, for example, Tadzhik, are transliterated according to the system developed by Professor Edward Allworth in *Nationalities of the Soviet East* (Columbia University Press, 1971). The only exceptions are for proper names so familiar in English that to transliterate them otherwise would mislead the user. For works cited in text we have translated the titles so that the full sense of the article will be preserved. The transliteration table used throughout the work for Russian Cyrillic is given below.

TRANSLITERATION GUIDE

А	а	*А*	*а*	a	Р	р	*Р*	*р*	r

Articles—Volume 29

The articles in the Russian-language Bol'shaia Sovetskaia Entsiklopediia *are alphabetized according to the Cyrillic alphabet; in our edition, they are translated and alphabetized within each volume according to the English alphabet. Thus, the articles in Volume 29 of the Russian edition are listed below; they run from A through Z in English because of the title changes that occur when they are translated. In this complete list of articles for Volume 29, the asterisks indicate those titles that appear in the Russian edition only; these constitute less than 1 percent of the total wordage of the volume.*

VOLUME 29

ACANTHIS (redpolls), a genus of birds of the family Fringillidae of the order Passeriformes. The birds are 12 to 14 cm long. The plumage is gray with speckles; males of the species *A. flammea* and *A. hornemanni* have a red or pink cap and breast. The genus comprises three species, distributed in Europe, Asia, and North America. All three occur in the USSR. The common redpoll (*A. flammea*) inhabits coniferous forests and forest tundra, Hornemann's redpoll (*A. hornemannis*) inhabits the forest tundra, and the twite (*A. flavirostris*) is found on the Kola Peninsula, in the stony steppes of Kazakhstan, and in the mountains of the southern part of the USSR (from the Caucasus to the Altai). In winter the birds migrate in flocks. They build their nests in shrubs. A clutch contains four to six eggs, which are incubated 13 or 14 days. The diet consists of seeds. [29–522–4]

ACHNATHERUM, a genus of perennial herbaceous plants of the family Gramineae. The inflorescence is a panicle that is sometimes almost spicate. The spikelet bears a single bisexual flower. There are 15 to 20 species, found in the temperate and subtropical belts of Eurasia, northern Africa, and North America. The USSR has six species. The most common is *A. splendens* (formerly *Lasiagrostis splendens*), which usually grows in steppes and semideserts on more or less saline soil. The plant also occurs on rocky and debris-strewn slopes. It often forms large clumps. *A. splendens* grows in the southern Urals, along the lower Volga, in southern Siberia, and in Middle Asia (except the Karakum and Kopetdag). A grazing plant, it is eaten by animals before spike formation. The plant can also be used as hay. [29–553–2]

ADIT, a horizontal or inclined excavation that has an outlet to the surface and is designed to facilitate mining operations. Adits can be exploratory or used for working deposits. Transport, ventilation, and water-removal adits are distinguished, depending on their purpose. [29–1484–3]

ADRIAN, EDGAR DOUGLAS. Born Nov. 30, 1889, in London; died there Aug. 4, 1977. English physiologist. Fellow of the Royal Society of London (from 1923; president, 1950–55). Student of K. Lucas.

Adrian graduated from Cambridge University in 1915 and then lectured on physiology at Trinity College, where he became a professor in 1937; beginning in 1951 he was master of Trinity College. Adrian's research was primarily devoted to the electrophysiology of the sense organs and nerve conductors. Adrian, a brilliant experimenter, was a pioneer in the use of electronics in physiological research. He was the first to perform experiments on individual nerve fibers and nerve endings. His research led to the wide use of the all-or-none law. Beginning in 1934, Adrian worked on the electrophysiology and functional disturbances of the brain. He received a Nobel Prize in 1932, with C. Sherrington.

L. G. MAGAZANIK [29–1689–1]

AEDICULA (aedicule, edicule), in classical architecture, a niche framed by columns or pilasters resting on a pedestal and with a pediment above. It contained statues of the gods and was featured in temples, public buildings, and residences. The term is also used in reference to small Greek and ancient Roman shrines. [29–1684–1]

AEDILES, ancient Roman officials. The *aediles plebeii*, established in 494 B.C., were two assistants to the people's tribunes. The two *aediles curules*, introduced in 367 (or 366) B.C., were elected by the *comitia tributa* for one year.

The aediles conducted the distribution of bread to the citizens; supervised the water supply, the operation of the markets, the cleanliness of the city, and the building and maintenance of the temples; and organized games at their own expense. The two *aediles ceriales* were introduced by Julius Caesar in 44 B.C. to distribute bread; they were also responsible for conducting public games in the circus.

By the fourth century A.D., the office of aedile had ceased to exist. [29–1684–2]

AEDUI, an ancient Celtic tribe inhabiting the area between the Saône and Loire rivers in Gaul; their central city was Bibracte. As a result of Caesar's Gallic campaigns (58–51 B.C.), the area settled by the Aedui was conquered by the Romans and incorporated into the Gallic provinces of Rome. From 16 B.C., it was part of Gallia Lugdunensis. [29–1692–3]

AEGEAN CIVILIZATION, the general name of the Bronze Age civilization (third and second millennia B.C.) on the Aegean Islands, Crete, and the Greek mainland and in Asia Minor (Anatolia).

The first centers of the Aegean civilization were discovered by H. Schliemann in Mycenae (in 1876) and A. Evans on Crete (from 1899). (*See* MYCENAE.) Several hundred monuments and cultural remains have been studied since the 19th century, includ-

ing burial grounds, settlements, and large cities, such as Poliochni on the island of Lemnos, with a 5-m high stone wall, and Phylakopi on the island of Melos, as well as a number of royal residences—in Troy and on Crete (Cnossus, Mallia, and Phaestos)—and the acropolis in Mycenae (*see* TROY; CNOSSUS; MALLIA; and PHAESTOS). The development of the Aegean civilization proceeded unevenly, and its centers underwent periods of decline and prosperity. Cities with public buildings and temples and fortified by walls with towers and bastions appeared in western Anatolia in the third millennium B.C., and fortified settlements appeared on mainland Greece in the late third millennium. Fortresses were unknown on Crete as late as the second millennium B.C.

Several local archaeological cultures or civilizations are distinguished within the Aegean civilization—Thessalian, Macedonian, Western Anatolian, Helladic, Cycladic, and Minoan (*see* CYCLADIC CULTURE and MINOAN CULTURE). Chronologically, it is conventional to divide these cultures into three main periods—early, middle, and late—and each period into three subperiods—I, II, and III—for example, Early Minoan I or Middle Thessalian III.

The formation of the Aegean civilization was complex and lengthy. The cultures of western Anatolia and central Greece evolved from local Neolithic cultures. Trojan culture dominated the islands of the eastern Aegean Sea, while the western Anatolian influence was strong on other islands.

Circa 2300 B.C., the Peloponnesus and northwestern Anatolia were invaded, judging from the evidence of fires and destruction in the settlements. By the early second millennium B.C., under the influence of invaders who were probably of Indo-European origin, the material culture of mainland Greece, Troy, and several islands had changed. On Crete, which escaped invasion, the Minoan culture continued to develop; hieroglyphic scripts appeared in the early second millennium B.C., and the Linear Script A in 1600 B.C. The Middle Bronze Age (first half of the second millennium B.C.) was the period of the greatest consolidation of the Aegean civilization, which is attested to by the absolute unity of the material culture, including the pottery and metalware. Circa 1600 B.C., the invasion of mainland Greece by new tribes, probably the Achaeans, who used battle chariots, prepared the way for the development of a number of small states of what is now referred to as the Mycenaean period around other cities—Mycenae, Tiryns, and Orchomenos (*see* TIRYNS and ORCHOMENOS). Circa 1470 B.C., several centers of the Aegean civilization, especially Crete, were destroyed by an eruption of the Santorin volcano. An Achaean (Mycenaean) population appeared on Crete, bringing a new culture and the Linear Script B. Beginning in the late 13th century B.C., the Aegean civilization underwent a profound internal crisis, accompanied by an invasion of the Dorians and the Peoples of the Sea, which led to its downfall. V. S. TITOV

Art. Throughout the history of the development of Aegean art, the leading center of artistic culture often shifted from one part of the Aegean world to another. Aegean art is characterized by the development of regional styles and shows influences of ancient Egyptian, Syrian, and Phoenician art. In comparison with the art of the ancient East, it is more secular. Among the remains from the third millennium B.C., of particular interest are the funerary sculptures of the Cyclades—the Cycladic idols—marble statuettes or heads (fragments of statues) of geometricized, austere, monumental form with clearly expressed architectonics ("violin-shaped" figures, nude female statuettes).

Circa the 23rd century B.C., Crete became the leading center of artistic culture, reaching its zenith in the first half of the second millennium B.C. The influence of Cretan art spread to the Cyclades and mainland Greece. The highest achievements of the Cretan architects are the palaces in Cnossus, Phaestos, Mallia, and Kato Zakro, in which the combination of wide horizontal spaces (courts), blocks of two- and three-story chambers, light wells, ramps, and stairways creates the effect of picturesque boundless space and an emotionally rich artistic image permeated with endlessly changing impressions. A unique type of column, one that widens toward the top, was created on Crete. In Cretan fine and decorative applied arts, the ornamental-decorative style of the 20th to 18th centuries B.C., which attained perfection in the painted Kamares ware, was replaced in the 17th and 16th centuries B.C. by a more detailed and straightforward depiction of plants, animals, and people (the frescoes in the palace at Cnossus, vases with representations of sea creatures, and small figurines, toreutic works, and glyptic art). By the late 15th century B.C., probably in connection with the Achaean conquest, conventionality and stylization became more pronounced (the throne room frescoes and the painted stucco relief of a priest-king in the Cnossus Palace and the "palace-style" vase painting).

The art of Achaean Greece reached its zenith in the 17th to 13th centuries B.C. Fortress cities, such as Mycenae and Tiryns, were contructed on hills, with thick walls built in the Cyclopean style from blocks of stone weighing up to 12 tons; such cities had two levels—a lower city, sheltering the surrounding population, and an acropolis, where the ruler's palace stood. In Achaean residential architecture, palaces and dwellings were built on stone socles of mud brick with wooden trusses, as on Crete; a type of porticoed rectangular building was developed—the megaron—the prototype of the ancient Greek temples in antis. The palace in Pylos (*see* PYLOS) was excavated more thoroughly than other sites. Of particular interest are the round domed tholos tombs, with a false arch and dromos, including the Treasury of Atreus near Mycenae (14th or 13th century B.C.).

The fine and decorative applied arts of Achaean Greece were strongly influenced by the art of Crete, especially in the 17th and 16th centuries B.C., judging from the gold and silver articles found in the shaft graves in Mycenae. The regional style is characterized by generalized and austere forms (the reliefs on the superjacent stelae of the shaft graves, the funerary masks, and several vessels found in the graves, including Nestor's Cup). Achaean art of the 15th to 13th centuries B.C., like Cretan art, devoted considerable attention to man and nature (the frescoes in the palaces in Thebes, Tiryns, Mycenae, and Pylos; vase painting and sculpture), but gravitated toward stable symmetrical forms and generalization (the heraldic composition with the figures of two lions on the relief on the Lion Gate in Mycenae). N. M. LOSEVA

AEGEAN SEA, a semi-enclosed body of water in the basin of the Mediterranean Sea, bounded by the Balkan Peninsula, Asia Minor, and the island of Crete. The Aegean is linked with the Sea of Marmara and ultimately with the Black Sea by the Dardanelles in the northeast and with the Mediterranean by several straits between islands in the south. The sea has an area of approximately 179 sq km. It formed as a result of the submersion in the late Pliocene and Pleistocene of the land block known as Aegeides. The numerous islands are remnants of this land, and for this reason the Aegean was formerly called the Greek Archipelago.

The prevalent depths are 200–1,000 m, reaching a maximum of 2,529 m in the south. Currents in the western parts of the sea flow south, while those in the eastern part flow north. The velocity of the currents reaches 0.5–1 km/hr. The water temperature at the surface is 11°–15°C in winter and 22°–25°C in summer. At depths of more than 350 m the water temperature is 12°–13°C and remains constant throughout the year. The salinity of the sea is 37.0–39.0‰. Tides are semidiurnal and have ranges of 30–60 cm. The sea yields fish and sponges. The principal ports are Piraeus and Thessaloniki in Greece and Izmir in Turkey. [29–1673–1]

AEGILOPS, a genus of annual herbs of the family Graminae. The inflorescence is narrowly cylindrical. The lanceolate or oval spikes fall as a whole or in parts upon maturation. The spikelets are two- to five-flowered; the flowers are borne singly on the axis of the spike. There are 20 to 25 species, distributed from the Mediterranean to Afghanistan and Central Asia. The USSR has ten species, in the southern European section, in the Caucasus, and in Middle Asia. The plants grow on rocky and dry slopes, on sand, and near roads; more frequently they occur as weeds in various cultivated crops. *Aegilops cylindrica*, which is eaten by grazing livestock and sometimes used as hay, is commonly found in steppes and semideserts. [29–1674–4]

AEGIRITE (from Aegir, the Scandinavian god of the sea), also aegirine, a rock-forming mineral, a silicate of the group of monoclinic pyroxenes, with the chemical composition $NaFe[Si_2O_6]$. It contains admixtures of Mn, Zn, Ti, Nb, Zr, and V. As a result of the isomorphism $Na^+ \rightleftarrows Ca^{2+}$ accompanied by the replacement of Fe^{3+} by $(Mg, Fe)^{2+}$ or Si^{4+} by Al^{3+}, transitions are observed to aegirite-diopside, aegirite-hedenbergite, and aegirite-augite.

Aegirite occurs in the form of elongated tabular, columnar, or acicular crystals, radiated and fibrous ("mermaid hair") concretions, and sometimes spherulites. The color ranges from green to greenish black; sometimes the mineral is almost colorless. Aegirite has a vitreous luster, a hardness of 5.5–6 on Mohs' scale, and a density of 3,400–3,600 kg/m^3.

Aegirite is a typical mineral in alkali rocks and associated pegmatites; it is also characteristic of zones of alkaline metasomatism that develop after various intrusive and sedimentary-metamorphic rocks (gneisses, schists, and ferruginous quartzites). In agpaitic nepheline syenites it is found together with nepheline, orthoclase, eudialite, and apatite. In alkali granites it occurs with albite, riebeckite-arfvedsonite, and zircon. In zones of alkaline metasomatism it is found together with albite, hematite, and pyrochlore. Aegirite alters to chlorite, hematite, and limonite.

A. I. GINZBURG [29–1675–2]

AEGITHOGNATHISM, a type of palate structure characteristic of sparrows and martins. Aegithognathism is a variation on neognathism. In aegithognathism the palatal processes of the maxillary bones do not fuse to each other or to the vomer. [29–1675–3]

AEQUI, an ancient Italian tribe, evidently of Oscan descent. In the middle of the first millennium B.C. the Aequi settled in the Aniene Valley. From the early fifth century B.C., along with the Sabines, Volscians, and Hernicians, they waged a bitter struggle with the Romans, who finally subjugated the Aequi in 304 B.C. [29–1750–1]

AESOP, Greek author of fables in the sixth century B.C. According to legend, Aesop was a Phrygian freedman who was employed at the court of the Lydian king Croesus and died a violent death in Delphi. Biographical information on Aesop is drawn from legend.

Aesop has been credited with supplying the themes of most of the fables known in antiquity. Short written versions of these fables were collected in the fourth and third centuries B.C.; more than 300 fables with short "morals" appear in many later manuscripts ranging in time from the tenth to the 15th century. Ideologically, Aesop's fables are skeptical and pessimistic; their protagonists—mainly animals—are avowedly conventional figures, the narrative is concise and straightforward, and the language is simple and close to the colloquial. Aesop's fables are the basic source of themes for the European literary fable from Phaedrus and Babrius to La Fontaine and I. A. Krylov.

M. L. GASPAROV [29–1694–7]

AESOPIAN LANGUAGE (from the name of the ancient Greek fabulist Aesop), a special type of cryptographic or allegorical writing used in literature, criticism, and journalism in order to circumvent censorship when such literary activity is denied freedom of expression.

An example of Aesopian language was the technique worked out in the Russian press between the late 18th and the early 20th century—that is, the system of "deceptive means," or of encoding (and decoding) freely conceived ideas—as a reaction against the ban that forbade mention of certain ideas, subjects, events, and persons. Specific examples of such techniques were the use of images derived from fables and of allegorical "fairy-tale descriptions," particularly in the work of M. E. Saltykov-Shchedrin, who in fact popularized the term "Aesopian language"; semitransparent circumlocutions and pseudonyms, such as those used by A. V. Amfiteatrov in *The Obmanovs* (Deceivers), his feuilleton about the tsar's family (the Romanovs); more or less covert allusions; and irony—which, when "clothed in tactfulness," was invulnerable to censorship. "Foreign" subject matter was used to disguise condemnations of actual conditions in Russia, and common phrases became gibes, as in the case of the expression "At your service, Sir," which was a reference to A. S. Suvorin's newspaper *Novoe vremia*. Readers knew that "the big job" stood for "revolution," that "the realist" was K. Marx, and that "those missing from the anthologies" meant V. G. Belinskii or N. G. Chernyshevskii. When so used, Aesopian language was accessible to the general reader and served as a tool not only of political struggle but also of realistic literary craftsmanship. In France, H. Rochefort was master of the Aesopian language.

In time, the typical techniques used in Aesopian language became part of the satiric style, and today's writers resort to such techniques independently of censorship pressures. Whether used separately or combined with other means of creative linguistic expression, these techniques have become attributes of specific writers' styles, as exemplified by A. France's *Penguin Island*, the works of M. A. Bulgakov, K. Čapek's *The War With the Newts*, and various literary genres of science fiction and humor.

AESOPUS, CLAUDIUS. Flourished first century B.C. Ancient Roman tragic actor. Friend of Cicero.

Aesopus was famous for his majestic bearing and his carefully thought out gestures; he was a master at evoking powerful emotional and psychological responses from his audience. He acted with great success in the tragedies of Euripides. Aesopus last performed in 55 B.C. at the dedication of a theater built by Pompey.

AGARICUS (meadow mushroom and related species), a genus of mushrooms of the family Agaricaceae. The cap is 3–25 cm in diameter, smooth or scaly, fleshy, and compact. There are about 60 cosmopolitan species. The mushrooms grow mainly on forest or meadow humus, on well-manured soils, on the barks of dead trees, and in anthills. They can be found on roadsides, in flower gardens, in vegetable gardens, in parks, on livestock farms, and in hotbeds.

The most common species are *A. campester* (common field mushroom), *A. arvensis*, and *A. bernardii* (which also occurs in deserts and semideserts). Two species—*A. meleagris* and *A. xanthoderma*—are poisonous. The species *A. bisporus* is raised commercially in many countries, including the USSR, the USA, Great Britain, France, Holland, Denmark, and the German Democratic Republic. The mushroom contains 46.5 percent pro-

tein and yields a harvest of up to 15 kg/m^2. In the USSR mushrooms of the genus *Agaricus* are cultivated commercially in the suburbs of many large industrial centers, including Moscow, Leningrad, and Gorky.

AGRICULTURAL ECONOMICS, in the USSR, socialist agricultural economics, or the science of agriculture as an integrated branch of the economy producing agricultural products. Agricultural economics dates back to the socialist transformation of small peasant farms into the socialist type of large-scale collective production in accordance with V. I. Lenin's cooperative plan.

Agricultural economics is the study of the particular features that distinguish agricultural production, reproduction, and accumulation, the intensification of agriculture, and the socialist agricultural system as a whole. The subject matter of agricultural economics is the land—the principal means of production in agriculture—and its rational utilization, including (1) the land resources of the USSR and their classification and composition, (2) the material and technological basis and technological advances of agriculture, agricultural fixed capital stock, and agricultural working capital, (3) labor and labor productivity in agriculture, (4) the location and specialization of production in agriculture, and (5) prime costs, prices, and pricing in agriculture, sales of agricultural output, the role of commodity-money relations, and profit-and-loss accounting.

Crop production and animal husbandry, including fodder production, are separate branches of agricultural economics. The industrialization of agriculture is a specialized field. The organization of agricultural enterprises (such as kolkhozes and sovkhozes, interkolkhoz production enterprises, and agroindustrial complexes) is a subdivision of agricultural economics.

The science of agricultural economics is closely related to agronomy—that is, to cropping methods, soil science, land reclamation and chemicalization, agrobiology, genetics, and zootechny. Studies in agricultural economics deal with questions of land appraisal, differential pricing of agricultural products, and equalization of the operating conditions of agricultural enterprises located in different economic and natural zones.

The basic provisions of agricultural economics are worked out in the zonal agricultural economics research institutes and in the departments of agricultural economics that are part of all the agricultural higher education institutes and academies. The All-Union Scientific Research Institute of Agricultural Economics was established in 1955 as part of the V. I. Lenin All-Union Academy of Agricultural Sciences, with affiliates in the RSFSR (North Caucasus, Volga Region, and Central Chernozem Zone); institutes have also been set up under the ministries of agriculture of all the Union republics. In addition, research work in this field is carried out in the agronomy divisions and sectors of the institutes of economics of the Academy of Sciences of the USSR and of the Union republics. Publications on agricultural economics include the newspaper *Sel'skaia zhizn'* and the journal *Ekonomika sel'skogo khoziaistva*, both published in Moscow.

AGRICULTURAL ECONOMICS, INSTITUTE OF (full name, All-Union Scientific Research Institute of Agricultural Economics of the V. I. Lenin All-Union Academy of Agricultural Sciences). The institute was founded in Moscow in 1955. It has, as of 1978, 12 scientific divisions. One division specializes in problems of increased reproduction in agriculture, while another studies economic problems of cooperation among farms, agroindustrial integration, ties among economic sectors, labor, stimulation of agricultural production, and management and planning. Other divisions deal with socioeconomic problems of rural life; optimization and location of agricultural facilities; efficiency of intensifying agriculture; and the study of the economics of agriculture in foreign countries. The scientific-organizational division has 36 sections.

The institute has branches in the Central Chernozem Zone, the North Caucasus, and the Volga Region. It has a large network of centers for the scientific organization of labor. The institute has research bases and economics groups at farms in different zones of the USSR. It works on theoretical and practical problems of the development of agriculture by zone and region, coordinates research in agricultural economics by other institutions, and publicizes results of advanced studies.

The institute offers graduate study in residence and by correspondence and is certified to confer the degree of doctor and candidate. It publishes collections of scientific articles, methodological works, and writings on recommended procedure. [29–1810–2]

AIKEN, a city in the southeastern USA, in the state of South Carolina; a suburb of Augusta, Georgia. The Savannah River Atomic Energy Plant is located near Aiken. [29–1706–2]

ÄIKIÄ, ÄRMAS (peudonym of Vilje Wiio). Born Mar. 14, 1904, in Konnitsa; died Nov. 20, 1965, in Helsinki. Finnish poet, journalist, and public figure. Member of the Communist Party of Finland from 1924.

Äikiä was imprisoned on several occasions between 1923 and 1930 for political activity. He was the author of the narrative poem *The Song of the Eagle* (1935–40), which deals with the life of the Finnish revolutionary T. Antikainen, and of the poetry collection *The Lyre Behind Bars* (1945). In the poetry collections *The Fiery Kantele* (1947) and *The Exile* (1948) he exposed German fascism and Finnish reactionary circles. In 1962 he published *The Singer at the Foot of the Volcano*, about the life and work of K. Kaatra. Äikiä also translated poems of A. S. Pushkin and M. Iu. Lermontov, as well as works by V. V. Mayakovsky and other Soviet poets.

AIR-CUSHION VEHICLE, RAM-WING (ram-wing ACV; also called ram-wing ground-effect machine [GEM]), an aircraft designed to fly close to the earth's surface, usually at heights of one-tenth to one-fifth the width of the wing. A ram-wing ACV differs from an airplane in that the former uses the ground effect to produce the aerodynamic forces and differs from a marine GEM in that it uses the approaching airflow—that is, a velocity head—rather than the pressure of the air forced under a marine GEM by a special fan.

The main design features of a ram-wing ACV are as follows. The wing is mounted low to enhance the ground effect and has a low aspect ratio (seldom exceeding 1.5–2) to ensure safety in flight. End plates or floats are carried on the underside of the wing at the wing tips to reduce the flow of air from beneath the wing—that is, from the high-pressure area—over the wing tips. The tail unit, which is horizontal and extends above both the influence of the ground effect and the airflow swept past the wing, is set high to provide longitudinal stability. Takeoff devices—for example, flaps, spoilers, ailerons, water skis, and forcing engines—are used to reduce aerohydrodynamic drag when the vehicle accelerates over water or to reduce the frictional resistance of the ground when it moves over land.

The main advantage of a ram-wing ACV is its high lift-drag ratio, which may be as high as 20–25. The lift-drag ratio of a ram-wing ACV is 25–50 percent higher than that of modern transport airplanes. Such a high lift-drag ratio makes it possible to increase

the payload or to reduce the thrust of the engine and, consequently, the fuel consumption.

Virtually all the ram-wing ACV's that have been built are designed for takeoffs from water and landings on water. Ram-wing ACV's that are intended for use only over land and do not have the required buoyancy for use over water have also been built. Some ram-wing ACV's that have been developed can fly above the influence of the ground effect, that is, above a height ranging from eight-tenths the width of the wing to the width of the wing.

The first ram-wing ACV was built in 1935 by the Finnish engineer T. Kario. As of 1978, about 30 small experimental vehicles had been built in Finland, Sweden, the USA, Japan, the Federal Republic of Germany (FRG), Great Britain, and the USSR. As a rule, the performance characteristics of the experimental vehicles are modest. The vehicles weigh 0.3–4.3 tons, are powered by one or two engines that develop a total of 16–520 hp, have cruising speeds of 22–250 km/hr, and can seat one to six persons. Four of the experimental vehicles—the ESKA-1 (USSR), the X-112 (USA), and the X-113 and X-114 (FRG)—can fly above the influence of the ground effect. For example, the X-113 can reach an altitude of 800 m.

N. I. BELAVIN [29–1889–1]

AIRY FUNCTION, either of the functions Ai(z) and Bi(z), which are solutions of the second-order differential equation

$$W'' - zW = 0$$

where z is the independent variable.

The Airy functions of the argument $(-z)$ may be expressed in terms of Bessel functions of order $\nu = \pm 1/3$:

$$\mathrm{Ai}(-z) = \frac{z^{1/2}}{3}\left[J_{-1/3}\left(\frac{2}{3}z^{3/2}\right) + J_{1/3}\left(\frac{2}{3}z^{3/2}\right)\right]$$

$$\mathrm{Bi}(-z) = \left(\frac{z}{3}\right)^{1/2}\left[J_{-1/3}\left(\frac{2}{3}z^{3/2}\right) - J_{1/3}\left(\frac{2}{3}z^{3/2}\right)\right]$$

$$|\arg z| < 2\pi/3$$

The asymptotic representations for large $|z|$ are

$$\mathrm{Ai}(z) = \frac{\pi^{-1/2}}{2} z^{-1/4} e^{(-2/3)z^{3/2}}[1 + O(|z|^{-3/2})]$$

$$|\arg z| \leq 2\pi/3 - \delta$$

$$\mathrm{Bi}(z) = \pi^{-1/2} z^{-1/4} e^{(2/3)z^{3/2}}[1 + O(|z|^{-3/2})]$$

$$|\arg z| \leq \pi/3 - \delta$$

Airy functions play an important role in the theory of asymptotic representations of various special functions; they have diverse applications in mathematical physics—for example, in the theory of the diffraction of radio waves at the earth's surface. Airy functions were studied by J. R. Airy in 1911.

AIX-EN-PROVENCE (also Aix), a city in southeastern France, in Bouches-du-Rhône Department. The ancient capital of Provence. Population, 111,000 (1975). Aix-en-Provence is a transportation junction. It has enterprises for the production of wine-making equipment, electrical machinery, matches, hats, carpets, and food products. Part of the University of Aix-Marseille is located there. The city is a balneological health resort.

Aix-en-Provence was founded in the second century B.C. In ancient times it was called Aquae Sextiae. Architectural monuments include the ruins of Roman buildings, the Romanesque Cathedral of St. Sauveur (constructed mainly in the 12th and 13th centuries), the Gothic church of St. Jean de Malte (c. 1285), and numerous palaces and fountains of the 17th and 18th centuries, mostly in the Italian baroque style. The museums of the city include the Granet Museum, which primarily houses works of the old French school, and the Museum of Tapestries and Old Furniture. P. Cézanne's studio is open as a museum in the city.

[29–1890–4]

AIX-LES-BAINS, a city in eastern France, in the Savoy Alps, on the Lake of Le Bourget, in Savoie Department. Population, 21,000 (1968). The city has electronics industry. Aix les-Bains is a balneoclimatic health resort. The climate is warm and dry; the average temperature in the summer is 21°C. Curative measures include climatotherapy, sulfide thermal springs (with temperatures of 43.5° to 47°C), and bicarbonate-calcium-chalybeate springs (with temperatures of 15° and 8°C). The spring water is used for bathing, inhaling, and irrigating. Disorders of the organs of movement and support, the nervous system, the female reproductive system, and the skin are treated. Facilities include bathhouses, balneological clinics, hotels, and boarding hotels. Aix-les-Bains is a popular winter-sports resort. [29–1905–2]

ALCEA (also *Althaea*), a genus of biennial or perennial herbs of the family Malvaceae. The alternate leaves are entire or serrate-lobed. The flowers are solitary or in groups in the leaf axils. About 60 species occur in the Eastern Mediterranean region. They are raised as ornamentals and for their nectar. The hollyhock (*A. rosea*) reaches 250 cm in height and has large, often double, flowers. The coloration of the flowers may be black-red, violet, pink, or white. Cultivated forms are used in floriculture. The plants thrive under most conditions, and they have a long flowering period. The black-red petals are used for coloring wines, liqueurs, and fabrics. The dried flowers are used medicinally in the form of teas as an emolient and for poultices. The stems yield a coarse fiber used to manufacture ropes, twines, and sackcloth. [29–1483–3]

ALCIDAE, a family of birds of the order Charadriiformes. There are 13 genera, comprising 20 or 22 extant species. The most common genera are *Uria, Alca, Aethia, Alle, Brachyramphus, Lunda, Fratercula*, and *Cepphus*. One species, the great auk (*Pinguinnus impennis*), became extinct in the mid-19th century. Alcids are typical seabirds, going ashore only to mate and lay eggs. The birds are common along the seas of the moderate and cold latitudes of the northern hemisphere. They are excellent swimmers and divers; they propel themselves underwater with their wings. Alcids feed only on marine organisms—small fish and various invertebrates, including crustaceans and mollusks. The birds usually nest in colonies along seashores; many species, along with gulls, constitute the main residents of bird rookeries. The eggs are usually laid in crevices of cliffs or among rocks. Murres (*Uria*) breed on open rocky ledges, and Atlantic puffins (*Fratercula*) and tufted puffins (*Lunda*) burrow in loose soil. A clutch contains one or two large eggs, weighing more than 10 percent of the female's weight. Both parents incubate the eggs (24 to 35 days) and feed the young. The young are born sighted and covered with dense down. In some parts of the world alcids are commercially valued for their down, feathers, meat, and eggs.

N. N. KARTASHEV [29–640–2]

ALISMA (water plantain), a genus of perennial herbs of the family Alismataceae. The long-petioled entire leaves are in a radical rosette. The white bisexual flowers have a double perianth and are in whorled panicled branches. The fruit is a compound nutlet of dry monospermous fruitlets. There are nine or ten species (according to another classification, one or two species with subspecies), distributed in the temperate zone of the northern hemi-

sphere and in Australia. The USSR has six species. *A. plantago-aquatica* grows along bodies of water, grassy marshes, swampy meadows, and ditches. Its rootstock is rich in edible starch. The plant contains a substance that irritates the skin; in fresh form it is poisonous to cattle. Water plantain is sometimes cultivated as an ornamental. [29–92–3]

ALKALI, a base in aqueous solution. Aqueous alkaline solutions have high concentrations of OH^- (hydroxyl) ions. Alkalies include the hydroxides of the alkali metals, the alkaline-earth metals, and ammonium.

Most alkalies are highly hygroscopic white solid compounds. Their dissolution in water is accompanied by the liberation of large amounts of heat. Alkaline solutions change the color of acid-base indicators. The strongest, that is, caustic, alkalies are the hydroxides of the alkali metals, such as NaOH and KOH, while the weakest alkalies are ammonium hydroxide and the hydroxides of the alkaline-earth metals, such as $Ca(OH)_2$ and $Ba(OH)_2$. Also sometimes considered as alkalies are the salts of strong bases and weak acids (*see* ACIDS AND BASES), whose aqueous solutions exhibit alkaline reactions, for example, the hydrosulfides NaSH and KSH, the carbonates Na_2CO_3 and K_2CO_3, the hydrocarbonate $NaHCO_3$ and the borax $Na_2B_4O_7$. Alkalies are commonly used in laboratory work and in industry (*see* SODIUM HYDROXIDE; POTASSIUM HYDROXIDE; and CALCIUM HYDROXIDE). [29–1587–1]

ALKALI METAL, any one of several chemical elements of the major subgroup of Group I of Mendeleev's periodic system of the elements: lithium, sodium, potassium, rubidium, cesium, and francium. The subgroup's name is derived from the hydroxides of the alkali metals, called caustic alkalies. The atoms of alkali metals have one *s* electron in their outer shell and, with the exception of lithium, two *s* electrons and six *p* electrons in the next to the last shell. The alkali metals always exhibit an oxidation number of +1 in their compounds. They are very reactive chemically. They are oxidized rapidly by atmospheric oxygen and react vigorously with water to form alkalies, MeOH (where Me is a metal). Their reactivity increases from lithium to francium. (*See also* LITHIUM; SODIUM; POTASSIUM; RUBIDIUM; CESIUM; and FRANCIUM.) [29–1589–1]

ALKALINE-EARTH METAL, any one of the chemical elements of the main subgroup of Group II of Mendeleev's periodic system, comprising the calcium family: calcium, strontium, barium, and radium (beryllium and magnesium are also sometimes considered to be alkaline-earth metals). The origin of the name is related to the fact that the oxides of the alkaline-earth metals ("eerths" in alchemical terminology) were found to be alkaline in water. The outer electron shell of alkaline-earth metal atoms contains two *s* electrons; the preceding shell contains two *s* and six *p* electrons. The alkaline-earth metals exhibit an oxidation number of +2 in their compounds. They are chemically reactive, and their reactivity increases from calcium to radium. (*See also* CALCIUM; STRONTIUM; BARIUM; and RADIUM.) [29–1588–1]

ALKALINE STORAGE BATTERY, an electrical accumulator in which the active mass of the negative electrode is a plate made of porous iron or cadmium; the positive electrode is a nickel body filled with nickel(III) oxide, and the electrolyte is a 20-percent solution of potassium hydroxide. The transformation of electrical energy into chemical energy (charging) and the reverse process (discharging) occur as a result of a reaction such as

$$Fe + Ni_2O_3 + 3H_2O \underset{\text{discharge}}{\overset{\text{charge}}{\rightleftharpoons}} Fe(OH)_2 + 2Ni(OH)_2$$

The emf of an alkaline storage battery is 1.3 V. The specific capacity of such a battery is less than in a lead-acid storage battery, but it sustains overloads well and is insensitive to surplus charge and to strong discharge. Alkaline storage batteries are preferable for use under difficult conditions, for example, in power trucks and in the start-up of large diesel engines. [29–1588–2]

ALKALI-RESISTANT MATERIALS, materials capable of resisting the action of alkalies. The behavior of a material in alkalies depends on the material's chemical composition, structure, and particle size, on the concentration and temperature of the alkali, and on the duration of the action of the alkali. Alkali-resistant materials are subdivided into metallic and nonmetallic (inorganic and organic) materials.

Metallic materials. Strong alkaline solutions do not affect metals of the copper subgroup (copper, silver, and gold) and the iron subgroup (iron, cobalt, and nickel) and cadmium, magnesium, the rare-earth metals, thallium, thorium, and the platinum metals. Molybdenum, tungsten, vanadium, and tantalum are stable in alkaline solutions at room temperature. Most metals react with molten alkalies. Zirconium and hafnium are quite resistant to alkaline solutions and melts. Copper-base, nickel-base, and zirconium-base alloys are also stable in aqueous alkaline solutions.

Nonmetallic inorganic materials. Many inorganic materials whose composition includes the basic oxides (portland cement, dolomite, and magnesite) are alkali resistant. Many oxides, including Cr_2O_3, ZrO_2, HfO_2, ThO_2, CeO_2, Al_2O_3, and CdO, are stable in aqueous alkaline media at room temperature and upon heating; they react with molten alkalies. Aluminum oxide and zirconium oxide are the most stable to the action of molten sodium hydroxide at 540°C.

Quartz glasses and multicomponent silicate glasses, which contain ZrO_2, are the most resistant glasses to alkaline solutions. Many pigments, such as cadmium yellow, cinnabar, ocher, and iron minium (Berlin brown), are resistant to alkaline solutions.

Hot concentrated alkaline solutions do not affect graphite and crystalline boron. The carbides of boron, chromium, titanium, zirconium, and tungsten are highly resistant to dilute and concentrated alkaline solutions, as are metalloceramic alloys based on chromium carbide with nickel. Also resistant to alkaline solutions are the nitrides of chromium, niobium, zirconium, silicon, and boron, nickel boride, iron boride, the hexaborides of the rare-earth metals, and the silicides, sulfides, and fluorides of some elements.

Organic materials. Many polymer materials have high resistance to alkaline solutions and are used to produce anticorrosion coatings and dyes. Polyisobutylene, polypropylene, polyethylene, and fluoroplastics are stable in hot and cold alkaline solutions. Vinyl asbestos, Pentaplast, polyamides, polyvinyl chloride, and polystyrene exhibit satisfactory resistance in hot alkaline solutions and high resistance in cold solutions.

N. I. TIMOFEEVA [29–1586–3]

ALKALI ROCK, a magmatic rock that is relatively rich in the alkali metals sodium and potassium. The mineral composition of alkali rocks is typified by nepheline and other feldspathoids (sodalite, cancrinite, and leucite), as well as by alkali pyroxenes and by amphiboles, such as aegerine and arfvedsonite.

Alkali rocks are divided into three groups according to silicon content: ultrabasic rocks—ijolites, melteigites, and urtites (40–45 percent SiO_2); gabbroid rocks—theralites and essexites (45–50 percent); and syenitic rocks—alkali syenites and nepheline syenites (more than 50 percent SiO_2).

In the earth's crust, alkali rocks are found chiefly in small (to 50–100 sq km) intrusive bodies of nepheline syenites and alkali syenites or their effusive varieties (nephelinites, phonolites, leucitites, and tephrites) within volcanic alkali-basaltic associations on the continents and oceanic islands. Ijolites and melteigites are typical of complex alkali-ultrabasic massifs, where pyroxenites and olivinites predominate. Major carbonatite deposits have been identified in these massifs. The nepheline syenites are divided into miascite, in which potassium and sodium together are less than aluminum, and the rarer agpaite, in which potassium and sodium together are more than aluminum. Various minerals

rich in Zr, Ti, Nb, and Sr are typical of agpaitic rocks. The apatite and nepheline ores in the USSR (the Khibiny on the Kola Peninsula) and in Greenland, Canada, Brazil, and South Africa are also associated with alkali rocks.

ALLIARIA, a genus of biennial plants of the family Cruciferae. The leaves are entire; the radical leaves are reniform and long-petioled. The flowers are white and gathered in racemes. The fruit is a capsule. The plants emit a strong garlic odor. There are about five species, distributed in the temperate zone of Eurasia. The USSR has two species. *A. petiolata* (formerly *A. officinalis*) grows in shady forests, shrubbery-thickets, and in ravines; it also is a weed in parks, orchards, and gardens. The plant is used as a seasoning in place of garlic. The leaves contain vitamin C, and the seeds contain a fatty oil. The seeds can be used as a substitute for mustard. The milk of cows that have eaten *A. petiolata* acquires a reddish yellow color and a caustic aftertaste. [29–341–3]

ALLIED POWERS (also Allies; Russian, *chetvernoe soglasie*), in World War I, a coalition that, together with other states, opposed the Central Powers. In Russian usage the term is somewhat more restricted than in the West and refers to Great Britain, France, Russia, and Italy. The coalition was formed when Italy, which had been part of the Triple Alliance of 1882, joined the Triple Entente. [29–347–1]

ALTERNATION OF GENERATIONS, a regular succession of generations differing in mode of reproduction.

Animals may have primary or secondary alternation of generations. A primary alternation of generations, which characterizes many protozoans, is the alternation of a sexual generation with a generation reproducing by asexual cells (agametes). In foraminifers, for example, the alternating generations consist of sexual and asexual individuals—gamonts and agamonts (schizonts), respectively. By repeated division of the nucleus, the gamonts form gametes, which copulate in pairs to form a zygote, which in turn develops into an agamont. The agamont divides into agametes—future gamonts—as a result of schizogony. Since reduction division, or meiosis, occurs before agametes form, the sexual generation, like the gametes, is haploid, whereas the zygote and agamonts are diploid. In sporozoans and flagellates only the zygote is diploid, because meiosis is effected during the first division. In heliozoans, some flagellates, and infusorians meiosis is associated with the formation of gametes, the only haploid stage in the life cycle. This pattern typifies all multicellular animals.

A secondary alternation of generations occurs in two forms in animals. The alternation of different forms of sexual reproduction, for example, the normal sexual process with parthogenesis, is called heterogony. The alternation of sexual and asexual reproduction by means of multicellular vegetative bodies or by transverse division is called metagenesis. Heterogony is characteristic of trematodes, some roundworms, rotifers, and some arthropods (including water fleas, aphids, gallflies, and some gall midges). Metagenesis is very characteristic of tunicates (salpae, Doliolidae, ascidians, and pyrosomes) and coelenterates (hydrozoans and scyphozoans) in which the sexual generation consists of single free-swimming medusae and the asexual generation consist of sessile polyps, which often form colonies. Metagenesis in the broad sense should also include polyembryony, since embryos that reproduce vegetatively more or less constitute an underdeveloped asexual generation.

A. V. IVANOV

The alternation of generations in plants usually refers to the alternation of diploid and haploid phases in the developmental cycles. It is characteristic of plants in which both the diploid phase (diplont) and the haploid phase (haplont) are multicellular. The diplont forms sporangia, in which spores result from meiosis (hence a diplont is also called a sporophyte); the haplont forms gametangia, whose gametes are formed without reduction division (a haplont is also called a gametophyte). A sporophyte develops from a zygote, and a gametophyte from a spore. In some plants, for example, the algae *Ulva* and *Dictiota*, the sporophyte and gametophyte develop equally. In others, however, there is dominance of either the gametophyte (some brown algae [for example, *Cutleria*] and all bryophytes) or the sporophyte (some brown algae [for example, *Laminaria*] and all ferns and seed plants). In many green and, possibly, in some red algae only the zygotes that divide by meiosis are diploid, whereas in Siphonales, diatoms, and some brown algae only the gametes are haploid, as in the great majority of animals. These plants do not actually have an alternation of generations, although there is a succession of nuclear phases.

The sporophytes, or sporogonia, of bryophytes develop on the gametophytes. The gametophytes of ferns exist independently, whereas those of seed plants develop on the sporophytes. The gametophytes of isosporous plants are monoecious; those of heterosporous plants are dioecious and more reduced (especially males) than those of isoporous plants. In angiosperms the male gametophyte is the pollen grain, and the female gametophyte the embryo sac.

AMERY ICE SHELF, an ice shelf in eastern Antarctica, between the Lars Christensen and Ingrid Christensen coasts. The Amery Ice Shelf measures more than 200 km in length and ranges in thickness from 400 m to 800 m. It extends 250 km into the continent and merges in the south with the Lambert Glacier, its main source. The shelf has an area of approximately 40,000 sq km. In 1964 a huge iceberg covering an area of approximately 11,000 sq km broke off from the shelf.

The shelf was discovered in 1931 by an expedition sponsored by Great Britain, Australia, and New Zealand and was named for W. B. Amery, a representative of the British government in Australia. Amery Base, a temporary Australian station, was used to conduct research on the shelf in 1968. Soviet antarctic expeditions carried out detailed geological and geographical research from 1971 to 1974 at the temporary Sodruzhestvo Station. [29–1719–3]

ANABLEPS (four-eyed fishes), a genus of viviparous fishes of the family Anablepidae of the order Cyprinodontiformes. The body length is 15–20 cm (rarely to 30 cm). The cornea and retina of the eyes are divided by an epithelial septum into upper and lower divisions. The upper part is adapted for vision above the water. Hence, the fishes, which usually swim near the surface, are able to see over and under the water simultaneously. There are two known species of four-eyed fishes, inhabiting lagoons in Central America and northern South America. The fishes feed on small invertebrates, mainly flying insects, found in the water or above the water's surface. Fertilization is internal; one to five fry, measuring 4–6 cm long, are born.

ANCISTRODON (also *Agkistrodon*), a genus of poisonous reptiles of the family Crotalidae (rattlesnakes). The top of the head is covered with large symmetrical plates, and the body scales have a rugged surface; there is no rattle on the tail. The snakes measure as much as 1 m in length and have mottled markings. The genus embraces 13 species, of which ten are found in Asia (one of these also in southeastern Europe) and three in North and Central America.

Representatives of the genus are mainly crepuscular and nocturnal. They live chiefly in dry places, but some have strong aquatic habits, for example, the water moccasin (*A. piscivorus*), a North American species. The snakes are ovoviviparous. They feed on frogs, rodents, and lizards, as well as invertebrates. The USSR has two species: *A. blomhoffi*, which inhabits southeastern parts of the Far East, and *A. halys*, found from the southern Trans-Volga Region and southeastern Azerbaijan to the southeastern borders of the USSR. The bite of the snakes is painful to humans, but recovery is usually complete in five to seven days. [29–1613–2]

ANTHROPOMORPHIDAE, a group of higher primates that, together with the family Hominidae, make up the superfamily Hominoidea. According to the most commonly used taxonomic system, the Anthropomorphidae include two families: Hylobatidae (gibbons) and Pongidae (orangutans, chimpanzees, and gorillas).

Gibbons are about 1 m tall when erect and weigh 4–12.5 kg. Orangutans and chimpanzees attain a height of 1.5 m, and gorillas 1.75 m and greater. Chimpanzees weigh 50–70 kg, and orangutans and gorillas up to 100–150 kg. Some male gorillas in captivity attain a weight of 180 kg or greater. Female orangutans, chimpanzees, and gorillas are smaller than their male counterparts.

Cheek pouches and a tail are absent, and ischial callosities are present only in gibbons. The arms are considerably longer than the legs. The brain is relatively large, with developed sulci and convolutions; it weighs 100–150 g in hylobatids and 350–600 g in pongids (sometimes to 750 g in gorillas). Male orangutans and gorillas have well-developed cranial crests. Orangutans have 12 pairs of ribs; all other species have 13 pairs. The animals have an appendix, which reaches a length of 20–25 m. Laryngeal sacs are well developed.

Chimpanzees and gorillas inhabit the tropical rain and mountain forests of Africa. Gibbons occur in Southeast Asia, including Malacca and Sumatra. Orangutans are found on Kalimantan and Sumatra. The animals live in small herds or family groups. Pongids build nests for the night, but gibbons sleep amid dense foliage midway up trees. The animals often swing through the trees using only their arms. They feed mostly on plant substances, occasionally eating birds' eggs and young birds. Chimpanzees sometimes feed on ants and termites.

Reproduction is year-round. The gestation period is seven months for gibbons, 225 days for chimpanzees, 275 days for orangutans, and 250 to 290 days for gorillas. Usually there is a single offspring. Sexual maturity is reached by the age of seven to ten years. The life-span may reach 30 to 60 years.

In many anatomical and physiological respects, chimpanzees and gorillas are the animals most closely related to humans. Biochemical research has revealed a nearly 100-percent similarity of polypeptides in humans and chimpanzees. For this reason, the chimpanzee is widely used in medical and biological experiments.

Fossil Anthropomorphidae were widespread in the Miocene and Pliocene periods of the Old World. *Dryopithecus*, the parent form of all extant pongids and the predecessor of humans, descended from the Miocene *Pliopithecus*, ancestors of the gibbons.

Owing to their decreasing numbers, orangutans, dwarf chimpanzees, the mountain gorilla, and two gibbon species are protected and registered in the Red Data Book of the International Union for the Conservation of Nature and Natural Resources.

APPENDIX, a process of the cecum in lemurs, apes, humans, many rodents, and some Carnivora. The base of the human appendix is situated at the bottom of the cecum, 2–3 cm below the start of the ileum. The average length of the appendix in adults is 8–10 cm, and the cavity averages 4–5 mm in diameter. The appendix is not fixed and is sometimes found behind the peritoneum. It has its own mesentery with fatty tissue, blood vessels, nerves, and lymph nodes. Its wall consists of a mucous membrane and serous, muscular, and submucosal layers. The function and role of the appendix have been little-studied. Disorders of the appendix include appendicitis, diverticulosis, tumors, and, sometimes in humans, infestation by parasitic worms, protozoans, and fungi. [29–179–3]

ARAB STATES BROADCASTING UNION (ASBU), an intergovernmental radio broadcasting organization founded in 1969 within the Arab League in order to strengthen cooperation in radio broadcasting among the member countries and acquaint people throughout the world with life in the Arab countries. Radio and television organizations of Spain, Pakistan, France, and Yugoslavia are associate members. The working languages are Arabic, English, and French.

ASBU publishes the Arabic-language monthly *Arab Broadcasts*, the English-language quarterly *ASBU Review*, and the serial publications *Broadcasting Reports* and *Broadcasting Studies and Researches*. [29–1736–3]

ARTHROPODA, the highest and largest phylum of invertebrates, including approximately 1.5 million terrestrial, aquatic, and parasitic species. Arthropods evolved from forms with a single metamerism but eventually acquired heteronomous segmentation manifested both as specialization of individual body segments and their appendages and as the formation of body regions consisting of relatively similar segments. The primitive marine annelid worms are believed to be the ancestors of arthropods, but whether arthropods are monophyletic, that is, derived from a single group of ancestors, remains a contentious issue.

Arthropods have a bilaterally symmetrical body, usually consisting of a head, thorax, and abdomen. Thoracic segments are often attached to the head, thus forming a cephalothorax. The limbs are articulated, in the form of multijointed levers; they were probably biramous initially. (The ancient trait of biramosity is, for example, characteristic of Paleozoic trilobites and is preserved to this day in many crustaceans.) The body is covered with a chitinous cuticle, forming a protective skeletal shell to which the internal muscles are attached. Growth is intermittent in arthropods, occurring after the old cuticle is shed and before the new cuticle has hardened.

The nervous system consists of three pairs of united supraesophageal ganglia (brain) and an abdominal nerve net in which the segmental ganglia often come together and fuse. The advanced differentiation of the brain is related to the complexity of movement and behavior and to the high level of development of the sense organs, among which compound eyes are especially typical. The alimentary canal consists of an ectodermal pharynx and hind-gut that are lined with chitin and an endodermal midgut into which open ducts from a digestive (hepaticopancreatic) gland, which is also referred to as the liver. The respiratory organs are gills, book lungs, or tracheae.

During the embryonic period, paired coelom sacs form. The sacs subsequently break down, and the individual cavities merge together and with the remains of the original body cavity. The result is the formation of a mixed body cavity, which contains the internal organs and is filled with hemolymph. Arthropods have an open circulatory system; only the large arteries and aorta are present. The metameric heart, which is located above the alimentary canal and which is homologous with the dorsal circulatory vessel of annelid worms, is always arterial.

The excretory organs are in the form of coelomoducts (coxal, green, and maxillary glands), or, in terrestrial forms, Malpighian tubules. The sexes are separate. Reproduction is sexual or, sometimes, parthenogenetic. Embryonic development often involves metamorphosis.

The various systems of classification of arthropods differ greatly from one another. According to the most widely accepted classification, the phylum is divided into four subphyla: (1) Trilo-

bitomorpha (containing the extinct class Trilobita), (2) Chelicerata (containing the classes Merostomata and Arachnida), (3) Branchiata (containing the single class Crustacea), and (4) Tracheata, or Atelocerata (containing the classes Myriopoda and Insecta).

The behavior of arthropods is extremely diverse. Relatively complex instincts are characteristic of the higher arthropods. For example, many insects form associations in which there is distribution of labor among polymorphic individuals. Many arthropods are beneficial to man. Some are edible (crayfish, lobsters) or manufacture important products, for example, honey, wax, or silk (the honeybee and the silkworm). Some beneficial arthropods are raised by man. A significant number of arthropod species are crop pests (Colorado potato beetle, locusts), human and animal parasites (itch mite, fleas, lice), and disease vectors (malarial mosquito, ixodid ticks).

ARTICULATA, a term introduced in 1812 by the French zoologist G. Cuvier to designate one of four animal phyla, the other three being Vertebrata, Mollusca, and Radiata. Some modern zoologists use the term to designate the higher segmented protostomatic animals, which include Annelida and Arthropoda, as well as the closely related Onychophora, Tardigrada, and Pentastomata. [29–670–1]

ASHLAR, a term applied to items made of natural stone, especially in the form of rectangular blocks, used in their natural form in construction and measured during quarrying by the piece or in cubic meters.

Most ashlar is produced for use in walling; it is made from porous rocks, such as limestones, volcanic tuffs, and coquina, which have good heat-insulation properties and which are relatively light and suitable for processing by cutting, hewing, and hammering. It is quarried by opencut or, less often, underground mining methods with stonecutting and coal-cutting machines and cable saws.

Three types of ashlar are produced for walling. Machine-cut wall ashlar with a sawed surface finish is produced in the USSR with the following standard dimensions: 19 × 19 × 39 cm and 19 × 24 × 49 cm (for limestone products), and 29 × 19 × 39 cm (for tuff products). The weight of the blocks does not exceed 40 kg, and the density ranges from 1,200 to 2,200 kg/m^3; the ultimate compressive strength ranges from 0.4 to 40 megapascals per m^2 (4–400 kg-force per cm^2). Rough-hewn wall ashlar is quarried from tuffs by coal-cutting machines; it is hewn on the face side on milling machines or by hand to dimensions of 30 × 20 × (30–55) cm. Large-block wall ashlar is produced in various sizes, up to blocks as high as the height of a building floor. The face side of porous ashlar has a sawed, hewn, or, rarely, polished texture. More than 10 million cu m of limestone ashlar and 2 million cu m of tuff ashlar are produced annually in the USSR.

Blocks of dense rock, such as granites, basalts, and marbles, are produced for subsequent finishing into facing sheets (made from decorative stone) and stone for walling (for socles and retaining walls). They are quarried only by opencut methods with explosives. Further working is accomplished manually or with pneumatic or steam-jet tools (for granite) or milling machines (for basalt). The dimensions of granite ashlar blocks are (45 or 60) × 17 × (50 or more) cm, and those of basalt blocks are 30 × 20 × (30–60) cm. The face side of dense ashlar has a steam-jet, point, grooved, riffled, hewn, or polished texture.

In the USSR ashlar is produced in the Ukraine (limestone and granite), Azerbaijan and Moldavia (limestone), Armenia (tuff and basalt), the Kabardinian-Balkar ASSR (tuff), and Georgia (teschenite). Ashlar is also produced in France, Italy, Great Britain, the USA, Czechoslovakia, and Yugoslavia.

ASHURAH (in Russian, *Shakhsei-vakhsei*), a day of mourning observed by Shiite Muslims in memory of the death of the "great martyr" Imam Husein, a son of Caliph Ali. Husein perished in a battle at Karbala on the tenth day of the month of Muharram in A.D. 680, the 61st year of the Hegira; he had been ambushed by soldiers of the Umayyad caliph Yazid I (ruled 680–683).

The religious ceremonies associated with Ashurah are accompanied by fasting and songs of prayer. Self-flagellation is encouraged, and the participants in the processions whip themselves, crying, "Shah Husein, ah, Husein!" (Russians in Persia heard the phrase as "Shakhsei-vakhsei!") In addition, they inflict saber and dagger wounds on themselves in accordance with the traditional belief that Husein was stabbed 33 times and slashed 34 times. A passion play (*taziyat*) is also performed; the play depicts scenes from the lives of Husein and Caliph Ali, with emphasis on the murder of Husein.

The Shiites have officially observed the day in memory of Husein since the 16th century. [29–906–2]

ATACAMA TRENCH, a narrow deep-sea depression in the Pacific Ocean that stretches along the foot of the Andes. The trench has a length of 2,200 km, widths ranging from 30 km to 90 km, and a maximum depth of 8,069 m. It forms a typical seam: on the eastern edge is a continental margin; on the western edge, a typical oceanic crust; and in the axial zone, the trench forms a wedge. [29–593–3]

AUGER BORING, rotary drilling with a rotary-blade drill bit, in which the broken rock is removed from the cutting face by means of a screw conveyor. The rock is broken up by steel or hard-alloy cutting tools (sometimes replaceable types), which rotate at 100–240 rpm and are pressed against the face with a force of 300–2,000 kg by a drilling strut composed of the augers. Auger drilling is used to drill shot holes in fairly weak rock (less frequently, to sink holes with the aid of a drill) and to sink shallow hydrogeological and engineering-geological wells. Drilling productivity ranges from a few meters to hundreds of meters per shift. Pneumatic auger drilling is currently being tested. The technique uses compressed air, which is fed into the spiral of the auger and which partially suspends the particles of broken rock moving through the auger, thus facilitating removal of the rock from the well. [29–1327–3]

AVEBURY, a complex of megalithic sanctuaries and tombs dating from the Neolithic period and early Bronze Age (2100–1650 B.C.), near the village of the same name in Wiltshire, Great Britain. It includes a large cromlech about 350 m in diameter, consisting of about 100 stone pillars weighing up to 50 tons each and surrounded by an earthen bank and ditch. Within this cromlech are two smaller ones, each about 108 m in diameter. An avenue of mehhirs, 2.3 km long, leads from the south of this complex to the cromlech of Overton Hill, which consists of two concentric circles. A number of long barrows and megalithic tombs are located near Avebury. [29–1697–5]

AVELING, EDWARD. Born Nov. 29, 1851, in Stoke Newington; died Aug. 2, 1898, in London. British socialist.

Aveling studied the natural sciences and became known as a popularizer of C. Darwin's theories and of atheism. In the early 1880's he became acquainted with Marxism, and in 1883–84 he edited the socialist journal *Progress*. Together with his wife Eleanor Marx, K. Marx's daughter, Aveling played a prominent role in the British and international labor movement and in the propagation of Marxist doctrine. He was active in the Democratic Federation (renamed the Social Democratic Federation in August 1884); he condemned the opportunistic tendencies of the federation's leader, H. Hyndman, and together with a group of left-wingers he left its ranks.

Aveling was one of the founders of the Socialist League (December 1884). With the support of F. Engels, he sought to convert the league into the nucleus of the mass political party of the proletariat. The anarchists' predominance in the league in the late 1880's caused Aveling and his followers to break with it. Having joined the new trade union movement, Aveling helped organize and was active in the Second International. He was a co-translator into English of the first volume of Marx' *Das Kapital* and Engels' *Development of Socialism From Utopia to Science* [published in English as *Socialism, Utopian and Scientific*].

Aveling was also known as a playwright and literary scholar. The last years of his life were clouded by ill health.

L. I. GOL'MAN [29–1639–4]

BALANCING, a genre of circus art centered on the performer's ability to maintain his equilibrium in any unstable position of the body while on a tightrope, large ball, or trapeze. It is often combined with acrobatics and juggling. [29–1749–5]

BALLAST-CLEANING MACHINE, a track machine for cleaning ballast of contaminants, such as fine debris and dust, that lower the resiliency of the ballast layer and prevent the drainage of moisture. Ballast becomes contaminated because the gravel is abraded and crushed by the dynamic loads of passing trains and compacted under railroad ties during track maintenance operations; in addition, particles of ore, coal, and the like are spilled on the ballast from passing trains. As a result of the impaired filtering capability of the gravel layer, moisture is retained by the contaminants, the ballast foundation becomes thin in places, the gravel is scattered, and frost heaves are formed in winter.

The most commonly used ballast-cleaning device in the USSR is the model ShchOM-D, which was designed by the Soviet engineer A. M. Dragavtsev; it is mounted on an electric ballasting machine. The device consists of an endless reticulated belt that moves crosswise to the direction of the railroad track around the rails and ties, which are elevated by the electric ballasting machine. The belt slides underneath along a blade (at a speed of 12 m/sec) that cuts under the gravel layer as the machine is moved. Fine particles of contaminants are ejected onto the shoulder of the roadbed through holes in the belt as the belt moves over the curved portion of its trajectory; large pieces fall into a bin and are then poured back onto the track and leveled off. The ShchOM-D can process up to 2,000 cu m of ballast per hour at an operating speed of 1 to 3 km per hour. Ballast-cleaning machines that operate without elevating the rails and ties have scraping mechanisms to separate the gravel and feed it into a cleaning device. They are used mainly to clean the ballast under railroad switch layouts and station tracks.

Ballast is cleaned on an average of once every 8–10 years; cleaning is done more often on track sections where contamination, such as by coal dust, is more severe. The use of ballast having special fillers, for example, asbestos, can extend the servicing period to as much as 15–20 years. [29–1573–4]

BALL VALVE, a valve in which the seal is effected by a ball. The spherical surface of the ball is pressed against a conical seat that forms the transmission path of a pipe, thus providing a hermetic seal in the channel. Globular check valves—a type of ball valve—are very common. The ball in such valves is pressed against the seat by the action of a spring or by the ball's own weight (in the latter case, the seat axis is vertical); the mechanism allows a gas or liquid to flow only in one direction when the pressure of the flow overcomes the force created by the spring or weight of the ball. Globular check valves with solid metal balls are used for inside diameters up to 15 mm; similar valves with hollow, rubber-coated balls are used for inside diameters up to 100 mm. Valves with balls that have a through hole are used as shut-off and regulating devices for inside diameters up to 1,000 mm. Such valves are opened and closed by rotation of the ball through 90°. [29–866–5]

BARBASTELLA, a genus of bats of the suborder Microchiroptera. The body is 4–6 cm long and weighs 6–10 g. The very broad ears are concresced at the forehead. There are two species—the European barbastel (*B. barbastellus*) and the Asiatic barbastel (*B. leucomelas*)—which are distributed in temperate and subtropical latitudes of Eurasia and in North Africa. In the USSR the European barbastel inhabits the Caucasus and western and southern regions of the European portion; the Asiatic barbastel inhabits the Caucasus, Transcaucasia, and Middle Asia. During the day the bats hide in caves, rock crevices, tree hollows, and buildings. They feed on insects. The females bear one or two young. [29–1230–4]

BARBELL, the basic apparatus used in weight lifting. It consists of a steel bar with freely revolving sleeves on the ends, removable metal disks attached to the bar ends to vary the weight, and locks to fasten the disks. The bar has a length of 2,200 mm and a diameter of 28 mm; the sleeves have a length of 400 mm and a diameter of 55–60 mm; and the disks have diameters up to 450 mm, with weights varying from 0.1 to 50.0 kg (international standard). [29–1451–1]

BARREL ORGAN, a mechanical wind instrument. The barrel organ, a type of portative organ, resembles a small box and consists of bellows, organ pipes in one or more ranks, and cylinders equipped with metal pins. As the cylinder is turned by a hand crank, the pins engage a special mechanism that opens a passage permitting air to reach the pipes; at the same time, air is pumped by means of the bellows. Some barrel organs have replaceable cylinders and can thus perform several musical pieces. The instrument, which first appeared in Western Europe in the 18th century and in Russia in the first quarter of the 19th century, was popular among itinerant musicians. The barrel organ is called a *katerynka* in the Ukraine and a *katarynka* in Poland.

A. M. MIREK [29–862–2]

BARRIER, a lifting or sliding beam, usually installed at a railroad crossing to stop automobile, cart, and pedestrian traffic prior to the passing of a train. Barriers may be operated manually, mechanically, or automatically. Automatic barriers are operated by signals from the railroad's automation and remote control systems; signal lights and acoustic devices may be used. The normal position for automatic barriers is the open position; for nonautomatic barriers it is the closed position. [29–1271–4]

BAYONET, a cold-steel thrusting weapon, affixed to the barrel of a firearm (since the 1800's, a rifle, carbine, or automatic weapon) for hand-to-hand fighting. The bayonet appeared in the mid-1600's in France (where it received its name). Originally it was a shortened spear that was driven into the bore of a gun barrel; by the late 1600's bayonets were made entirely of metal with a sleeve that fitted tightly over the gun barrel, which permitted loading and firing with the bayonet in place. The bayonet was adopted by Russia in the early 1700's. Various armies have used bayonets with three or four faces as well as blades, both detachable and nondetachable.

After World War II, Soviet troops were equipped with a bayonet-knife having a flat blade with teeth on one side, a hand grip by which the weapon could be attached to a gun, and a sheath; the bayonet-knife could also be used as a saw. [29–1508–2]

BIDENS (beggar-ticks, bur marigold, or sticktight), a genus of annual or perennial herbs of the family Compositae. The opposite leaves vary from entire to pinnatisect. The disk flowers are bisexual; sometimes there are infertile ray flowers. The flowers are in heads generally borne singly on the apices of the stem and the branches. The fruit is an achene, with two to four retrosely barbed bristles on the apex.

There are more than 200 species, which are distributed worldwide but mainly in the Americas. The USSR has eight species. *B. tripartita* grows along bodies of water marshes, ditches, moist wastelands, gardens, and fields. The plant sometimes forms a dense cover. It contains essential oil; mucilaginous, bitter, and tannic substances; carotene; and vitamin C. In folk medicine the leaves and stem apices are used in baths to heal various diatheses with rashes; the herb is also used in an antiscrofulous mixture.

BIG TOP, a collapsible structure designed for traveling circus shows. A big top is usually a dome-shaped canvas tent stretched over tall center poles and side poles by means of various fastenings; inside the tent are stands for spectators, room for equipment, and a backstage area. Big tops originated in the 1830's at the Cirque d'Eté on the Champs Elysées in Paris. They became widely popular in the USA and later in other countries. The first one in Russia was constructed in Moscow, in Neskuchnyi Sad in 1830.

The big top was the main circus structure in prerevolutionary provincial Russia, and traveling circuses with big tops of various types are practically the only form of circus in all the capitalist countries. In the USSR, a vast network of tent circuses is operated simultaneously with numerous permanent circuses.

BLACK AFRICA, a term used in scholarly works, political writings, and literature to denote African countries populated by negroid races. The French term *Afrique noire* first appeared in the second half of the 19th century, when France's colonial empire was taking shape in West and Equatorial Africa. The German term *Schwarzafrika* has not gained wide use. In English, the term "Negro Africa" has largely been replaced by "Black Africa," "Subsaharan Africa," and "Africa south of the Sahara," the last of which is also coming into use in French. The last term is accepted in Soviet writings. [29–232–1]

BLACK AND WHITE CATTLE, a breed of dairy cattle confirmed in 1959. Differences in the local parent stock, natural conditions, and the level of pedigree work have led to the development of features unique to the particular region where the cattle are raised.

In the central regions of the RSFSR the breed was developed in the late 19th century by crossing local Great Russian cattle and their crossbreeds with Ostfriesian, Swedish Black and White, and Holstein-Friesian breeds. The resulting cattle are larger than the parent stock. The bulls weigh as much as 1,000 kg, and cows 550–650 kg. The highest milk yields average about 4,000 kg (record yields to 12,000 kg). The fat content of the milk is 3.5–3.6 percent.

The Urals Black and White breed was developed in 1936–37 by crossing the Tagil breed with Ostfriesian and Baltic Black and White cattle. The bulls weigh 900–950 kg, the cows 500–600 kg. The average milk yield is 3,700–3,800 kg, with a record yield of 17,517 kg. The fat content of the milk is 3.7–3.8 percent. The Siberian Black and White cattle was developed in 1929–30 by crossing local Siberian cattle with Ostfriesian and Holstein-Friesian breeds. The bulls weigh 850–900 kg, and the cows 450–500 kg. The average milk yield is about 3,500 kg; the fat content is 3.7–3.8 percent.

The meat of Black and White cattle is of satisfactory quality. With intensive fattening, the young weigh 500–550 kg by 18 months of age. The Black and White breed is one of the most common cattle breeds in the USSR. It is raised in the central and northwestern regions of the RSFSR, in the Urals, and in Western Siberia, as well as in certain regions in Eastern Siberia, the Ukrainian SSR, the Byelorussian SSR, and the Uzbek SSR.

BLACK BOX (in Russian, *chernyi iashchik*), an object of study whose internal structure either is unknown or is too complex for any conclusions about the behavior of the object to be drawn on the basis of the properties of the object's elements or on the basis of the structure of the connections between the elements. In Russian, the term *chernyi iashchik* is also used to refer to the method of studying such objects.

The black-box method is used in cases where an outside observer knows only the input to an object and the object's response; in such cases, the processes occurring within the object are unknown. The study of a multiterminal network whose internal circuitry is unknown provides a very simple example of the use of the black-box method. By observing the behavior of such an object for a sufficiently long time and, if necessary, by carrying out active experiments on the object (that is, by changing the input in some specific manner), a level of knowledge about the properties of the object may be achieved such that changes in the object's behavior in response to any given input may be predicted. However, no matter how thoroughly the behavior of a black box is studied, an unambiguous conclusion about the internal structure of the object cannot be reached, since the same behavior may be characteristic of different objects.

The black-box method is widely used to solve problems in the modeling of controlled systems—for example, in the study of integrated systems—especially in cases where the behavior rather than the structure of a system is of interest. [29–308–6]

BLACK-BROWN RABBIT, a breed of rabbit raised for meat and fur. The Black-Brown Rabbit was first bred at the Biriulia Breeding Sovkhoz in the Tatar ASSR by crossing the Viennese Blue, Flanders, and White Giant breeds. The breed was officially recognized in 1948. The Black-Brown has a thick, dark brown pelt with glistening black tips on the awnlet hairs, which form a thick, black veil; its coloring resembles that of the silver fox. The rabbits are large; the length of the body is about 60 cm, and the average liveweight is about 5 kg, sometimes 7 kg. The females bear seven to eight young per litter. The breed, which acclimatizes well in various zones, is raised in the Tatar ASSR.

BLACK CARP (*Mylopharyngodon piceus*), a species of fish of the family Cyprinidae. The black carp reaches a length of 120 cm and a weight of 30 kg or greater. The body and fins are almost black, but the abdomen is lighter in coloration. The black carp is distributed from the Amur River southward to South China; it is sparse in the Amur basin. The fish feeds mainly on gastropod mollusks. Spawning occurs in June and July, with each female producing about 1 million floating roe. Sexual maturity is attained in seven to nine years. The black carp is a valuable commercial fish; it is being acclimatized in waters of the southern USSR. The fish is raised at pond fisheries. [29–306–2]

BLACK CHOKEBERRY (*Aronia melanocarpa*), a shrub of the family Rosaceae measuring 1.5–3 m tall. The leaves are elliptical and serrate. The shiny black fruits are globose and measure

0.7–1.5 cm in diameter. The dark red pulp is tart and astringent; the juice is ruby-colored.

The black chokeberry occurs in eastern regions of North America. Introduced into cultivation in the USSR by I. V. Michurin, it is widespread in commercial and farm orchards of the European USSR (the Baltic region and the northern, northwestern, and central regions of the RSFSR), Siberia, and the Altai. It thrives in various soils and climates, although it does require much moisture. The fruits, which contain sugars, vitamins P and C, and provitamin A, are used in fresh or dried form. They are used to make juice, jam, and various medicinal substances. The yield is 3–8.5 kg per shrub (50–70 quintals per hectare). The plants are set out in sunny areas in spring or autumn, with a distance of 4 m between rows and 1.5–3 m between plants in a row. The shrubs form many shoots, which thicken the plantings and require systematic pruning. Black chokeberries are ornamental, especially in the spring, when the plants are covered with large white inflorescences, and in the autumn, when they are covered with scarlet leaves. The shrubs are often used in landscaping. The plants are nectar bearers.

BLACK CODES, bills introduced in the legislatures of several Southern states after the US Civil War (1861–65). The codes forced Negroes to work for meager wages for their former owners and deprived them of their freedom of movement and their right to own or rent land; they also permitted the use of forced Negro child labor and forbade Negroes to hold meetings of any kind, carry weapons, or marry whites. Provision was made for the formation of special courts to deal with crimes committed by Negroes. The Black Codes were formally abolished in a number of states in the 1870's, but similar statutes were included in state constitutions and criminal legislation.

BLACK DEATH, the name given by contemporaries to the plague that spread throughout Europe between 1347 and 1353. During that period approximately 25 million people—that is, almost half the population of Europe—died of the Black Death. The pandemic recurred on a smaller scale in 1361 and 1369.

The Black Death resulted in a decline in the number of workers and, consequently, in a rise in the cost of labor. To provide the feudal aristocracy and urban patriciate with cheap labor, the governments of some countries enacted laws fixing wages at preplague levels. These measures intensified the class struggle, which found expression in uprisings, the rejection of feudal obligations, and the flight of peasants from their feudal lords.

[29–240–2]

BLACKENING, a type of oxide coating for iron and steel products, used for corrosion protection and for decorative purposes. The most common method of blackening is to immerse the products in a concentrated alkaline solution containing sodium nitrate or sodium nitrite as an oxidizer. As the concentration of the alkali is increased (other conditions being equal), the thickness of the oxide film also increases. A thin coating (20 to 40 angstroms) does not alter the external appearance of the surface nor does it provide practical protection for the metal against corrosion. Thick coatings (2.5 micrometers), which are black or grayish black, have poor mechanical strength. The best thickness is 0.6 to 0.8 micrometer. Blackening is a special case of blueing.

[29–240–5]

BLACK FOREST (in German, Schwarzwald), a mountain massif in the southwestern part of the Federal Republic of Germany. The Black Forest extends 160 km along the right bank of the Rhine. It measures 35–60 km in width and rises to an elevation of 1,493 m at Mt. Feldberg. It is composed primarily of gneisses, granites, and sandstones. The massif falls sharply toward the Upper Rhine Lowland. The peaks are flat and dome-shaped, with rivers cutting deeply into the slopes. Oak and beech forests are found at elevations to 800 m, and spruce-fir forests grow at higher elevations. The upper zone of the Black Forest is timberless. There are mineral springs and resorts at Baden-Baden and Badenweiler. [29–930–2]

BLACK FRIDAY (Apr. 15, 1921), in Great Britain, the day that opportunist leaders of the "triple alliance" of miners, railwaymen, and transport workers thwarted a sympathy strike planned by railwaymen and transport workers in support of miners locked out by the coal industry. A few hours before the strike was to take place, the union leaders canceled it against the wishes of the rank and file. Forced to strike alone, the miners were defeated. After Black Friday the bourgeoisie launched a broad frontal attack on the working people and nullified many of the victories that had been won during the upsurge in the class struggle between 1918 and 1921.

BLACK HEADS (also Schwarzhäupter). **(1)** A society in Livonia from the 14th to 16th centuries, membership in which was dependent on a person's class and religion. The members included servants and low-ranking officials of the Livonian Order. The name of the society is derived from the group's coat of arms, on which an image of the head of St. Mauritius was emblazoned.

(2) From the 14th to early 20th centuries, societies of foreign merchants in the Baltic region who did not have their homes and families in the area. Named for the symbol of St. Mauritius, who was considered their protector, the Black Heads defended the interests of foreign merchants and arranged social activities for them. In Riga, Tallin, and Vilnius, the societies owned houses that fulfilled the combined functions of clubs and dormitories. A number of the buildings constructed for the Black Heads have been preserved and are outstanding monuments of medieval architecture in the Baltic region.

(3) In Riga until 1939, a society of Riga German merchants who were bachelors. [29–263–2]

BLACK HOLE, a celestial object that is formed as a result of the relativistic gravitational collapse of a massive body. In particular, the evolution of a star whose mass at the moment of collapse exceeds some critical value may terminate in catastrophic gravitational collapse. The value of the critical mass is not precisely determined and, depending on the equation of state of matter used, ranges from 1.5 to 3 solar masses ($M_\odot$).

For any equation of state of matter, the general theory of relativity predicts that no stable equilibrium exists for cold stars of several solar masses. If, after a star becomes unstable, not enough energy is released to halt the collapse or to cause a partial explosion after which the remaining mass would be less than the critical mass, the central portions of the star collapse and, in a short time, reach the gravitational radius r_g. No forces whatsoever can prevent the further collapse of a star if the radius of the star shrinks down to r_g, which is also known as the Schwarzschild radius and is the radius of a sphere whose surface is called the event horizon. A fundamental property of the event horizon is that no signals emitted from the surface of the star and reaching the event horizon can escape from the region inside that horizon. Thus, as a result of the gravitational collapse of a massive star, a region in space-time is formed from which no information whatsoever about physical processes occurring within the region can emerge.

A black hole has a gravitational field whose properties are determined by the hole's mass, angular momentum, and—if the collapsing star was electrically charged—electric charge. At large distances, the gravitational field of a black hole is virtually indistinguishable from the gravitational field of a normal star. In addition, the motion of other objects that interact with a black hole at

large distances is governed by the laws of Newtonian mechanics. Calculations show that a region known as the ergosphere, which is bounded by a surface called the static, or stationary, limit, should exist outside the event horizon of a rotating black hole. The attractive force that a black hole exerts on a stationary object situated in the ergosphere tends to infinity. However, the attractive force is finite if the object has an angular momentum whose direction coincides with that of the black hole's angular momentum. Therefore, any particles that happen to be in the ergosphere will revolve around the black hole.

The presence of an ergosphere may lead to energy losses by a rotating black hole. In particular, energy losses are possible in the case where some object that has entered the ergosphere breaks up (for example, as a result of an explosion) into two fragments near the event horizon of the black hole. In this case, one of the fragments continues to fall into the black hole, but the other fragment escapes from the ergosphere. The parameters of the explosion may be such that the energy of the fragment that escapes from the ergosphere is higher than the energy of the original object. The additional energy in this case is drawn from the rotational energy of the black hole.

As the angular momentum of a rotating black hole decreases, the static limit comes closer to the event horizon; when the angular momentum is zero, the static limit and the event horizon coincide and the ergosphere disappears. Owing to the effects of the centrifugal force of rotation, the rapid rotation of a collapsing object prevents the formation of a black hole. Therefore, a black hole cannot have an angular momentum that is greater than some extreme value.

Quantum-mechanical calculations show that particles—such as photons, neutrinos, gravitons, and electron-positron pairs—may be produced in the strong gravitational field of a black hole. As a result, a black hole radiates like a blackbody with an effective temperature of $T = 10^{-6}(M_{\odot}/M)$ °K, where M is the mass of the black hole, even in cases where no matter whatsoever falls into the hole. The energy of the radiation is drawn from the energy of the black hole's gravitational field; as a result, the mass of the black hole decreases with time. However, owing to their low efficiency, the quantum radiation processes are unimportant for massive black holes, which are formed as a result of stellar collapse.

In the early stages of the evolution of the universe, which were hot and ultradense, black holes with masses ranging from 10^{-5} g to a solar mass or higher may have been formed as a result of an inhomogeneous distribution of matter. In contrast to the black holes that are formed by collapsed stars, these objects are called primordial black holes. Since quantum radiation processes reduce the mass of a black hole, all primordial black holes with a mass of less than 10^{15} g should have evaporated by the present time. The intensity and effective temperature of black-hole radiation increase as the mass of a black hole decreases. Therefore, in the final stage, the evaporation of a black hole with a mass of the order of 3×10^9 g would be an explosion accompanied by an energy release of 10^{30} erg in 0.1 sec. Primordial black holes with a mass of greater than 10^{15} g have remained virtually unchanged. The detection of primordial black holes on the basis of their radiation would make it possible to draw important conclusions about the physical processes that occurred in the early stages of the evolution of the universe.

The search for black holes in the universe is a task of current interest in modern astronomy. Searches are carried out on the assumption that black holes may be the invisible components of certain binary star systems. However, this inference is not definite, since the normal star in a binary system may be invisible against the higher luminosity of the second component. Another method of identifying black holes in binary systems is based on the radiation emitted by matter flowing from the companion, which is a normal star, to the black hole. In this case, a disk consisting of matter flowing to the black hole is formed near the hole; the layers of the disk move around the hole with various velocities (see Figure 1). Owing to friction between adjacent layers, the matter in the disk is heated to tens of millions of degrees. The inner regions of the disk emit energy in the X-ray region of the electromagnetic spectrum. The same type of radiation is produced in the case where a binary system contains a neutron star rather than a black hole. However, a neutron star cannot have a mass higher than some limiting value.

As a result of space studies, a large number of X-ray sources in binary systems have been discovered. The X-ray source Cygnus X-1 is the most likely candidate for a black hole. In this binary system, the mass of the X-ray source, which may be estimated from the observed orbital velocity of the optical star and from Kepler's laws, exceeds 5 $M_{\odot}$, that is, is higher than the limiting mass for a neutron star.

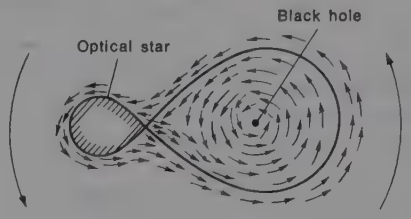

Figure 1. A black hole in a binary star system

The hypothesis has also been advanced that supermassive black holes—that is, black holes with a mass $M \simeq 10^6$–10^8 $M_{\odot}$—may be located in the nuclei of active galaxies and in quasars. In this case, the activity of the active galactic nuclei and quasars is attributed to the infall of ambient gas onto the black hole.

BLACK HOODS (Russian, *Chernye Klobuki*), members of a Turkic alliance that was formed circa the mid-12th century in the forest-steppe regions of Rus' (primarily along the Ros' River) from surviving groups of such peoples as the Pechenegs, Torks, and Berendei, who had settled there in the second half of the 11th century. As vassals of Rus', the Black Hoods were required to guard the southern borders of the state and to take part in the campaigns of the Kievan princes. As they gradually turned from nomadic stock raising to land cultivation, feudal relations developed among them. In the 13th century, after the Mongol-Tatar invasion, some of the Black Hoods intermingled with the Russian population, and some left to roam the steppe.

BLACK HUNDREDS, members of certain reactionary public organizations in Russia at the beginning of the 20th century.

The Black Hundreds, who believed that the autocracy should remain intact and continue to pursue a policy of great-power chauvinism, assisted the tsarist regime in its efforts to repress the revolutionary movement. Precursors of the Black Hundreds were the Sviashchennaia Druzhina (Holy Host) and the Russian Assembly in St. Petersburg; beginning in 1900 these organizations united reactionary members of the intelligentsia, the bureaucracy, the clergy, and the landowning class.

During the Revolution of 1905–07 numerous right-wing organizations were formed in response to the intensifying class struggle; these included the League of the Russian People, located in St. Petersburg; the Union of Russian Men, the Russian Monarchist Party, and the Society for Active Resistance to the Revolution, all located in Moscow; and the White Two-headed Eagle, located

in Odessa. The organizations drew support from diverse social elements: landowners, clergy, members of the big and petite urban bourgeoisie, merchants, *meshchane* (members of the lower urban strata), artisans, politically unaware workers, and *déclassé* elements. The activities of the Black Hundreds organizations were directed by the Council of the United Nobility and were given financial and moral support by the autocracy and the camarilla of the tsarist court.

Although their programs differed somewhat, all the Black Hundreds groups were united in their opposition to the revolutionary movement. Members of the groups spoke on behalf of their cause at churches, assemblies, political meetings, and lectures; they held religious services and demonstrations, and sent delegations to the tsar. This agitation, by arousing anti-Semitism and monarchist fervor, led to a wave of pogroms and acts of terrorism against revolutionaries and progressive public figures.

Newspapers published by the Black Hundreds groups included *Russkoe znamia, Pochaevskii listok, Zemshchina, Kolokol, Groza*, and *Veche*. Such right-wing newspapers as *Moskovskie vedomosti, Grazhdanin*, and *Kievlianin* also printed articles by the Black Hundreds. Leading figures of the Black Hundreds included A. I. Dubrovin, V. M. Purishkevich, N. E. Markov, the lawyer P. F. Bulatsel', the priest I. I. Vostorgov, the engineer A. I. Trishchatyi, the monk Iliodor, and Prince M. K. Shakhovskoi.

In an effort to form a united front, the Black Hundreds held four national congresses, and in October 1906 a central board was elected for the United Russian People, an organization representing all the Black Hundreds organizations. After the Revolution of 1905–07 the national organization collapsed, the Black Hundreds movement lost momentum, and the number of organizations sharply declined. During the February Revolution of 1917 the remaining groups were officially banned. After the October Revolution the leaders and many rank-and-file members of the groups opposed Soviet power. The term *chernosotenets* (member of the Black Hundreds) came to be applied to, for example, extreme reactionaries and militant opponents of socialism.

BLACK LEG, a disease of agricultural plants in which the root collar and the base of the stem turn black and rot. Causative agents are parasitic fungi and bacteria.

Black leg of cabbage, caused by parasitic fungi, mostly infects cabbage, cauliflower, kohlrabi, and radish seedlings. Diseased plants lose turgor, turn yellow, and droop. The disease is ubiquitous. Control measures include replacement and disinfection of soil in garden frames, treatment of seeds, and proper care of plants.

Black leg of potato, caused by soil bacteria, results in yellowing, curling, and wilting of leaves and in blackening and rotting of the base of the stem. If infected before flowering, the plants form no tubers. With later infection, the tubers are also affected. Control measures include removal of diseased plants, planting of healthy tubers, and disinfection of seed tubers.

Black leg also affects carrots, forage legumes, and seedlings of fruit trees. [29–239–1]

BLACK PARTITION (Chernyi Peredel; also Party of Socialists and Federalists), a revolutionary populist organization in Russia in the early 1880's. The Black Partition was formed in August and September 1879 after a split in the secret society Land and Liberty. Its name is connected with the rumor, widespread among the peasants, of an imminent partition of the land among the common people (*chern'*).

The members of the Black Partition initially subscribed to the program of Land and Liberty; they denied the need for political struggle and rejected the terrorist and conspiratorial tactics of the People's Will in the belief that only the people could bring about a revolution. They favored large-scale agitation and propaganda among the masses. The organizers of the Central Circle of the Black Partition in St. Petersburg included G. V. Plekhanov, P. B. Aksel'rod, O. V. Aptekman, M. P. Popov, L. G. Deutsch, and V. I. Zasulich. The circle set up a press, which published the journal *Chernyi peredel* and the newspaper *Zerno*, and established ties with students and workers. Affiliated circles were active in such cities as Moscow, Kharkov, Kazan, Perm', Saratov, and Samara.

After such figures as Plekhanov, Deutsch, and Zasulich emigrated in the early 1880's, the leaders of the Black Partition included A. P. Bulanov, M. K. Reshko, K. Ia. Zagorskii, and M. I. Sheftel'. The new leaders set up a press in Minsk and broadened their ties with the workers. The organization's headquarters was moved to Moscow. In the spring of 1880 the Black Partition members E. N. Koval'skaia and N. P. Shchedrin organized in Kiev the Southern Russian Workers' Union, which comprised several hundred workers.

By this time the views of the Black Partition members had undergone a major evolution. The importance of struggle in order to attain political freedom and the need to use terror as a means of revolutionary struggle were recognized in the program of the northern Russian society Land and Liberty. The program was drafted with Aksel'rod's help and was approved by the members of the Black Partition who had emigrated.

Arrests in 1880 and 1881 weakened the Black Partition. Influenced by the successes of the People's Will, many members adopted the views of that organization, notably Ia. V. Stefanovich, Bulanov, and Popov. By the end of 1881 the Black Partition had ceased to exist as an organization, although some of the group's circles remained active until the second half of the 1880's. Such former members as Plekhanov, Deutsch, and Zasulich broke with Populism and in 1883, adopting a Marxist position, established in Geneva the first Russian Marxist organization, the Liberation of Labor group.

BLACK RUST, a plant disease caused by various fungi, both saprophytes and hemiparasites. It affects fruit and berry crops (including citrus, grape, mulberry), cereal grains, hops, houseplants, hothouse plants, and certain forest trees. It occurs mainly in subtropical and tropical climates. Black and dark brown spots and films (mycelia and spore sacs of fungi) appear on affected plants, decreasing photosynthetic activity and obstructing access of air to the tissues. Black rust is especially damaging to spikes and caryopses of cereal grains, lowering the yield and quality of wheat, rye, and millet grains. Control measures consist mainly in destroying aphids and scale insects, upon whose discharges the causative agents feed.

BLACK SEA, an inland sea of the Atlantic Ocean, between Europe and Asia Minor.

Physical geographic description. GENERAL INFORMATION. The Black Sea is bounded by the USSR, Rumania, Bulgaria, and Tur-

key. In the northeast it is connected with the Sea of Azov by way of Kerch' Strait, and in the southwest it is connected with the Sea of Marmara by way of the Bosporus and then with the Aegean Sea and the Mediterranean Sea by way of the Dardanelles. The Black Sea's greatest east-west length is 1,150 km, and the greatest north-south length, 580 km. At its narrowest point, the sea is 265 km wide. It has an area of 420,300 sq km and a water volume of 547,000 cu km. Its average depth is 1,300 m. The chief rivers that empty into the Black Sea are the Danube, Dnestr, Iuzhnyi Bug, Dnieper, Rioni, and Kızıl (Kyzyl Irmak).

COASTLINE. The Black Sea coastline, which measures a total of 3,400 km, is relatively smooth, with only one major peninsula—the Crimean Peninsula. Some of its segments have their own name, for example, the Southern Coast (Iuzhnyi Bereg) of the Crimea and the Black Sea Coast (Chernomorskii Bereg) of the Caucasus in the USSR and the Rumelian and Anatolian coasts in Turkey. In the west and northwest the shores are low and, in places, steep; limans are characteristic of the shores in the northwest. The northern coast of the Crimean Peninsula is flat, while the southern coast is mountainous. In the east and south the mountains of the Greater and Lesser Caucasus and the Pontic Mountains extend to the very edge of the sea; there are a few low-lying areas here, formed by river deltas jutting out into the sea near the capes of Pitsunda and Kodor in Georgia and Civa and Bafra in eastern Anatolia. The largest bays and gulfs are Karkinitskii, Kalamitskii, Dnieper-Bug, Dnestr, Varna, and Burgas in the northwest and west and Sinop and Samsun in the south. Islands are few, the most important being Berezan' and Zmeinyi.

TOPOGRAPHY OF THE BOTTOM AND GEOLOGICAL STRUCTURE. Three parts are identified in the topography of the bottom: the shelf, the continental slope, and the deep sea basin. The shelf extends to a depth of 110–160 m and reaches its greatest width, more than 200 km, in the northwest; elsewhere it usually extends to depths less than 110 m and ranges in width from 2.5 km (along the coast of Turkey) to 10–15 km.

The continental slope is strongly dissected by underwater valleys and canyons. Its average inclination is 5°–8°, but in the northwest and near Kerch' Strait, the inclination is 1°–3°. Some parts reach a steepness of 20°–30°. A system of underwater ridges measuring more than 150 km in length stretches almost parallel to the shore between Sinop and Samsun.

The floor of the deep sea basin is a flat aggradation plain, whose depth gradually increases to more than 2,000 m at the center; the maximum depth is 2,211 m. Geologically, the bottom comprises parts of different type and age. Most of the Black Sea is located within the Alpide geosynclinal (folded) region. The earth's crust beneath the deep sea basin consists of two layers: the sedimentary and "basalt" layers. The sedimentary layer is 10–16 km thick, and its upper part, at least 3–4 km thick, lies almost horizontally. In the central parts of the deep sea basin, the crust is 22–25 km thick, reaching 30–35 km along the periphery, where a granite layer appears above the "basalt" layer. In the northwest, the shelf encompasses the southern edge of the East European Platform and the Epipaleozoic Scythian Platform.

The formation of the Black Sea basin is linked with either the processes of "oceanization" of the continental crust or with the relict nature of the Black Sea basin as a remnant of the basin of the ancient ocean Tethys. The outlines of the modern basin had formed during the Oligocene, when uplifts in Asia Minor gradually separated the Black and Caspian seas from the ocean. During the Upper Miocene, the Black Sea was one of a chain of freshwater lake-seas (the Sarmatian Basin). After a short-lived connection with the Mediterranean Sea, during the Meotian stage, the freshwater Lake Pontus formed. In the late Pontian stage, the connection between the Black Sea and the Caspian was closed. During the Middle and Upper Pliocene, the Black Sea was probably a freshwater lake with an outlet. In the Middle Pleistocene, the Black Sea was twice connected with the Mediterranean for short periods and had more saline water. During the last glaciation, the New Euxine lake-sea formed, with relatively fresh water; 6,000–7,000 years ago, it was connected to the Mediterranean Sea by way of straits, giving rise to the modern Black Sea. Tectonic activity is manifested by earthquakes, whose epicenters are located along the margins of the basin and in the adjoining regions.

In the littoral zone, coarse deposits—pebbles, gravel, and sand—predominate. Farther out to sea, they are replaced quite rapidly by fine-grained sand and aleurites. In the northwest, coquinas and latter-day shell mounds inhabited by mytilids, oysters, and other mollusks are widespread. The continental slope and sea floor are characterized by pelitic oozes, whose carbonate content increases toward the open sea, exceeding 50 percent in some places; coccolithophores play a significant role in the carbonate material. At depths to 2,000 m in the southeast, aleuritic and sandy sediments deposited by turbidity currents are found.

The chief useful minerals in the Black Sea are petroleum and gas, found in the northwestern part of the basin, and titanomagnetite sands, found in the coastal waters off Taman' and the Caucasus.

CLIMATE. In the course of the year, the Black Sea is affected primarily by continental polar, marine polar, and marine tropical air masses. Continental polar air predominates. In the winter its intrusion is accompanied by strong northerly and northeasterly winds, a drop in temperature, and frequent precipitation; the winds are especially strong in the vicinity of the city of Novorossiisk, where they are called boras. When marine polar air intrudes from the Atlantic Ocean, considerable cyclonic activity develops, accompanied by squalls and precipitation. The marine tropical air, which is always warm and has higher humidity, is brought in by southwesterly winds from the Mediterranean Sea basin.

Most of the Black Sea has warm, humid winters and hot, dry summers. The average air temperature in January is about 8°C in the central part of the sea, 6°C along the eastern coast, −3°C in the northwest, and 6°–9°C in the southeast and south. The temperatures in the northern part of the Black Sea may drop to as low as −30°C, and in the southern part, to −10°C. Snowfalls occur everywhere during the winter; Sochi and Khost have up to eight days of snow a year.

In the summer, part of the Azores high extends over the Black Sea, bringing consistently clear and warm weather. The average air temperature in July is 22°–24°C; temperatures sometimes reach 30°–35°C. Average annual cloudiness is 60 percent, with a maximum in the winter and a minimum in the summer. Annual precipitation is 300–500 mm in the west and northwest, 750–800 mm in the south, and 1,800–2,500 mm in the east. Waterspouts occur in the fall.

HYDROLOGICAL REGIME. The sea's water balance is governed by atmospheric precipitation (230 cu km per year), continental runoff (310 cu km per year), and the influx of water from the Sea of Azov (30 cu km per year), on the one hand, and evaporation from the surface of the sea (360 cu km per year) and outflow through the Bosporus (210 cu km per year), on the other. The general cyclonic atmospheric circulation over the Black Sea and continental runoff lead to the development of cyclonic circulation of water, moving counterclockwise along the shores at the surface. Internal cyclonic circulations develop deep within this cycle in the west, central part, and east. The surface currents have velocities up to 1 km/hr; in some areas, they increase to 5–6 km/hr as a result of strong winds.

The excess fresh water flowing into the Black Sea causes the water to be steadily discharged through the Bosporus into the Sea of Marmara by the upper (to a depth of 40 m) current, while the lower current carries transformed salt water from the Mediterranean Sea, by way of the Bosporus, to fill the deep layers of the Black Sea. As a result, the vertical exchange of water in the Black Sea is impeded. The surface and deep waters intermix as a result of vertical flows of water in the centers of the circulations and along the continental slope.

Water-level fluctuations as a result of wind-driven currents vary from 40–60 cm in the Crimea to 1.5 m in the northwest. Changes in level caused by tides do not exceed 10 cm, while seiches do not exceed 60 cm. Wind-driven currents can cause the temperature of the coastal surface water in the summer to drop from 25°C to 10° or less in a few hours as a result of the rising of the deep waters to the surface.

During the winter, the water temperature at depths of 60 m drops to 6°–7°C. In the northwest it reaches 0.5°C, and the inlets usually freeze at temperatures below zero. In the southeast the water temperature is higher, reaching 9°–11°C. In the summer, the surface water warms up to 24°–26°C, reaching 29°C along the

shore. The temperature remains at about 7°C year-round at depths below 60–80 m.

The abundant continental runoff, the influx of relatively fresh water from the Sea of Azov, and atmospheric precipitation determine the salinity. The salinity of the surface water is 17–18 ‰ in the open sea and 3–9 ‰ near the mouths of rivers. At depths of 60–80 m it is 19–20 ‰, and at the bottom, 22–22.5 ‰. The water density at the surface is 1.013–1.015 g/cm^3 in the winter and 1.0085–1.0120 g/cm^3 in the summer. Dissolved oxygen is found only in the top layer of water; its content is 8–9 ml/*l* at the surface.

Below depths of 150–200 m, the water is "contaminated" by hydrogen sulfide, which reaches a concentration of 11–14 ml/*l* at the bottom. It is believed that hydrogen sulfide forms in the Black Sea primarily as a result of the vital activity of sulfate-reducing bacteria, the sharply delineated water stratification, and weak vertical exchange.

The color of the water differs in different parts of the sea. It is greenish blue in the central and eastern parts and bluish green in the northwest. The transparency of the water averages 16–22 m; in the western and eastern parts it is 20–27 m, decreasing to 6–8 m in the coastal regions and even to 2–3 m in some areas.

L. M. FOMIN

PLANT AND ANIMAL LIFE. A characteristic feature of the Black Sea is the almost total absence of life at depths greater than 150–200 m, where the hydrogen sulfide zone begins, with the exception of anaerobic bacteria, primarily *Microspira*. Of the plants, 350 species of unicellular phytoplankton algae are known, including about 150 species of diatoms and 150 of peridinians, and about 280 species of benthic macrophytes, including 129 species of red algae, 71 of brown algae, 77 of green algae, and several species of marine grasses, primarily *Zostera*. The brown algae *Cystoseira* and the red algae *Phyllophora* are especially numerous, forming enormous accumulations at depths of 20–50 m in the northwestern part of the sea; they are commercially important, with estimated reserves of more than 5 million tons.

The fauna of the Black Sea is approximately one-third as rich as that of the Mediterranean Sea. Benthic species predominate, numbering about 1,700. The most typical biocenoses are the mytilid oozes and phaseoline (named for the mollusk *Modiola phaseolina*) oozes, the former occurring primarily at depths of 30–70 m, and the latter, at 50–200 m. With respect to origin, immigrant species from the Mediterranean Sea predominate, constituting more than 30 percent of all the species. Of lesser importance are relicts of the Pliocene brackish Pontic Basin and freshwater immigrant species that inhabit the parts with less saline water. Endemic species constitute about 12 percent. More than 2,000 species of animals are known, including about 300 species of protozoans, 650 of various types of worms (including 190 species of marine polychaetes), 640 of crustaceans, more than 200 of mollusks, 160 of fishes, and about 150 of animals of other groups, including four mammalian species—seals—and three species of dolphins. Because of the lowered salinity, many groups of stenohaline marine animals are represented by only a small number of species (for example, there are only 14 species of echinoderms and one species of radiolarian) or are completely absent (there are no cephalopod mollusks or brachiopods). Many fish (about 20 percent of the species) are commercially important, among them the anchovy, horse mackerel, Atlantic mackerel, bonito, sprat, and sturgeon.

G. M. BELIAEV

Economic geography. The Black Sea is an important artery, linking the USSR with foreign countries; one-fourth of all USSR imports and one-half of all exports are shipped by way of the sea. The Black Sea merchant fleet accounts for a significant share of USSR marine shipping. Considerable domestic cargo is also shipped on the Black Sea, often by way of the V. I. Lenin Volga–Don Ship Canal, which links the Black Sea with the Volga River and Caspian Sea. The largest port on the Black Sea is Odessa, which, together with the nearby port of Il'ichevsk, accounts for one-third of the total freight turnover on the Black Sea. Virtually all types of raw materials and industrial products pass through Odessa. Petroleum is shipped from Novorossiisk, Tuapse, and Batumi. Cement is shipped from Novorossiisk and manganese ore from Poti. Other large ports are Nikolaev, Kherson, Kerch', Feodosiia, Sevastopol', and Izmail.

The Black Sea is also very important for the economies of Bulgaria, Rumania, and Turkey. The main ports in Bulgaria are Burgas and Varna, and in Rumania, Constanţa. A large part of the cargo from the Balkan countries is transported to the Black Sea along the Danube. The most important Turkish ports are Trabzon, Samsun, and Zonguldak.

The Black Sea is a major commercial source of fish, algae, and mollusks.

The favorable climate of the Black Sea has favored the development of resorts and tourism. In the USSR, the Southern Coast of the Crimea, with its center in Yalta, is a major climatic resort area, as are the cities of Sochi, Pitsunda, Gagra, Sukhumi, Batumi, Anapa, and Gelendzhik on the Caucasian coast. The chief resorts in Bulgaria are Golden Sands and Sunny Coast; the main resort in Rumania is Mamaia.

An important problem is the protection of the Black Sea from pollution. The main pollutants are petroleum, petroleum products, phenols, and detergents. Especially polluted by petroleum are the coastal waters and the western part of the sea, site of shipping lanes from Odessa, to the mouth of the Danube, and then to Istanbul or Varna. Measures have been undertaken to prevent the discharge of untreated industrial and household wastes into the sea; the dumping of petroleum, petroleum products, and other substances that pollute the water has been prohibited.

History of study. Opinions differ regarding the source of the modern name Black Sea. Greek navigators of the sixth and fifth centuries B.C. called the sea Pontus Axeinus, literally "inhospitable sea"; in the early part of the Common Era, it was called Pontus Euxinus, or "hospitable sea." In the ninth and tenth centuries the Arabs called it the Russian Sea. In the 15th century the Turkish named it Karadeniz, literally "black sea" or "bad sea." Another explanation links the word "black" to the color designation used by some peoples for the countries of the world: "black" signified the north. In Slavic, *chermnoe* means "bleak" or "stormy"; the ancient Persian name Achshaena literally means "dark sea," which signifies a harsh sea.

Since ancient times the Black Sea has been an active sea route, well known to the Phoenicians and Greeks. In the third century B.C., the Greeks made the first map of the Black Sea. In the late ninth century A.D., Russians began using the sea to sail from the Baltic to Byzantium, the route "from the Varangians to the Greeks."

The study and scientific development of the Black Sea began in the early 19th century. The first Russian expedition, led by G. P. Manganara, surveyed the coastline, took depth measurements, and studied the soil, and the results obtained were used to draw navigation charts and a map of the Black Sea. Similar studies were later carried out by numerous hydrographic expeditions, which also studied water temperature and currents. The first atlas of depths (down to 180 m), sediments, and currents was published in Russia in 1842. Important studies of the Bosporus were conducted in 1881–82 by S. O. Makarov. He established the two-layer current, the upper current flowing from the Sea of Marmara into the Black Sea and the lower from the Black Sea into the Sea of Marmara. In 1890–91 an expedition led by I. B. Shpindler on the ships *Donets* and *Zaporozhets* made the first deep-water observations and established the "contamination" of the deep sea waters by hydrogen sulfide. After the founding of the Sevastopol' Biological Station in 1871, extensive biological research developed under the direction of A. O. Kovalevskii.

In the 1920's, the Sevastopol' Biological Station and the Marine Observatory embarked on a planned, coordinated study of the Black Sea. The largest expeditions were N. M. Knipovich's scientific-commercial expedition of 1922–27, Iu. M. Shokal'skii's hydrologic and hydrographic expedition of 1923–27, and the Marine Observatory expedition of 1928–38, headed by V. A. Snezhinskii. These expeditions contributed much to the study of the topography of the bottom and to the study of sediments, the vertical structure of the water, and the ichthiofauna of the Black Sea. The material they gathered enabled A. D. Arkhangel'skii and N. M. Strakhov to advance the first generalization of the stratigraphy and geological history of the Black Sea in the Cenozoic.

With the introduction of observations on standard cross sections in the 1930's, the study of the Black Sea became systematic.

The Hydrometeorological Observatory and the Azov–Black Sea Scientific Research Institute of Fishing and Oceanography became involved in studying the sea. In the late 1940's and subsequent years observations on cross sections expanded greatly; hydrologic and hydrochemical observations are now made once a month or every ten days on standard cross sections. Since the late 1950's, a systematic study of the geology and geophysics of the Black Sea, the geomorphology of the bottom, bottom sediments, and other aspects has been conducted. Regular seismic investigations of the structure of the earth's crust beneath the Black Sea was begun in 1957. In 1975 a deep-sea drilling project that went down to a depth of 1 km was carried out by scientists from various countries on the ship *Glomar Challenger*. The State Oceanographic Institute has been systematically monitoring the pollution of the Black Sea since the mid-1960's.

The following institutions are engaged in the study of the Black Sea: the Institute of the Biology of the Southern Seas (the former Sevastopol' Biological Station), the Marine Hydrophysical Institute of the Academy of Sciences of the Ukrainian SSR, the Azov–Black Sea Scientific Research Institute of Fishing and Oceanography, the Sevastopol' division of the State Oceanographic Institute, the Black Sea division of the Institute of Oceanography of the Academy of Sciences of the USSR, the All-Union Scientific Research Institute of Marine Geology, and the Marine Observatory. A. M. MUROMTSEV

BLACK SEA COSSACK HOST, a military force that was formed in 1787, on the initiative of G. A. Potemkin, in the southern Ukraine from former Zaporozh'e Cossacks. Called the Host of Faithful Cossacks, it was given official status by a ukase of January 1788.

The host, which fought under the atamans S. Belyi and Z. Chepega in the Russo-Turkish War of 1787–91, was renamed the Black Sea Cossack Host and granted lands between the Iuzhnyi Bug and the Dnestr rivers. In 1792 and 1793 the government moved to strengthen the Northern Caucasus by resettling the host in the Kuban'; there it comprised 40 *kureni* (units), with approximately 25,000 men, and maintained a headquarters in Ekaterinodar (now Krasnodar). The host occupied a defensive line along the right bank of the Kuban' River from its mouth to the Laba River.

The Black Sea Cossack Host retained certain external features of the Zaporozh'e Sech', such as formal voting for the members of the host's government and the use of the term *kuren'*, which had been used to designate the Zaporozh'e units. In the first half of the 19th century the host's ranks were swelled by approximately 70,000 settlers—former members of the Zaporozh'e Sech' who had returned from Turkey and cossacks from various Ukrainian hosts that had been abolished, such as the Ust'-Dunai, Azov, Bug, and Ekaterinoslav hosts. By 1860 the host numbered approximately 200,000 men and included 12 cavalry regiments, nine infantry (crawler) battalions, four batteries, and two guard squadrons.

The Black Sea Cossack Host fought in the Caucasian War of 1817–64, and the crawlers took part in the defense of Sevastopol' of 1854–55. In 1860 the host became part of the newly formed Kuban' Cossack Host.

BLACK SEA FLEET, a higher operational command, a component of the Navy of the USSR in the Black Sea.

The fleet was created in 1783 after the Crimea became part of Russia. Previously there had been naval shipbuilding on the Sea of Azov and at Kherson (from 1778). On May 2, 1783, 11 ships of the Azov Flotilla sailed into the bay at Akhtiar (Sevastopol'); together with the 17 ships of the Dnieper Flotilla that later joined them, they formed the nucleus of the new fleet. In 1785 the first table of organization was established for the Black Sea Fleet, with 12 ships of the line, 20 frigates, five schooners, 23 transport vessels, and a personnel complement of 13,500. The Black Sea Admiralty was created in Kherson for the direction of the fleet.

Throughout its entire history, the Black Sea Fleet has successfully carried out its assigned missions. During the Russo-Turkish War of 1781–91, in spite of the numerical superiority of the enemy's navy, Russian sailors inflicted stunning defeats on the enemy in a battle at Phidonisi (1788), the Kerch' naval battle (1790), a battle off Tendra Island (1790), and at Cape Kaliakra (1791). During the war, brilliant naval leadership was demonstrated by Admiral F. F. Ushakov, who commanded a squadron and, from 1790 to 1798, the Black Sea Fleet.

A shipyard was constructed in Nikolaev in 1789, and the Black Sea Admiralty was moved there from Kherson. In 1804 Sevastopol' became the home port of the fleet. Between 1798 and 1800, during the war with France, a squadron of the Black Sea Fleet under Ushakov's command saw action in the Mediterranean Sea, liberated the Ionian Islands, and captured the island of Kerkira (Corfu) by storm. In 1806 and 1807 a squadron under the command of Vice Admiral D. N. Seniavin, operating in the Aegean Sea, destroyed the Turkish fleet in battles in the Dardanelles (1807) and at Athos (1807).

In 1816, Vice Admiral A. S. Greig was made commander in chief of the Black Sea Fleet and its ports. He bolstered the combat readiness of the fleet by improving ships' armaments, instituting annual maneuvers, and perfecting navigational and hydrographic support; much attention was devoted to the training of officers, and in 1822 the Naval Library was created in Sevastopol'. During the Russo-Turkish War of 1828–29 the fleet supported ground offensives in the Balkan and Caucasus military theaters. The brig *Merkurii* won eternal glory by defeating two Turkish ships of the line.

In 1831 the headquarters of the fleet commander in chief was created. Rear Admiral M. P. Lazarev was appointed chief of staff in 1832 and served as commander in chief of the Black Sea Fleet from 1833 to 1851. Under his leadership ships were renovated, powerful bombardment weapons were introduced as armaments, and an admiralty building and casemate batteries were built in Sevastopol'. By the mid-19th century the Black Sea Fleet had become the finest sailing fleet in the world and included 14 sailing ships of the line, six frigates, four corvettes, 12 brigs, and six steam frigates.

During the Crimean War (1853–56), a squadron under the command of Vice Admiral P. S. Nakhimov destroyed a Turkish squadron in the battle of Sinop (1853). During the defense of Sevastopol' (1854–55), men of the Black Sea Fleet under the leadership of Admirals V. A. Kornilov, Nakhimov, and V. I. Istomin heroically fought on land. Some ships were sunk at the entrance to Sevastopol' Bay to defend the sea approaches, and others provided artillery support to the ground forces.

The Treaty of Paris (1856) deprived Russia of the right of maintaining a fleet in the Black Sea. This limitation of the sovereign rights of Russia in the Black Sea was abolished only in 1871. The reestablishment of the fleet as an ironclad steamship fleet in the late 19th century is associated with the names of G. I. Butakov and S. O. Makarov. A shipbuilding program for the Black Sea Fleet was adopted in 1881. By the early 20th century the fleet included seven squadron ironclads, one cruiser, three mine cruisers, six gunboats, and 22 torpedo boats.

In the early 20th century, with the growth of the revolutionary movement in the country, the sailors of the Black Sea Fleet also

initiated revolutionary activities. A crucial role in the awakening of political consciousness among the sailors of the fleet was played by Lenin's *Iskra* and the first Social Democratic organizations, which were created in the fleet in 1901 and 1902. The Central Naval Committee of Military Organization of the RSDLP ("sailors' central") was formed in Sevastopol' in April 1904; the committee established communications with the Bolshevik committees of Sevastopol', Nikolaev, and Kherson. In June 1905 an uprising broke out on board the battleship *Potemkin*, and the Sevastopol' mutiny of 1905 occurred on the cruiser *Ochakov* in November; both uprisings were brutally suppressed by the tsarist government. The names of the heroes of the uprisings—G. N. Vakulenchuk, P. P. Shmidt, A. I. Gladkov, S. P. Chastnik, and N. G. Antonenko—have been inscribed for eternity in the history of the revolutionary struggle.

By the beginning of World War I, the Black Sea Fleet had six battleships (pre-dreadnoughts), two cruisers, 17 destroyers, 12 torpedo boats, and four submarines. During the war the fleet added three battleships (one was lost in 1916), nine destroyers, ten submarines, and two seaplane transports. The fleet fought in the Black Sea against German and Turkish naval forces, supported the ground forces of the Caucasian Front along coastal axes, and disrupted the enemy's lines of communication.

The sailors of the Black Sea Fleet greeted the victory of the February Revolution of 1917 with great enthusiasm. Despite pressure from the conciliatory parties in the soviets and the sailors' committees, the sailors in the fleet continued to align themselves with the Bolsheviks. The Central Committee of the RSDLP(B) sent to Sevastopol' such experienced party workers as Iu. P. Gaven and N. A. Pozharov. Within the fleet, as in the soviets, a fierce struggle was waged against the Mensheviks, Socialist Revolutionaries, Ukrainian bourgeois nationalists, and anarchists. On Dec. 16, 1917, the conciliatory soviet in Sevastopol' was dissolved, and the newly created military revolutionary committee took power into its own hands. With the help of sailors of the Black Sea Fleet, Soviet power was established in January 1918 in Feodosiia, Kerch', Evpatoriia, Yalta, Odessa, and Rostov.

During the Civil War of 1918–20, sailors of the Black Sea Fleet fought as part of the Dnieper, Azov, and Volga flotillas and in various units of the Red Army. Heroes of the Civil War included sailors A. V. Mokrousov, A. V. Polupanov, and I. A. Nazukin. The occupation of the Ukraine and the Crimea by German and Austrian forces prompted V. I. Lenin to order the transfer of the Black Sea Fleet to Novorossiisk. The revolutionary ships of the Black Sea Fleet carried out Lenin's order in April and May 1918. However, because of the threat of capture by the German interventionists who had appeared at Taman', the Soviet government ordered on June 18 that one battleship, nine destroyers, and several other vessels be scuttled near Novorossiisk and Tuapse. The ships that remained in Sevastopol' were captured by German interventionists and Ukrainian nationalists. Soviet power was reestablished in May 1919, but the Crimea and the Black Sea Fleet were captured soon after by the White Guard forces of General A. I. Denikin. In May 1920 an order of the Revolutionary Military Council of the Republic created the Naval Forces of the Black Sea and the Sea of Azov, units of which fought against the White Guard flotilla. General P. N. Wrangel's troops took with them to Bizerte more than 130 warships and other vessels during their retreat from the Crimea.

The Tenth Congress of the RCP(B) of 1921 adopted a resolution concerning the reestablishment of the Black Sea Fleet. Two destroyers, five gunboats, two submarines, and several minesweepers and minelayers were refitted in 1922. Restoration of the fleet was fundamentally completed by 1928, and the renovation of equipment was begun. During the winter of 1929–30 the battleship *Parizhskaia Kommuna* (later, *Sevastopol'*) and the cruiser *Profintern* (later, *Krasnyi Krym*) were transferred from Kronstadt to Sevastopol'. In 1936 the Naval Forces of the Black Sea and the Sea of Azov became the Black Sea Fleet. After the first and second five-year plans (1929–37), the Black Sea Fleet received more than 500 new warships. In 1938 and 1939 the fleet received new leader-class warships (the *Moskva* and *Khar'kov*) and destroyers of the *Gnevnyi* type, construction was completed on new cruisers (the *Voroshilov*) and other ships, and air forces, coastal defense, and an air defense system were created.

The chiefs of the Naval Forces of the Black Sea and the Sea of Azov (from 1935, commanders of the Black Sea Fleet) were A. V. Dombrovskii (1920), E. S. Pantserzhanskii (1920–21, 1925–26), A. S. Maksimov (1921–22), A. K. Vekman (1922–24), M. V. Viktorov (1924), V. M. Orlov (1926–31), I. K. Kozhanov (1931–37), P. I. Smirnov (1937), I. S. Iumashev (1938–39), and F. S. Oktiabr'skii (from August 1939).

By the beginning of the Great Patriotic War of 1941–45, the Black Sea Fleet was well equipped for the time. It had one battleship, six cruisers, 16 leaders and destroyers, 47 submarines, two brigades of torpedo boats, several divisions of minesweepers and patrol and antisubmarine vessels, fleet air forces (more than 600 airplanes), and a strong coastal defense.

The high level of combat readiness of the Black Sea Fleet frustrated the enemy's attempt to disable the main forces of the fleet during the first days of the war. Fleet aviation delivered strikes on Constanţa, Sulina, and Ploieşti. The Black Sea Fleet fought in the defense of Odessa (1941) and the heroic defense of Sevastopol' (1941–42); the commander in chief of the fleet headed the Sevastopol' Defense Region. Of major importance was the Kerch'-Feodosiia Landing Operation of 1941–42, which was carried out with the active participation of the Black Sea Fleet.

In 1942 and 1943 the Black Sea Fleet fought in the battle for the Caucasus. Submarines from Batumi and Poti traversed 600 miles in order to disrupt the enemy's lines of communication, and surface ships, aviation, and the marine infantry fought for Novorossiisk and in the area of Tuapse. Heroic chapters in the history of the Black Sea Fleet include the landing operations in the area of Iuzhnaia Ozereika and Stanichka (near Myskhako) in February 1943, the defense of the *Malaia Zemlia*, the Novorossiisk-Taman' Operation of 1943, and the Kerch'-El'tigen Landing Operation of 1943. The Azov Flotilla, which was a part of the Black Sea Fleet, participated in the liberation of ports on the Sea of Azov through its support of ground forces. Ships and units of the Black Sea Fleet fought in the liberation of the Crimea, Nikolaev, and Odessa and in the Iaşi-Kishinev Operation of 1944. The Danube Naval Flotilla, which was also part of the Black Sea Fleet, saw action from the lower reaches of the Danube to Vienna.

During the war the title "guards" was awarded to 18 ships and units of various sizes of the Black Sea Fleet; 59 ships and units were awarded orders of the USSR. More than 200 sailors of the fleet received the title of Hero of the Soviet Union. For special merit in combat, the Order of the Red Banner was awarded the fleet by the decree of the Presidium of the Supreme Soviet of the USSR of May 7, 1965.

Commanders of the Black Sea Fleet during the war were F. S. Oktiabr'skii (August 1939–April 1943, March 1944–November 1948) and L. A. Vladimirskii (April 1943–March 1944). Members of the military council were N. M. Kulakov (May 1940–December 1943) and I. I. Azarov (1941–March 1943, February 1944–May 1947). Chiefs of staff were I. D. Eliseev (April 1941–January 1944) and I. F. Golubev-Monatkin (February 1944–December 1945).

In the 1950's and 1960's important changes took place in all the combat arms of the Black Sea Fleet. Reinforcement of the fleet with new ships and the provision of the newest combat matériel, missile weaponry, and electronic equipment have permitted the assignment of entirely new missions to the Black Sea Fleet. The ships of the fleet complete long voyages and cruises into the Mediterranean Sea and various regions of the world, during which they conduct combat training missions and ensure defense of the state interests of the USSR at sea. The Black Sea Fleet demonstrated a high level of combat proficiency during the Okean (1970) and Iug (1971) training exercises and in dozens of cruises to various countries of the Mediterranean and Atlantic. Especially high marks in combat training were gained by the crews of the cruisers *Mikhail Kutuzov* and *Dzerzhinskii*, the antisubmarine cruiser *Leningrad*, the missile cruiser *Groznyi*, the large landing vessel *Voronezhskii Komsomolets*, and the destroyers *Naporistyi*, *Plamennyi*, and *Nakhodchivyi*.

In the postwar period, the Black Sea Fleet has been commanded by Admirals N. E. Basistyi (1948–51), S. G. Gorshkov (1951–55), V. A. Kasatonov (1955–62), S. E. Chursin (1962–67), V. S. Sysoev (1968–74), and N. I. Khovrin (since 1974).

BLACK SEA HIGHWAY (Route 19), a trunk road, with a length of 750 km, that connects Novorossiisk and Batumi.

The Black Sea highway was constructed between 1887 and 1910 and was rebuilt and modernized between 1946 and 1950. It crosses Krasnodar Krai, the Abkhazian ASSR, and the Adzhar ASSR. In addition to Sochi, whose health resorts line the highway for approximately 150 km, its principal intermediate points are the health resorts of Gelendzhik, Dzhubga, Tuapse, Gagra, Gudauta, Novyi Afon, Sukhumi, Ochamchira, and Zugdidi. Except for the Ochamchira-Samtredia-Kobuleti section, the highway runs along the seacoast.

The Black Sea highway has spurs that connect it to Myskhako (6 km), Abrau-Diurso (23 km), Krasnaia Poliana (59 km), Mount Akhun (11 km), Salkhino (18 km), Pitsunda (13 km), Ritsa Preserve (56 km), Iuzhnyi Priiut (102 km), Tkvarcheli (27 km), and Zugdidi and Mestia (136 km). It is connected to the highway system of the USSR by the Pavlovskaia-Krasnodar-Novorossiisk highway (Route 18) and the Armavir-Maikop-Tuapse highway. Highways run from Samtredia to Tbilisi, Yerevan, and Baku (routes 15 and 17).

The highway travels through an internationally known tourist area and zone of climatic and balneological health resorts; it is the largest such area in the USSR. Passenger transport predominates, but freight for the resorts and vacationers in the area is carried on the road. Goods shipped from the area include products of the food-processing industry and various fruits, including citrus fruits and grapes. Work is being carried out to increase the traffic capacity of the most heavily traveled sections of the road.
G. I. SHEINIS [29–300–1]

BLACK SEA MUTINY IN THE FRENCH FLEET, an uprising in April 1919 on ships of the French Navy, which had been taking part in the intervention against Soviet Russia; the most important revolutionary uprising among the interventionist forces.

A major role in preparing the mutiny was played by underground Communist organizations, which carried on revolutionary propaganda among the foreign forces; of particular importance was the work of the French group of the Foreign Board (including J. Labourbe) of the Odessa oblast committee of the Bolshevik Party. After several French ground-troop units refused to fight against Soviet power, disturbances broke out on French ships on April 16. On April 19 the sailors of the battleship *France* and the flagship *Jean Barre* mutinied; they were joined by the sailors of the battleship *Justice* and other vessels lying near Sevastopol'. After running up red flags on the ships, the sailors went ashore and organized a demonstration with the workers of Sevastopol'.

The uprising spread to other French ships in the Black Sea. On April 27 a mutiny broke out on the cruiser *Waldeck-Rousseau*, anchored in the outer roads of Odessa's harbor. The sailors and soldiers demanded that they be sent home and that anti-Soviet intervention cease. The French government was forced to announce the evacuation of its armed forces from Soviet Russia. By early May 1919 the French Navy had left the Black Sea.

The French command dealt harshly with the insurgents, many of whom were arrested and imprisoned. The uprising was a clear expression of the solidarity of the international proletariat with Soviet Russia. Amnesty for those who took part in the Black Sea mutiny constituted a demand of the French working-class movement in the 1920's.
G. P. DRAGUNOV [29–299–2]

BLACK SEA PRESERVE, a nature preserve located in Kherson and Nikolaev oblasts, Ukrainian SSR. The Black Sea Preserve covers an area of 64,806 hectares (1976) on the northern coast of Tendra and Iagorlytskii bays of the Black Sea and islands in the bays. It was established in 1927 to protect wintering, migrating, and nesting birds and their habitat. The preserve includes isolated sections of solonchak and sandy steppes; oak, birch, European aspen, and black alder groves; spits; and salt and freshwater lakes, as well as the water area of the bays.

The Black Sea Preserve is the nesting area for numerous seagulls, terns, ducks, and birds of the suborder Limicolae, the family Rallidae, and the order Ciconiiformes. Large numbers of swans (whooper swan and mute swan), ducks, Limicolae, and Rallidae winter in the bays. Many geese (particularly the white-fronted goose), Limicolae, Passeriformes, and other birds stop there during migration. A few bustards and white-tailed eagles nest in the forest-steppe sections, and little bustards are occasionally encountered. The Japanese deer (*Cervus nippon*), which was introduced from Askaniia-Nova in 1957, has adapted well. Fish include mullet, the Black Sea flounder (*Pleuronectes flesus luscus*), and gobies. [29–295–1]

BLACK SEA STRAITS, the general name for the Bosporus, the Dardanelles, and the Sea of Marmara, which lies between the Bosporus and the Dardanelles (*see* BOSPORUS and DARDANELLES). The Black Sea straits constitute the only passage between the Black and Mediterranean seas and consequently occupy a special place in the system of international waterways. So long as Byzantium and, after the Turkish conquest of Constantinople in 1453, the Ottoman Empire ruled the entire Black Sea region, the Black Sea was an internal sea and the use of the Black Sea straits, therefore, was the internal affair of the corresponding state. By the late 17th century, however, the situation was fundamentally different. Peter I embarked on the construction of the Azov Fleet, and in 1696 he took Azov. Russia's border now extended to the Sea of Azov and the Black Sea. Consequently, entry into and departure from the Black Sea became an international issue and thereafter constituted an important part of the Eastern Question (*see* EASTERN QUESTION). The efforts of Russian diplomats to secure access to the Black Sea and Black Sea straits for the Russian fleet long remained unsuccessful. In 1774 the Treaty of Kuchuk Kainarji recognized Russia's right to commercial navigation in the Black Sea and Black Sea straits [*see* KUCHUK KAINARJI, TREATY OF (1774)]. Later, other states, except those at war with Turkey, were granted the same right.

The resolution of the question of the passage of warships proved a much more complex matter for Russian diplomacy. The security of the Black Sea countries necessitated the establishment of a regime of the straits that would guarantee the naval fleets of these countries reliable access to the high seas but at the same time provide protection from the threat of aggression from non–Black Sea powers. This principle was formulated clearly in 1802 by the chancellor A. R. Vorontsov in response to French claims regarding the right of passage of the French fleet through the Black Sea straits. At that time, Turkey held a position similar to Russia's position. While prohibiting the passage of warships of non–Black Sea countries, Turkey granted Russian warships, following the Russo-Turkish treaties of alliance of 1799 and 1805, the right to pass into the Mediterranean Sea (*see* RUSSO-TURKISH TREATIES OF ALLIANCE).

Meanwhile, the non–Black Sea powers, first and foremost Great Britain and France, were seeking to obtain the right of direct access to the Black Sea for both their commercial vessels and their warships, while at the same time denying that right to the Russian fleet. Inasmuch as there could be no straightforward justification for such an unjust demand, they sought "parity" with Russia, that is, either opening up or closing completely the Black Sea straits to warships of all countries.

Under the influence of Napoleon's diplomacy, Turkey in 1806, in violation of the 1805 treaty of alliance with Russia, revoked the right of free passage of Russian ships through the straits. Soon after, during the Russo-Turkish War of 1806–12, Great Britain imposed a treaty on Turkey (1809) that, under the guise of an "ancient rule of the Ottoman Empire," prohibited the passage of the warships of any foreign power through the Black Sea straits. The Treaty of Unkiar Skelessi of 1833, virtually restoring the Russo-Turkish alliance, obligated Turkey to close the Darda-

nelles on Russia's demand to warships of other countries [*see* UNKIAR SKELESSI, TREATY OF (1833)]. However, a few years later, the London Convention of 1840 resurrected the supposedly always extant ancient rule of the Ottoman Empire.

The first multilateral international agreement concerning the Black Sea straits, the London Convention of 1841, confirmed the ancient rule and transformed it into an international obligation. Turkey and Russia thus lost the right of independently regulating the passage of warships into and from the Black Sea through bilateral agreements. The Russian fleet found itself locked within the Black Sea. The prohibition of passage for warships of non–Black Sea countries was of little value to Russia, especially since the 1841 convention stipulated that the ban applied only in peacetime. Turkey, meanwhile, fell ever more under the influence of the Western European powers and often made exceptions to the ancient rule for them. This was one of the leading factors that led tsarist Russia into war with Turkey in 1853 (*see* CRIMEAN WAR OF 1853–56). The Paris Peace Treaty of 1856, which ended the war, prohibited Russia, under the guise of an obligation to maintain the "neutralization" of the Black Sea, from taking effective steps to protect its Black Sea coast [*see* PARIS, TREATY OF (1856)]. In 1870 the Russian government refused to recognize the articles in the Treaty of Paris concerning the "neutralization" of the Black Sea. The London Convention of 1871 sanctioned the abolition of these articles but essentially retained the same status of the Black Sea straits as the 1841 convention. The status was also preserved by the Berlin Treaty of 1878 (*see* BERLIN CONGRESS OF 1878).

Right up to World War I, Russian diplomacy sought in vain to alter the status of the Black Sea straits, which was unfavorable to Russia. There were cases, in 1891 and 1894, for example, when the Turkish sultan allowed Russian warships to pass through the Bosporus and the Dardanelles, albeit without armament and without armed escort, but the non–Black Sea powers made it difficult to obtain such authorization, and during the Russo-Japanese War of 1904–05 Great Britain staged a naval demonstration near the Dardanelles to prevent Russian warships from passing into the Mediterranean and appearing in the Far East.

International supervision of the Black Sea straits was also disadvantageous for Turkey, since it infringed on Turkey's sovereignty, tended to turn Turkey into a semicolony of the imperialist powers, and led to a dangerous exacerbation of relations with Russia. In the late 19th and early 20th centuries, Great Britain and France enjoyed the greatest economic and political influence in Turkey. However, in the years immediately preceding World War I, German influence increased significantly.

After Turkey's entry into World War I as a German ally, the secret Anglo-French-Russian Agreement of 1915 was signed, providing for the inclusion of Constantinople (Istanbul) and the Black Sea straits within the Russian Empire. This agreement was expected to maintain the interests of Russian ruling circles in continuing the war with Germany until a victorious conclusion. (*See* ANGLO-FRENCH-RUSSIAN AGREEMENT OF 1915.)

After the victory of the Great October Socialist Revolution, Soviet Russia renounced the secret treaties of the tsarist government and the agreement on Constantinople and the Black Sea straits. The imperialist powers, on the other hand, set themselves the task of seizing the Black Sea straits. After the signing of the Moudhros Armistice of 1918, the navy of the Entente powers entered the Black Sea straits (*see* MOUDHROS ARMISTICE OF 1918). In 1920 the troops of the Entente occupied Istanbul. Their control of Istanbul and the Black Sea straits zone enabled the imperialist powers to organize an armed intervention into southern Soviet Russia, as well as into Turkey, with the help of the Greek Army. According to the Treaty of Sèvres of 1920, signed by the sultan's government, the issue of the Black Sea straits was resolved to the benefit of the imperialist powers [*see* SÈVRES, TREATY OF (1920)].

The Treaty of Sèvres never went into effect owing to the failure of the Anglo-Greek intervention in Turkey. V. I. Lenin worked out the principles for the resolution of the straits question that met the interests of both Soviet Russia and Turkey. They were set down in the Moscow Treaty of Mar. 16, 1921, between the RSFSR and Turkey, which envisioned that the international status of the Black Sea and Black Sea straits would be worked out by a conference "of delegates from the countries with a Black Sea coastline on the condition that the decisions reached not infringe on the complete sovereignty of Turkey or the security of Turkey and its capital Constantinople." Identical articles were included in the Treaty of Kars of 1921 and a Ukrainian-Turkish treaty of 1922 [*see* KARS, TREATY OF (1921)]. At the Lausanne Conference of 1922–23, the Soviet delegation worked hard to obtain a just resolution of the straits question (*see* LAUSANNE CONFERENCE OF 1922–23). The Lausanne convention on the straits, signed on July 24, 1923, stipulated that the Black Sea straits zone would be demilitarized and opened to passage by any warships. Because such a regime would subject the Black Sea countries to the threat of aggression, the Soviet Union refused to ratify the convention. In April 1936 the Turkish government, relying on the support of Great Britain, which sought to draw Turkey into the orbit of its Mediterranean Sea policy and to make use of Turkish naval bases, proposed that the powers that met in the Lausanne Conference conduct negotiations for a new convention on the Black Sea straits.

An international conference on the straits question opened in Montreux in June 1936; it ended on July 20, 1936, with the signing of a new convention on the Black Sea straits (*see* MONTREUX CONFERENCE OF 1936). This convention took into account, although not fully, the interests of the Black Sea countries. All ships of the Black Sea states were allowed to cross the Black Sea straits observing established rules of passage, whereas limitations on tonnage, class, and cruising time in the Black Sea were imposed on the warships of non–Black Sea powers. Passage by warships of countries at war was prohibited. Turkey had the right, in case of its entry into a war or being threatened by war, to permit or prohibit any warship to pass through the straits.

During World War II (1939–45), Turkey, declaring its neutrality after Germany attacked the USSR, nevertheless allowed the fascist aggressors to use the Black Sea straits for their purposes. In light of these circumstances, the Potsdam Conference of 1945 acknowledged that the convention concluded in Montreux would have to be revised (*see* POTSDAM CONFERENCE OF 1945). In 1946 the USSR began negotiations with Turkey, but the Turkish government rejected Soviet proposals. In 1953 the Soviet government informed Turkey that it had revised its former view with respect to these proposals. Thus, the convention of 1936 remains the international document regulating navigation in the Black Sea straits.

BLACK TIKHORETSK TURKEYS, a pedigreed group of small turkeys developed between 1952 and 1957 on kolkhozes and sovkhozes in Tikhoretsk Raion, Krasnodar Krai, through the se-

lective breeding of local turkeys. The plumage is shiny black, with a bronze sheen on the tail. A tuft of black filamentous feathers extends from the base of the neck to the breast; these feathers are more developed in males. Adult males weigh 9–10 kg, and adult hens 4.5–5 kg. The young weigh 3.5–4 kg by 14 to 16 weeks of age and yield high-quality meat. The average egg yield is 80 to 90 per year; the hens are marked by a high level of fertility. Black Tikhoretsk turkeys are raised in Krasnodar Krai and Rostov and other oblasts. [29–305–4]

BLAST FURNACE SMELTING, a metallurgical process carried out in shaft furnaces, used mainly in nonferrous metallurgy for the smelting of lead bullion, copper, copper matte, and nickel matte. The charge is loaded from above and consists of lumped metal-bearing raw material, fluxes, and coke. As the coke is burned and the materials are smelted, the charge descends; the air or oxygen required for the combustion of the coke is blown through a tuyere, and the combustion products move toward the charge. An oxygen zone is created near the tuyeres, in which the coke is combusted primarily to CO_2, most of the heat is released, and the maximum temperature is reached. A reduction zone is formed beyond the oxygen zone, in which the hot gases react with the succeeding layers of coke in the reaction

$$CO_2 + C = 2CO$$

The gases become enriched with carbon dioxide as their temperature decreases since the reaction proceeds with the absorption of heat; the reaction virtually ceases at 800°C.

Reduction, sulfidizing, and oxidation variants of blast furnace smelting are used in nonferrous metallurgy. Reduction blast furnace smelting of lead produces lead bullion, slag, dust, and gases. Copper matte is also formed if the agglomerate has a high content of copper and sulfur. The exhaust gases pass through an electrical filter or bag filter that traps dusts with a high content of zinc and lead. Sulfidizing blast furnace smelting of nickel oxide ores with the addition of pyrites or gypsum is performed in a weakly reducing atmosphere and produces matte. Oxidation blast furnace smelting of copper sulfide ores is designed to produce copper matte and remove barren rock with the slag, as well as to oxidize a portion of the sulfur of the sulfides and remove it as sulfuric anhydride; two variants of the process are pyritic and semipyritic smelting. Copper-sulfur blast furnace smelting with the production of elemental sulfur is a combined oxidation-reduction process.

Blast furnace smelting is commonly characterized by various parameters. The unit smelting capacity may be defined as the weight of ore, agglomerate, or charge smelted in one day per square meter of cross-sectional area of the furnace in the plane of the tuyeres; it is 50–100 tons per sq m per day for lead sulfide and copper sulfide charges and 30–40 tons per sq m per day for nickel oxide ores. The unit coke consumption is the ratio of the weight of coke to the weight of loaded ore or charge. A third commonly used index is the degree of extraction of valuable metals. In comparison with reverberatory and fluidized-bed smelting, blast furnace smelting exhibits higher efficiency, lower temperature of the exhaust gases, and, consequently, higher thermal efficiency; in comparison with smelting in reverberatory and electric furnaces, it ensures greater desulfurization. The disadvantages of blast furnace smelting are the need for preliminary sintering of the raw material, the low concentration of sulfuric anhydride in the exhaust gases, and a high dust output.

Major trends in the effort to improve blast furnace smelting, in addition to further development of the design of shaft furnaces, include oxygen enrichment of the oxygen blast, heating of the blast, improvement of charge preparation, automation of control of the smelting process, and the combination of blast furnace smelting with processes for the subsequent extraction of valuable metals from slags and the improvement of gas and dust trapping.

I. D. REZNIK [29–910–1]

BLIND TILLAGE, the first shallow loosening of the interrow spaces of sugar beets. The soil is tilled when sprouting occurs and distinctive rows have appeared. Blind tillage is done at a depth of 4–5 cm by tractor cultivators. Its purpose is to kill weeds, break up the soil crust, reduce evaporation, and ensure an influx of air to the roots. It is especially effective on wet clayey soils in regions having cold protracted springs. The yield of root crops is significantly reduced if blind tillage is done too late. Harrowing the fields before and after the appearance of sprouts is often substituted for blind tillage. [29–866–2]

BOARDING SCHOOL, as instituted in the USSR in 1956, a general-education school—most commonly an eight-year school—with residential facilities where the children live while attending classes (but not on Sundays or holidays or during vacations, which they spend with their families or relatives).

The chief purpose of the boarding school is to make public education available to orphans and children from low-income families. In the Far North, such schools are open to all children who have no regular means of transportation to school. Children who are physically or mentally handicapped are raised and educated at special boarding schools. The cost of supporting boarding-school students is partly covered by the parents; orphans, children from low-income families, and children who are physically or mentally handicapped are maintained at state expense.

The boarding schools have a staff of educational workers in addition to instructors. The academic study program is supplemented by Pioneer and Komsomol activities, clubs, study groups, work and socially useful activities, games, and sports. The students' activities are organized on a pedagogically and medically sound foundation—that is, the alternation of work and leisure and variation in the type of activity engaged in. In addition to classrooms, the boarding schools include production-work training shops, school garden plots, living quarters, sports facilities, and space for small-group activities. [29–1266–2]

BOAT (Russian, *shliupka*), an open vessel with a wooden, metal, or plastic hull. Boats may be propelled by oars or powered by internal-combustion engines; most rowboats also have rigging with removable masts. Boats are of several types, including naval ship's boats, lifeboats and working boats for merchant ships, lifeboats for lake and river vessels, boats used by shore rescue stations, and sports boats. Boats range in length from less than 3 m for a sculler to more than 11.5 m for the 22-oar naval launch. [29–1305–5]

BOATBILL (*Cochlearius cochlearius*), also boat-billed heron, a bird of the family Cochleariidae of the order Ciconiiformes. The body length is about 50 cm. The broad bill, which measures as much as 5 cm across, has a small hook on the end and resembles an overturned boat. The eyes are large. The plumage is mostly gray and black. The abdomen is brown, and there is a long black tuft on the back of the head. The boatbill is distributed in North and South America, from northern Mexico to northern Argentina. It is sedentary and nocturnal. The bird nests in trees. There are two to four eggs in a clutch; the eggs range from light blue to white with brownish speckles. The boatbill feeds on fish, frogs, small crustaceans, and small rodents. Some scientists classify the boatbill in the family Ardeidae. [29–136–3]

BOAT-HANDLING GEAR, on a ship, the structures, accessories, and mechanisms used to lower boats into the water, raise them on board, and store them on the ship.

Boat-handling gear includes the boats themselves, davits, boat winches, boat falls, boat cradles, lines, and covers. The davits, two for each boat, allow the boat to be swung out over the side under the force of gravity or under manual control (for example, with a worm drive). There are three types of davits: turning davits, which turn on a vertical axis; swing-out davits, which turn on a horizontal axis parallel to the longitudinal axis of the ship; and roller davits, which, together with the boat, move to the side of the ship on guided rollers. Work boats are sometimes lowered overboard and hoisted by a freight crane or boom. The lowering of lifeboats may be controlled from the ship or from the lifeboat. When not in use, boats are set on cradles, secured, and covered.

Classification societies regulate the strength of the parts of boat-handling gear, the maximum trim and roll angles under which the safe launching of lifeboats must be provided for, gear design, the hoisting rate for boats, and the number and capacity of lifeboats on a ship (specified with respect to the number of people on the ship and the ship's area of operation). [29–1306–1]

BOHEMIAN FOREST (in Czech, Český Les; in German, Böhmerwald), mountains in Czechoslovakia and the Federal Republic of Germany, in the southwestern part of the Bohemian Massif. The Bohemian Forest measures 80 km in length and rises to a maximum elevation of 1,042 m at Mt. Čerchow. The mountains, composed chiefly of gneisses, granites, and schists, are flat-topped ridges separated by valleys. The region has glacial lakes, beech and fir-spruce forests, mountain meadows, and peat bogs. Timber is harvested, cattle are grazed, and granite is mined in the area. [29–525–1]

BOHEMIAN GLASS, an art industry that developed in Bohemia in the 14th and 15th centuries. Bohemian glass became widely known in the second half of the 17th century, with the introduction of Bohemian crystal, thick-walled transparent vessels whose high calcium content made possible the cutting of deep facets.

From the 18th century to the early 20th century, Bohemian glass followed the main stylistic trends in European art. Modern Bohemian glass, while preserving the traditional methods of faceting and engraving, is noted for its integrated use of expressive artistic forms and its subtle light and color effects.

Masters of Bohemian glass production include Z. Seidl, J. Brichta, L. Smrčková, J. Soukup, and L. Metelák.

BOHEMIAN MASSIF, a mountain massif in western Czechoslovakia and adjacent regions of Poland, the German Democratic Republic, the Federal Republic of Germany, and Austria. The massif is approximately 500 km long and reaches a width of 300 km. The maximum elevation is 1,602 m, at Mount Sněžka.

The rhomboid Bohemian Massif extends from east to west. Along the margins of the massif rise ranges of medium elevation: the Šumava and the Bohemian Forest in the southwest, the Erzgebirge (Krušné Hory) in the northwest, and the Krkonoše of the Sudetes in the northeast. The Bohemian-Moravian Highlands lie in the southeastern part of the massif. The interior of the Bohemian Massif, a broad depression known as the Bohemian Basin, consists of several lowlands separated by uplands and low-mountain massifs.

A protruding body of the ancient basement of the Hercynian folded region, the Bohemian Massif is composed of gneisses, migmatites, schists, and granulites of the Proterozoic and slates, quartzites, and sandstones of the Lower and Middle Paleozoic; the sedimentary mantle is represented by Cretaceous and Cenozoic rocks. Neogene and Anthropogenic (Quaternary) movements brought about fractures and faults along which volcanic lava flowed. Tectonic troughs in the northeastern rim are associated with the formation of the Upper Silesian Coalfield.

On the mountain slopes mixed and coniferous forests of spruce, fir, pine, beech, and oak grow on mountain brown forest soils and mountain podzols; above 1,400 m there are subalpine meadows and shrubs on mountain meadow soils. Such health resorts as Karlovy Vary and Mariánské Lázně have developed around the region's mineral springs. [29–525–2]

BOHEMIAN-MORAVIAN HIGHLANDS, the southwestern section of the Bohemian Massif in Czechoslovakia. The Bohemian-Moravian Highlands measure approximately 150 km in length and as much as 100 km in width. They rise to a maximum elevation of 837 m at Javorová Skála. The highlands are composed chiefly of granites and gneisses. The relief consists mainly of hills and low mountains cut by rivers, with individual rocky crests in the Žd'árské Vrchy and other regions. The highlands feature broad-leaved and coniferous forests, and landforms include mountains and pastures. [29–528–2]

BOMBIDAE, a family of large bumblebees that measure as much as 3.5 cm long and are densely covered with hair. The coloration is a combination of black, white, red-yellow, and yellow stripes. There are about 300 species, distributed mainly in temperate climates. The bees can tolerate northern climates; for example, their range includes Greenland, Novaia Zemlia, the Chukchi Peninsula, and Alaska. About 100 species occur in the USSR.

Social insects, the bees live in families consisting of three castes—males, reproductive females (queens), and nonreproductive females (workers). Families are formed in the spring, with only the fertilized queens surviving through the next winter. In the spring the queens build nests and form new families. The nests, which are usually spherical and contain irregular oval cells, are built in the abandoned burrows of rodents, in the ground, in the grass, or under roofs. The queen builds a brood cell from a mixture of wax and pollen and places a few eggs into it. She then builds a cell, or waxen pot, to store honey. The larvae are fed a combination of pollen and nectar in one common cell, a feature unique to the Bombidae. Prior to pupation, each larva builds its own cocoon. With the emergence of the workers from the cocoons, the queen no longer leaves the nest. The workers build new honeycombs and feed the brood, from which the reproductive males and females appear at the end of the summer. In the fall the young males and females leave the nest and mate. Soon thereafter the males die, and the young females find sheltered areas for hibernation. In old families that have survived until autumn, all the workers die by the time winter arrives. Families usually consist of 100 to 200 (rarely to 500) individuals.

The bees are the principal pollinators of valuable forage crops, including clover, alfalfa, and many other legumes. The nests are protected. Methods are being developed to resettle the bees artificially and to increase their numbers.

G. M. Dlusskii [29–1313–1]

BOMBYCIDAE, a family of moths having a relatively stocky body, a rudimentary mouth, and pectinate antennae. The external edge of the forewings is dentate, with a crescent-shaped peak. The larvae have a spinelet on the eighth segment of the abdomen, and the anterior part of the body is narrow. The pupa develops in a silk cocoon.

There are about 20 species, distributed mainly in the tropics. The Chinese silkworm moth (*Bombyx mori*) is cultivated in the USSR. Wild species of the genera *Theophila* and *Oberthueria* also occur in the USSR.

In the 19th century the term "silkworm moth" was used to refer to a group of moth families that do not feed in the adult stage, including Notodontidae, Lymantriidae, Lasiocampidae, Bombycidae, and several others. Some species from these families continue to be referred to as silkworm moths, including *Lymantria dispar, Dendrolimus pini, D. sibiricus, Antheraea pernyi,* and *A. jamamai.* M. I. Fal'kovich [29–1109–2]

BOWING, in music, the elicitation of sounds from a stringed instrument by means of a bow. Sounds may be produced by a variety of techniques, including *détaché*, in which the bow is moved alternately up and down to produce staccato sounds, and legato, in which a series of uninterrupted sounds are produced by a continuous movement of the bow. Bowing technique imparts a different character to the sound. The technique to be used is indicated by the composer, or the player himself applies the bowing appropriate to the phrasing of the piece. [The Russian term for bowing—*shtrikhi*—is used broadly to refer to the production of sound on bowed stringed instruments, wind and percussion instruments, and the piano; in this wider sense it is roughly equivalent to "execution."] [29–1495–4]

BRIQUETTING, the processing of a material into briquettes—pieces having a uniform, geometric shape and practically identical weight. Briquetting creates additional raw material resources from fine materials, primarily fuels and ores, the use of which

would otherwise be inefficient or difficult; it also makes it possible to use waste products, such as dust, slags, and metal chips. In all cases, the usefulness of briquetting is judged by economic factors.

Depending on the material to be processed, briquetting may be done with binders at medium pressures (10–50 meganewtons per m^2) or without binders at high pressures (100–200 meganewtons per m^2). In order to produce briquettes of high quality, the material used must meet specific requirements for fractional composition, moisture content, temperature, and the like.

Briquetting was proposed in Russia in the 1830's by the Russian inventor F. P. Veshniakov, who developed a method of producing hard briquettes from waste wood charcoal and hard coal; Veshniakov called the fuel produced *karbolein*. The first factory for the briquetting of brown coal was put into operation in Germany in 1858; a briquetting factory for hard coal that used roller presses was set up in 1860. Briquetting was widely used in the second half of the 19th century to nodulize ore fines.

The mechanism of the principal stage of briquetting—compressing of the raw material into the desired shape—may be described as follows. At low pressures there is an external compacting of the material caused by reduction of the spaces between particles. The particles themselves are then compressed and deformed, and a molecular bond is created between the particles. High pressures at the end of the process cause a transition from elastic deformation of the particles to plastic deformation, which strengthens the briquette and enables it to retain a given shape. The physical and chemical properties of the raw material are a major factor affecting the nature of the deformations.

The following fuels are briquetted in factories primarily for power engineering and home and municipal use: residues of hard coals and of nearly hard, old brown coals with a relatively strong mechanical structure; common weak-structured, young brown coals; and peat. The ash content of the briquettes produced may reach 20 percent. The briquettes stand up well to being transported, withstand long storage in the open air, and do not fall apart until they have finished burning. Briquetting is used in various new coking processes designed to produce metallurgical coke from gas coals and weakly sintering coals. Lean coals, anthracite, old brown coals, and semicoke are briquetted with a binder—solid or liquid pitch from a hard coal, bitumen, or the like.

Hard coal is briquetted with a binder in the following stages: delivery of the raw material (charging of different types of coals); sorting of the coal and pulverizing to dimensions of 6 mm or smaller; drying of the coal to a residual moisture content of 3–4 percent; preparation of the binder (crushing and liquefaction); batching and mixing of the heated coal with the binder (6–10 percent) at a temperature of approximately 100°C to produce a homogeneous mass, or charge; cooling of the charge to 80°–90°C; compacting in roller presses at pressures of 15–30 meganewtons per m^2; and cooling of the briquettes to 40°C. Egg-shaped briquettes weighing 70–75 g are the most commonly used type; they withstand shipment well.

Fundamental disadvantages of briquettes containing a pitch or bitumen binder are the production of soot upon combustion and a low thermal stability, which seriously limit their use. Methods are being introduced for the treatment of such briquettes with hot gases containing a specific quantity of oxygen or with a solid heat-transfer agent. This causes an oxidation polymerization of the binder, as a result of which the briquette becomes stronger and is made to burn with a smokeless flame. Hot briquetting is widely used to produce a high-quality smokeless fuel or coke without a binder. The process consists in compacting sintering coals that have been preheated to a plastic state or a mixture of such coals and nonsintering coals (anthracite and lean and brown coals) and semicoke.

Young brown coals with high moisture contents (45–60 percent) ordinarily fall apart during storage and transporting. They may be briquetted without a binder for fluidized-bed combustion in the following manner: delivery of the coal; batching; sorting in rotary or screen sieves and pulverizing in impactors to a grain size under 6 mm; drying in steam-heated or gas-fired tube dryers to an optimum moisture content of 14–19 percent; supplementary crushing of large coal particles; cooling of the coal, which emerges from the dryers at a temperature of 85°–90°C, to a temperature of 35°–45°C in cooling installations (omitted in some cases); compacting at pressures of 100–200 meganewtons per m^2 in auger extruders or, less often, rotary presses; cooling of the briquettes, which leave the presses at a temperature of 70°–80°C, to a temperature of 40°C in cooling troughs and on screen conveyors; and delivery of the briquettes to the consumer. The briquettes produced have the shape of a parallelepiped with rounded edges and weigh 500–600 g.

Auger extruders are used to fashion semibriquettes from milled peat with a moisture content up to 25 percent. When the moisture content is higher (up to 50 percent), the peat is first dried in dryers to a moisture content of 12 percent. The dryers used—pneumatic steam-heated, steam-heated tube-type, gas-fired steam-heated, or pneumatic gas-fired—constitute the principal component of the briquetting process.

When pneumatic gas-fired dryers are used, the briquetting process for peat consists in the following steps: sorting and (in some cases) pulverizing of the delivered peat to dimensions of no more than 6–10 mm; drying by means of smoke-producing gases in a pneumatic gas-fired dryer (tube-type or with a grinding fan or hammer mill) with recovery of the dried peat in cyclone separators; compacting at pressures of 7–20 meganewtons per m^2; and cooling of the briquettes to a temperature of 40°C in cooling troughs.

The technology of briquetting has progressed through development and introduction of new processes and intermediate stages, new binders, and new equipment, both for the production of a high-quality smokeless fuel for household use and for the manufacture of a fuel for continuous coking processes; the latter is designed to broaden the raw material base and improve the economy of the coke industry.

The world production of coal briquettes amounts to approximately 110 million tons a year, of which briquettes made from brown coal account for 85 percent. In 1968 the USSR produced approximately 8 million tons of coal briquettes (70 percent from brown coal) and approximately 7 million tons of peat briquettes.

In the briquetting of metal ores, the raw materials used include iron ore fines (separate or mixed with a fuel), finely ground and powdered nonferrous ores, charge dust from blast furnaces, and other metallurgical wastes. The binders used include lime, various cements, and liquid glass. The briquetting is done in roller presses or auger extruders according to the following plan: batching and mixing of the ores with binders, compacting of the mixture, and consolidation of the briquettes to provide strength; the last step includes seasoning, roasting, steaming, and drying. Iron ore briquettes are used in open-hearth and blast furnaces; nonferrous ore briquettes are used in water-jacketed and reverberatory furnaces.

Metal chips and ferrous and nonferrous metal wastes may also be efficiently briquetted. The direct use of a loose, high-volume mass of metal presents several difficulties: oxidation during storage, inconvenience of transportation, the production of carbon monoxide fumes during combustion, and others. The briquetting of metal chips eliminates such problems and makes it possible to manufacture a totally useful metal product from the chips. The briquetting consists in compacting chips that have been finely crushed and freed of such impurities as oil; both hydraulic and mechanical presses are used. In some instances the process is facilitated by heating the material directly during compacting.

The briquetting process is also used for various other materials (*see* FOOD CONCENTRATES, FEED BRIQUETTES, and FEED BRIQUETTER).

BRISTLE, the hair of domestic and wild hogs. Bristle consists of a broad base and a shaft, the upper part of which is separated into brushes, or flags. Histologically it is made up of squamous and cortical layers and a medulla. Bristle is similar to wool in chemical composition. Rigid and resilient, bristle has high tensile strength.

There are three basic sources of bristle. It may be obtained from leather factories after the processing of hog hides or from meat-packing plants after the scalding of carcasses. Bristle may also be obtained by combing the animals during the shedding period or by pulling. One hide yields 80 to 160 g of bristle. The amount and quality of bristles depend on the hog's breed, age, and sex, as well as on the growing region, the season of slaughtering, and the means of collection. Bristle is used for the manufacture of brushes for cleaning and painting. [29–1599–1]

BRISTLE PROCESSING AND BRUSH PRODUCTION, the technological processes involved in treating animal bristles and hair and manufacturing scrub and paint brushes. Brushes are also made from synthetic polymer materials (for example, polypropylene and polyvinyl chloride fibers) and plant fibers (for example, sorghum and sisal).

The processing of bristles includes removing foreign bodies and excess fat and moisture, laying the bristles out with the flags in one direction, sorting by length, and gathering into bundles. Bristles to be used in the manufacture of toothbrushes, shaving brushes, and other brushes for personal hygiene are also disinfected and bleached with hydrogen peroxide.

The processing of animal hair includes washing, sorting by color, initial combing to remove short hair and loosen tangled hair, gathering into bundles, toughening, cutting for size, a second combing to prepare for mixing, mixing, pushing against the butt end to even the hairs out, and tying into bundles.

The production of scrub brushes entails making and finishing the handles, drilling holes, attaching clusters of bristles, hair, or fiber substitutes by means of wire or strong thread, and finishing. Special types of brushes, for example, wire brushes, are manufactured at the same enterprises as scrub brushes.

The production of paint brushes includes making the handle and bands; connecting the bundles of bristles, hair, or fiber substitutes to the handle with the band; evening out the bottom end of the bundle; and removing poorly attached hairs.

By-products from bristles and hair are reprocessed at enterprises to make twisted hair for use in the manufacture of matresses and upholstered furniture. A. I. SHOBOROV [29–1601–1]

BRITISH BANK OF THE MIDDLE EAST, a British joint-stock bank founded as the Imperial Bank of Persia in 1889 under a concession granted by the shah of Iran for a period of 60 years.

Until 1930 the bank had the exclusive right to issue bank notes in Iran and functioned as a central bank. In 1935 its name was changed to the Imperial Bank of Iran. The bank's concession expired in August 1949; since its operations had already expanded beyond the borders of Iran, the bank became the British Bank of Iran and the Middle East. It worked with the Anglo-Iranian Oil Company until 1952, when it was no longer allowed to operate in Iran. In July 1952 it was reorganized as the British Bank of the Middle East.

In January 1960 the Hongkong and Shanghai Banking Corporation acquired 99.5 percent of the bank's shares, but the bank continued to function under its old name. In July 1973 the entire capital of the bank was transferred to the parent corporation. The British Bank of the Middle East, whose main headquarters is in London, has 66 branches (primarily in countries of the Middle East and North Africa) and two subsidiary banks. At the end of 1976 the bank had total assets of £1,571 million, capital and reserves of £42 million, current accounts and deposits of £1,413 million, and loans and discounted bills of £1,112 million. [29–892–7]

BROADBAND ANTENNA, an antenna whose main parameters and characteristics do not vary substantially over a rather wide frequency band. Broadband antennas are used to transmit, receive, or transmit and receive radio signals with a wide frequency spectrum, for example, in television, radar, or radio astronomy. [29–1230–1]

BROAD-LEAVED FORESTS, forests of deciduous (summergreen) trees with broad laminae. Broad-leaved forests are widespread in eastern North America, Europe, North China, and Japan as the native vegetation between the coniferous and boreal forests of the north and the steppes and the Mediterranean, or subtropical, vegetation of the south.

Broad-leaved forests are confined to humid and moderately humid regions with lessened continentality, even annual distribution of precipitation, and relatively high temperatures. Gray, dark gray, and brown forest soils are characteristic, with chernozems sometimes occurring.

The trees in broad-leaved forests constitute the first and second layers of foliage. An undergrowth stratum of shrubs makes up the third layer, and grasses and low brush make up the fourth and fifth layers. Beech and oak broad-leaved forests predominate in Europe, with hornbeam and linden forests less common. In addition to the principal trees, ash, elm, and maple commonly occur in European broad-leaved forests. In North America maple-beech, oak-hickory, and oak forests are most widespread. Oak-chestnut forests were common there until the chestnut was wiped out by the parasitic fungus *Endothia parasitica*. Other frequently encountered trees are the tulip tree, liquidambar, and American linden. In coniferous–broad-leaved forests, pines, spruces, larches, and other coniferous species constitute a significant part of the stand. Common members of the understory in the broad-leaved forests of Eastern Europe are hazel, hedge maple, Tatar maple, European bird cherry, and spindle tree. Mesophyllic eutrophic or mesotrophic species predominate in the grass cover of the broad-leaved forests; prominent species in European forests are mercury, goutweed, dead nettle, wild ginger, lungwort, woodruff, and hairy sedge. Vernal ephemeroid geophytes, whose leaves open and whose seeds mature before foliage appears on the trees, also are characteristic. Common species are corydalis, anemone, toothwort, snowdrop, squill, and star-of-Bethlehem.

In the southern hemisphere forests of evergreen beech (*Nothofagus*) are classified as broad-leaved forests.

BROAD SOCIALISTS, an opportunist group in the Bulgarian Workers' Social Democratic Party in the 1890's. In 1903 the Broad Socialists, who had been known as the *obshtodeltsi* (*obshchedel'tsy*) since 1900, formed the Bulgarian Workers' Social Democratic Party (Broad Socialists). [29–1227–5]

BROAD WHITEFISH (*Coregonus nasus*), a lake and river fish with a body length reaching 80 cm and a weight of 2–4 kg (sometimes to 16 kg). The broad whitefish is common in the basin of the Arctic Ocean from the Pechora to the Anadyr'. It is sometimes found in the salt waters of gulfs and bays. The fish reaches sexual maturity at six or seven years of age. Spawning occurs in October and November. The female deposits 13,000 to 135,000 large eggs that reach 4 mm in diameter. The broad whitefish feeds mainly on benthic invertebrates. It winters in river channels. The fish is commercially valuable.

BROWN SWISS (also Schwyz), a breed of dairy and beef cattle. The breed was developed in Switzerland through the long-term selection of descendants of Shorthorn cattle brought there in ancient times. The animals are light gray to dark brown. A characteristic feature is the light coloring around the dark gray nose. The coloration is lighter along the upper torso, from the withers to the tail head. The males weigh 800–950 kg, sometimes reach-

ing 1,200 kg; the females weigh 550–600 kg, sometimes reaching 800 kg. Calves raised for meat weigh 260–300 kg at the age of one year. The milk yield is 4,000–4,500 kg, with the most efficient cows producing more than 10,000 kg. The fat content of the milk is 3.7–3.8 percent.

The Brown Swiss was first imported into Russia in the mid-19th century to improve local breeds. In the USSR, it is bred for both milk and meat. By crossing local cattle from various regions with the Brown Swiss and by reproducing the crosses, large groups of brown cattle were developed that later became the basis for various indigenous breeds, such as the Kostroma, Alatau, Lebedin, and Caucasian Brown cattle.

The Brown Swiss is bred in the German Democratic Republic, the Federal Republic of Germany, Austria, Italy, France, Spain, and Czechoslovakia, in the countries of North and South America, and in southern Africa. In the USSR it is bred in the central part of the RSFSR and in the Northern Caucasus.

B. V. FANDEEV [29–1062–2]

BRUSH BORDER, the aggregate of rod-shaped structures on the surface of certain cells in animals and humans. The brush border consists of separate cytoplasmic processes arranged like a brush along the free margin of the cells of the excretory ducts of the salivary glands, the convoluted uriniferous tubules of the kidney, and certain other epithelial cells. By substantially increasing the cell surface, the brush border promotes more intensive absorption and excretion of matter. [29–1602–3]

BURIN, a tool used for engraving, consisting of a thin steel bar cut off obliquely at one end and sharpened; the other end is inserted into a wooden, mushroom-shaped handle that is trimmed off on the side. Burins used for engraving metal usually have a rhombic cross section; those used for engraving wood have a variety of cross sections. [29–1481–4]

BUS (bus bar), a copper, aluminum, or, less often, steel electrical conductor, usually rectangular or circular in cross section, used to handle large currents, for example, in switchgear. [29–1204–6]

BUTT SEAM WELDING, a type of resistance welding for joining the edges of sheets in a butt joint, used mainly in the manufacture of welded pipe. The metal in the weld zone is heated by an electric current in resistance pipe-welding machines, and the butt joint is then pressed by steel rollers. With steel pipe of small diameter (10–50 mm), the stock (a steel band) is first heated in a gas-fired furnace and formed into pipe; the lengthwise seam is welded by drawing through a mandrel rod at speeds up to 1,200 m per minute. Such units can produce up to 70 km of welded pipe per hour. [29–1332–3]

ČAČAK, a city in Yugoslavia, in the Socialist Republic of Serbia; situated in the Zapadna Morava River valley. Population, 39,000 (1973). Čačak has enterprises of the metalworking, machine-building, woodworking, pulp and paper, ceramics, and food-processing industries. Magnesite is mined nearby. [29–110–5]

CAECILIIDAE, a family of amphibians of the order Apoda. Caecilians reach a length of 1.1 m and resemble large earthworms. There are 25 genera, distributed in the tropics of Africa, Asia, and the Americas. The amphibians live mostly in soil or rotten wood. Some species inhabit ants' or termites' nests. [29–183–5]

ÇAJUPI, ANDON (pen name; real surname Cako, later Zako). Born Mar. 27, 1866, in the village of Şeperi; died July 11, 1930, in Al-Matariyah, near Cairo. Albanian poet and figure in the national renaissance.

Çajupi was educated in Switzerland. His collection of poetry *Dad Tomorri* (1902) consolidated the tendencies of critical realism in Albanian poetry. Çajupi appealed for armed uprising against Turkish domination in his poems, for example, "The Albanian" and "July." In his satirical works he strongly criticized the Albanian feudal system, as well as the bourgeois order in Egypt, where he spent most of his life. In the pamphlet *Salonican Club* (1909) he condemned the Albanian politicians who betrayed their country to Turkey and Greece. In several of his works he described the suffering of the common people.

Çajupi wrote a play about Skanderbeg entitled *Hero of the Land* (published 1937) and a collection of poetry, *The Old Testament* (published 1957). He also translated fables by La Fontaine, poems by Heine, and Indian poetry (*Flowers of the Hindis*, 1922).

ČAKSTE, JĀNIS. Born Sept. 14, 1859, in Lielsesavas Volost (small rural district), Dobele District, Kurzeme Province, in what is now the Latvian SSR; died Mar. 14, 1927, in Riga. Latvian bourgeois political figure.

A member of a wealthy family, Čakste graduated from the law faculty of Moscow University in 1886 and began practicing law in Mitava (now Jelgava). In 1888 he became the publisher and editor of the bourgeois newspaper *Tēvija* (Fatherland). In 1906 he was a deputy to the First State Duma, where he voted with the Constitutional Democrats (Cadets). In 1916 and 1917 in Petrograd he served as chairman of the bourgeois Latvian Central Committee for the Protection of Refugees.

Čakste was hostile to the October Revolution. He was a member of the kulak Peasants' Union party, which later became semifascist, and he served as chairman of the People's Council, a counterrevolutionary body of the Latvian bourgeoisie. He was also a leader of the movement that fought from February 1919 to January 1920 with the help of foreign interventionists to suppress Soviet power in Latvia.

After the establishment of the bourgeois dictatorship in Latvia, Čakste served from 1920 to 1922 as chairman of the Constituent Assembly. Čakste was president of the bourgeois Latvian state from 1922 to 1927. [29–35–5]

CALIXTINES (Czech, *Kališníci*; Utraquists), members of a moderate wing of the Hussite revolutionary movement in Bohemia in the first half of the 15th century. The program of the Calixtines, which reflected the interests of minor and some major feudal lords and the middle strata of the urban population, was formulated in the Prague Articles of 1420. The Calixtines demanded that the Eucharist be given under both species (bread and wine) to all the faithful, laymen as well as clergy (in the Roman rite of Catholic Church, communion under both species is a privilege of the clergy). They also attempted to eliminate the dominance in Bohemia of German feudal lords and urban patricians. They tried to bring about the secularization of church lands and to secure the freedom to preach the Hussite creed. In November 1433 the Calixtines entered into an agreement with the feudal Catholic camp (*see* COMPACTATA) to oppose the Taborites, whom they decisively defeated at the battle of Lipany on May 30, 1434.

CALM, a condition of little or no wind. On the Beaufort scale, wind velocity during a calm is 0–0.2 m/sec. Calms are usually observed within stable anticyclones, in cols, and in the intertropical convergence zone. Calms occur more often in valleys and basins than in open areas with free circulation of air. There is little turbulence during a calm, and therefore harmful atmospheric aerosols (smoke and gas) may accumulate in the lowest atmospheric layer. [29–1479–1]

CALYX, the aggregate of usually green outer leaflets, or sepals, surrounding the corolla in flowers having a double perianth. The sepals are separate or fused.

The biological purpose of the calyx is to protect the flower's internal organs and the developing fruit and to ensure supplementary feeding. In a few plants (*Hydrangea, Erica,* and some Ranunculaceae) the calyx is large and brightly colored and serves, instead of a corolla (which is either absent or underdeveloped), to attract insects. In some plants (*Papaver*) the calyx falls off when the flower opens; in others (*Ranunculus*) it falls off after the completion of flowering. In the majority of plants, however, the calyx remains after flowering and may even proliferate and participate in fruit formation. In Umbelliferae, Compositae, and some other plants the calyx is completely reduced or converted into hairs. [29–111–4]

ČAPEK, JOSEF. Born Mar. 23, 1887, in Hronov; died Apr. 1945, in the Bergen-Belsen concentration camp in Germany. Czech artist and writer; antifascist. Representative of progressive Czech art.

Čapek studied at the School of Industrial Arts in Prague and in Paris. His first works, which he wrote jointly with his brother K. Čapek, were published in 1907. From 1910 through the 1920's he worked for progressive newspapers and journals, wrote critical articles and topical satires, and drew caricatures for the Brno newspaper *Národni novini.*

As an artist, Čapek strove for expressiveness and simplicity, introducing devices of cubism, fauvism, and primitivism. In his paintings he depicted the life of the urban poor, as in *Man With a Bag* (1926, National Gallery, Prague). He drew illustrations, including drawings, lithographs, and linocuts of laconic composition for works by Czech writers, including his brother's novels *The Absolute at Large* (1922) and *Krakatit* (1924) and his own *Tale of a Dog and a Cat* (1929).

Čapek combined subtle irony and the grotesque with dramatic force. In the cycles of paintings *Fire* and *Dream* (1938–39, National Gallery, Prague), he symbolically depicted the suffering of his people during the fascist dictatorship. His series of antifascist caricatures seethe with passionate anger.

ČAPEK, KAREL. Born Jan. 9, 1890, in Malé Svatoňovice; died Dec. 25, 1938, in Prague. Czech writer.

Čapek graduated from the faculty of philosophy of Charles University in 1915. He was first published in 1907. Most of his early stories, dating from the years 1908 to 1913 and later included in the collections *The Garden of Krakonoš* (1918) and *The Luminous Depths* (1916), were written with his brother Josef Čapek.

The tragic events of World War I caused Čapek to undertake an intense search for the criterion of truth, to meditate on philosophical problems, and to seek the source of life's contradictions—as evidenced in the short-story collections *Crucifixion* (1917) and *Money and Other Stories* (1921). In such works Čapek came close to expressionism. At the same time, however, he came under the influence of pragmatism and relativism; specifically, he was influenced by the notion of a multiplicity of truths, or the idea that "everyone is right in his own way." Rejecting revolutionary struggle, Čapek tended toward moral and ethical humanism. Many of his works, including the poetic comedy *The Robber* (1920), are based on the juxtaposition of several "truths." Čapek conceives, as it were, of various alternatives simultaneously, but without relinquishing his own ethical ideal.

Čapek achieved world fame through his socially oriented works of science fiction, as represented by the play *R.U.R.* (1920) about a robots' rebellion (the word "robot" was coined by Čapek), the play *The Macropoulos Secret* (1922), and the novels *The Absolute at Large* (1922) and *Krakatit* (1924; English translation under the title *An Atomic Phantasy*, 1948). On the assumption that a discovery or invention can rapidly alter mankind's living conditions, Čapek's science fiction constructs a kind of imaginary sociophilosophical experiment, creating an artificial situation in which certain philosophical problems and modern trends are made particularly evident.

Much of Čapek's work is critical of inhumanity, militarism, and the church; nevertheless, the elemental nature of bourgeois socioeconomic processes is presented by him in absolute terms as a common feature of human development. Čapek's plays and novels are ironic and satirical utopias, warning against the danger of dehumanizing trends and the catastrophic potential inherent in contemporary social and international conflicts. His writings, while tending toward realism, occasionally show evidence of preconceived philosophical ideas.

Čapek's travel sketches of the early 1920's, such as *Letters from Italy* (1923) and *Letters from England* (1924), are outstanding for their realistically picturesque characterizations and poetic humor.

In the late 1920's and early 1930's, Čapek was close to T. G. Masaryk; the writer's bourgeois democratic illusions gained in strength, the marks of crisis grew more pronounced in his work—for example, in the play *Adam the Creator* (1927), which he wrote with his brother. Withdrawing temporarily from large-scale social and political problems and conflicts, Čapek now concentrated on writing short humorous works, such as those collected in *Tales From Two Pockets* (1929). His *Apocrypha* (1932) is a collection of humorously philosophical reinterpretations of familiar stories from the Bible.

The intensification of social conflicts and the "brute doctrine" of fascism revealed to Čapek the unfoundedness of the idea that "everyone is right in his own way." His philosophical victory over relativism is reflected in his trilogy—*Hordubal* (1933), *Meteor* (1934), and *An Ordinary Life* (1934). Faced with the renewed threat of war, Čapek turned toward active antifascism and voiced his criticism of Czechoslovakia's ruling circles. He openly expressed his sympathies toward the USSR.

Čapek's highest achievement was the novel *The War With the Newts* (1936), in which his traditional protest against the dehumanization of human relationships is channeled into a satire against bourgeois society, against militarism, and against the racist theories and policies of fascism. The novel combines the characteristic mystifications of science fiction and the genres of the animal parable, fictional social utopia, and political pamphlet. Čapek's antifascism and antimilitarism and his search for the ideal "whole man," capable of struggle, shaped the content of the play *Power and Glory* (1937), of the novel *The First Rescue Party* (1937), and of his last play, *Mother* (1938).

The suffering that Čapek experienced as a result of the Munich Pact of 1938, along with his persecution at the hands of fascist and profascist elements during the "second republic," aggravated the writer's ill health and hastened his death. Čapek's work has been an important influence in modern social science fiction and represents a notable contribution to classic world literature. There are two Čapek museums in Czechoslovakia—the suburban Čapek house Na Strži and the memorial museum at the writer's birthplace.

CAP OF MONOMAKH (Russian, *shapka Monomakha*), a symbol of autocracy in Russia. The crown of the Russian grand princes and tsars, the cap of Monomakh was made in Middle Asia during the 14th century. A pointed headdress with gold filigree, it is bordered with sable and embellished with precious stones. The crown is topped with a cross.

The legend that the crown was a gift from the Byzantine emperor Constantine Monomachus to his grandson Vladimir Vsevolodovich Monomakh, the grand prince of Kiev, arose in the late 15th or early 16th century as a unified Russian state took shape. The legend served as a basis for the political theory of Moscow as the third Rome.

The cap of Monomakh was first used in a coronation when Ivan III Vasil'evich crowned his successor with it. Ivan IV Vasil'evich (Ivan the Terrible) was crowned with the cap. In 1721 an imperial crown replaced the cap of Monomakh in the coronation ceremony. [29–848–2]

CAPSTAN, a ship's winch with a vertical drum for lowering and hoisting the anchor, taking up the slack in mooring lines, lowering fishnets and trawls, and the like. Capstans may be operated manually or by steam, electric, or hydraulic drives. The drives are usually set below deck. [29–1394–5]

CARBON TETRACHLORIDE (also tetrachloromethane), CCl_4, a colorless liquid, with a sweetish odor, a melting point of −22.9°C, a boiling point of 76.8°C, and a density of 1.593 g/cm^3 (at 20°C). Carbon tetrachloride is practically insoluble in water but is soluble in many organic solvents. It forms azeotropic mixtures with water (boiling point 66°C; 95.9 percent CCl_4), methanol (55.7°C; 79.4 percent CCl_4), and other liquids. It readily dissolves oils, greases, waxes, and many natural and synthetic resins and rubbers. Under ordinary conditions, it is resistant to the action of air, light, and concentrated acids; in the presence of iron or aluminum, it is decomposed by water into CO_2 and HCl. It interacts with the alcoholates of the alkali metals to form orthocarbonic-acid esters: $CCl_4 + 4NaOC_2H_5 \rightarrow 4NaCl + C(OC_2H_5)_4$; it takes part in the telomerization reaction together with olefins. The chlorine atoms in carbon tetrachloride can be replaced with F, Br, or I. For example, the Freons CCl_3F and CCl_2F_2 are commercially prepared from CCl_4 and HF.

Carbon tetrachloride is produced by the chlorination of methane or carbon disulfide, as well as by other methods. It is widely used in various industrial sectors as an incombustible fire-resistant solvent.

Poisoning. Carbon tetrachloride enters the body through the respiratory organs and the skin, inducing a narcotic effect on the central nervous system, a slightly irritating effect on the skin, and a toxic effect on the liver, kidneys, and other organs. Acute poisoning is accompanied by headache, vertigo, weakness, nausea, and vomiting. Severe poisoning cause dyspnea, cyanosis, and an increase in body temperature; strong agitation, loss of consciousness, sense disturbances, and paralysis are possible, as are sometimes toxic emphysema and hepatitis. Chronic poisoning is characterized by gastrointestinal disorders, weight loss, and anemia, as well as by irritation of the eyes and mucosa of the upper respiratory tract. Indications of severe cases are toxic hepatitis, polyneuritis, and kidney damage. Carbon tetrachloride induces dermatitis on contact with the skin.

Preventive measures include the replacement of carbon tetrachloride with less toxic solvents, prevention of carbon tetrachloride vapors from entering inhaled air, and personal safety measures. Preliminary and periodic medical examinations are also helpful. A. A. KASPAROV and V. N. FROSIN [29–365–1]

CARDING MACHINE, a machine for carding fiber materials for the production of textiles; one of the primary machines used in spinning. A distinction is made between carding machines proper and combing machines. In the former, tangled fibers are separated and fine, cohesive contaminants and defective fibers are removed by passing the fiber between the working members of a machine, which are covered by regular or metallic card clothing.

Two types of carding machines are used, depending on the material being processed and the type of production: machines with flats (for cotton and short chemical fibers) and machines with roller cards (for wool, bast fibers, and long chemical fibers). Various methods of feeding material to the machine are used to obtain a carded product of uniform thickness. Cotton is fed to flats in a layer of uniform thickness—a lap prepared by an opening-scutching machine. Roller-card machines are fed by a weighing device that periodically weighs out equal portions of the fiber material.

The primary working members of a carding machine with flats are a taker-in, a cylinder, a doffer roller, and flats. Flats are narrow plates of a spiked belt arranged above the cylinder and covering approximately half of the cylinder's surface. The lap proceeds from the feed plate to the taker-in, which is covered with teeth. The taker-in performs a preliminary carding of the fibers and removes contaminants and defects. The fibers are then fed to the cylinder, which is covered with a serrated or spiked belt. The primary carding process takes place between the cylinder and the flats; short fibers and contaminants adhere to the flats and are removed. The carded fibers are taken from the cylinder by the doffer roller, from which they are removed by a comb in the form of a thin web. After passing through a special funnel, the layer of fibers is transformed into a relatively dense, thin sliver which is deposited in a cylindrical container. Special carding machines with two cylinders are used to prepare sliver for spindleless spinning; such machines ensure higher quality carding.

The principal working members of a roller-card machine are the taker-in, the cylinder, from three to six pairs of worker rollers and stripper rollers set around the cylinder in pairs, a fancy roll, and a doffer roller. The taker-in separates large clumps of fiber material into smaller ones and prepares the material for the primary carding process between the cylinder and the worker rollers. Clumps and individual fibers that remain on the worker rollers after being processed against the cylinder are returned to the cylinder by the doffer roller. The rapidly revolving fancy roll has spikes that fit in the spaces between the spikes of the cylinder, thereby extracting the fibers from the surface of the cylinder. The fibers are then fed to the doffer roller, where they are arranged in a denser layer and made uniform in thickness and composition. The carded material from the doffer roller is removed by a comb, which makes a rapid vibratory motion.

Further improvements in carding machines are aimed at increasing efficiency and productivity by improving the precision of machine manufacture, increasing the speed of the working members, and equipping the machines with stronger preliminary carding units, compression rollers, and other devices.

V. V. ZHOKHOVSKII [29–336–1]

CARDING OF FIBER MATERIALS, the process of separating clumps of fiber materials, such as cotton, wool, and chemical fibers, into individual fibers, accompanied by some straightening and blending, removal of contaminants and some short fibers, and the conversion of the opened bulk material into a unbroken, homogeneous product—the sliver or roving. It is one of the primary processes in spinning.

A distinction is made between carding proper and combing. The former process is used for card spinning, card and comb spinning, and condenser spinning and in the production of nonwoven materials and fulling and felt articles. During the process, fibers are subjected to the action of the needles or teeth of the working members of a flat or roller card. Combing is used only for card and comb spinning to produce fine, strong, uniform, and smooth yarn. It is done on a combing machine.

V. V. ZHOKHOVSKII [29–337–1]

CARDUUS (plumeless thistle), a genus of thorny plants of the family Compositae. There are about 120 species, distributed in Eurasia and northern Africa. The USSR has more than 30 species. The musk thistle (*C. nutans*), the welted thistle (*C. crispus*), and *C. acanthoides* grow as weeds in fields and along roads. Some species are nectar-bearers. The Russian common name for the genus—*chertopolokh*—is also used to designate other thorny plants of the same family (mainly in the genera *Cirsium* and *Xanthium*) or of other families (for example, *Eryngium planum* of the family Umbelliferae). [29–332–2]

CARPODACUS (rosefinches), a genus of birds of the family Fringillidae of the order Passeriformes. The birds are 22 cm long. The plumage of the male is pink and red; the female is brownish gray. There are about 20 species, distributed mainly in Central Asia. One species occurs in Europe, and three in North America. The USSR has five species: *C. erythrinus, C. roseus, C. rubicilla, C. grandis*, and *C. rhodochlamys*. The birds inhabit shrubbery thickets and the edges of forests, both in the plains and at high elevations in the mountains. *C. erythrinus* migrates long distances during the winter, whereas the other four species migrate short distances or descend into the foothills. A clutch contains three to six eggs, which are incubated for 13 or 14 days. The diet consists of seeds, berries, and, sometimes, insects. [29–506–1]

CASEMAKING CLOTHES MOTH (*Tinea pellionella*), a moth of the family of Tineidae. The wingspread reaches 17 mm. The fore wings are golden, and the posterior wings gray. The head is covered with yellow-gray hairs. The casemaking clothes moth is distributed worldwide. In the spring it deposits as many as 120 eggs on articles made of wool, fur, or feathers. Naked whitish caterpillars emerge from the eggs and live and feed on the wool, fur, and feathers. The caterpillars live in small tubular cases that they spin themselves. In the fall they attach their cases to ceilings, walls, or the inside of closets for overwintering. They pupate in the spring, and the moths emerge in ten to 20 days. Control measures include keeping premises clean and storing woolens and furs in special bags that contain naphthalene crystals. [29–1517–2]

CASPIAN TERN (*Hydroprogne caspia*), a bird of the family Laridae of the order Charadriiformes. The body is about 50 cm long and weighs about 650 g. The bird is gray above and white below, with a black head cap and black legs. The Caspian tern is distributed sporadically in Europe (except the north), Western and Southeast Asia, Australia, New Zealand, Africa, and North America. In the USSR it is found along the Baltic, Black, Azov, Caspian, and Aral Seas, as well as along lakes of Kazakhstan, Transbaikalia, and the southern Primor'e. The Caspian tern is a migratory bird. It nests in colonies on shoals and islands. A clutch contains two or three eggs, which are incubated by both parents for 22 or 23 days. The Caspian tern feeds on small fish, invertebrates, and, sometimes, the young of other birds. [29–123–3]

CASSIDINAE, a subfamily of beetles of the family Chrysomelidae (leaf beetles). The flat body is usually 4–20 mm long (some individuals reach a length of 10 mm in the USSR). The edges of the pronotum and elytra protrude to the sides, forming a shield that covers the top of the head and body (hence the common name of tortoise beetle for several species). The coloration varies and sometimes has a metallic or pearly cast. There are about 1,000 herbivorous species, distributed mainly in the tropics and subtropics. The USSR has 60 species. Some, for example, *Cassida nebulosa*, are agricultural pests. Adult beetles and the light green larvae, which carry their excrement on their backs, are found on the leaves of beet plants. [29–1613–4]

ČASTEK, SLAVOJAR (also Jaroslav Častek). Born Dec. 24, 1894, in Plzeň, Bohemia; died Feb. 6, 1920, in Penza. Internationalist and participant in the Civil War in Soviet Russia. Member of the CPSU from July 1918.

Častek was the son of a minor Czech merchant. As a lieutenant in the reserves, he was called to fight in the Austro-Hungarian Army during World War I. In January 1917 he was taken prisoner by the Russians. In March 1918 he joined the Red Army and became the commander of a combined international detachment in Penza, where he joined an organization of Social Democratic internationalists in April 1918. From May to July 1918, Častek fought in battles against the White Czechs near Penza and Syzran'. In September 1918, as a member of the International Regiment of the 1st Simbirsk Infantry Division, he took part in the liberation of Simbirsk, of which he became commandant.

In April 1919, Častek became chief and military commissar of the Directorate on the Formation of International Units of the Red Army. In July 1919 he took command of the International Regiment of the 1st Simbirsk Infantry Division. Častek died of typhus. [29–76–5]

CAST IRON, an iron alloy containing carbon, usually in amounts greater than 2 percent, and a number of impurities—silicon, manganese, phosphorus, and sulfur—and, sometimes, alloying elements; it hardens, forming a eutectic.

Cast iron is one of the most important primary products of ferrous metallurgy (*see* FERROUS METALLURGY and BLAST-FURNACE PRODUCTION), used for reconversion in the production of steel and as a component of the charge used for remelting into iron castings. One of the major construction materials, it is also used as a casting alloy. The widespread use of cast iron in machine building is based on its good casting and strength properties; some cast irons are only slightly inferior in strength to carbon steels (*see* INOCULATED CAST IRON). Cast iron accounts for about 75 percent of all metal used in modern machine building. The USSR is the world's leading producer of cast iron (1976).

History. The first information about cast iron dates from the sixth century B.C. Cast iron containing up to 7 percent phosphorus and having a low melting point was produced in China from high-phosphorus iron ores and was used for casting various items. Cast iron was also known to Greek and Roman metallurgists of the fourth and fifth centuries B.C.

The production of cast iron in Western Europe dates to the 14th century, when the first blast furnaces (bloomery furnaces) for smelting cast iron from ores appeared (*see* METALLURGY). The cast iron produced was used either for conversion into steel in bloomeries (*see* BLOOMERY CONVERSION) or for the production of various structural elements, such as pillars, and weapons, such as cannons and cannon balls. In Russia, the production of cast iron dates to the 16th century. It steadily expanded, and by the time of the reign of Peter I, Russia exceeded all other countries in the production of cast iron, only to lag behind the Western European countries a century later. The development of cupola furnaces (*see* FURNACE, CUPOLA) in the second half of the 18th century led to the separation of casting shops from blast furnace shops, that is, initiated independent iron casting (at machine-building plants). Malleable cast iron was first produced in the early 19th century.

The alloying of cast iron dates to the second quarter of the 20th century (*see* ALLOY CAST IRON). Alloying made it possible to greatly improve the properties of cast iron and produce special cast irons resistant to wear, corrosion, and heat. The development of methods of producing inoculated cast iron also dates to this period. Inoculated cast iron with inclusions of spheres of graphite instead of the usual graphite flakes was obtained at the end of the 1940's; such cast iron, called ductile cast iron, has considerably higher strength (σ_b), up to 500 meganewtons/m^2 (50 kilograms-force/mm^2) in the cast state and 1,200 meganewtons/m^2 (120 kilograms-force/mm^2) after heat treatment. A type of cast iron known as high-duty cast iron, possessing good mechanical properties despite the presence of graphite flakes, was obtained in the 1960's in electric furnaces from steel scrap with the addition of a carburizing agent (*see* IRON-CARBON ALLOYS).

Classification and properties. Cast iron obtained in blast furnaces is characterized either as basic pig iron, used for conversion into steel, or foundry pig iron, which serves as a basic component of the charge in iron casting.

Up until the 1970's, specular cast iron, which contains 10 to 25 percent manganese and is used as a deoxidizing agent in the production of steel and some special cast irons, was sometimes produced in blast furnaces. Natural alloyed cast irons are produced from iron ores containing chromium, nickel, titanium, and other

alloying elements. Various criteria are used at iron foundries in classifying cast iron used in the production of casts. Cast iron is classified as gray, white, or mottled according to the extent of graphitization, which determines the type of fracture. Cast irons can also be classified on the basis of the graphite inclusions, which can be flaked, spheroidal (ductile cast iron), vermicular, or in the form of rosettes (malleable cast iron). Depending on the nature of the metal base, cast iron can be classified as pearlitic, ferritic, pearlitic-ferritic, austenitic, bainitic, or martensitic. On the basis of use, a distinction is made between structural and special-purpose cast irons, and on the basis of chemical composition, between alloy and unalloyed cast irons.

GRAY CAST IRON. Gray cast iron, or simply gray iron, the most common form of cast iron, used in machine building, sanitary engineering, and building construction, has inclusions of graphite in the form of flakes. Items made of gray iron are characterized by resistance to the effect of external stress concentrators under cyclical loading and by a higher vibration absorption coefficient (two to four times greater than steel). An important structural feature of gray iron is its ratio of creep limit to tensile strength, which is higher than for steel. The presence of graphite improves the lubrication conditions upon friction, which improves the antifriction properties.

The properties of gray iron depend on the structure of the metal base and on the type, size, amount, and nature of distribution of the graphite inclusions. Pearlitic gray cast iron has high strength and is used for cylinders, bushings, and other stressed parts of engines and engine blocks. Gray iron with a ferrite-pearlite metal base is used for less critical parts.

WHITE CAST IRON. White cast iron, or simply white iron, is an alloy in which the excess carbon not found in the solid iron solution is present in a bound state in the form of the iron carbide Fe_3C (cementite) or special carbides (in alloy cast irons). The crystallization of white iron occurs in a metastable system with the formation of cementite and pearlite. Because of its poor mechanical properties and brittleness, white iron has limited use for simple articles subjected to conditions of high abrasive wear. The alloying of white iron with carbide-forming elements, such as chromium, tungsten, and molybdenum, enhances its resistance to wear.

MOTTLED CAST IRON. In mottled cast iron, or mottled iron, part of the carbon is in the free state in the form of graphite and part is in the bound state in the form of carbides. Mottled iron is used for the production of items operating under conditions of dry friction (brake shoes) and wear-resistant parts, such as roller, paper-making, and flour-milling shafts.

MALLEABLE CAST IRON. Malleable cast iron is made as a white-iron casting and then subjected to annealing in which graphitization takes place, which results in the decomposition of the cementite and the formation of flaked graphite. Malleable iron is more resistant to shocks and cuts than steel and performs satisfactorily at low temperatures. Its mechanical properties are a function of the structure of the metal base and the amount and compactness of the graphite inclusions. Depending on the type of thermal treatment, malleable iron may have a ferrite, ferrite-pearlite, or pearlite metal base. Malleable iron in a matrix of granular pearlite has the best properties and may be used instead of cast or hammered steel. Ferritic malleable iron is used when high ductility is required. To accelerate the graphitization process upon heat treatment, malleable iron is inoculated with tellurium, boron, or magnesium.

Malleable iron is used mainly in the production of automobiles, tractors, and agricultural machinery. There is a trend, especially in automobile production, to replace malleable iron with ductile iron, with spheroidal graphite, in order to provide stronger casts, decrease production time, and improve the final product.

DUCTILE CAST IRON. Ductile iron (also called nodular iron or spheroidal graphite iron) is characterized by spheroidal or nearly spheroidal graphite inclusions, produced by the inoculation of liquid cast iron with magnesium, cerium, yttrium, calcium, or some other element in the pure form or as a component of an alloy. Spheroidal graphite least weakens the metal matrix, which leads to considerable improvement in the mechanical properties of cast iron with pearlite or bainite structure, whose properties approach those of carbon steels. High ductility is observed for a pure ferrite matrix in the cast or heat-treated states.

Ductile iron has good casting and technical properties, such as flowability, low linear shrinkage, and good machinability by cutting, but it is similar to steel with respect to concentrated volumetric shrinkage. It is used to replace cast and hammered steel parts, such as the crankshafts of engines and compressors, as well as items made of malleable iron or ordinary gray iron.

Ductile iron with vermicular graphite inclusions, which appear as thickened, bent plates with twisted edges under a microscope, occupies an intermediate position between cast iron with spheroidal graphite and cast iron with graphite flakes. It has good technical properties and exhibits low volumetric shrinkage and high heat conductivity, which is almost the same as that of gray iron. It is used in the construction of diesel engines and other types of machinery.

ALLOY CAST IRONS. Alloying elements, such as nickel, chromium, copper, aluminum, titanium, tungsten, vanadium, and molybdenum, are added to cast iron to improve its strength and operational characteristics or to impart special properties, such as nonmagnetism, high-temperature strength, and resistance to wear, heat, and corrosion. Manganese in amounts greater than 2 percent and silicon in amounts greater than 4 percent are also considered as alloying elements. Alloy cast irons can be classified according to the content of the major alloying elements, for example, chromium, nickel, or aluminum cast iron. A distinction is made between low-alloy cast irons, with the content of alloying elements totaling less than 2.5 percent, medium-alloy cast irons, with 2.5 to 10 percent alloying elements, and high-alloy cast irons, with more than 10 percent alloying elements. Low-alloy cast irons are in a matrix of pearlite or bainite, medium-alloy cast irons are usually in a matrix of martensite, and high-alloy cast irons are primarily in a matrix of austenite or ferrite.

Cast irons with 5 to 7 percent silicon (Silals) are used as heat-resistant materials. Cast irons with 12 to 18 percent silicon (Ferrosilides) exhibit high corrosion resistance in solutions of salts, acids (except hydrochloric acid), and alkalies. Such cast irons alloyed with molybdenum (antichlor) are highly resistant to hydrochloric acid. Of all known cast irons, cast iron with 19 to 25 percent aluminum (Chugal', or aluminum cast iron) has the highest heat resistance in the air and in sulfur-containing media. The most common wear-resistant cast irons are alloyed with up to 2.5 percent chromium and up to 6 percent nickel (Nikhard cast irons). Austenitic nickel cast irons alloyed with manganese, copper, and chromium (Ni-resist alloys) are used as corrosion-resistant and high-temperature strong materials.

Marking of cast irons. The system of marking cast irons adopted in the USSR uses letters and numbers. The letters indicate the principal intended use of the iron product: P for basic iron, used in oxygen-converter and open-hearth production, and L for foundry iron, used for iron casting. Foundry coke iron is indicated by LK, and iron produced with charcoal, by LD. The silicon content decreases with increasing number; for example, LK5 contains less silicon than LK4. Each brand of cast iron, depending on its content of manganese, phosphorus, and sulfur, is placed, correspondingly, in a group, class, and category. Cast irons for foundry production, as a rule, are designated by letters indicating the principal type or intended use of the cast iron: SCh indicates gray iron, VCh indicates ductile iron, and KCh indicates malleable iron. Antifriction cast irons are designated by the letter A placed at the beginning, for example, ASCh, AVCh, and AKCh.

The numbers in the brands of unalloyed cast irons indicate the mechanical properties of the cast irons. Standardized tensile and bending strengths are given for gray irons in kilograms-force/mm^2, for example, SCh21-40. For ductile and malleable irons, the numbers indicate the tensile strength (in kilograms-force/mm^2) and relative elongation (in percent), for example, VCh60-2.

A brand of alloy cast iron is designated by a letter indicating the alloying elements and a number directly after each letter indicating the average content of the given alloying element. When the content of the alloying element is less than 1.0 percent, the numbers after the corresponding letter are omitted. The arbitrary system of symbols for the chemical elements is the same as for steel (*see* STEEL). An example of an alloy cast iron is ChN19Kh3, which is a cast iron containing about 19 percent nickel and about

3 percent chromium. If spheroidal graphite is required for an alloy cast iron, the letter Sh is placed at the end, for example, ChNl9Kh3Sh.

Cast iron in art. Cast iron has been used in artistic ironwork since the Middle Ages; for example, a remarkable sculpture, now lost, of a lion weighing 100 tons was cast in China in the tenth century A.D. Cast iron sculpture appeared in Germany in the 15th century and subsequently in other European countries; it appeared in Russia at the end of the 17th century. The production of objects from cast iron became widespread (park sculpture, memorials, fences, walls, and garden furniture). In the 20th century, the casting of objects from cast iron is nearly as widespread as casting from bronze, since cast iron objects, although more massive and characterized by the expressiveness of the heavy weight and muted tones, are less costly to produce.

Cast iron is used for various purposes in architecture (beginning in the late 18th century). The use of cast iron structural elements was characteristic of architecture of the 19th century (the age of cast iron).

ÇATAL HÜYÜK, a Neolithic settlement that flourished in the second half of the seventh and in the early sixth millennia B.C. on the Konya Plain in southern Turkey. Çatal Hüyük, which was excavated between 1961 and 1963 by the British archaeologist J. Mellaart, occupies an area of 12.8 hectares. The cultural level, which is more than 6 m thick, is divided into 12 horizons. The rectangular dwellings were made of mud brick; they were attached to one another and access to them was from the roof. The economy was based on land cultivation, as seen from the discovery of wheat, emmer, and barley grains, peas, vetch, and almonds and the discovery of sickle insets and grain mortars. Cattle raising was also developed to some extent.

Beginning with the oldest horizon (12th horizon), small articles made of native copper and lead were found, along with tools made of flint and obsidian. Primitive clay pottery was discovered in the tenth horizon, but none was found in a number of succeeding horizons, which yielded vessels of stone and wood only. Clay pottery reappeared in the upper horizons in the form of flat-bottomed vessels of more sophisticated workmanship and occasionally with painted designs.

A shrine was also discovered at Çatal Hüyük, with paintings and reliefs depicting hunting scenes, animals, birds, and geometric designs. Numerous stone statuettes of people and animals were unearthed. The dead were buried in a flexed position beneath the floors of the houses.

CATTAIL INFECTION (also choke), a disease of grasses caused by the cattail fungus *Epichloe typhina*. Among the many plants affected by the disease are timothy, orchard grass, fescue, bromegrass, and couch grass. A thick feltlike body forms on the upper section of the plant stem prior to blooming; the growth is first white, then yellow, and finally brownish yellow. Plant development ceases, and spikelets do not form. The fungus spreads by means of conidia. The disease can be combatted by early cutting of the grasses for hay. [29–400–1]

CATTOPADHYAY, SARATCHANDRA (also Saratchandra Chatterji or Chatterjee). Born Sept. 15, 1876, in the village of Debanadapur, Bengal; died Jan. 16, 1938, in Calcutta. Indian Bengali-language writer.

From 1903 to 1916, Cattopadhyay lived in Burma. In the early 1920's he took part in the national liberation movement. Cattopadhyay at first wrote works containing elements of romanticism; later, however, he turned to realism. He dealt with the status of women in a caste society and criticized feudal and bourgeois mores in the novels *Gone Astray* (1917; Russian translation, 1971), *The Burned House* (1920; Russian translation, 1958), and *Village Society* (1916; Russian translation, 1971). The novel *Srikanta* (parts 1–4, 1917–33; Russian translation, 1960) presents a multifaceted depiction of Indian society.

Cattopadhyay was the author of *Make Way* (1926), the first anticolonial political novel in Indian literature. His novel *One Last Question* (1931) is concerned with the place of ethical and religious traditions in modern life.

L. A. STRIZHEVSKAIA [29–689–1]

CEAUŞESCU, NICOLAE. Born Jan. 26, 1918, in the village of Scorniceşti, Olt District. A leader of the Rumanian and international communist and working-class movements; political and state figure of the Socialist Republic of Rumania (SRR).

The son of a peasant, Ceauşescu became active in the revolutionary working-class movement in 1932. He joined the Union of Communist Youth (UCY) in 1933 and shortly thereafter became a member of its central committee. In 1936 he joined the Rumanian Communist Party (RCP). He was persecuted for his revolutionary activities. In 1939 and 1940, Ceauşescu served as secretary of the Bucharest city committee of the UCY and was a member of the Central Commission on Work Among Youth of the Central Committee of the RCP. He was arrested in 1940 and remained in prison until 1944.

Ceauşescu served as secretary of the Central Committee of the UCY in 1944 and 1945. In 1945, at the National Conference of the RCP, he was elected a candidate member of the Central Committee. In 1945 and 1946 he served as secretary of the party committee of the first city district of Bucharest, and from 1946 to 1948 he was secretary first of the Dobruja regional party committee and then of the Oltenița regional party committee. Ceauşescu served as deputy minister of agriculture from 1948 to 1950 and as deputy minister of national defense from 1950 to 1954. He became a member of the Central Committee of the RCP in 1952.

Ceauşescu was elected a candidate member of the Politburo and secretary of the Central Committee of the RCP in 1954, and he became a member of the Politburo of the Central Committee of the RCP in 1955. He was elected first secretary of the Central Committee in March 1965 and general secretary of the Central Committee in July 1965. He served as a member of the Executive Committee and of the Permanent Presidium of the RCP from 1965 to 1974.

Ceauşescu became general secretary of the RCP in August 1969, a member of the Political Executive Committee of the Central Committee of the RCP in 1974, and chairman of the State Council of the SRR in December 1967. He was elected president of the SRR in March 1974. He became chairman of the National Council of the Democracy and Socialist Unity Front in 1968 (from 1968 to 1980 he was chairman of the Socialist Unity Front).

Ceauşescu was named a Hero of Socialist Labor of the Republic in 1964 and a Hero of the SRR in 1971 and was awarded the Order of Lenin in 1978. [29–109–6]

CEBOIDEA (New World monkeys), a group of higher primates. In most species the nasal septum is broad, and the nostrils are far apart and face outward. The body length ranges from 13 cm

(Goeldi's marmoset) to 75 cm (howler monkey), and the tail is from 19 cm (Goeldi's marmoset) to 90 cm (coaita). The tail in some species is prehensile. There are no cheek pouches or ischial callosities. The hair is dense and of varying color. There are 32 (marmosets) or 36 (cebids) teeth. Ceboidea include one superfamily that unites two families: Callithricidae and Cebidae. The monkeys are distributed in Central and South America. They are arboreal, diurnal (except *Aotus*), herd animals. Some live in small family groups. [29–1229–2]

ČECH, EDUARD. Born June 29, 1893, in Stračov; died Mar. 15, 1960, in Prague. Czech mathematician. Member of the Czechoslovak Academy of Sciences.

Čech's principal works deal with differential geometry and topology. He made important contributions to the theory of compact spaces and the general theory of homologous invariants. Čech was awarded the State Prize of the Czechoslovak Socialist Republic in 1951 and 1954.

ČECH, SVATOPLUK. Born Feb. 21, 1846, in the village of Ostředek, near Benešov; died Feb. 23, 1908, in Prague. Czech writer.

Čech graduated from the faculty of law of the University of Prague in 1869. From 1878 to 1899 he was an editor of the progressive journal *Květy*. He began writing in the 1860's. In his verse anthologies *Morning Songs* (1887) and *New Songs* (1888) and the narrative poems *The Songs of a Slave* (1894) and *The Mowers* (1903), Čech criticized bourgeois society and praised the struggle of working people against oppression, expressing faith in their victory. His prose works include the satirical novella *A New Amazing Excursion of Mr. Brouček, This Time Into the 15th Century* (1888; Russian translation, 1953), in which Čech ridiculed the philistinism and unscrupulousness of the Czech bourgeoisie and glorified the heroic Hussite past. In the narrative poem *The Steppe* (1908) he hailed the Russian Revolution of 1905–07.

Čech's works reveal romantic tendencies but are essentially realistic. They influenced the development of Czech democratic and revolutionary poetry.

ČELAKOVSKÝ, FRANTIŠEK LADISLAV. Born Mar. 7, 1799, in Strakonice; died Aug. 5, 1852, in Prague. Czech poet and folklorist.

Čelakovský studied at Charles University. During the years 1834–35 he edited the newspaper *Pražské noviny* and the supplement *Česká včela*. He taught at various universities from 1842 to 1952. Čelakovský published the collections *Slavic National Songs* (vols. 1–3, 1822–27), *Lithuanian National Songs* (1827), and *The Wisdom of the Slavic Peoples in Proverbs* (1851).

Čelakovský employed motifs of folk poetry in the poetry collections *Echoes of Russian Songs* (1829) and *Echoes of Czech Songs* (1839). He was the author of the philosophical and didactic narrative poem *The Hundred-petal Rose* (1840) and of numerous epigrams. He compiled anthologies of Russian and Polish literature. Čelakovský's works reflected the rise of the patriotic and democratic movement in Bohemia.

CELESTA, a keyboard metallophone. The celesta was named for its unusually dulcet, bell-like, ethereal tone. The instrument, which resembles a small upright piano, has a piano action and a set of chromatically tuned steel plates or bars with a compass from middle C to C of the five-line octave; the plates or bars are placed in box-shaped resonators designed to intensify the fundamental of each tone. Many composers, including modern composers, have used the celesta in orchestral works to obtain special effects. [29–133–6]

CELLINI, BENVENUTO. Born Nov. 3, 1500, in Florence; died there Feb. 13, 1571. Italian sculptor, goldsmith, and writer.

Cellini studied with the goldsmith M. Bandinelli and was influenced by Michelangelo. He worked in Florence, Pisa, Bologna, Venice, Rome (1532–40), and Paris, as well as at the court of Francis I at Fontainebleau (1540–45).

One of the most notable masters of mannerism, Cellini produced virtuoso sculptures and jewelry marked by delicate, exaggeratedly elongated figures, often with complex curves. Examples are the saltcellar made for Francis I (gold, enamel, precious gems; 1539–43, Museum of Art History, Vienna), *Narcissus* (marble, 1540's, National Museum, Florence), and *The Escorial Crucifix* (marble, 1562, the Escorial, Spain). Cellini boldly resolved the problems of creating sculptures in the round, especially in the statue *Perseus With the Head of Medusa* (bronze, 1545–54, Loggia dei Lanzi), which, like many of Cellini's other works, is characterized by excessive detail.

Cellini gained world fame as a writer from his *Life*, which he dictated between 1558 and 1565 (1st ed., 1728; Russian translation, 1848). An autobiography reading like a picaresque novel, Cellini's *Life* is noted for directness of narration. Ignoring the norms of literary style and the rules of grammar, Cellini used the language of the streets to re-create vividly the personality of the late Renaissance man in Italy.

Cellini also was interested in art theory. In 1568 he wrote two treatises, one on goldsmithing and the other on sculpture.

CENA, GIOVANNI. Born Jan. 12, 1870, in Montanaro Canavese; died Dec. 6, 1917, in Rome. Italian poet and journalist.

Cena studied at the University of Turin. He gained recognition with his first work, the narrative poem *Mother* (1897), which was devoted to the simple peasant woman. This was followed by *In umbra* (1899), a collection of lyrical poems depicting scenes of country life that were pervaded by love for the working people. Cena's poetry is notable for its unaffected speech, simplicity, and sincerity. In 1902, Cena became editor in chief of *Nuova antologia*, a literary and sociopolitical journal published in Rome that printed translations of works by M. Gorky, A. P. Chekhov, and V. G. Korolenko. Cena interpreted socialist ideas in the spirit of humanist enlightenment. His only novel, *The Forewarners* (1904; published in Russian as *At the Price of Life*, 1905), described the life of the urban poor.

CENTERBOARD, a retractable keel made of metal sheet or, less often, wood, used on small sailing vessels, such as yachts; its primary function is to increase resistance to leeway. The centerboard can be retracted into a watertight slot for sailing in shallow waters. [29–1000–1]

CENTER BOARDER, a single-masted, shallow-draft racing or pleasure sailboat equipped with a centerboard. Center boarders range in length up to 12 m. They have a gaff or Bermuda rig and are sometimes equipped with an engine. Center boarders are not very seaworthy and therefore are usually used where large waves are uncommon—on rivers, lakes, and small reservoirs. Their shallow draft permits them to sail in shallow waters with the centerboard retracted. [29–1000–2]

CENTRAL POWERS, the coalition, comprising Germany, Austria-Hungary, Turkey, and Bulgaria, that opposed the Allied Powers and their supporters in World War I. The coalition was formed when Turkey (in 1914) and Bulgaria (in 1915) joined the Dual Alliance of Austria-Hungary and Germany, which had been created by the Austro-German Agreement of 1879. [29–347–2]

CEPPHUS, a genus of birds of the family Alcidae. The body is 32–40 cm long and weighs 340–600 g. The bill is black, straight, and thin. The plumage of the adults is black in summer and mottled in winter. The feet are red. The birds fly, swim, and dive well, but they walk poorly. The diet consists of small fishes and marine invertebrates. The birds nest in groups in the crevices of cliffs or amid rocks. The clutch usually contains two eggs. The young are born with dense, soft, dark down; they leave the nest fully fledged.

There are two (or three) species. The black guillemot, or sea pigeon (*C. grylle*), lives along the coasts of the Arctic, North Atlantic, and Pacific oceans; those occurring in the Pacific are sometimes regarded as the separate species *C. columba*. The sooty guillemot (*C. carbo*), which has a white circle around the eyes, is common along the coasts of the seas of Okhotsk and Japan. In some places the birds are used commercially for their meat and eggs. [29–640–1]

ČERMÁK, JAROSLAV. Born Aug. 1, 1830, in Prague; died Apr. 23, 1878, in Paris. Czech painter.

From 1847 to 1850, Čermák studied in Prague, Munich, Antwerp, and Brussels. Beginning in the 1850's he lived mainly in Paris and traveled through Europe, visiting Dalmatia and Montenegro in 1858.

Čermák at first employed academic devices; however, he later painted convincingly realistic pictures notable for their significant imagery. He depicted scenes from history, including the Hussite Wars (*Hussites Defending the Pass*, 1857, National Gallery, Prague), as well as the life of Slavic peoples and their struggle for freedom and the everyday life of Norman fishermen; he also did landscapes. Čermák was an outstanding painter of portraits, the best of which express deep emotion and reveal keen psychological analysis (*Portrait of J. E. Purkinje*, 1857, National Gallery, Prague).

CERNAVODĂ, a city in southwestern Rumania, in Constanţa District; a port on the Danube. Population, 13,000 (1975). Cement, hardware, and wine are produced in the city. The Danube–Black Sea Canal begins near Cernavodă. [29–231–4]

CERUTI, GIACOMO (nicknamed Il Pitocchetto, or the Little Beggar). Years of birth and death unknown. Italian painter of the 18th century.

From 1720 to 1750, Ceruti worked in Brescia and possibly also in Venice. He was one of the most original masters of 18th-century Italian genre painting. His works, executed with a restrained palette, reveal a love for the common people, in particular, sympathy for the misery of the peasantry. One example is *The Traveler*, one copy of which is housed at the Testori Collection in Novara. Ceruti also painted religious scenes and portraits.

CESALPINO, ANDREA (also Andreas Caesalpinus). Born June 6, 1519, in Arezzo; died Feb. 23, 1603, in Rome. Italian physician, naturalist, and philosopher.

Cesalpino was a professor at the universities of Pisa (1555) and Rome (1592). A forerunner of W. Harvey in the study of blood circulation, he was the first to describe systemic circulation. Cesalpino laid the groundwork for plant morphology, anticipating the theories of metamorphosis and the homology of organs. In 1583 he proposed the first system of the plant kingdom, based mainly on the structure of seeds, flowers, and fruits. He distinguished two classes of trees and shrubs, 12 classes of subshrubs and herbs, and one class of aspermous plants. His classification system greatly influenced the development of botany. Cesalpino's philosophical views on nature were based on the teachings of Aristotle.

CESENA, a city in northern Italy, in Forlì Province, in Emilia-Romagna Region. Situated on the ancient Aemilian Way, near the Adriatic Sea. Population, 86,100 (1971). Industry includes machine building, the processing of fruits and vegetables, and the manufacture of building materials and wood products. [29–125–2]

ČESKE BUDĚJOVICE, a city in Czechoslovakia, in the Czech Socialist Republic; situated on the Vltava River. Administrative center of the province of South Bohemia. Population, 80,000 (1974).

Ceske Budějovice is a railroad junction and an important industrial center, accounting for one-fifth of South Bohemia's industrial labor force. A center for metalworking and machine

building, it manufactures motors, pots and pans, and needles. Light industry is also important; food products, pencils, furniture, paper, and ready-made clothing are produced.

Famous works of architecture in the city include the ruins of a 15th-century castle, a Gothic Dominican monastery with a church and cloister (13th century), and the Cathedral of St. Nicholas (13th–17th centuries) with the Black Tower (begun 16th century). Other structures of interest include the baroque town hall (1727–30) and the Piarists' College (18th century), as well as houses in the Gothic, Renaissance, and baroque styles. Modern structures include a stadium for swimming events (1971). The city has a museum of the revolutionary workers' movement (founded 1975). [29–338–2]

ČESKÝ KRUMLOV, a city in southwestern Czechoslovakia, in the province of South Bohemia; situated on the Vltava River.

Český Krumlov is known for its castle (13th–16th centuries) with its art collection and 18th-century theater, the Gothic Church of St. Vitus (14th century), the Corpus Christi Church (15th century), a Minorite church and monastery (14th–17th centuries), and the remains of the city fortifications (14th–16th centuries).

Other structures of note include the Renaissance town hall (c. 1580), the Jesuit College (16th–17th centuries), and 16th- and 17th-century houses with ornamental attics and ground-floor galleries. [29–339–1]

ÇEŞME, a city in western Turkey, on Çeşme Bay of the Aegean Sea. Population, approximately 6,000 (1975). Çeşme is a commercial center for tobacco, grapes, and figs. The battle of Çeşme took place in Çeşme Bay. [29–524–2]

ÇEŞME, BATTLE OF (1770), a sea battle that took place on June 26 (July 7), 1770, during the Russo-Turkish War of 1768–74, in Çeşme Bay in the Khios Channel of the Aegean Sea.

Operating in the Aegean Islands with nine ships of the line, three frigates, and one bombardier and under the nominal command of Count A. G. Orlov, the Russian fleet attacked the Turkish fleet on June 24 (July 5) in the Khios Channel northwest of Çeşme. The Russian fleet was under the immediate command of Admiral G. A. Spiridov. The Turkish fleet was commanded by Grand Admiral Gazi Hasan Paşa and consisted of 16 ships of the line, six frigates, six xebecs, 13 galleys, and 32 galliots. The Turkish flagship was sunk in the fighting. When the Russian ship of the line *Evstafii* exploded, the Turkish fleet, under covering fire from shore batteries, fled in panic and took shelter in Çeşme Bay, which was then blockaded by the Russian fleet.

On the night of June 25 (July 6), Spiridov sent advance units commanded by Rear Admiral S. K. Greig to the entrance of the bay. The units—four ships of the line, two frigates, and one bombardier—opened fire and, using incendiary shells, set fire to a number of Turkish ships. Four fire ships were then committed to the attack, one of which, commanded by Lieutenant D. S. Il'in, set fire to a Turkish ship of the line. The fire spread to other Turkish ships. Except for one ship of the line and five galleys, which were captured by the Russians, the entire Turkish fleet was destroyed by fire. The Turks lost more than 10,000 men, and the Russians, 11 men. As a result of the battle, the Russian fleet gained supremacy in the Aegean Sea. [29–339–2]

CETATE, a settlement in Rumania, on the left bank of the Danube, 20 km northeast of the city of Vidin.

During the Crimean War (1853–56), a battle was fought on Dec. 25, 1853 (Jan. 6, 1854) between Russian and Turkish troops near Cetate. After separating from the main force of the Danube Army to observe crossing points on the Danube, the forward detachment of Colonel A. K. Baumgarten—about 2,500 men, including 200 cavalrymen, and six artillery pieces—was unexpectedly attacked by an 18,000-man Turkish force approaching from the direction of Calafat and supported by 24 artillery pieces. The Russian troops repulsed several attacks, inflicting considerable losses on the enemy. At a critical moment in the battle, when the Russians had lost half their men and had run out of artillery shells, the 2,500-man detachment of Major General K. A. Bel'gard came to their aid and, with a decisive counterattack, overran the enemy. The Turks lost as many as 3,000 men, six artillery pieces, and three banners; the Russians lost about 2,000 men. [29–346–2]

CEVA, GIOVANNI. Born 1648; died 1734. Italian mathematician.

Ceva's most important contributions to mathematics were his results in the theory of transversals; they gave rise to a new, synthetic geometry. These results are presented in Ceva's work *De lineis rectis* (Concerning Straight Lines; Milan, 1678). [29–121–3]

CHABAN-DELMAS, JACQUES (real surname, Delmas). Born Mar. 7, 1915, in Paris. French political and state figure.

Chaban-Delmas began writing journalism in 1933. During World War II he was active in the Resistance. He became a deputy to the National Assembly in 1946 and was elected mayor of Bordeaux in 1947. He was a leader of two Gaullist parties: the Rally of the French People and the Union for the Defense of the Republic.

Chaban-Delmas was minister of public works in 1954 and 1955, minister of state in 1956 and 1957, and minister of national defense in 1957 and 1958. From 1958 to 1969 and from 1978 to 1981 he served as president of the National Assembly. As prime minister from 1969 to 1972 he carried out a flexible social policy and put forward a program designed to bring about a more just "new society." Chaban-Delmas became inspector general of finance in 1973 and ran for the office of president of the republic in 1974. [29–790–1]

CHABAZITE, a mineral of the zeolite group, with the chemical composition $(Ca, Na_2, K_2)Al_2Si_{3-8}O_{10-20}(5.4–9.4)H_2O$ and admixtures of Ba or Sr. Chabazite crystallizes in the trigonal system, forming rhombohedral crystals up to several centimeters in size. It also occurs in the form of crystalline aggregates and massive cryptocrystalline crusts. Chabazite is white or brownish, with a hardness of 4–5 on Mohs' scale and a density of 2,080–2,160 kg/m^3. It is formed in the pores and amygdules of effusive rocks and replaces volcanic tuff when acted upon by solutions of varied origin. It also occurs in hydrothermal veins and hot springs beds. Commercial deposits of chabazite are located in Bowie, Ariz. Structural analogues of chabazite have been synthesized. (*See also* ZEOLITES.) [29–788–2]

CHABOD, FEDERICO. Born Feb. 22, 1901, in Aosta; died July 4, 1960, in Rome. Italian historian. Director of the Italian Institute of Historical Research in Naples (1947); editor in chief of the journal *Rivista storica italiana* (1948–60).

During the fascist German occupation of Italy from 1943 to 1945, Chabod was active in the partisan movement in Valle d'Aosta. In 1946, after autonomy had been granted to the region, he headed its local government. His historical ideas were greatly influenced by the ethical and political world view of B. Croce. Chabod's research focused on political ideas, the bearers and originators of these ideas, and the ruling elite. Many of his works were devoted to the Renaissance. His best known work is *The History of Italy's Foreign Policy from 1870 to 1896*, of which only one volume was completed. In this work, Chabod presents a broad and many-sided picture of the ideological and political life of Italy after the country's unification.

WORKS

Lo stato di Milano nell'impero di Carlo V. Rome, 1934.
Storia della politica estera italiana dal 1870 al 1896, vol. 1: *Le premesse*. Bari, 1951.
L'Italia contemporanea (1918–1948), 3rd ed. Turin, 1970.
Storia dell' idea d'Europa. Bari, 1962.
L'idea di nazione. Bari, 1967.
Scritti su Machiavelli. Turin, 1964. [29–793–1]

CHABROL, JEAN PIERRE. Born June 11, 1925, in Chamborigaud, Gard Department. French writer. Participant in the Resistance.

Chabrol studied at the University of Paris and became a con-

tributor to the newspaper *L'Humanité*. His novel *The Last Cartridge* (1953) deals with the war in Vietnam; its hero is a spiritually dynamic individual who remains true to his sense of social justice. Life in a proletarian district of Paris is the subject of the novel *The Wretched Settlement* (Populist Prize, 1955; Russian translation, 1957). A Rabelaisian love of life is displayed in the novel *The Wild Rose* (1957), and historical optimism is evinced in the novel *God's Madmen* (1961; Russian translation, 1963).

Chabrol's series of novels *The Rebels* consists of three volumes: *The Rebels* (1965; Russian translation, 1969), *The Beggarwoman* (1966), and *Better Weather* (1968); the heroes of these novels take part in events of European history between Hitler's rise to power and the victory of the Popular Front in France in 1936. The novel *The Cannon "Fraternité"* (1970; Russian translation, 1972) deals with the Paris Commune of 1871 and is imbued with a faith in the just cause of the universal brotherhood of the toiling masses. Chabrol's science-fiction novel *A Goat in the Desert* (1975) re-creates the dramatic fate of A. d'Aubigné.

CHACO, a province in northern Argentina, in the basin of the Paraná and Bermejo rivers. Area, 99,600 sq km. Population, 566,600 (1970). The capital of Chaco is the city of Resistencia. Chaco is a major cotton-growing region. Livestock are raised for meat. Industry includes quebracho lumbering and the production of tanning extract. [29–34–3]

CHACONNE, an old dance. The chaconne originated in the late 16th century and acquired its characteristic stately, majestic quality in the 17th century. It is danced in a slow tempo, in ¾ time. J. B. Lully used chaconnes as concluding pieces in his ballets.

In the 17th and 18th centuries the chaconne developed as an instrumental piece with a theme repeated in the bass, in a manner similar to the passacaglia. A chaconne for violin with bass attributed to T. Vitali and the chaconne from J. S. Bach's Partita in D Minor for Unaccompanied Violin became especially popular. Many pieces have been composed in the chaconne form, including Beethoven's 32 Variations on an Original Theme in C Minor for Piano. Composers of the 17th and 18th centuries used the chaconne form in opera finales. [29–35–1]

CHACO WAR OF 1932–35, a war between Bolivia, which had ties with monopolies in the USA, and Paraguay, which was dependent on Great Britain.

The Chaco War was fought over a disputed border region in the Chaco, where petroleum deposits had been discovered in the 1920's. Armed clashes took place as early as 1927, and war broke out in July 1932. During the war, the USA openly supported, and supplied arms to, Bolivia. Great Britain did the same for Paraguay. By June 1934, Paraguay controlled most of the disputed territory.

Both sides suffered heavy casualties: a total of 250,000 were killed or wounded. The war exhausted the resources of both countries and sharply aggravated their internal political situations. In June 1935, after mediation by the USA, Argentina, Brazil, Chile, Peru, and Uruguay, a truce was declared. The peace treaty of July 1938 gave Paraguay most of the territory at issue. By the 1940's, however, the area was controlled by US oil monopolies. [29–35–4]

CHAD (République du Tchad; Republic of Chad), a state in Central Africa. Chad borders on Libya in the north, on the Sudan in the east, on the Central African Republic in the south, and on Cameroon, Nigeria, and Niger in the west. Area, 1.284 million sq km. Population, 4.160 million (1977). The capital is the city of Ndjamena (formerly Fort Lamy). For administrative purposes, the country is divided into 14 prefectures.

Government. In November 1979, a provisional government of the National Unity was formed as a result of a military coup.

Natural features. The northern half of Chad lies within the Sahara, while the southern half encompasses the Sahel and part of the natural region of the Sudan. Most of Chad is occupied by a flat plain, with elevations of 250–300 m in the west (the Bodele depression, 155 m) and 350–400 m and higher in the north, east, and south. In the north the plains are crossed by numerous wadis, and extensive areas are occupied by shifting sands. The Tibesti plateau, whose highest elevation reaches 3,415 m, is located in the extreme north. Rising in the northeast are the Erdi (1,115 m) and Ennedi (1,450 m) plateaus, while the Wadai (Ouaddaï) massif (with Mount Guéra at 1,790 m) is located in the southeast.

Chad lies in the northeastern part of the African Platform, within the Central African Shield, the Saharan Platform, and the Chad Syneclise. There are outcrops of metamorphic rocks of the Precambrian foundation in the Tibesti and Wadai massifs (highlands) and in the southwestern part of the country. The platform mantle is composed of diverse sedimentary rocks of the Paleozoic Era, Cretaceous period (the Tibesti massif and Erdi and Ennedi plateaus), and Cenozoic era (Chad Syneclise). The Tibesti and Wadai massifs have extensively developed Cenozoic volcanic rocks.

Minerals have been poorly studied. The northeastern shore of Lake Chad has deposits of natural sodium carbonate. Located in the southwest are deposits of bauxites (at Moundou, with known reserves of 10 million tons, and Laï, with 3.5 million tons; containing up to 57 percent Al_2O_3); iron-ore deposits are found in the eastern part of the Wadai massif (Hadjer) and near the city of Pala. There are also deposits of tin and tungsten ores (Tibesti), linked with rare-metal pegmatites, within which are also encountered tantalum and niobium ores, as well as some gold (Wadai), zinc (Tibesti), copper (Lake Léré), and uranium (Ennedi plateau). Deposits of petroleum have been discovered in the western and southwestern parts of the country, in the Chari (Shari) River basin.

North of 15°–16° N lat. the climate is tropical desert. The average January temperature is 15°C (on the Tibesti highland, below 10°C), while the average July temperature is 30°–35°C; daily temperatures fluctuate greatly, on an average 20°C. Annual precipitation amounts to 100–250 mm, although in places it is less than 50 mm; rainfall is infrequent and irregular. Strong winds causing sandstorms are characteristic. In the south the climate is equatorial monsoonal, with dry winters (October or November to April or May). The average temperature in January is 21°–24°C, and in April or May, 30°–33°C. The annual amount of precipitation increases from 250–500 mm in the north to 1,000 mm in the south.

There are no permanent surface streams in the northern part of Chad; the wadis fill up with water only after rainfall. In the south the river network is fairly dense. The principal navigable rivers are the Chari, which empties into Lake Chad (the eastern part of which belongs to the Republic of Chad), and its tributary the Logone. Other rivers include the Aouk and the Salamat, both tributaries of the Chari River, and the Batha, which empties into Lake Fitri. The rivers overflow considerably during the rainy season, flooding enormous areas and turning them into unbroken swamps; during the dry season they become very shallow.

The northern regions are dominated by stony deserts, nearly devoid of vegetation, alternating with sandy deserts, with thorny subshrubs and shrubs, such as camel thorn, tamarisk, and acacia. Date palms grow in the oases. Along the southern edge of the Sahara the vegetation is of the semidesert type. South of 15°–16°N lat. there are extensive desert-type savannas, with sparse grassy cover and acacia thickets growing on reddish-brown and brown soils. The extreme south has typical savannas, with baobabs and doum palms growing on leached out reddish-brown soils. The low-lying areas have black hydromorphic compact soils, enriched with carbonates. There are grassy swamps in the floodplains of the rivers and along the shores of the lakes.

The savannas are the habitat of many large mammals, such as the elephant, rhinoceros, including the white rhinoceros, buffalo, giraffe, and various antelopes. Predators include the lion, leopard, jackal, and hyena; certain savanna-type fauna, namely, lions

and antelopes, are also encountered on the edge of the desert zone; fauna is scarce deep within the desert. Hippopotamuses and crocodiles inhabit the lakes. Snakes, lizards, and insects abound. Characteristic among the birds are ostriches, along the edge of the Sahara, as well as various aquatic and swamp birds, along the rivers and lakes. Within Zakouma, the country's largest national park, elephants, rhinoceroses, giraffes, buffalo, antelopes, ostriches, and other animals are protected.

Population. The ethnic composition of the population is complex. About one-half of the population consists of peoples who speak the languages of the Central and Eastern Sudan, including Baguirmi (along with the related Sara, Laka, Bongo, and other languages), Mboum, Maba, Mimi, Massalit, Dago, and Tama. The desert regions north of Lake Chad are inhabited by the Tubu, who linguistically belong to the Kanuri-Tubu group, and Arabs, some of whom lead a nomadic way of life. South of Lake Chad are the peoples of the Hausa language family, including the Hausa, Moubi, Massa, and Kotoko. There is also a small number of Europeans, primarily French. The official language is French. The Arabic language is also widespread.

More than 50 percent of the population adheres to traditional local beliefs. The rest are mainly Muslims; there are some Christians—Roman Catholics and Protestants. The official calendar is the Gregorian.

In the period 1970–74, the average annual population growth amounted to 2.1 percent. The economically active population totals (1976) 1.5 million, of which 1.3 million are engaged in agriculture and only 24,000 in industry. The average population density is (1977) 3.2 persons per sq km. The southern part of the country is the most populated, while the northern part is the least populated. The urban population constitutes 15 percent (1977, estimate) of the total. The most important cities are Ndjamena (population, 300,000 in 1975, including the suburbs), Sarh, Moundou, and Abéché.

Historical survey. Archaeological finds reveal that the area now occupied by Chad was settled in ancient times. The earliest archaeological culture that has been studied in what is now Chad is the Sao culture, dating from the end of the first millennium A.D. (*see* SAO). The Kanem state emerged in the ninth century (*see* KANEM-BORNU EMPIRE). The Wadai (Ouaddaï) state formed in the eastern part of present-day Chad between the 12th and 14th centuries (*see* WADAI). In the 16th century, the Baguirmi (Bagirmi) state emerged in the central part of Chad. In the mid-18th century it seized part of Kanem-Bornu, but at the beginning of the 19th century Baguirmi itself came under the vassal dependency of the Wadai state. At the end of the 19th century, almost all of Baguirmi and part of Kanem-Bornu and Wadai were included in the Rabah, or Rabeh, state (*see* RABAH STATE). The peoples of the Rabah state stubbornly resisted the French colonialists, who in the late 19th century embarked on colonial expansion in Equatorial Africa. After the destruction of Rabah's army by French troops in 1900, Chad was proclaimed a French military territory, although the conquest of certain areas continued until 1914. In 1904, Chad was made a part of the French colony of Ubangi-Shari-Chad (or Ubangi-Chari-Chad), which in 1910 was included in the colonial federation of French Equatorial Africa. In 1914, Chad was separated from Ubangi-Shari and made an independent colony within French Equatorial Africa. France made Chad a military-strategic base of operations and the source of agricultural raw materials for the mother country. During World War II, Chad was one of the bases of the Fighting French, and military operations were conducted from its soil against Italian and German troops in Libya.

After World War II, the national liberation movement intensified in Chad. In 1946, Chad became an overseas territory of France within French Equatorial Africa. The struggle for Chad's independence was led by the Progressive Party of Chad (Parti Progressiste Tchadien; PPT), founded in 1947 as a local section of the African Democratic Assembly (*see* AFRICAN DEMOCRATIC ASSEMBLY). In 1957 a government council of Africans was founded in Chad. On Nov. 28, 1958, in accordance with the results of a referendum of Sept. 28, 1958, on the draft of the new French constitution, Chad was proclaimed a republic within the French Community, and F. Tombalbaye, the PPT leader, was named head of the government. On Aug. 11, 1960, Chad was proclaimed an independent state, and Tombalbaye became president. On Sept. 20, 1960, Chad became a member of the UN.

After the proclamation of independence, Chad's development proceeded amid an intense internal political struggle. In April 1962 a constitution was adopted that reaffirmed the presidential system that had emerged in the country. In 1962 all political parties except the PPT were disbanded, resulting in a one-party system; all opposition was prohibited, which was officially confirmed by a 1965 amendment to the constitution.

In the economic sphere the development of private capital was encouraged: various tax incentives were granted by the government, which also sought to attract foreign capital, primarily French. In 1963 a code on investments was adopted that granted various privileges to foreign entrepreneurs. At the same time, in order to overcome economic backwardness, the government broadened the state's role in all spheres of economic life. It strove to gain control of the credit and monetary system, and it endeavored to establish state-run enterprises and mixed enterprises (that is, partially state controlled), and to introduce economic planning; it also turned to social development.

In 1965 antigovernment demonstrations by the ethnic groups of the north and northeast increased. In 1966 leadership of the struggle was taken over by the underground military-political organization of the Chad National Liberation Front (Frolinat); the group's program sought the political and social renewal of Chad, the strengthening of its national independence, and the provision of equal rights for all citizens of the country. In order to suppress these outbreaks, French troops were brought into Chad in 1968, and remained until 1972. (French military units were sent to Chad after 1972 upon the request of the Chad government.)

In order to ease the situation in the country, a policy of national reconciliation was implemented in 1971. An extraordinary congress of the PPT was held in 1973, which adopted a resolution providing for its own dissolution and for the founding of a new political organization—the National Movement for Cultural and Social Revolution (Mouvement National pour la Révolution Culturelle et Sociale; MNRCS). Nevertheless, the domestic political situation remained tense. A military coup was staged on Apr. 13, 1975, as a result of which Tombalbaye was killed, the government was dissolved, constitutional guarantees were suspended, and the activities of political parties and trade unions were prohibited. In August the Supreme Military Council was proclaimed as the highest body of power; Brigadier General F. Malloum became president of the Supreme Military Council and head of state.

On Aug. 29, 1978, the Fundamental Charter of the Republic of Chad (Charte Fondamentale du Tchad) was proclaimed. According to the charter, F. Malloum became president, and H. Habré, leader of the Armed Forces of the North (FAN), a military and political group that split from Frolinat, became prime minister. In February 1979 the military forces supporting Habré, Frolinat, and other rebel groups confronted the army of Malloum in Ndjamena. In March 1979 the Malloum regime fell.

The struggle for power among certain ethnic groups continued. In August 1979 these groups reached an agreement in Lagos, and the Transitional Government of National Unity (Gouvernement de l'Union Nationale de Transition) was formed; it included representatives of all ethnic groups, on the basis of equal representation, from southern and northern Chad. Goukouni Oueddei became head of state and of government. As a result of armed conflict between FAN and Frolinat in March 1980, internecine conflict erupted again. In December 1980 the army under Goukouni Oueddei seized control of Ndjamena.

Since its independence, the Republic of Chad's foreign policy has been guided by the principles of nonalignment with power blocs and noninterference in the internal affairs of other countries. Chad supports peaceful coexistence, universal and complete disarmament, and the declaration of Africa as a nonnuclear zone. It opposes racism and apartheid and supports the eradication of the colonial system. Chad is a member of the Organization of African Unity and an associate member of the European Economic Community (Common Market). It supports close relations with France, with which in 1960 it signed a number of agreements on cooperation in various spheres; the agreements were reviewed in 1976.

The USSR recognized the Republic of Chad the day independence was proclaimed and established diplomatic relations in November 1964. An agreement on scientific and cultural cooperation was concluded between the USSR and Chad in 1966, a trade agreement in 1967, an agreement on economic and technical cooperation in 1968, and an agreement on air transportation in 1974. S. Iu. Sorokina

Economy. Chad is an agrarian country. Agriculture accounts for about 80 percent of the gross domestic product, while industry accounts for approximately 11 percent. In 1976 the per capita gross domestic product was $90. The key positions in the economy are occupied by foreign, primarily French, capital. The government's economic policy focuses on ways of attracting and encouraging foreign investments. At the same time, the complex problems of overcoming the country's economic backwardness have necessitated extensive involvement by the state in the economy, the establishment of state enterprises and mixed enterprises (that is, partially state controlled), and the introduction of planning in economic and social development.

AGRICULTURE. Agriculture is dominated by communal landownership, and land tenure is by subsistence and semisubsistence peasant farms. All farming operations are done by hand. The state grants credits to the peasants and establishes state forms of organization of agricultural production.

Agricultural land occupies 40 percent of the country's land area; 13 percent of the agricultural land is cultivated. The main branch of agriculture is crop production, which is widespread in the southern part of the country. The principal export crop is cotton, which is cultivated primarily in the southwest, in the Logone River basin. In 1976, 174,000 tons of raw cotton were harvested from an area of 330,000 hectares (ha). The principal food crops are millet (area, 900,000 ha; harvest, 523,000 tons in 1975), peanuts (56,000 ha, 45,000 tons), rice (53,000 ha, 37,000 tons), and wheat (5,000 ha, 4,000 tons). Date palms, which yielded 26,000 tons of dates in 1975, are grown in the oases of the southern Sahara.

The traditional occupation of one-third of the population is nomadic or seminomadic stock raising. Periodic droughts contribute to a considerable decline in the livestock population. In 1976 there were 4 million head of cattle and 5 million sheep and goats. There is also fishing, on Lake Chad, the Logone River, and elsewhere, yielding as much as 110,000 tons of fish annually. Fish are exported in dried or smoked form.

INDUSTRY. Industry is represented primarily by small-scale, mainly cottage-type, enterprises engaged in processing agricultural raw materials. Most of the major enterprises are in the food-processing industry; they include slaughterhouses and refrigeration plants, a meat-packing complex, a flour mill, rice mills, vegetable-oil mills, a sugar refinery, and a brewery. Enterprises of the textile industry include cotton-ginning mills and a textile complex in Sarh. A sugar-refining complex was under construction in 1978 in Sarh.

Electric power plants operate on imported petroleum. The generation of electric power amounted to 60 million kW-hr in 1975. Sodium carbonate is extracted (about 10,000 tons in 1974).

TRANSPORTATION. Motor-vehicle roads total 32,000 km, of which 255 km are paved with asphalt (1976). Motor vehicles number 12,000 (1976). There is shipping along the Logone and Chari rivers. Ndjamena has an international airport.

FOREIGN TRADE. In 1974 exports amounted to 9.1 billion francs CFA, and imports amounted to 20.9 billion francs CFA. The chief exports are cotton, which accounts for 70 percent of the export value, and livestock products, which account for 20 percent. The principal imports are industrial and transportation equipment (more than 40 percent), petroleum products (23 percent), foodstuffs (12 percent), chemicals (10 percent), and textile goods (8 percent). The principal trading partner is (1974) France, which bought 50 percent of the exports and provided 44 percent of the imports.

The monetary unit is the franc CFA. (As of July 1977, 244.1 francs CFA = US $1). S. Iu. Sorokina

Armed forces. The armed forces comprises the army (4,500 men), air force (300 men), and a police force (2,500 men). In addition there is a national guard and a nomad guard (4,200 men). General leadership of the armed forces is exercised by the Committee of National Defense, the president of which is also head of state; he also heads the Ministry of National Defense.

Medicine and public health. According to the World Health Organization, the birthrate in the period 1965–70 (on an annual average) was 47.7 per 1,000 population, and the mortality rate, 25; infant mortality is high (160 per 1,000 live births in the period 1965–70). The principal causes of death are infectious and parasitic diseases, as well as malnutrition. Also widespread are tuberculosis, venereal diseases, malaria, leprosy, gastrointestinal diseases, and childhood diseases.

In 1977, Chad had four hospitals, two polyclinics, 20 medical centers, and about 150 other medical establishments; the number of hospital beds totaled 3,500. There were 89 physicians (one physician per 50,000 inhabitants), of which 26 were Africans, three dentists, five pharmacists, and more than 1,000 secondary and other types of medical personnel. Physicians are trained abroad, while the secondary medical personnel are trained (since 1961) at a special medical school in Chad. Expenditures for health care amounted to 6.8 percent of the state budget in 1976.

A. S. Khromov

VETERINARY MEDICINE. Veterinary services in Chad are only in the formative stage. There is an acute shortage of veterinary personnel, and veterinary statistics have not been compiled. Enormous economic damage is inflicted by anthrax, as well as rinderpest, epidemic pneumonia, and parasitic diseases. Also widespread are bovine scabies, scabies of solid ungulates and camels, helminthiasis of camels, cattle, and swine, echinococcosis and cysticercosis of ruminants, fascioliasis, trypanosomiasis, and piroplasmosis. Cases have also been registered of rabies, streptotrichosis, and emphysematous anthrax, or blackleg (primarily among cattle and camels). Diseases caused by a deficiency in trace elements and vitamins are responsible for the low productivity of livestock.

As of 1976, Chad had 25 veterinarians. There is a veterinary research center in Ndjamena. Chad has 52 veterinary stations, including six border stations (1976), as well as a veterinary school. The USSR assists Chad in operating the veterinary center and in training veterinary specialists.

Education. The first European-type schools appeared in what is now Chad at the beginning of the 20th century. Before that there existed a rather well-developed network of Muslim educational institutions, including Koran schools and madrasas. By the time independence was declared (1960), about 10 percent of the children of the corresponding age group were attending primary schools and less than 1 percent were attending secondary schools. A state center for the elimination of illiteracy was founded in 1962. A 1967 law introduced four-year compulsory education.

To a large extent, Chad's school system is based on the French system. The administration of public education is under the jurisdiction of the Ministry of National Education, which monitors the work of both state and private educational institutions. Children from the age of six are accepted at the primary, six-year, school. The primary school is subdivided into three two-year cycles: preparatory, elementary, and intermediate. Rural localities have incomplete primary schools, with a four-year course of instruction. Competitive examinations must be passed in order to gain admission to secondary educational institutions. There are two types of secondary general-education schools: general-education colleges, with a four-year term of instruction, which provide an incomplete secondary education, and *lycées*, with a seven-year term of instruction, which provide a complete secondary education. *Lycée* graduates who have passed examinations for a baccalaureate diploma can enroll at a higher educational institution without taking examinations.

Vocational-technical education is poorly developed. Those completing primary school can go on to apprenticeship centers, with a term of instruction ranging from two to three years; there are also technical and business schools, with a term of instruction lasting six or seven years.

Instruction in all educational institutions is conducted in French. During the 1975–76 academic year, primary schools had an enrollment of more than 450,000 pupils, which amounted to about 50 percent of the total number of children of the corresponding age group. In the 1973–74 academic year, secondary schools had an enrollment of 12,900 persons, of which 11,400

were in general-education institutions, while the remainder were in vocational-technical and teacher-training educational institutions.

Located in Ndjamena is the University of Chad. Founded in 1971, it has faculties of literature, law, exact sciences, pedagogy, and zootechny; during the 1976–77 academic year, it had an enrollment of 600 students. The university library has 9,000 volumes. Also in Ndjamena are the National School of Administration, the Institute of Stock Raising and Veterinary Medicine, and the National Museum (founded 1963). V. P. BORISENKOV

Press and radio. Since 1979, a bulletin of the Chad Press Agency is published, although irregularly, in Chad. A radio station operates in the city of Moundou.

Architecture and art. Remains of the ancient Sao culture, primarily dating from the eighth through tenth centuries, have been discovered in the southern part of Chad; they include ruins of settlements and the remains of pottery for daily use and terra-cotta and bronze statuettes of people and animals. Particularly expressive are the clay human heads with sharply deformed facial proportions dating mainly from the tenth century. Rural villages consist of closely grouped huts, surrounded by an earthen wall or enclosure. The huts are circular or rectangular, with pisé walls and pointed roofs. In the cities, the houses have inner courts and flat roofs and are surrounded by crenelated walls. Weaving (bright, striped fabrics) and embroidery (geometric designs) are well developed, as are leatherwork (bags, saddles, footwear, vessels), metalworking (weapons with fine, geometrical ornamentation, copper and bronze ornaments, silver embossing), braiding and plaiting (baskets, cups, plates with geometric ornamentation), and pottery-making (basins, vases, jars with polychrome drawings).

Music. The diversity of Chad's music stems from the ethnic diversity of the population. The musical traditions of Chad's many ethnic groups are strictly regulated. Many difficulties in the development of music are linked with the castelike structure of society and to the limitations imposed by the social order; for example, not everyone has the right to play certain instruments.

The most important musical instruments are drums. Made of clay or various types of wood, they are cylindrical, in the shape of a truncated cone (with membranes consisting of a tough, viscous cake) and have one or two heads. A performer frequently plays two drums simultaneously, one of which seemingly represents the male voice, and the other, the female voice. Ensembles of three drums are popular, their mixed resonance producing a complex polyrhythmic texture. Other percussion instruments are also widespread, including various types of rattles and little bells; of particular importance are xylophones (balaphons), of which there are several varieties. Wind instruments and stringed instruments (for example, the lute) were evidently brought in from the Arab countries. The former include the *alghaita* (a type of oboe), a reed transverse clarinet, and a metallic horn (about 230 cm long). Usually the wind instruments are combined with drums; a typical professional ensemble consists of an *alghaita*, two or three drums, and a singer accompanying himself on the lute.

Songs and dances are diverse; many are connected with specific occupations (the hunters' dance *mdomdang*), rituals (*ndom mbessi, bajan*, and *n'dassdon*, dances accompanying initiation rites, and *klag*, a funeral dance), or holidays (*amgermane, mbille, sai, basaka*, and *joro-joro*). There is a rich repertoire of laudatory songs honoring famous events or persons. Most of the songs are characterized by the pentatonic scale, an octave range, a descending melodic line, and an antiphonal execution (soloist and chorus or a vocal exchange between two choruses).

Since the proclamation of independence, a great deal of attention has been focused on the development of music. The National Center, organized under the auspices of the university in Ndjamena, is involved in collecting and arranging folk music. In 1970 the National Dance Ensemble was established (with Ngorjo Buletit as artistic director), with which the work of many of Chad's musicians is connected, including that of the singers Magalvana Betara and Zaido Kema. The ensemble has toured abroad, including the USSR (1975).

CHAD, a lake in Africa with no outlet, located within the natural region of the Sudan in Nigeria, Niger, the Republic of Chad, and Cameroon.

The modern lake is the relict of an ancient landlocked basin of water, which during periods of increased climatic humidity repeatedly expanded—to as much as 400,000 sq km about 5,000 or 6,000 years ago—and then shrank in size. The area of the lake varies, depending on long-term fluctuations in the level, from 10,000 to 26,000 sq km; the maximum depth varies with the area from 4 to 11 m.

Lake Chad lies within a flat basin at an elevation of 240 m; the shores are flat and primarily swampy, bounded in the north by sand dunes. The open expanses of water in the northwestern, southern, and southeastern parts of the lake are separated by shoals—ancient submerged dunes overgrown with reeds and papyrus. Numerous islands, the peaks of semisubmerged dunes, are found along the northeastern and eastern shores.

The lake receives the Chari (Shari) River from the south, the Komaduga Yobé River from the west, and several smaller rivers. The average annual fluctuation of the water level is about 1 m; the highest levels occur in December or January, when the mean flow rate of the Chari is the highest; the lowest levels occur in July. The water of Lake Chad is fresh near the river mouths and slightly salty everywhere else; the negligible mineralization is explained by the continual replacement of the water in the lake as a result of the underground drainage of infiltration waters. In rare instances, during extraordinarily high levels, there is a temporary surface flow of the lake to the northeast, through the dry arm Bahr el Ghazal.

Manatees, hippopotamuses, and crocodiles abound in Lake Chad. There are numerous species of aquatic and swamp birds. The lake is used for fishing, yielding an annual catch of about 100,000 tons. It is navigable between the mouths of the Chari and Komadugu Yobé rivers.

CHADAN, a city and the administrative center of Dzun-Khemchik Raion, Tuva ASSR. Chadan is located in the western part of the Tuva Basin, on the Chadan River of the Enisei basin, 225 km west of Kyzyl on the Kyzyl–Ak-Dovurak highway. Chadan has a butter factory and an industrial combine. Hard coal is mined in the area. [29–14–1]

CHAD LANGUAGES, a group of languages spoken in West and Central Africa and related to the Afrasian, or Afro-Asiatic, languages (*see* HAMITO-SEMITIC LANGUAGES).

The Chad languages are classified genealogically into numerous subgroups. The western subgroup, spoken in northern Nigeria, includes (1) Hausa; (2) Angas, Sura, Gerka, Ankwe, and Montol; (3) Karakare, Bolewa, Ngamo, and Kanakuru (Dera); (4) Warjawa and Afawa (Pa'a); (5) Bedde (Bade) and Ngizim; and (6) Ron, Fyer, Bokkas, Sha, and Kulere. The central subgroup, spoken in northeastern Nigeria, northern Cameroon, and Chad, includes (1) Tera and Ga'anda; (2) Bura, Margi, and Kilba; (3) Higi (Hiji), Bata, Hidkala (Laamang), and related languages; (4) Wandala (Mandara), Gamergu, Paduko, and Glavda; (5) Sukur, Matakam, and Gisiga; (6) Daba; (7) Gidder; (8) Kotoko, Logone, Buduma, and related languages; and (9) Musgoi, Masa, and related languages. The eastern subgroup,

spoken in Chad and the Central African Republic, includes Chire, Nancere, Somrai, Modgel, Sokoro, Mubi, Tumak, and Tuburi. There are more than 150 Chad languages.

The German scholars J. Lukas and D. Westermann classified the Chad languages by typological features into two independent groups, the Chad and Chado-Hamitic; only the latter were considered to be related to the Afrasian languages. J. Greenberg demonstrated that all the Chad languages are Afrasian.

The phonology of the Chad languages is characterized by a rich consonant system that includes glottalized obstruents: the injective (preglottalized) consonants ɓ and ɗ and such ejective consonants as ƙ and ƈ. The central subgroup has voiced and voiceless lateral sibilants. Vowels are short or long. Certain tones serve to differentiate lexical and grammatical meaning in otherwise identical words.

The morphological structures of the Chad languages are typologically diverse. Masculine and feminine genders are distinguished in many of the languages. Verbs have a highly developed system of aspect and tense forms; in many of the languages these forms are expressed by analytic markers that often form a single complex with personal adverbal markers of the subject. The highly developed system of derived forms of the verb, which includes the intensive, iterative, causative, and reflexive, is based on suffixes, internal inflection, reduplication, and, in some cases, prefixes. The central subgroup exhibits an opposition between inclusive and exclusive pronouns.

CHADOBETS, a river in Krasnoiarsk Krai, RSFSR; a right tributary of the Angara River. The Chadobets is 647 km long and drains an area of 19,700 sq km. It flows over the Central Siberian Plateau; there are rapids near the mouth. The Chadobets is fed by snow and rain. High water occurs in May and June, and there are freshets in summer. The mean flow rate 133 km from the mouth is approximately 63 cu m per sec. The Chadobets freezes over in October, and the ice breaks up in May. [29–14–3]

CHADOR, a white, blue, or, sometimes, black covering in which Muslim women used to wrap themselves from head to foot when they left the house. Only the eyes remained uncovered. The chador was worn by a number of peoples in Iran, Afghanistan, Azerbaijan, and the Arab countries, including Yemen and Iraq. It was used mainly in the cities. The chador is still worn by some women in Iran, Afghanistan, and certain Arab countries. [29–14–4]

CHADWICK, JAMES. Born Oct. 20, 1891, in Manchester; died July 24, 1974. English physicist. Fellow of the Royal Society of London (1927). Student of E. Rutherford.

Chadwick graduated from the University of Manchester and received the Ph.D. degree from Cambridge University. From 1923 to 1935 he taught at Cambridge University and was assistant director of the Cavendish Laboratory. From 1935 to 1948 he was a professor at the University of Liverpool. Beginning in 1948, he was master of Gonville and Caius College at Cambridge University.

Chadwick's main works were devoted to nuclear physics. His first papers were on radioactivity. In 1920, Chadwick experimentally confirmed that the charge of a nucleus was equal to the atomic number of the element. He then studied the artificial transmutation of elements under the action of alpha particles (with Rutherford). One of his major contributions was the discovery in 1932 of the neutron upon bombardment of a beryllium target by a stream of alpha particles, for which he was awarded a Nobel Prize in 1935. In 1934–35, Chadwick and his co-worker M. Goldhaber set up experiments on the photodissociation of the deuteron into a neutron and proton under the action of gamma quanta. From 1943 to 1945, Chadwick headed the group of British scientists who were working at the Los Alamos Laboratory (United States) on the atomic bomb.

CHADYR-LUNGA, a city since 1958 and the administrative center of Chadyr-Lunga Raion, Moldavian SSR. Situated on the Lunga River, Chadyr-Lunga has a railroad station on the Bessarabskaia-Reni line. Industry includes an electrothermal-equipment plant, a tobacco-curing plant, the Soiuzzhivmash Experimental Plant, a meat-packing plant, a winery, and a rug-making factory. A museum of local lore and history is located in Chadyr-Lunga. [29–15–1]

CHAETA, one of numerous movable hairlike pectinate or hooked protuberances of the cuticle in invertebrates. Chaetae have many purposes. In some invertebrates they help support the body during digging (Echiuroidae, many annelid worms, Pogonophora) or crawling (annelid worms). In other invertebrates it serves a protective function (certain polychaetes and brachiopods), and in still others it is used in capturing prey (chaetognaths). In polychaetes, the chaetae are part of the primitive extremities—parapodia. Each chaeta consists of a single cell on the floor of a cutaneous invagination. The chaetae of arthropods are hairlike or feathery protuberances of the chitinous cuticle; they are sense organs (mainly of touch) and sometimes help protect the body, especially the wings, from excessive wetness. Some ticks and mites still preserve primitive metamerism in the arrangement of their chaetae. [29–1599–2]

CHAETODONTIDAE, a family of fishes of the order Perciformes. The tall, laterally compressed body usually reaches a length of 25 cm. The coloration is a bright mottling. The fishes are solitary. They are not good long-distance swimmers but when pursued by predators easily find a hiding place in the cavities or crevices of reefs. The fishes inhabit shallows of the world ocean and are most numerous in the tropics, where they invariably appear around coral reefs. There are about 150 species. Best known are the butterfly fishes and angelfishes (the latter are often assigned to the separate family Pomacanthidae).

CHAETOGNATHA (arrowworms), a phylum of marine invertebrates having a transparent elongate body that measures 5 mm to 9 cm in length. There are lateral fins and a caudal fin. The head bears sickle-shaped bristles that serve to capture prey. The coelom is divided by transverse septa into a head, trunk, and tail. The digestive tract is straight. There are no circulatory or excretory systems. The nervous system consists of an epipharyngeal brain and a ventral ganglion that are connected by long longitudinal cords. Chaetognaths are hermaphrodites. They are predators that live amid marine plankton. There are six genera, embracing about 30 species. Chaetognaths are usually assigned to the group of deuterostome animals; sometimes the invertebrates are regarded as an independent taxonomic category higher than a phylum.

CHAFFEE, ROGER BRUCE. Born Feb. 15, 1935, in Grand Rapids, Mich.; died Jan. 27, 1967, on a launch pad at Cape Kennedy. US astronaut and pilot; lieutenant commander in the US Navy.

Chaffee graduated in 1957 from Purdue University with a degree in aeronautical engineering and then served at a naval air station in Florida. He entered the Air Force Institute of Technology at Wright-Patterson Air Force Base, Ohio, in 1963. That same year, Chaffee was among a group selected for astronaut training by the National Aeronautics and Space Administration. He was chosen with V. Grissom and E. White to be a crew member on the first flight of the Apollo spacecraft. Chaffee died with Grissom and White in a fire that swept through the command module of the spacecraft during a launch rehearsal. A crater on the far side of the moon has been named for Chaffee. [29–110–1]

CHAGALL, MARC. Born July 7, 1887, in Liozno, near Vitebsk. French painter and graphic artist.

Chagall studied in St. Petersburg from 1907 to 1909 with L. Bakst and others. From 1910 to 1914 he lived in Paris, where he was influenced by cubism. In 1914 he returned to Russia, where he directed the Art School in Vitebsk (from 1917) and participated in the work of the College of Fine Arts. In 1922 he emigrated, settling first in Berlin and then in Paris.

Chagall is one of the most outstanding representatives of modernism. His works are characterized by a keenly subjective perception of reality, reflecting the spiritual crisis of the intelligentsia in the West. The inspiration for most of his works has been his Jewish childhood in a small village, scenes from which he interprets in a symbolic and mystical spirit. Chagall is known for an analogous arrangement of objects in unreal space, linear sketchiness and vagueness, and fantastic and vivid color. Characteristic works are *I and My Village* (1911, Museum of Modern Art, New York) and *Over Vitebsk* (1914, private collection, Toronto). Chagall illustrated N. V. Gogol's *Dead Souls* (etching, 1923–27) and the Bible (lithograph, 1931–36). He has painted a number of decorative works, including a mural for the Kamernyi Jewish Theater in Moscow (1920, Tret'iakov Gallery, Moscow), the sets for G. Balanchine's production of I. Stravinsky's ballet *The Firebird* (1944–45), and sketches for stained-glass windows for the cathedral in Metz (1958). In 1973, in connection with an exhibit of his lithographs, Chagall visted the USSR.

CHAGAN, an urban-type settlement in Semipalatinsk Oblast, Kazakh SSR. Chagan is under the jurisdiction of the Semipalatinsk City Soviet. It has a railroad station 80 km northwest of Semipalatinsk. Industrial enterprises include a *keramzit* shop and a branch of the fur factory of the Semipalatinsk Leather and Fur Association. [29–1–2]

CHAGAN, a river in Orenburg Oblast, RSFSR, and Ural'sk Oblast, Kazakh SSR; a right tributary of the Ural. The Chagan measures 264 km in length and drains an area of 7,530 sq km. It originates on the Obshchii Syrt Upland. The river is fed mainly by snow.

The mean flow rate 40 km from the mouth is 7.7 cu m per sec. The Chagan usually freezes in November but sometimes as late as early January, and in the upper course it freezes through. The ice breaks up in late March or April. [29–1–1]

CHAGAS' DISEASE (also called American trypanosomiasis), a transmissible parasitic disease of humans and animals caused by trypanosomes. The disease was described in 1909 in Brazil (state of Minas Gerais) by the physician C. Chagas. It occurs in Central and South America, chiefly among the poorest strata of the population, who live in dwellings infested by transmitters of the disease (bloodsucking hemipterous insects, mainly triatomids). Humans and wild and domestic animals suffering from Chagas' disease are the sources of infection.

Infection occurs when the causative agent, together with insect feces, enters injured skin or the mucous membranes of the eyes, nose, and mouth. The main symptoms are fever and enlargement of the lymph nodes in the acute stage, with involvement of the heart and gastrointestinal tract when the disease becomes chronic. The main methods for controlling Chagas' disease are improvement of social and living conditions of the people, disinsectization, and destruction of infected animals. [29–800–2]

CHAGATAI, a medieval Middle Asian and Turkic literary language that reached its highest level of development and standardization as a classical language in the second half of the 15th century and in the 16th century in the Timurid principalities (the former Jagatai, or Chagatai, Khanate).

Turcologists have not been able to agree on a definition or chronology for Chagatai. According to P. M. Melioranskii, Chagatai existed from the 13th to 18th centuries. A. N. Samoilovich has divided the development of the Middle Asian and Turkic literary language into three periods, with the first beginning in the 11th century; he used the term "Chagatai" to refer to the third period, from the 15th to the early 20th century. Samoilovich's theory is widely accepted and, with minor refinements, has won the support of foreign Turcologists.

From the 1930's to the 1960's A. K. Borovkov, A. M. Shcherbak, and Uzbek linguists referred to Chagatai as Old Uzbek, which encompasses earlier texts in Turkic script (*see* UZBEK). The term "Chagatai" emphasizes the supradialectal nature of the literary language, which had taken on the linguistic traditions of an earlier language. As S. E. Malov showed, works in Chagatai were widely read by Turkic-speaking peoples inhabiting the region that extends from the Bosporus to the Altai and India; this dissemination was facilitated by the use of an Arabic script, which allowed for variations in vowel sounds.

In the 15th and 16th centuries there existed clearly distinguished prose and poetic variants of Chagatai, which in the work of A. Navoi and Baber completed the transition to a literary language. The basic morphological system of Chagatai, including such distinguishing features as declension, was finally reconciled with the Turkic urban koine of Andizhan of the 15th and early 16th centuries. The observable features of the underlying morphological system may be classified as Old Uzbek elements. The poetic variant of Chagatai, which retained the traditional mixture of forms of varied origin, had fewer such elements. Many scholars continue to posit a chronological boundary between Chagatai and Old Uzbek and, in attempting to establish a chronology for the language rely on historical and cultural factors.

CHAGAT-STROEV, PAVEL ALEKSANDROVICH (pen name of P. A. Trepikhin). Born 1887 in the village of Myiuta, in what is now Shebalino Raion, Gorno-Altai Autonomous Oblast; died 1938. Soviet Altai writer. In his publicist writings and poetry, Chagat-Stroev was inspired by the goals of socialist revolution. He wrote the narrative poems *The Wise Batyr* (1925), which was devoted to V. I. Lenin, and *Kara-Korum* (1927), which portrayed the revolutionary movement in the Altai. His works also include primers for Altai schools.

Chagat-Stroev was a member of the All-Russian Central Executive Committee, representing the Gorno-Altai Autonomous Oblast.

CHAGDA, an urban-type settlement in Aldan Raion, Yakut ASSR. Chagda has a landing on the right bank of the Aldan River near its confluence with the Uchur River. Gold is mined in the area. [29–2–2]

CHAGIN, BORIS ALEKSANDROVICH. Born Mar. 10 (22), 1899. Soviet philosopher. Corresponding member of the Academy of Sciences of the USSR (1960). Member of the CPSU since 1920.

Chagin graduated from the Institute of the Red Professors in 1931. He began his teaching career in 1922, and in 1963 he became a senior research worker in the Leningrad subdepartment of philosophy of the Academy of Sciences of the USSR. His principal works deal with the history of Marxist-Leninist philosophy and with historical materialism. Chagin has been awarded the Order of Lenin, the Order of the October Revolution, four other orders, and various medals.

CHAGODA, an urban-type settlement and administrative center of Chagodoshcha Raion, Vologda Oblast, RSFSR. Chagoda is situated on the Chagodoshcha River (Volga River basin), near the Chagoda railroad station on the Kabozha-Podborov'e line. It has enterprises of the glass and food-processing industries, a logging and timber distribution establishment, and a timber-chemistry plant. [29–3–2]

CHAGODOSHCHA (also Chagoda), a river in Leningrad and Vologda oblasts, RSFSR; a left tributary of the Mologa River (Volga River basin). The Chagodoshcha measures 242 km in length and drains an area of 9,680 sq km. It originates on the Tikhvin Ridge and is fed predominantly by snow. High water is in April and May. The mean flow rate 112 km from the mouth is 58 cu m per sec. The Chagodoshcha freezes in November or December, and the ice breaks up in April or early May. The lower 157 km are part of the Tikhvin Water System. [29–3–3]

CHAGOS, a British archipelago in the Indian Ocean. Area, approximately 200 sq km. The Chagos Archipelago consists of five groups of coral atolls, which represent the tops of peaks of the submarine Maldive Ridge and are surrounded by coral reefs. The economy is based on fishing and the raising of coconut palms. An American military base is located on Diego Garcia, which, with an area of 25 sq km, is the largest atoll in the archipelago. [29–3–4]

CHAGOS, a narrow trench in the central part of the Indian Ocean, at the foot of the submarine Maldive Ridge, east of the Chagos Archipelago. The Chagos Trench is bounded on the west by a ridge with a height of 1,000 to 2,000 m and on the east by a submarine swell with a height reaching 1,000 m. The trench is 900 km long and as much as 5,408 m deep. The width of its flat bottom is approximately 15 km. Foraminiferal oozes constitute the sediment in the Chagos Trench, which has a strong bottom current. [29–4–1]

CHAGOVETS, VASILII IUR'EVICH. Born Apr. 18 (30), 1873, on the *khutor* (farmstead) of Patychis, Romny District, Poltava Province, now Sumy Oblast; died May 19, 1941, in Kiev. Soviet physiologist, Academician of the Academy of Sciences of the Ukrainian SSR (1939).

Chagovets graduated from the Military Medical Academy in 1897. He studied physiology in I. P. Pavlov's laboratory at the academy from 1903 to 1909. In 1910 he became a professor at the University of Kiev (later the Kiev Medical Institute), occupying the chair of physiology in the medical faculty.

Chagovets primarily studied electrophysiology. He investigated the physicochemical nature of electric potentials in living tissues and the mechanism of the electrical stimulation of the tissues. Chagovets was the first to apply the theory of electrolytic dissociation to explain these processes. His ionic theory of the origin of bioelectric phenomena was of great importance to further studies of the mechanism of the occurrence of biopotentials. In 1906, Chagovets developed the capacitor theory of electrical stimulation of living tissues and proposed a physicochemical explanation of the stimulating action of an electric current. He demonstrated experimentally that living tissues polarize under the influence of an electric current, and he determined the magnitudes of electrical capacitance for several tissues.

CHAGRA, a river mainly in Kuibyshev Oblast, RSFSR (the lower course is in Saratov Oblast); a left tributary of the Volga River. The Chagra River is 251 km long and drains an area of 3,440 sq km. It rises in the Kamennyi Syrt Upland and empties into the Saratov Reservoir. The river follows a sinuous path.

The Chagra is fed mainly by snow, and high water occurs in April. The mean flow rate 78 km from the mouth is 3.5 cu m per sec. In the summer the river in its upper course is an intermittent stream and divides into individual reaches. The Chagra freezes over in November or early December; the ice breaks up in April. [29–4–2]

CH'AHAERH (also Chahar), a province of China from 1928 until 1952. The capital of Ch'ahaerh Province was the city of Changchiak'ou (Kalgan). In 1947, northern Ch'ahaerh, which is inhabited primarily by Mongols, became part of the Inner Mongolian Autonomous Region. The remaining territory of the province was divided between Shansi and Hopeh provinces in 1952. [29–110–2]

CHAIA, a river in the Buriat ASSR and Irkutsk Oblast, RSFSR; a right tributary of the Lena River. The Chaia is 353 km long and drains an area of 11,400 sq km. It rises on the slopes of the Verkhneangara Ridge and flows primarily through the Severo-Baikal Highland. The Chaia is fed mainly by rain. High water occurs between May and September, when the river is swollen by rain freshets. [29–113–1]

CHAIA, a river in Tomsk Oblast, RSFSR; a left tributary of the Ob'. The Chaia River is formed by the confluence of the Parbig and Bakchar rivers. The Chaia is 194 km long and drains an area of 27,200 sq km. It is fed primarily by snow. High water occurs between mid-April and early July. The mean flow rate is 70 cu m per sec; the maximum flow rate is 950 cu m per sec, and the minimum is 20 cu m per sec. The river freezes over in November, and the ice breaks up in April. The Chaia is used for timber flotation and for shipping. [29–113–2]

CHAIKA, a passenger car with a large-displacement engine, manufactured at the Gorky Automotive Plant (GAZ) since 1950. The Chaika GAZ-13 has been in production since 1959, and the GAZ-14, since 1977.

A seven-passenger car, the Chaika has a chassis-mounted, limousine-type body with three seats. The middle seat is collapsible. The engine is V-eight with a carburetor and produces, in the GAZ-14 model, 162 kilowatts of power, or 220 hp. In addition to a three-speed automatic transmission with a torque converter and planetary gearing, the drive train includes a single-reduction hypoid differential. The Chaika has power steering, hydraulic brakes with vacuum assist, and an independent, wishbone-type front suspension with coil springs. The rear suspension consists of two lengthwise, semielliptic leaf springs. A fully equipped Chaika weighs 2,385 kg, and its maximum speed is 170 km/hr. [29–22–1]

CHAIKHANA, in Russian, a term for a tearoom in Middle Asia and Iran. [29–33–2]

CHAIKINA, ELIZAVETA IVANOVNA. Born Aug. 28, 1918, in the village of Runa, Peno Raion, Velikie Luki (now Kalinin) Oblast; died Nov. 22, 1941, in the settlement of Peno. Participant in the partisan movement during the Great Patriotic War of 1941–45; Hero of the Soviet Union (Mar. 6, 1942, posthumously). Member of the Communist Party from 1939.

Chaikina was the daughter of a peasant. In 1933 she was made head of a village reading room. She became secretary of the Peno raion committee of the Komsomol in 1939, and she served as secretary of the underground Peno raion committee of the Komsomol after the fascists invaded and occupied the area. In November 1941, having been betrayed, she was captured by the Fascists, cruelly tortured, and shot to death.

Enterprises, schools, and Pioneer brigades have been named for Chaikina. The Chaikina Museum of Komsomol Glory is located in Kalinin, and a monument to Chaikina (1944, sculptor N. V. Tomskii) has been erected in the settlement of Peno.

CHAIKOVSKAIA, ELENA ANATOL'EVNA. Born Dec. 30, 1939, in Moscow. Soviet figure skater. Master of Sport (1957) and Honored Coach of the USSR (1970). Skating choreographer. Champion of the USSR (1957).

Chaikovskaia graduated from the A. V. Lunacharskii State Institute of Theatrical Arts in 1964 and began coaching the same year. Among her students have been such repeated champions and prizewinners of international, European, and Soviet competitions as L. A. Pakhomova and A. G. Gorshkov, V. N. Kovalev, and N. V. Linichuk and G. M. Karponosov. Chaikovskaia has been awarded the Order of the Red Banner of Labor.

WORKS

CHAIKOVSKII, BORIS ALEKSANDROVICH. Born Sept. 10, 1925, in Moscow. Soviet composer. Honored Art Worker of the RSFSR (1969).

In 1949, Chaikovskii graduated from the Moscow Conservatory, where he had studied composition with N. Ia. Miaskovskii; previously he had studied with V. Ia. Shebalin and D. D. Shostakovich. In the late 1950's and early 1960's Chaikovskii emerged as a leading composer of Soviet symphonic and chamber music. His principal works include the Symphony No. 2 (1962; State Prize of the USSR, 1969), *Chamber Symphony* (1967), and the orchestral work *Theme and Eight Variations* (1974). Other notable works are a piano quintet; piano, violin, and cello concerti; six quartets; and *The Lyric Poetry of Pushkin* (1972), a cyclic vocal composition. Chaikovskii has also composed *The Signs of the Zodiac* (1974), based on Russian poems, and music for motion pictures and radio. [29–24–2]

CHAIKOVSKII, IAKOV GRIOGOR'EVICH. Born May 30 (June 12), 1901, in Ekaterinoslav, now Dnepropetrovsk; died July 8, 1947, in Dnepropetrovsk. Steelworker; founder of the Stakhanovite movement in the metallurgical industry. Member of the CPSU from 1936.

In 1936, Chaikovskii became the first in the country to make steel by a high-speed method. On Jan. 5, 1937, he smelted 18.6 tons of steel in 4 hours 20 minutes, using a hearth 1 m square in a furnace with a capacity of 8.4 tons. He was named the "Best Steelworker in the Soviet Union" in 1937. He became a foreman in 1938 and a shift supervisor in 1939. Chaikovskii worked at a metallurgical plant in Gorky in 1942 and at the Revda Metallurgical Plant in the Urals in 1943. From 1944 to 1947 he worked at the Komintern plant in Dnepropetrovsk. Chaikovskii was awarded the Order of Lenin.

CHAIKOVSKII, NIKOLAI VASIL'EVICH. Born Dec. 26, 1850 (Jan. 7, 1851), in Viatka (now Kirov); died Apr. 30, 1926, in London. Russian political figure.

Of noble birth, Chaikovskii graduated from the University of St. Petersburg in 1872. He took part in the student disturbances of 1868 and 1869. An opponent of S. G. Nechaev, he was a member of the Chaikovskii circle; after that group was disbanded in autumn 1874, he emigrated. Chaikovskii settled in London in 1880 and helped organize the Foundation of the Free Russian Press.

Chaikovskii joined the Socialist Revolutionary Party (SR's) in 1904 and returned to Russia in 1906. In 1910 he broke with the SR's and withdrew from politics. During World War I, Chaikovskii was a leader of the All-Russian Union of Cities (*see* ZEMSTVO AND MUNICIPAL UNIONS). After the February Revolution of 1917 he became a member of the Central Committee of the Trudovik Popular Socialist Party.

After the October Revolution of 1917, Chaikovskii actively opposed Soviet power, helping organize the Union for the Rebirth of Russia. When interventionists landed in Arkhangel'sk in August 1918, he became chairman of the Supreme Administration of the Northern Oblast, and in September 1918 he was elected in absentia to the Ufa Directory. He emigrated in January 1919 and joined A. I. Denikin's government in early 1920. After Denikin was defeated, Chaikovskii took up residence in London.

CHAIKOVSKII, a city under oblast jurisdiction and the administrative center of Chaikovskii Raion, Perm' Oblast, RSFSR. Located on the Votkinsk Reservoir. Railroad station (Saigatka) 260 km southwest of Perm'. Population, 64,000 (1977).

Chaikovskii was established as a settlement in 1955 during the construction of the Votkinsk Hydroelectric Power Plant. A city since 1962, it is named for the great Russian composer P. I. Tchaikovsky. Industry in Chaikovskii includes a silk combine, the Stroidetal' Plant, a repair and machine shop, a timber log pond, a sawmill, an operations and repair base for a river steamship line, a meat-packing plant, and a milk plant. Construction of

a plant for the production of synthetic rubber was in progress in 1978. A district heat and power plant is located in the city. Chaikovskii has a branch of the Perm' Polytechnic Institute, a secondary specialized polytechnic for light industry, medical and music schools, a museum of local lore, and an art gallery. [29–27–2]

CHAIKOVSKII CIRCLE (also Chaikovtsy, the Great Organization of Propaganda), a revolutionary Populist organization in Russia in the early 1870's.

The Chaikovskii circle was formed in St. Petersburg during the student disturbances of 1868 and 1869 by opponents of S. G. Nechaev. The name traditionally applied to the group is derived from one of its members, N. V. Chaikovskii. The nucleus of the organization was a student study group at the Medical and Surgical Academy that comprised M. A. Natanson, V. M. Aleksandrov, and A. I. Serdiukov; they were joined by Chaikovskii and F. N. Lermontov.

The major purpose of the group, besides self-education, was to unite progressive students of St. Petersburg and other cities and then to disseminate propaganda among workers and peasants in order to prepare the way for a social revolution. The Chaikovskii circle, opposed to the unscrupulous methods of Nechaev, placed high moral demands on its members; the group disapproved of struggle for political freedoms, which it believed to be advantageous only to the emerging bourgeoisie. These positions were formulated in *A Program for Study Groups and Practical Activity*, which was put together by the group in late 1870 and early 1871.

The first stage in the circle's activities was devoted to publishing. Assisted by N. P. Poliakov and K. T. Soldatenkov, it published and distributed scientific and revolutionary literature among the intelligentsia, including the first volume of K. Marx' *Das Kapital* and works by such writers as N. G. Chernyshevskii, N. A. Dobroliubov, A. I. Herzen, P. L. Lavrov, V. V. Bervi (N. Flerovskii), F. Lassalle, C. Darwin, and J. S. Mill.

In the summer of 1871, Natanson's circle joined with the women's study group of A. I. Kornilova and S. L. Perovskaia. The new organization was soon joined by such figures as S. M. Kravchinskii, S. S. Sinegub, D. A. Klements, N. A. Charushin, and L. E. Shishko. The central St. Petersburg circle, which comprised some 60 persons, formed a federation with circles in other cities, including Moscow (L. A. Tikhomirov, N. A. Morozov, and M. F. Frolenko), Odessa (F. V. Volkhovskii and A. I. Zheliabov), and Kiev (Ia. V. Stefanovich and P. B. Aksel'rod). The total membership of these organizations was about 100.

In 1872, the Chaikovskii circle began organizing workers' groups in order to train propagandists for activity in the villages. This organizational work was most successful in St. Petersburg and Odessa, where circles attracted some 400 workers. The workers trained in this manner, notably V. P. Obnorskii and F. I. Kravchenko, subsequently organized the first proletarian organizations: the Southern Union of Russian Workers and the Northern Union of Russian Workers. P. A. Kropotkin reported on the propaganda work in a programmatic note, which was discussed in the St. Petersburg circle in late 1873.

The final stage in the activity of the organization was the "going to the people" movement, which was initiated by members of the Chaikovskii circle. Mass arrests in 1873 and 1874 brought the circle to an end. Most of its members were convicted at the Trial of the 193 and later took part in all revolutionary Populist organizations.

CHAILAKHIAN, MIKHAIL KHRISTOFOROVICH. Born Mar. 8 (21), 1902, in the city of Nakhichevan'-na-Donu, now within the city limits of Rostov-on-Don. Soviet plant physiologist. Academician of the Academy of Sciences of the USSR (1968); academician of the Academy of Sciences of the Armenian SSR (1971). Honored Scientist of the Armenian SSR (1967).

Chailakhian graduated from the University of Yerevan in 1926. In 1935 he became head of the laboratory of growth and development at the K. A. Timiriazev Institute of Plant Physiology of the Academy of Sciences of the USSR. From 1941 to 1948 he was chairman of the department of plant physiology and anatomy of the University of Yerevan (professor from 1943). Between 1941 and 1946 he also was chairman of the department of plant physiology and microbiology at the Armenian Agricultural Institute.

Chailakhian primarily studied plant growth and development (particularly ontogenesis) and the photoperiodic and thermal regulation of flowering. The founder of the hormone theory of plant development, he worked out methods of using plant hormones to regulate growth and flowering. These hormones included gibberellins—growth stimulators—used to increase crop yields and growth retardants used to prevent cereal grains from falling over onto the ground.

Chailakhian is a foreign member of the German Leopoldine Academy of Natural Scientists (1969). He has been awarded two orders of Lenin, two other orders, and medals.

CHAIN, ERNST BORIS. Born June 19, 1906, in Berlin. British biochemist. Fellow of the Royal Society of London (1949).

Chain received a Ph.D. degree from the University of Berlin in 1930. In 1933 he emigrated to Great Britain. He conducted research at the School of Biochemistry in Cambridge from 1933 to 1935 and at Oxford University from 1935 to 1948. From 1948 to 1961 he was scientific director of the International Research Center for Chemical Microbiology in Rome; beginning in 1950, he was also a professor at the center. In 1961 he became a professor of biochemistry at the University of London.

Chain's major works deal with antibiotics, the mechanism of the action of insulin, the technology of microbiological products, the formation of lysergic acid, and fungal metabolites. In 1939 he headed research on the isolation and purification of penicillin, which finally yielded a salt of penicillin in crystalline form. He established the chemical structure of penicillin.

Chain is a foreign member of the Academy of Sciences of the USSR (1976). He received a Nobel Prize in 1945, with A. Fleming and H. Florey.

CHAINIKOV, KUZ'MA PAVLOVICH (Kuzebai Gerd). Born Jan. 2 (14), 1898, in the village of Bol'shaia Dok'ia, in what is now Vavozh Raion, Udmurt ASSR; died Nov. 2, 1941. Soviet Udmurt poet and folklorist.

Chainikov studied at the V. Ia. Briusov Higher Literary Institute from 1922 to 1925. His works were first published in 1914. In his poetry collections *The Gusli Player* (1922), *The Flowering Land* (1927), and *Steps* (1931), he faithfully depicted the plight of the Udmurt people under tsarism. His vivid verses about the revolution, the Civil War, and the new life of the Udmurts were set to music as folk songs. Chainikov was the author of the first Udmurt narrative poem about V. I. Lenin (1925); his other narrative

poems include *War* (1916), *The Plant* (1921), and *Ten Years* (1931).

Chainikov also wrote elementary-school textbooks and readers. A student of Udmurt folklore, he published three anthologies of folk songs and a number of articles on the folklore and ethnography of the Udmurts.

CHAITYA, the name for various sacred objects in India. In art history, the term is usually used in reference to an architectural type characteristic of Buddhist architecture in ancient and medieval India. It consists of an elongated cave cut into a cliff, with a vaulted ceiling and a stupa in the back as an object of worship. [29–33–1]

CHAK, ALEKSANDR IANISOVICH (Aleksandrs Čaks). Born Oct. 27, 1901, in Riga; died there Feb. 8, 1950. Soviet Latvian poet.

Chak was the son of a tailor. In 1919, while studying at the medical school of Moscow University, he enlisted in the Red Army. In 1922 he returned to Latvia. Chak first published his works in 1925. He was the most prominent urban writer of Latvian lyric poetry, the poet of the working-class neighborhoods of Riga. His works also describe the ugliness of bourgeois reality. He wrote the collections *The Heart on the Sidewalk* (1928), *My Paradise* (1932), *The Mirrors of Fantasy* (1938), and *Poem About a Carter* (1930). The collection of narrative poems *Overshadowed by Eternity* (parts 1–2, 1937–39) deals with the heroism of the Latvian riflemen.

Chak's poetry of the Soviet period extols the peaceful life and the happiness to be found in constructive labor. Typical examples are the collections *The Patriots* (1948), *Under a High Star* (1948), and *To Struggle and Labor* (published posthumously in 1951).

Chak was a master of hyperbole and emotional free verse. He also wrote several collections of short stories. His books have been translated into the languages of the peoples of the USSR.

CHAKOVSKII, ALEKSANDR BORISOVICH. Born Aug. 13 (26), 1913, in St. Petersburg. Soviet Russian writer and public figure. Hero of Socialist Labor (1973). Member of the CPSU since 1941. Candidate member of the Central Committee of the CPSU since 1971.

Chakovskii, the son of a physician, graduated from the M. Gorky Institute of Literature in 1938. His first published writings—works of criticism—appeared in 1937. His first work of fiction was a trilogy devoted to the heroism of Leningrad in the Great Patriotic War: *It Happened in Leningrad* (1944), *Lida* (1945), and *Peaceful Days* (1947). Chakovskii further developed the distinctive style of this trilogy, at once lyrical and publicistic, in the novel *It Is Already Morning Here* (1949; State Prize of the USSR, 1950), which successfully evokes the spirit of socialist transformation in South Sakhalin in the postwar years.

Chakovskii dealt with the moral and ethical problems of Soviet society and the lives of young intellectuals who work in technical fields in the novels *A Year of Life* (1956) and *The Roads We Choose* (1960). Chakovskii is also the author of the novellas *The Light of a Distant Star* (1962) and *The Bride* (1966).

Chakovskii's major work is the novel *Blockade* (books 1–5, 1968–75; Lenin Prize, 1978). Portraying a panorama of the battle of Leningrad, the book interprets the historical significance of the battle within the context of the entire war and depicts the moral and political superiority of the Soviet soldiers over the enemy. Chakovskii has also written publicist works, for example, *Blessed Are the Poor in Spirit?* (1970).

Chakovskii was editor in chief of the journal *Inostrannaia Literatura* (Foreign Literature) from 1955 to 1963 and has been editor in chief of *Literaturnaia Gazeta* since 1962. He has been secretary of the administrative board of the Writers' Union of the USSR since 1962 and was a deputy to the seventh through ninth convocations of the Supreme Soviet of the USSR. He has been awarded two Orders of Lenin, the Order of the October Revolution, two other orders, and several medals.

CHAKRA, a steel throwing ring with a sharp outer edge, used in the ancient Indian army. The chakra was twirled around the middle finger and thrown at an enemy. [29–35–2]

CHAKRI (also Chakkri), the royal dynasty of Thailand (formerly Siam) since 1782. The Chakri dynasty was founded by the Siamese military commander Phya Chakri, who came to power after the execution of King Taksin. The kings of the Chakri dynasty are Rama I (1782–1809), Rama II (1809–24), Rama III (1824–51), Mongkut (Rama IV, 1851–68), Chulalongkorn (Rama V, 1868–1910), Vajiravudh (Rama VI, 1910–25), Prajahipok (Rama VII, 1925–35), Ananda Mahidol (Rama VIII, 1935–46), and Bhumibol Adulyadej (Rama IX, since 1946; crowned 1950). [29–35–3]

CHAKVA, an urban-type settlement in Kobuleti Raion, Adzhar ASSR. Chakva is situated on the Black Sea coast and has a railroad station on the Samtredia-Batumi line. The settlement has three tea factories, a tea-pressing plant, and facilities for the production of fruit wines and citrus liqueurs. There are tea and citrus-fruit sovkhozes in Chakva, and the settlement has a branch of the All-Union Scientific Research Institute of Tea and Subtropical Crops. Chakva also has tourist facilities. [29–34–1]

CHALAINOERH, a city in Northeast China, in Heilungkiang Province. Coal is mined near Chalainoerh. The city manufactures leather goods and such foodstuffs as flour and dairy products. [29–531–4]

CHALCALBURNUS, a genus of fishes of the family Cyprinidae. The body is elongated and of medium size. The posterior section of the keel, located behind the ventral fin, is free of scales. There are several species, inhabiting the basins of the Black, Azov, Caspian, and Aral seas, Van Lake, bodies of water in southern Iran, and the Tigris and Euphrates rivers. The USSR has a single species, *Chalcalburnus chalcoides*. There are about nine subspecies, which differ in their habits and life histories. For example, the Crimean (*C. chalcoides mentoides*) and Batumi (*C. chalcoides derjugini*) subspecies live permanently in fresh water; the Aral (*C. chalcoides aralensis*) subspecies lives in the Aral Sea; and the Caspian subspecies (*C. chalcoides chalcoides*) is anadromous. The type subspecies is *Chalcalburnus c. chalcoides*. The body has a length up to 40 cm and weighs up to 360 g. Spawning takes place in the spring in the Terek and Kura rivers; some individuals enter the Volga and Ural rivers. The females deposit 10,000–50,000 eggs. The diet consists of planktonic crustaceans, insects that have fallen into the water, and small fish. *Chalcalburnus* is commercially fished and bred.

CHALGRIN, JEAN FRANÇOIS. Born 1739 in Paris; died there Jan. 21, 1811. French architect.

Chalgrin studied under G. N. Servandoni and L. P. Moreau-Desproux. He visited Rome in 1758. Chalgrin's early structures, which are in the classical style, include several *hôtels* built in the 1760's and the Church of St. Philippe-du-Roule (1769–84). His masterpiece is the Arc de Triomphe on the Place de l'Etoile (now Place De Gaulle) in Paris (1806–37). Instead of copying classical triumphal arches, Chalgrin created an original composition: a rectangular mass cut through with a monumental passage.
[29–816–4]

CHALIAPIN, FEDOR IVANOVICH. Born Feb. 1 (13), 1873, in Kazan; died Apr. 12, 1938, in Paris. Russian bass. People's Artist of the Republic (1918).

The son of a clerical worker, Chaliapin in his youth was an apprentice to a cobbler and a turner and worked as a copyist. At the same time, he sang in a church choir. He was attracted to the theater at an early age and served as an extra in many theatrical and operatic performances. In 1890 he became a member of the chorus with the opera company in Ufa, where he also sang small solo parts, including Stolnik in Moniuszko's opera *Halka*. In 1891 he toured Russia with a Ukrainian operetta company. In 1892 and 1893 he studied with the opera singer D. A. Usatov in Tbilisi, where he began his professional stage career. During the 1893–94 season, Chaliapin performed many roles, among them Mephistopheles in Gounod's *Faust* and the Miller in Dargomyzhskii's *The Mermaid*. In 1895 he was accepted into the company of the Mariinskii Theater, where he sang several roles; however, the management of the imperial theaters failed to notice his talent.

In 1896, at the invitation of S. I. Mamontov, Chaliapin joined the Moscow Private Russian Opera, and it is here that his talent was finally discovered. His subsequent study and artistic collaboration with S. V. Rachmaninoff were very important. During his years with the Private Russian Opera, Chaliapin performed virtually all the principal roles of the repertoire: the title role in Glinka's *Ivan Susanin*, the Miller in Dargomyzhskii's *The Mermaid*, Boris Godunov and Varlaam in Mussorgsky's *Boris Godunov*, Dosifei in Mussorgsky's *Khovanshchina*, Ivan the Terrible and Salieri in Rimsky-Korsakov's *The Maid of Pskov* and *Mozart and Salieri*, Holofernes in Serov's *Judith*, and Nilakantha in Delibes's *Lakmé*. Chaliapin won great success during the company's tour in St. Petersburg in 1898. It was also then that V. V. Stasov became an avid admirer of his work, and over the years he wrote many articles about Chaliapin.

Beginning in 1899, Chaliapin sang at both the Bolshoi and Mariinskii theaters, as well as in provincial cities. In 1901 he gave a triumphant performance at the La Scala Opera in Italy. Soon after he began his continuous foreign tours, which brought him world acclaim. Chaliapin's performances in the Russian Seasons (1907 to 1909, 1913) in Paris were particularly important for the popularization of Russian culture, particularly the works of Mussorgsky and Rimsky-Korsakov.

Between 1899 and 1914, Chaliapin performed a series of new roles, including Farlaf in Glinka's *Ruslan and Liudmila*, Pimen in Mussorgsky's *Boris Godunov*, Eremka in Serov's *The Power of Evil*, the title roles in Rubinstein's *The Demon*, Rachmaninoff's *Aleko*, Boito's *Mefistofele*, and Massenet's *Don Quichotte*, and Philip II in Verdi's *Don Carlos*. He tirelessly worked to perfect the interpretations of his early roles, attaining the highest mastery.

Chaliapin's ideas and artistic principles were greatly influenced by his friendship with M. Gorky, which began in 1901. To a large degree, under Gorky's beneficial influence, Chaliapin came in contact with progressive social circles; he sang for workers and performed revolutionary songs.

After the victory of the October Revolution of 1917, Chaliapin became involved in the development of a new theatrical and musical culture. In 1918 he was artistic director of the Mariinskii Theater, and in 1919 he was elected to its managing board. During the 1918–19 season, he took part in many performances and concerts for workers and Red Army troops. However, the contradictory nature of his character and the instability of his political convictions contributed to Chaliapin's transformation into a touring performer, concerned only with his own financial enrichment.

In 1922, Chaliapin went abroad for a concert tour and did not return to the Soviet Union, settling in Paris. Torn away from his homeland and suffering constant sorrow, he created no new stage roles. In his work, however, he retained the best traditions of his native art, remaining a Russian artist to the end of his life.

Chaliapin was one of the greatest representatives of the Russian vocal school and a deeply national artist, who raised Russian realist musical dramatic art to extraordinary heights. He was both a talented singer and a talented dramatic actor. The roles he created were distinguished by a unity of vocal and stage conception. He had the rare gift of being able to transform himself entirely, creating each role with extraordinary realism and power. His voice, a high bass, was characterized by exceptional softness and beauty of timbre, combining sincerity with depth and power; it was able to transmit a wide range of emotions, from rapturous profound tenderness to high tragedy and biting sarcasm. Chaliapin also sang baritone parts, such as the title role in Tchaikovsky's *Eugene Onegin* and Rubinstein's *The Demon*. His masterful command of phrasing, nuance, and diction enabled him to imbue each musical phrase with imagery and profound psychological meaning. He combined an amazing freedom of execution with strict adherence to rhythm. Above all, Chaliapin sought to reveal all facets of a particular character, all the complexity and contradictions of the protagonist's inner world. His greatest roles were Boris Godunov and Mephistopheles.

In his performances, Chaliapin combined inspiration with enormous preparatory work on a role. He was innovative and often altered a role's interpretation. He strove for historical and everyday accuracy and for fidelity in the *mise-en-scène*. He also strove for vivid expressiveness in makeup (sketches of which he made himself) and costumes and for a faultless stage technique.

Chaliapin, a great chamber singer, interpreted with great sensitivity the songs and romances of Glinka, Dargomyzhskii, Mussorgsky, Rimsky-Korsakov, Tchaikovsky, A. G. Rubinstein, Schumann, and Schubert, as well as Russian folk songs. He was accompanied by first-rate pianists, and his duets with Rachmaninoff were particularly famous. Chaliapin was also an operatic stage director, mounting Massenet's *Don Quichotte* and Mussorgsky's *Khovanshchina*. In addition, he acted in films (*Ivan the Terrible, Don Quixote*). Chaliapin's wide-ranging creative talents were manifested in his gifted sculptures, paintings, and drawings. Chaliapin also exhibited a talent for writing.

CHALIER, MARIE JOSEPH. Born 1747; died July 17, 1793. Figure in the French Revolution; left Jacobin.

On the eve of the revolution, Chalier was a partner in a commercial firm in Lyon. He became a municipal officer of Lyon in 1790 and chairman of the Lyon district tribunal in 1792. Defending the interests of the urban lower classes, Chalier advocated a price ceiling for produce and extra taxes on the rich. He demanded that a revolutionary tribunal and a revolutionary army be created in the department to suppress the resistance of the propertied classes. After a counterrevolutionary coup took place in Lyon on May 29, 1793, Chalier was guillotined. [29–816–5]

CHALK RIVER, a city in Canada, in Ontario Province, on the Ottawa River. Population, 6,000 (1971). With the city of Deep River, a residential area for scientists, and with Rolphton, which has a 20-megawatt experimental atomic power plant, Chalk River forms an important center for the study of Canada's nuclear energy problems. [29–679–4]

CHALLENGER, a three-masted English corvette with sail rigging and an 885-kilowatt (1200-hp) auxiliary engine. The *Challenger* was 62.5 m long and had a displacement of 2,300 tons.

The *Challenger* was refitted in 1872 into an oceanographic vessel for hydrologic, geological, chemical, biological, and meteorological research. Commanded by Captain G. Nares, the *Challenger* made a round-the-world cruise from 1872 to 1876, carrying an expedition headed by C. W. Thomson. The expedition collected data on the physical and chemical characteristics of the water, on bottom relief, and on the geologic structure of the floor of the world ocean.

The *Challenger* was the first of the world's oceanographic vessels. A modern US research vessel used for deep-sea drilling, the *Glomar Challenger*, was named in honor of the *Challenger*. Built in 1968, the *Glomar Challenger* has a 7.36-megawatt (10,000-hp) engine. It is 122 m long, has a displacement of 10,500 tons, and can run at a speed of 12 knots. [29–134–6]

CHALNA, a seaport in the extreme south of Bangladesh, 85 km from the Bay of Bengal; situated on the Pusur River, a deep arm of the Ganges. The port was established in 1950 to serve the western regions of the country; in 1975 it handled approximately 2 million tons of cargo. [29–36–2]

CHALNA, an urban-type settlement in Priazha Raion, Karelian ASSR. Chalna has a railroad station on the Petrozavodsk-Suoiarvi line. Industry is represented by the Shuia-Vidany logging and timber distribution establishment and mechanized state forestry establishment. A forestry school is located in the settlement. [29–36–3]

CHÂLONS-SUR-MARNE, a city in northeastern France, on the Marne River. Capital of Marne Department. Population, 63,000 (1975). A transportation junction, Châlons-sur-Marne is a wine-making center and a center of trade in champagnes. The city has some light industry and produces electrodes and musical instruments. [29–814–6]

CHALON-SUR-SAÔNE, a city in eastern France, in Saône-et-Loire Department, on the Saône River and the Canal du Centre. Population, 71,000 (1975). Chalon-sur-Saône is a transportation junction and a river port. Industries include metallurgy and machine building, with the manufacture of atomic power plant equipment, machine tools, riverboats, and locomotives. The city also produces metal structural components and photographic film and has a sugar factory. [29–815–1]

CHALUKYA, the name of several medieval dynasties and the states they ruled in the Deccan (southern India).

The first of the dynasties was the Early Chalukyas, who ruled from about A.D. 550 to A.D. 642 over an area that lay mainly in the western Deccan. The Chalukyas from Vatapi (now Badami) ruled the same area from about 655 to 753. The Chalukyas of Vengi (the Eastern Chalukyas) ruled the eastern Deccan (eastern Andhra Pradesh) from 615 to 1070. The Chalukyas of Kalyani, who ruled from 973 to 1187, laid claim to the entire Deccan.

The name "Chalukya" was also borne by a number of minor princely states ruled by families related to the Chalukya dynasties mentioned above. [29–36–4]

CHALUS, a city in northern Iran, in the *ostan* (province) of Mazanderan, on the coast of the Caspian Sea. Located on the Rasht-Gorgan highway. Population, approximately 30,000. Chalus has a textile combine that produces silk fabrics. [29–36–5]

CHALYSH, an urban-type settlement in Urgench Raion, Khorezm Oblast, Uzbek SSR. Chalysh is situated on the left bank of the Amu Darya, 20 km from the Urgench railroad station on the Chardzhou-Beineu line. Chalysh has a wine-making sovkhoz. [29–36–6]

CHAM (also Chiam; self-designation, *Tham, Kham*), a people living in southern Vietnam and in Cambodia. According to a 1970 estimate, the Cham in Vietnam number more than 60,000; in Cambodia, together with the Malays, they number approximately 150,000. Small groups of Cham live in Thailand and Indonesia. In antiquity the Cham developed an advanced civilization, which became the kingdom of Champa at the beginning of the Common Era. The Cham speak an Indonesian language. Approximately two-thirds of them are Hindus; the rest are Muslims. In Cambodia the Muslim Cham have intermarried with the related Malay people. The Cham engage primarily in fishing, stock raising, and the cultivation of rice in paddies; various handicrafts are highly developed.

CHAMA CHA MAPINDUZI (CCM; Revolutionary Party), the ruling party of the United Republic of Tanzania.

The CCM was formed in January and February 1977 through the merger of the Tanganyika African National Union (TANU; founded 1954) and the Afro-Shirazi Party of Zanzibar and Pemba (founded 1957). It comprises workers, peasants, the progressive intelligentsia, and other strata of the working people. The party's policies, as set forth in its charter, follow the socialist course proclaimed in the Arusha Declaration, which was adopted by the TANU in 1967. The CCM directs the activities of various public organizations, such as trade unions and youth and women's organizations. Its foreign policy, which is anticolonialist and antiracist, advocates increased cooperation with the USSR and other socialist states.

The CCM is organized according to the production and territorial principle. The supreme body of the party is the National Conference; the supreme executive body is the Central Committee. The chairman of the CCM is J. K. Nyerere. [29–36–7]

CHAMBA, a people living in the region of the headwaters of the Benue River in Nigeria and Cameroon and in the Republic of Chad. With the related Duru, Li (Bali), Vere (Werre), Fali, Mbum, and Mumuye peoples, the Chamba number approximately 400,000 in Nigeria, approximately 200,000 in Cameroon, and more than 200,000 in the Republic of Chad (1970 estimate). Their language, which has been little studied, belongs to the group of languages spoken in the central and eastern Sudan. The Chamba profess Islam, although the traditional practices of nature and ancestor worship have been preserved in some areas. The principal occupation is cattle raising. [29–37–2]

CHAMBAL, a river in India, a right tributary of the Jamna River. The Chambal is approximately 830 km long and drains an area of approximately 135,000 sq km. It rises in the northern part of the Deccan Plateau, in the Vindhya Mountains, and flows over the Malwa Plateau; its lower course lies in the Gangetic Plain. The Chambal is fed by rain, and high water occurs in the summer. The mean flow rate is approximately 600 cu m per sec, with a maximum of approximately 20,000 cu m per sec. There are large hydroelectric complexes on the Chambal, including three power plants with a total output of 275 megawatts. The river also supplies an irrigation system that waters 440,000 hectares. Regu-

lation of the water flow has decreased the rate of erosion, which had been catastrophic. Some sections of the river are navigable. The city of Kota is situated on the Chambal. [29–37–3]

CHAMBERLAIN, ARTHUR NEVILLE. Born Mar. 18, 1869, in Edgbaston, Birmingham; died Nov. 9, 1940, at Heckfield House, near Reading. British state figure and leader of the Conservative Party. Son of Joseph Chamberlain.

Neville Chamberlain was educated at the exclusive Rugby School and at Mason College, Birmingham. For many years an entrepreneur, he served as lord mayor of Birmingham in 1915 and 1916 and was elected to Parliament in December 1918 as a Conservative. He held the posts of postmaster general in 1922 and 1923, minister of health in 1923, from 1924 to 1929, and in 1931, and chancellor of the exchequer from 1931 to 1937. Chamberlain served as leader of the Conservative Party in 1930 and 1931 and as prime minister and leader of the Conservative Party from 1937 to 1940.

Pursuing a policy of appeasement toward the fascist aggressors, Chamberlain signed the Munich Pact of 1938 with A. Hitler, B. Mussolini, and E. Daladier. His government was responsible for breaking off the Moscow negotiations of 1939 between the USSR, Great Britain, and France, which were aimed at containing the aggressors; during these talks he conducted secret negotiations with fascist Germany (*see* LONDON NEGOTIATIONS OF 1939). When appeasement failed, Great Britain entered World War II in September 1939 under extremely adverse conditions. The Chamberlain government then tried to direct German aggression eastward against the USSR. In May 1940, after Great Britain suffered major military defeats, Chamberlain was forced to resign as prime minister, but until September 1940 he remained a member of W. Churchill's coalition government and the leader of the Conservative Party.

V. G. TRUKHANOVSKII [29–170–1]

CHAMBERLAIN, AUSTEN (also Joseph A. Chamberlain). Born Oct. 16, 1863, in Birmingham; died Mar. 16, 1937, in London. British state figure. Son of Joseph Chamberlain.

Austen Chamberlain, who was educated at the exclusive Rugby School and at Cambridge University, entered Parliament in 1892. He served as financial secretary to the treasury from 1900 to 1902, postmaster general in 1902, and chancellor of the exchequer from 1903 to 1905 and from 1919 to 1921. He was secretary of state for India from 1915 to 1917, a member of the war cabinet in 1918, minister without portfolio in 1921 and 1922, and foreign secretary from 1924 to 1929.

Chamberlain fought to establish Great Britain as the leading European power. He favored a strong and rearmed Germany, hoping to use it against the USSR and as a counterbalance to France; the signing of the Locarno Treaties of 1925 was a major step toward the realization of this policy. Chamberlain helped initiate the breaking off of diplomatic relations with the USSR in 1927 (relations were resumed in 1929 by the new Labour government) and sought to renew the military intervention in the USSR. He served as first lord of the admiralty in 1931. In his final years, Chamberlain spoke out in Parliament about the aggressive intentions of Germany. V. G. TRUKHANOVSKII [29–170–2]

CHAMBERLAIN, JOSEPH. Born July 8, 1836, in London; died there July 2, 1914. British state figure.

A manufacturer by profession, Chamberlain began his political career as a member of the radical wing of the Liberal Party. He was mayor of Birmingham from 1873 to 1876, when he entered Parliament. He served in W. Gladstone's cabinets from 1880 to 1885 and in 1886. In 1886, Chamberlain opposed the home rule bill, which was designed to grant autonomy to Ireland, and thereby split the Liberal Party; the separate, influential group that emerged under his leadership, the Liberal Unionists, later merged with the Conservatives.

From 1895 to 1903, Chamberlain was colonial secretary in Conservative cabinets. During the Boer War of 1899–1902 he was a major spokesman and organizer of British expansionist policy. Beginning in 1903 he conducted an extensive campaign aimed at replacing free trade, which did not suit the interests of the monopolies, with a policy of protection. In 1906, illness forced Chamberlain to retire from politics. [29–169–8]

CHAMBERLAIN, OWEN. Born July 10, 1920, in San Francisco. American physicist. Member of the National Academy of Sciences (1960).

Chamberlain graduated from Dartmouth College in 1941 and received a doctorate from the University of Chicago in 1949. From 1942 to 1946, he worked at the Los Alamos Scientific Laboratory on the development of the atomic bomb. He joined the faculty at the University of California at Berkeley in 1948, becoming a professor at the university in 1958.

Chamberlain's main works deal with nuclear physics and particle physics. In 1955, Chamberlain discovered the antiproton, for which he shared a Nobel Prize with E. Segré in 1959. [29–171–1]

CHAMBERLIN, EDWARD HASTINGS. Born May 18, 1899, in La Conner, Wash.; died 1967. American economist.

Chamberlin received his higher education at the University of Iowa, the University of Michigan, and Harvard University. Over a period beginning in 1920 he occupied various teaching posts at Michigan and Harvard, as well as at the universities of Paris and Copenhagen. Awarded honorary doctorates by many universities, he was a member of the American Economic Association, of which he became vice-president in 1944; the Royal Economic Society; and the Catholic Economic Association, of which he became vice-president in 1943.

Chamberlin's research was devoted to an analysis of the relations between monopoly and competition in the capitalist market. In the late 1920's and early 1930's he developed the main propositions of the theory of monopolistic competition; the theory was an undisguised apologia on behalf of monopolies, which he believed to be beneficial for capitalist society as a whole. He opposed state interference in the economy and defended "free competition." Chamberlin made slanderous attacks on the trade union movement and the working class.

M. P. EVTIKHIEV [29–171–2]

CHAMBERS, ROBERT. Born Oct. 23, 1881, in Erzurum, Turkey; died July 22, 1957. American cytologist.

Chambers was appointed a professor at the Medical College of Cornell University in New York City in 1923 and was also a professor at New York University from 1928 to 1948. He was one of the first to work out the techniques of cell microdissection, or micrurgy. With the aid of a micromanipulator of his own design and a hydrostatically operated micropipette, Chambers and his coworkers were able to examine both isolated cells and cells in tissues, their research focusing on the physiochemical properties of cells.

CHAMBERS, WILLIAM. Baptized Feb. 23, 1726, in Göteborg, Sweden; died Mar. 8, 1796, in London. British architect.

Chambers served in the Swedish East India Company from about 1740 to 1749. In the years 1748–49 he traveled to India and China. He studied in France during the years 1749–50 and in Italy from 1750 to 1755. He worked in England beginning in 1755.

Chambers was the last important representative of Palladianism in English architecture. He was also one of the creators of the landscape garden and is known for his designs for Kew Gardens, Surrey (1757–62). Chambers made use of classical as well as Gothic and Oriental motifs in his park structures.

CHAMBÉRY, a city in southeastern France, in the Savoy Alps. Capital of Savoie Department. Population, 88,000 (1975). Chambéry has machine-building, chemical, textile, food-processing, leather, wood-products, and glass industries. [29–821–2]

CHAMBORD, COMTE DE (Henri Charles Ferdinand Marie Dieudonné d'Artois). Born Sept. 29, 1820, in Paris; died Aug. 24, 1883, at Frohsdorf, Austria. Duke of Bordeaux. Grandson of the French king Charles X, who abdicated in his favor after the July Revolution of 1830.

The Comte de Chambord became an émigré in 1830. He carried on intensive negotiations with the French monarchists, who in 1873 were prepared to restore the monarchy and make him King Henry V of France. The Comte de Chambord was, however, frightened by the masses' opposition to the restoration plan and, at the crucial moment, declined to lead the conspiracy. [29–821–3]

CHAMISSO, ADELBERT VON. Born Jan. 30, 1781, at the Château de Boncourt in Champagne, France; died Aug. 21, 1838, in Berlin. German writer and naturalist.

Chamisso, descended from a line of the Lotharingian nobility, served as an officer in the Prussian Army from 1801 to 1806. From 1812 to 1815 he studied botany, zoology, and medicine in Berlin. From 1815 to 1818 he took part in an expedition around the world on the Russian brig *Riurik*, during which he kept a diary, published as *Voyage Around the World* (1834–36). In 1819 he discovered the alternation of generations (metagenesis) in organisms of the subclass Salpae.

Chamisso's most famous work of fiction is the tale *Peter Schlemihl's Remarkable Story* (1814; Russian translation, 1841). Employing the story of a man who loses his shadow, Chamisso reveals the psychological plight of contemporary man, tempted by wealth and threatened by the loss of his personality. Chamisso can only partly be considered a romantic, as *Peter Schlemihl* is actually an example of late realist literary trends. Chamisso's lyric poetry expresses love for the common people, as well as an interest in social issues. These works include his translations of P. J. de Béranger as well as original works in the style of Béranger and the narrative poem *The Exiles* (1831). His "Frauenliebe und -leben" cycle (1830) was set to music by R. Schumann (1840).

CHAMONIX, a mountain valley in eastern France, along the upper course of the Arve River (a tributary of the Rhône). Elevations range from 1,000 m to 1,500 m. Chamonix is a U-shaped valley into which glaciers, including a tongue of the Mer de Glace, descend from the Mont Blanc Massif. The valley has pastures and meadows and is at one end of the tunnel through Mont Blanc. [29–824–1]

CHAMORROS, the indigenous population of the Mariana Islands, in Western Micronesia. Decimated in the 17th century by Spanish colonists, the Chamorros spoke a Malayo-Polynesian language. They engaged in land cultivation and were evidently at the stage of the disintegration of the primitive communal system. A small number of the surviving Chamorros intermarried with the Spanish and with the Filipinos and Mexicans serving in the Spanish armed forces. The name "Chamorros" is now applied to the resulting group, which is made up of métis and has retained the old language. According to a 1971 estimate, the Chamorros number approximately 65,000. They engage primarily in land cultivation and are nearly all Roman Catholics.

CHAMOSITE (from the village of Chamoson in Switzerland). **(1)** A mineral of the subclass of phyllosilicates; an iron chlorite. Chamosite, whose chemical composition is $(Fe, Al, Mg)_3[(Si, Al)_4O_{10}](OH)_2(Fe, Mg)_3(O, OH)_6$, contains more than 30 percent iron oxides. The distance between layers in its structure is 14 angstroms.

(2) A mineral of the family of septechlorites; also known as berthierine or septechamosite. Its chemical composition is $(Fe^{2+}, Fe^{3+}, Al, Mg)_6[(Si, Al)_4O_{10}](OH)_8$. The mineral contains 40–45 percent iron oxides. The composition varies. The structure of chamosite resembles that of kaolinite; the distance between layers is 7 angstroms.

The two minerals may be found together and are difficult to distinguish. They crystallize in the monoclinic system (septechamosite also exhibits a hexagonal modification). They form green, yellow, or brown oolitic or fine-grained (to earthy) aggregates. The hardness on Mohs' scale is 3, and the density varies from 3,000 to 3,300 kg/m^3. Both are hypergenic in origin.

Chamosites are found in clay beds and sedimentary (oolitic) iron ores. Deposits in the USSR occur in the Urals (Alapaevsk, Aiat', and Khalilovo). Other deposits are found in the Lorraine Basin in France, Northhamptonshire in Great Britain, Thuringia in East Germany, and Nučice in Czechoslovakia.

L. G. FEL'DMAN [29–823–4]

CHAMOUN, CAMILLE. Born 1900 in Deir el Qamer. Lebanese statesman and political figure.

Chamoun received a law degree in 1924. He held various government posts during the 1930's and 1940's, and from 1952 to 1958 he was president of Lebanon. As president, Chamoun carried out a policy of rapprochement with the imperialist powers. He was forced to resign in September 1958 as a result of a popular uprising.

In 1958, Chamoun founded the National Liberal Party, the party of the reactionary Maronite bourgeoisie, landowners, and clergy, and became its chairman. He was a leader of the reactionary forces of the right during the Lebanese civil war of 1975–76. [29–829–4]

CHAMPAGNE, a historical region in northwestern France. Now the departments of Marne, Haute-Marne, Aube, and Ardennes. Area, 2,600 sq km. Population, 1,337,000 (1975). The principal city is Reims.

In 1974, 40.7 percent of Champagne's economically active population was employed in industry and construction, and 14.6 percent in agriculture. Such cities as Reims, St. Dizier, and Mézières have metalworking and machine-building industries. The region also has a textile industry, a knitwear industry (Reims, Troyes, and Sedan), a wood-products industry, and a paper industry.

Food products are manufactured; of particular importance is the production of champagne in Reims, Epernay, Châlons-sur-Marne, and Bar-sur-Aube. Agriculture is dominated by the cultivation of wheat, barley, Indian corn, and, on the slopes of the cuestas of Ile-de-France, grapes. Livestock is also raised.

Champagne is first mentioned in historical sources as a county formed between the late ninth and late tenth centuries. During the Middle Ages, Reims, Châlons-sur-Marne, Troyes, and Provins were noted for the production of woolen fabrics; sheep were raised in the region. In the 14th century wine-making became a major industry.

In the 12th and 13th centuries the trade fairs of Champagne played an important role in Western European commerce. The fairs were held in a fixed order in the cities of Lagny, Bar-sur-Aube, Provins, and Troyes, so that virtually throughout the year a fair was under way in some city of the region.

Champagne was first joined to the royal domain in 1284; the union became permanent in 1361. In the 14th century, during the Hundred Years' War of 1337–1453, Champagne was one of the main theaters of military action; as a result, the economic significance of the fairs declined. The Jacquerie, an antifeudal peasant uprising, spread to part of the region in 1358.

On the eve of the French Revolution, Champagne was one of the most backward provinces in France. When France was divided into departments in 1790, Champagne ceased to exist as an independent entity. [29–826–1]

CHAMPAGNE, a sparkling grape wine saturated with carbon dioxide by secondary fermentation of wine material that has been specially prepared and processed in hermetically sealed bottles or tanks. The increased content of carbon dioxide in champagne causes the wine's frothing and sparkling when the bottle is opened.

Champagne took its name from the French province of Champagne, where it was first made in the mid-17th century, and the process of saturating wine with carbon dioxide by secondary fermentation is referred to as *champagnization*. In accordance with French law, the name "champagne" can be used only for bottle-fermented sparkling wine produced in the province of Champagne. Sparkling wines from other wine-making regions of France are called *mousseux*. In the German Democratic Republic and the Federal Republic of Germany, German sparkling wines are produced under the name *Sekt*, and the Italian name is *spumante*. In the USSR the terms *Sovetskoe shampanskoe* and *Igristoe* are used. The different varieties of the latter include Donskoe, Sevastopol'skoe, Muskatnoe, and Tsimlianskoe.

Wine material obtained from special grape varieties is used to make sparkling wines. Wine may be secondarily fermented in the bottle or in the tank; tank fermentation may be done in several steps or by the continuous method.

Bottle fermentation begins with the preparation of a tirage mixture containing blended wine material, a sugar solution, and a separate pure yeast culture. The bottles are carefully corked and racked for fermentation and aging. After three to four weeks the sugar added to the wine ferments, and a pressure of up to five atmospheres develops in the bottles as a result of the formation of carbon dioxide. The aging of the wine in contact with the yeast (from the moment the wine is poured into the bottle until the yeast residue is removed) lasts three years. During this period the champagne acquires its characteristic flavor and bouquet, as well as its ability to sparkle and froth, as a result of complex physicochemical and biochemical processes.

Toward the end of the aging process the bottles are racked to clarify the wine and collect the sediment on the cork; this process is called riddling or *remuage*. The necks of the bottles are frozen to facilitate the collection of sediment on the cork, after which the bottle is opened and the sediment is removed, along with the cork; this process is called disgorging or *dégorgage*. A liquor of high-grade wine, sucrose, and brandy spirits is added to the bottle for the required sweetness. The bottle is then recorked, put through a final aging period, and packaged and shipped.

In step-by-step tank fermentation, the wine is fermented in large-capacity tanks (usually 5–10 cu m) for about one month. It is then cooled, filtered, and poured into bottles.

In the continuous tank-fermentation method, which was developed in the USSR, all steps from the initial processing of the wine material to the finished product are conducted in a continuous flow. In this procedure the blend of wine materials is biologically deaerated in fermenters with a high yeast concentration. It then undergoes pasteurization and additional fermentation with yeast in a series of fermentation tanks or a single tank with numerous chambers. After the addition of sugar solution it is enriched by biologically active substances in special devices called biogenerators, cooled to a temperature of about −5°C, and filtered. A final dose of sugar solution is added, and the wine is poured into bottles. The continuous method produces a champagne as fine as bottle-fermented varieties.

Soviet champagne contains 10.5–12.5 percent alcohol by volume. Different types of Soviet champagne are distinguished according to sugar content: brut (to 0.3 percent), extra dry (0.8 percent), dry (3 percent), semidry (5 percent), semisweet (8 percent), and sweet (10 percent). Bottle-fermented champagne is marked "aged" (*vyderzhannoe*) on the label.

Z. N. KISHKOVSKII [29–825–2]

CHAMPAGNE D'ARGENT, a breed of rabbit raised for its meat and pelt. Developed in India, the rabbit was named for the French province of Champagne, where the breed was improved. Adult rabbits weigh 3.7–4.0 kg; young rabbits at four months weigh 2 kg. A litter consists of six or seven young. The pelt is thick and silvery. The tip of the snout and the ears are dark silver. The rabbits are black at birth, acquiring their adult coloration at the age of five or six months. They fatten rapidly and yield a high-quality carcass. The rabbits are bred in France, Austria, Great Britain, the USA, and other countries. In the USSR they were bred prior to the development of the silver rabbit. [29–827–1]

CHAMPAIGN, a city in the northern USA, in the state of Illinois. Population, 62,000 (1975; including the neighboring city of Urbana and the surrounding metropolitan area, 165,000). Champaign's industries include machine building and the production of scientific equipment, instruments, and medicines.

[29–827–3]

CHAMPAIGNE, PHILIPPE DE. Baptized May 26, 1602, in Brussels; died Aug. 12, 1674, in Paris. French painter.

Champaigne worked in Paris from 1621. He executed ornamental compositions in palaces and churches, notably those in the Luxembourg Palace, on which he collaborated with N. Poussin. Influenced by Jansenism, Champaigne painted religious scenes distinguished for their ascetic restraint, such as *The Last Supper* (1648, the Louvre, Paris). In his severe, penetrating portraits he combined elements of Flemish realism and early French classicism; of special note are his likenesses of A. J. Richelieu, J. Mazarin, and A. d'Andilly. Champaigne also painted group portraits, notably, *Two Nuns* (1662, the Louvre).

[29–827–4]

CHAMPART, in medieval France, the seigneurial requisition of a fixed portion, varying from one-twentieth to one-fourth, of the harvest. It was paid in grain, grapes, flax, and other produce. Lands held by enserfed peasants were subject to this requisition. During the French Revolution, decrees of Aug. 4 to 11, 1789, Mar. 15, 1790, and May 3, 1790, provided for the discontinuance of the requisition with compensation to the landowners. Under the Jacobin dictatorship, however, a decree of July 17, 1793, abolished the *champart* without compensation. [29–827–2]

CHAMPFLEURY (also Fleury, pen name of Jules-François-Félix Husson). Born Sept. 10, 1821, in Laon, Aisne Department; died Dec. 6, 1889, in Sèvres, Hauts-de-Seine Department. French writer.

Champfleury studied at a *collège* (a locally financed or privately owned secondary school) in Laon. In the mid-1840's he be-

gan contributing to magazines. His *Chien-Caillou* (1847) and other collections of short stories and sketches depicted the life of Parisian Bohemians.

A circle of writers formed around Champfleury; their hypercritical work was labeled "realism" by their literary opponents. Champfleury adopted the term, applying it to his own aesthetic theories, which combined tenets of realism with ideas close to those of naturalism and of "art for art's sake." He considered the portrayal of the lower classes of society to be the chief task of literature. Champfleury embodied his aesthetic views in such novels as *The Sufferings of Schoolmaster Delteil* (1853) and *The Bourgeois of Molencharat* (1855).

CHAMPIGNY-SUR-MARNE, a city in France, in Val-de-Marne Department, on the Marne River. Population, 76,000 (1975). Champigny-sur-Marne has machine-building and food-processing industries. [29–827–5]

CHAMPION, an athlete or team victorious in an official championship. The word is also applied by analogy to those who place first in a number of different sports events or in combined events, for example, in the Olympic Games and Spartakiads. [29–173–3]

CHAMPIONSHIP, an official major competition in any sport, held among sports associations or within a specific region (raion, city, oblast, nation, continent, world), in which the team or player capturing first place is declared the champion. In certain instances, "championship" (*chempionat*) is distinguished from "first place" (*pervenstvo*). In football and hockey, for example, adults compete for the USSR championship, and junior-class athletes and sports clubs compete for first place.

The Russian term *chempionat* is also used at livestock fairs in determining the best specimens of a given breed. [29–173–4]

CHAMPLAIN, SAMUEL DE. Born 1567 in Brouage, near Rochefort; died Dec. 25, 1635, in Quebec. French hydrographer. Explorer of Canada and the northeastern USA.

Champlain made a journey along the St. Lawrence and Saguenay rivers in 1603. Between 1604 and 1606 he explored various parts of the Atlantic coast of North America, including the peninsulas of Nova Scotia and Cape Cod, the Bay of Fundy, and Massachusetts Bay; he discovered the island of Nantucket. In 1608 he founded the city of Quebec near the mouth of the St. Lawrence River.

Champlain explored the Richelieu River, a right tributary of the St. Lawrence, in 1609. On that trip he discovered the Adirondacks, the Green Mountains, and the lake that was later named for him. Between 1609 and 1615 he undertook trips in search of a water route to the Pacific Ocean. In 1615 and 1616, Champlain journeyed by way of the St. Lawrence and Ottawa rivers and Lake Nipissing to Lake Huron deep within the North American continent.

CHAMPLAIN, a lake in the northeastern USA and in Canada. Lake Champlain has an area of 1,137 sq km and reaches a depth of 183 m. The basin is of tectonic origin. The lake drains into the St. Lawrence River and is part of the waterway that connects the Hudson River with the St. Lawrence. The cities of Burlington and Plattsburgh are situated on Lake Champlain. [29–828–2]

CHAMPOLLION, JEAN-FRANÇOIS. Born Dec. 24, 1790, in Figeac; died Mar. 4, 1832, in Paris. French scholar; founder of Egyptology. Member of the Académie des Inscriptions (1830).

After many years of studying the inscriptions of the Rosetta Stone, Champollion, in September 1822, set forth the main principles for the decipherment of the hieroglyphic writing of the ancient Egyptians. He also established the sequence of development of Egyptian writing—hieroglyphic, hieratic, and demotic. From 1828 to 1830 he headed an archaeological expedition to Egypt, where he collected and copied an enormous number of texts, ideograms, and records, which were published after Champollion's death in *Monuments de l'Egypte et de la Nubie*. In 1831, Champollion accepted the chair of Egyptology, created especially for him, at the Collège de France; he was the first to compile a grammar and dictionary of the Egyptian language, which was published posthumously.

Champollion was an honorary member of the St. Petersburg Academy of Sciences (1826).

CHAMSON, ANDRÉ. Born June 6, 1900, in Nîmes, Gard Department. French writer. Member of the Académie Française (1956). Participant in the Resistance.

Chamson graduated from the faculty of letters of the University of Paris. In his early novels, such as *Roux, the Bandit* (1925) and *The Men of the Road* (1927; Russian translation under the title *People From the Mountains*, 1937), Chamson showed himself to be an acute observer of social change in the French countryside.

During the 1930's, Chamson took part in the struggle of the Popular Front and wrote the antifascist books *The Year of the Vanquished* (1934; Russian translation, 1936) and *The Galley* (1939); he also produced a series of essays about republican Spain. The novel *The Well of Miracles* (1943, published 1945; Russian translation, 1947) is filled with loathing for occupiers and traitors.

Chamson focused on the spiritual degeneration of man in the bourgeois world in *The Man Who Walked Before Me* (1948) and continued his sharp criticism of social mores in the novel *The Snow and The Flower* (1951). His novels *The Meeting of Hopes* (1961) and *The Magnificent Woman* (1967) were received sympathetically by French democratic critics. Chamson's book *The Sum of Our Days* (1954) is autobiographical.

CHAMZINKA, an urban-type settlement and the administrative center of Chamzinka Raion, Mordovian ASSR. Chamzinka has a railroad station on the Krasnyi Uzel–Kanash line, 44 km northeast of the city of Saransk. Industry is represented by the Avtozapchast' Plant, a butter factory, and a bulb-base shop of the Svetotekhnika Saransk Production Association. The settlement also has a poultry farm and a people's amateur theater. [29–37–5]

CHAN (also Laz), the unwritten language of the Laz (Chan). Chan is a Kartvelian language; with Megrelian, it is often regarded as a dialect of San, or Mingrelo-Chan. Three dialects of Chan are spoken on the Black Sea coast of Turkey: Khopa, Vitse-Arkhaba, and Atina.

Chan has a simple vowel system (*a, e, i, o,* and *u*) and 32 consonants. Nominal stems are stable, and there are seven cases: nominative, ergative, dative, genitive, ablative, instrumental, and allative. Categories of the verb include person, number, tense, version, voice, potential, causative, and aspect; the category of mood includes 14 modal and tense forms. Directional preverbs are common. The vocabulary of Chan abounds in Turkisms and contains Georgian and Greek loanwords.

CHANBA, SAMSON IAKOVLEVICH. Born June 18, 1886, in the village of Atara, in what is now Ochamchira Raion, Abkhazian ASSR; died 1937. Soviet Abkhazian writer and state figure. Member of the CPSU from 1921.

Chanba, the son of peasants, graduated from the Khoni Teachers Seminary in 1914 and worked as a teacher. From 1921 to 1925 and from 1930 to 1932 he was people's commissar of education in Abkhazia. From 1925 to 1930 he served as chairman of the Central Executive Committee of the Abkhazian ASSR.

Chanba wrote in both Russian and Abkhazian. His works were first published in 1916. His romantic narrative poem *Mountain Maiden* (1919) was followed by the plays *Makhadzhiry* (1920, staged 1928), *Apsny Khanym* (1923), and *From the Past* (1929). These plays, based on themes drawn from revolutionary history and everyday life, were the first examples of Abkhazian drama. Chanba also wrote short stories of great psychological depth. His novella *Seidyk* (1934), which is concerned with the initial period of collectivization, was one of the first significant prose works in Abkhazian literature.

CHANCELADE, a commune in southwestern France, where in 1888, during excavations of a rock-shelter near the city of Périgueux, investigators found a human skeleton from the Upper Paleolithic period, along with implements and primitive art objects of the Magdalenian culture. Anthropologically, the person from Chancelade was a variant of Upper Paleolithic man of Western Europe, who lived 12,000 to 15,000 years ago. [29–834–5]

CHANCELLOR, RICHARD. Date of birth unknown; died Nov. 10, 1556, off the coast of Scotland. British navigator.

In 1553, Chancellor commanded one of the three ships in H. Willoughby's expedition, which had been sent by an English trading company to search for a northeast passage to India. Chancellor rounded the northern part of the Scandinavian and Kola peninsulas and sailed to the mouth of the Severnaia Dvina. He was received in Moscow by Ivan IV. After obtaining a charter for free trade with Muscovy, he left the city in March 1554. An account of the expedition was written by C. Adams, one of Chancellor's companions.

In 1555, Chancellor visited Moscow a second time. On the return voyage he perished during a storm.

CHAN CHAN, the ruins of the capital of the legendary kingdom of Chimor (the Chimú archaeological culture); located in Peru, near Trujillo, in the Moche River valley. Chan Chan, which dates from the first half of the second millennium B.C., had an area of about 18 sq km. Its center comprised rectangular palace complexes, with high (to 9 m) walls of mud brick; each complex included courtyards, storehouses and other outbuildings, and necropolises. Many walls were covered with textile-like reliefs depicting rows of geometricized birds, animals, and people. The edge of the city was randomly built up with dwellings of the common inhabitants.

CHANCHIANG, a city in Kwangtung Province, China, on the coast of the South China Sea. Population, more than 200,000 (1970). Chanchiang is a terminus of the Lit'ang-Chanchiang Railroad and a seaport. It has chemical, machine-building, construction, match, textile, and food-processing industries. From 1898 until 1945, Chanchiang was part of France's Canton concession. [29–535–2]

CHANCHIBADZE, PORFIRII GEORGIEVICH. Born Dec. 13 (26), 1901, in the city of Makharadze, Georgian SSR; died Mar. 14, 1950, in Moscow. Soviet military leader. Colonel general (1945). Hero of the Soviet Union (Apr. 19, 1945). Member of the CPSU from 1930.

The son of a Georgian peasant, Chanchibadze joined the Red Army in 1921. He graduated from infantry school in 1922, advanced courses for command personnel in 1927, two courses at the M. V. Frunze Military Academy in 1940, Vystrel courses in 1940, and the Higher Academic Courses at the Higher Military Academy in 1948. During the Great Patriotic War of 1941–45, Chanchibadze commanded a motorized rifle regiment, a rifle division, and a corps between 1941 and 1944. In June 1944 he assumed command of the Second Guards Army. He fought in the battles of Moscow and Stalingrad, in the liberation of the Crimea, the Donbas, and Byelorussia, and in the East Prussian Operation. After the war he held various command positions in the military.

Chanchibadze was a deputy to the second convocation of the Supreme Soviet of the USSR. He was awarded two orders of Lenin, three orders of the Red Banner, Orders of Suvorov First and Second Class, the Order of Kutuzov Second Class, the Order of Bogdan Khmel'nitskii Second Class, the Order of the Red Star, and various medals. [29–44–5]

CHANCROID (soft chancre; also called venereal ulcer in Russian), an infectious disease in man, caused by the streptobacillus *Hemophilus ducreyi*, or Ducrey's bacillus (described in the late 1880's and early 1890's by the Russian O. V. Petersen, the Italian A. Ducrey, and the German P. Unna) and transmitted mainly through sexual intercourse.

The causative agent of chancroid is found in the discharge from the chancre; under a microscope it looks like a short rod with rounded ends and a slender middle. Two to five days after infection, a pustule forms over a bright red edematous spot at the site of entry of the infection; the pustule opens three or four days later and becomes a small painful ulcer with ragged edges, undermined by a purulent deposit and with a soft base encircled by a red edematous rim. The purulent discharge from such ulcers reaches the surrounding tissues and gives rise to numerous new ulcerations, which become scarred after a month or two. When the streptobacilli penetrate the regional lymphatic nodes, the latter become enlarged (bubo formation); they coalesce and fuse with the skin, soften, and open to form ulcers. The process is accompanied by local pain, high temperature, and general malaise.

Treatment includes the use of antibacterial agents and immersion of the affected area in a warm manganese bath. (*See* VENEREAL DISEASES for a description of preventive measures.)

CHANDAR KRISHAN (also Krishan Chandar). Born Nov. 19, 1913, in Wazirabad; died Mar. 7, 1977, in Bombay. Indian Urdu-language writer.

Krishan Chandar graduated from Farman Christian College in Lahore, in 1934. In 1953 he became secretary-general of the Association of Progressive Writers of India. In his short stories of the 1930's and in his first novel, *Defeat* (Russian translation, 1958), he described events realistically while romantically idealizing reality. His later works reveal a more profound critical realism, and the novella *When the Fields Awakened* (1951; Russian translation, 1953), which describes an antifeudal peasant uprising in Telingana, contains features of socialist realism. His novella *The Traitor* and the short-story collection *We Are Savages* (1949) describe the partition of India in 1947.

In his novels, novellas, and short stories, Chandar dealt with topical issues of Indian reality, portraying the life of the peasants, the urban poor, and the artistic intelligentsia. He also published satirical works, such as the trilogy *The Ass's Adventure* (1958–65) and the novellas *The Children From Dadar Bridge* (1958; Russian translation, 1973) and *The Paper Boat* (1966, Russian translation, 1972).

CHAND BARDAI. Lived in the second half of the 12th century. Indian poet and storyteller.

Chand Bardai wrote in a Rajasthani dialect. He is the author of the heroic epic poem *Prithiraj Raso*, which recounts the life of the Delhi prince Prithwiraj III. According to legend, Chand Bardai lived at Prithwiraj's court. The poem, which long existed only in oral form, glorifies the military victories and romantic exploits of the feudal lords. The modern version, with later additions, dates no earlier than the 17th century. Approximately 50 known manuscript versions exist, the earliest of which dates from 1610.
V. I. BALIN [29–39–2]

CHANDERNAGORE, a city and port in northeastern India, in the state of West Bengal, near the city of Calcutta, on the Hooghly River (a branch of the Ganges) in the Ganges delta. Population, 76,000 (1971). Chandernagore has a railroad station; its port is accessible to oceangoing vessels. The city has a jute factory; cotton fabrics are also produced. From 1673 until 1950, Chandernagore was a French possession. [29–40–1]

CHANDIGARH, a union territory of India, that is, an administrative and political unit in India controlled by the central government. Located in the northwestern part of the country, in the foothills of the Himalayas, Chandigarh has an area of 114 sq km. The population was 300,000 in 1975. The city of Chandigarh is the capital of the union territory. [29–40–2]

CHANDIGARH, a city in northwestern India, at the foot of the Himalayas. Capital of the states of Punjab and Haryana (although not a part of either one) and of the Union territory of Chandigarh. Population, 257,000 (1971). Chandigarh manufactures woolens, knitwear, and pharmaceuticals. The city has a university.

The greater part of Chandigarh was built between 1951 and 1956 in accordance with a plan by a team of Indian and foreign architects headed by Le Corbusier. It combines a geometric system of transportation lines with picturesque landscaped pedestrian paths. It features principles of modern architecture and urban planning, including the use of dwelling units fully serviced with public utilities and transportation arteries differentiated according to purpose. Structures in the city also incorporate traditional Indian architectural devices, including the *jali*, or open-work lattice. [29–40–3]

CHANDLER, SETH CARLO. Born Sept. 17, 1846, in Boston; died Dec. 31, 1913, in Wellesley, Mass. American astronomer.

Chandler graduated from Harvard University in 1861 and was a staff member of the Harvard Observatory from 1881 to 1904. His principal works are devoted to latitude variations and the motion of the earth's poles. On the basis of approximately 33,000 observations he concluded that latitude variations consist of two periodic components: one with a period of a year and one with a period of 14 months (Chandler period). Chandler also investigated variable stars. [29–174–4]

CHANDPUR, a city in Bangladesh, in Chittagong Division, in the Ganges delta. Population, 34,800 (1961). Chandpur has a railroad station and is a river port. The city's principal industries are jute processing, oil milling, and sawmilling, including the production of matches. [29–40–4]

CHANDRA, ROMESH. Born Mar. 30, 1919, in Lyallpur. Figure in the Indian working-class movement; one of the leaders of the world peace movement; journalist.

Chandra received degrees from a university in Lahore and from Cambridge University. From 1934 to 1941 he was chairman of the Students' Union in Lahore. He became a member of the Communist Party of India (CPI) in 1939, of the Central Committee of the CPI in 1952, of the National Council of the CPI in 1958, and of the Central Executive Committee in 1958; from 1963 to 1967 he was a member of the Central Secretariat of the National Council of the CPI. From 1963 to 1966, Chandra was editor of the central organ of the CPI, *New Age*. He served as general secretary of the All-India Peace Council from 1952 to 1963. In 1953 he joined the World Peace Council, and in 1966 he became the council's general secretary and a member of its presidium; in 1977 he was elected president of the organization.

Chandra was awarded the F. Joliot-Curie Gold Peace Medal in 1964. He received the International Lenin Prize for Strengthening Peace Among Nations in 1968, and he was awarded the Order of Friendship of Peoples in 1975. [29–40–5]

CHANDRAGUPTA, the name of two ancient Indian rulers belonging to the Gupta dynasty.

Chandragupta I. Ruled from 320 to about 340, according to some sources.

Descended from a family of minor rulers of Magadha, Chandragupta I strengthened his position and became ruler of all Magadha by military conquest and the conduct of a successful foreign policy; particularly important was his marriage to Princess Kumara Devi of the Lichchhavi tribe. Chandragupta founded the Gupta empire; the Gupta Era, which began with his accession, was widely used as a chronological frame of reference in ancient and medieval India.

Chandragupta II. Grandson of Chandragupta I. Ruled from 380 to 415, according to some sources.

Chandragupta II ascended the throne after deposing his older brother Ramagupta. He thus inherited a fully developed empire, which he subsequently greatly enlarged. His most important territorial gain was the conquest of the "state of the western rulers" (Gujarat), which gave the empire access to the Arabian Sea. Chandragupta's reign marked the height of Gupta power and was a period of economic well-being for ancient India. Moreover, his rule, which has come to be known as the Golden Age of the Guptas, was a time during which ancient Indian culture flourished.
[29–41–1]

CHANDRAGUPTA MAURYA (also Candragupta Maurya), ruler of the ancient Indian state of Magadha (317–293 B.C.); founder of the Maurya dynasty.

There is little authentic information about Chandragupta's life. Both aristocratic and humble (sudra caste) origins have been ascribed to him. In his youth he served under the Nandas, the rulers of Magadha; he fought them for the throne, but he failed and fled to the northwestern part of the country. There he joined with the invading Greco-Macedonians and convinced Alexander the Great to wage war against the Nandas. After Alexander had left India, Chandragupta led a struggle to expel all the Greco-Macedonians from the country. He succeeded in doing so and resumed the fight for Magadha. After deposing Dhana Nanda, he ascended the throne himself.

In subsequent wars, Chandragupta subjugated all of northern India and founded the Indian Mauryan empire. In 305 B.C. he repulsed the invasion of Seleucus I Nicator. In accordance with the peace treaty they signed, Chandragupta gave Seleucus 500 elephants, in exchange for which he acquired a large area west of the Indus River and received the daughter of Seleucus as his bride. According to some sources, Chandragupta adopted Jainism in 293 B.C. and became a monk.

CHANDRASEKHAR, SUBRAHMANYAN. Born Oct. 19, 1910, in Lahore, India (now in Pakistan). American physicist and astrophysicist.

Chandrasekhar graduated from the University of Madras in 1930. He received a Ph.D. degree from Cambridge University in 1933 and taught at Cambridge until 1936. He moved to the USA in 1936, becoming an American citizen in 1953. In 1937 he joined the staff of Yerkes Observatory and the faculty of the University of Chicago; he became a professor at the university in 1942.

Chandrasekhar's main works deal with stellar structure, stellar atmospheres, and the dynamics of stellar atmospheres, as well as with mathematical physics, in particular, the theory of stochastic processes. Chandrasekhar developed a theory of white dwarfs that predicts the existence of a mass limit for white dwarfs, which is known as Chandrasekhar's limit, and gives a universal relationship between the mass and the radius of a star; the relationship specifies the final stages of stellar evolution. Chandrasekhar also studied the dynamics of stellar systems and radiative transfer in plane-parallel stellar atmospheres. He examined problems of hydrodynamic and hydromagnetic stability in the framework of the general theory of relativity.

Chandrasekhar became a fellow of the Royal Society of London in 1944 and is a member of both the American Academy of Arts and Sciences and the National Academy of Sciences.

O. V. KUZNETSOVA [29–41–2]

CHANDYR, a river in Iran and the Turkmen SSR, a left tributary of the Sumbar River of the Atrek River basin. The Chandyr, which is 90 km long and drains an area of 1,820 sq km, rises in the mountains of the Kopetdag. It is fed by springs and rain, and to a lesser degree, by snow. The river, which dries up in summer, reached a maximum measured flow rate of 422 cu m per sec in 1963. The Chandyr is used for irrigation. [29–41–3]

CHANG (also *chank*), an Uzbek and Tadzhik hammered stringed instrument; a type of dulcimer. The *chang* is a flat, wooden, trapezoidal box and is sometimes mounted on small legs; some instruments have round sound holes in the upper soundboard. The metal strings are grouped in threes, except for the bass string, which is single. The instrument produces a bright tone with a lasting resonance and is played by striking the strings with flexible bamboo or wooden sticks. Tempered *changs*, with a chromatic range, are primarily used in small ensembles, but they also appear in modern folk orchestras in the Uzbek SSR and the Tadzhik SSR. Besides the standard version, there are piccolo, tenor, and bass *changs*.

CHANG CH'IEN. Date of birth unknown; died circa 103 B.C. Chinese diplomat and traveler.

In 138 B.C., Chang Ch'ien was sent on a mission to Central Asia by Emperor Wu Ti in order to conclude an alliance with the Yüeh-chih tribe against the Hsiung-nu. He was captured by the Hsiung-nu, however, and did not escape and resume his journey westward until ten years later. On the return trip he was detained again by the Hsiung-nu, but he quickly escaped. In 115 B.C., Chang Ch'ien was dispatched at the head of an embassy to the ruler of the Wu-sun tribe, which roamed the area west of China's borders; he persuaded the Wu-sun ruler to form an alliance with China. [29–534–4]

CH'ANGCHIH, a city in China, in Shansi Province; located near the upper course of the Chang Shui of the Hai Ho basin, on the Loess Plateau. Population, 180,000 (1959). Industry includes ferrous metallurgy, machine building, the mining and processing of coal, and the production of textiles. [29–44–3]

CHANG CHIH-TUNG. Born Sept. 2, 1837, in Nanp'i Prefecture, Chihli Province; died Oct. 5, 1909, in Peking. Chinese state figure.

Chang Chih-tung was governor-general of Kwangtung-Kwangsi from 1884 to 1889 and of Hupeh-Hunan from 1889 to 1907; from November 1894 to February 1896 he served as governor-general in Nanking. In 1907 he became a member of the supreme ruling body, the Military Council, in Peking. He advocated moderate bourgeois reforms of the Chinese economy, political system, and culture. Chang Chih-tung opened a number of modern industrial plants in Wuhan, Nanking, and Canton. In the same cities he also founded several general-education schools and military academic institutions similar to those in Europe. [29–534–5]

CH'ANGCHOU (also Wuchin), a city in China, in Kiangsu Province. Population, more than 300,000 (1971). Ch'angchou has a railroad station and is a landing on the Grand Canal. Economic activity includes rice polishing, fishing, and the production of textiles and vegetable oil. [29–44–4]

CHANG CHÜEH (also Chang Chiao). Year of birth unknown; died 184. Leader of the Rebellion of the Yellow Turbans in China.

For ten years Chang Chüeh preached the "way of the great peace," an appeal for social equality and struggle against the Han Dynasty that was couched in the language of Taoist mysticism. In March 184 he assumed leadership of an armed uprising begun by his followers in North and Central China. Chang died from wounds received in battle. [29–534–3]

CH'ANGCH'UN, a city in Northeast China, on the It'ung Ho. Capital of Kirin Province. Population, more than 1.5 million (1970).

Ch'angch'un is an important railroad junction and has an airport. The city's machine-building industry, one of the largest in China, was developed between 1953 and 1957 with the help of the USSR. Ch'angch'un produces motor vehicles, rolling stock, tractors, agricultural machinery, machine tools, electric machines and equipment for the textile industry, checking and measuring devices, semiconductor devices, and motion-picture equipment. The city has a metallurgical plant. The chemical industry is represented by a pharmaceuticals plant and by plants producing mineral fertilizers, rubber, industrial rubber goods, synthetic fiber,

and plastics. There are also plants of the wood-products, paper, ceramic, textile, leather, food-processing, and tobacco industries. Cottage industries produce such articles as rugs. Ch'angch'un has a branch of the Chinese Academy of Sciences and a university.

Ch'angch'un arose in the early 19th century and after the construction of the Chinese Eastern Railway between 1897 and 1903 developed into a large commercial and transportation center. In 1931 the city was occupied by Japanese imperialists, who declared it the capital of the puppet state of Manchukuo and renamed it Hsinching, or New Capital. It was liberated by the Soviet Army in August 1945 but after the withdrawal of Soviet troops was seized by the Kuomintang in 1946. In October 1948 the Kuomintang was driven out of Ch'angch'un by the People's Liberation Army of China. [29–45–1]

CH'ANGCH'UN CONFERENCE, negotiations that took place from Sept. 4 through Sept. 26, 1922, in Ch'angch'un, China, between representatives of the Far East Republic (FER) and the RSFSR on one side and Japanese representatives on the other.

The successes of the People's Revolutionary Army of the FER, the strengthened international and domestic position of Soviet Russia and its allied republics, the sharpening of imperialist contradictions in the Far East, and growing difficulties in Japan's internal politics forced the Japanese government to resume the negotiations that were broken off at the Dairen Conference of 1921–22. In May and June 1922, Japan proposed that negotiations begin. On June 30 the government of the FER agreed on condition that the talks be conducted between Japan on one side and the FER and the RSFSR on the other. On July 19 the Japanese government accepted the proposal of the FER and declared that it would evacuate its troops from the Primor'e by Nov. 1, 1922, at the latest.

From the outset the Japanese delegation attempted to limit the conference to Far Eastern issues of interest only to Japan and suggested the conclusion of a treaty with the FER alone. The delegation of the RSFSR and FER opposed this proposal but agreed to adopt the Dairen draft as a basis for negotiations. The Japanese then announced that their government had agreed to conclude a treaty with both the FER and the RSFSR provided that the treaty was restricted to questions affecting the Far East; after the treaty was signed, negotiations could begin on an agreement that would apply to the entire RSFSR.

Japan also stated that it would not evacuate Northern Sakhalin until the issues raised by the Nikolaevsk incident were settled. In the early morning of Mar. 12, 1920, Japanese troops in Nikolaevsk-na-Amure, in violation of an agreement, had attacked partisans in the city and had been defeated; the Japanese government, using the incident as a pretext for continuing its intervention, had then occupied Northern Sakhalin. The delegation of the FER and RSFSR categorically opposed linking the evacuation of Northern Sakhalin with a settlement of the Nikolaevsk issues.

The negotiations in Ch'angch'un were broken off by the Japanese. In early October, White Guard detachments were routed in the Spassk Operation of 1922; the People's Revolutionary Army of the FER approached Vladivostok, which on October 25 was abandoned by the Japanese and the remaining White Guards. In accordance with an agreement of Jan. 20, 1925, on the basic principles of mutual relations between the USSR and Japan, Japanese troops were removed from Northern Sakhalin by May 15 of that year, thus ending the period of foreign intervention in the Far East.

CHANG GO, a Korean percussion instrument, a type of drum with two heads. [29–47–2]

CHANG HENG. Born A.D. 78; died A.D. 139. Chinese astronomer.

Chang Heng was one of the first to explain the cause of lunar eclipses and the phenomenon of lunar phases. He correctly described the apparent motion of celestial bodies and designed and built several astronomical instruments. His book, *The Armillary Sphere*, which appeared circa 120, presented in detail the theory of the "infinite sky." The theory holds that the universe is boundless in time and space. [29–533–3]

CHANG HSIEN-CHUNG. Born 1606; died 1647. A leader of the Peasant War of 1628–45 in China.

In 1630, Chang Hsien-chung headed a rebel detachment in Shensi Province. In 1635, with Li Tzu-ch'eng, he conducted a campaign in Anhwei Province; he began independent operations in the province in the following year. In 1638 he surrendered to the government and was appointed garrison commander at Kuch'eng, in Hupeh Province. Chang raised another rebellion in 1639 and fought in Hunan and Hupeh. In 1644 he seized the city of Ch'engtu, the capital of Szechwan Province, and proclaimed himself "sovereign of the Great Western State." In January 1647, Chang was defeated by Manchu and Chinese feudal lords. [29–532–4]

CHANG HSÜEH-LIANG. Born 1898. Chinese military and political figure. Son of the warlord Chang Tso-Lin.

After his father's murder in 1928, Chang Hsüeh-liang became ruler of the three northeastern provinces that make up Manchuria; in December 1928 he recognized the authority of the Kuomintang government in Nanking. In 1931, on orders from Chiang Kai-shek, his army gave up Manchuria to the Japanese without a fight. Chiang Kai-shek made use of Chang's army in 1935 and 1936 to combat the Chinese Red Army. In 1936, Chang signed a peace agreement with the Chinese Red Army and helped organize the arrest, on Dec. 12, 1936, of Chiang Kai-shek, who had arrived in Sian (*see* SIAN INCIDENT). After Chiang Kai-shek was released on Dec. 25, 1936, Chang was arrested and imprisoned. In 1946 the Kuomintang took Chang to Taiwan. [29–532–3]

CHANGI, a Georgian plucked stringed instrument, an angular harp. The body of the *changi* resembles an elongated rectangle, to which is attached at a right angle a neck with tuning pegs. The instrument's six to 11 strings are made of twisted horsehair or silk and vary in thickness. The six-string, or Svanetian, *changi* is widely used to accompany singing. The modern *changi* has 16 horsehair or 23 gut strings. Other modern types of *changi* are of different sizes and have 13 gut or nylon strings, which are tuned chromatically. The modern *changi* is used in the State Folksong and Folkdance Ensemble of the Georgian SSR, an orchestral group.

CHIANG KAI-SHEK (also Chiang Chieh-shih). Born Oct. 31, 1887, in Fenghua, Chekiang Province; died Apr. 5, 1975, in Taipei. Head of the Kuomintang regime; overthrown by the people's revolution in China in 1949.

The son of a merchant, Chiang Kai-shek graduated from military academies in Paoting and Tokyo. Pretending to be a left-wing member of the Kuomintang, he supported Sun Yat-sen in the first half of the 1920's. As commander in chief of the National Revolutionary Army he took part in the Northern Campaign of 1926–27. On Apr. 12, 1927, Chiang carried out a counterrevolutionary coup and established a reactionary dictatorship in China. For more than 20 years he wielded enormous power, holding the posts of chairman of the Central Executive Committee of the Kuomintang (from 1926), chairman of the Executive Yuan, president of the republic, and commander in chief of the armed forces; he assumed the title of generalissimo.

Between 1930 and 1934, Chiang undertook five punitive campaigns against the soviet regions (*see* SOVIETS IN CHINA). After the Japanese attacked China on July 7, 1937, he was forced to form a

united anti-Japanese national front, which rested on the agreement of the Communist Party of China (CPC) and the Kuomintang to carry out combined operations. Chiang continued to use large forces, however, to blockade the region along the Shansi-Kansu-Ninghsia border, which was controlled by the CPC.

After Japan surrendered on Sept. 2, 1945, Chiang rejected the offer of the CPC to form a coalition government and in June 1946 began a new civil war. In late 1949 the People's Liberation Army of China liberated virtually all mainland China from the Kuomintang. Chiang fled with his remaining troops to Taiwan, where he established himself with the military and financial support of the USA. V. I. ELIZAROV [29–42–2]

CHANGKUANGTS'AILING, a mountain range in northeastern China; part of the Manchurian-Korean Mountains. The range measures 420 km in length and rises to a maximum elevation of 1,404 m. It is composed chiefly of granites and gneisses. The range has coniferous and broad-leaved forests. [29–532–1]

CHANG LO-HSING. Year of birth unknown; died 1863. A leader of the Nien Rebellion of 1852–68 in China.

The son of a prosperous peasant, Chang became a salt trader. In early 1853 the insurgents of the Chihhochi region in Anhwei Province elected him their leader. In February 1853 the authorities succeeded in winning Chang to their side, but in August 1854 he rejoined the insurgents, who, in August 1855, proclaimed him supreme leader of the rebellion. From 1857 to 1861 he fought together with the Taiping rebels. In March 1863 his detachments were defeated, and Chang was taken prisoner and executed. [29–532–2]

CH'ANGPAI SHAN (in Korean, Paektu-san), a volcanic plateau in the Manchurian-Korean Mountains, situated mainly in China and partly in the People's Democratic Republic of Korea. The Ch'angpai Shan has elevations ranging from 1,000 to 2,000 m, with a maximum of 2,750 m at the volcano Pait'ou Shan. It is deeply dissected by the Yalu, Man, and Tumen rivers and their tributaries. Coniferous forests and dwarf cedar thickets grow on the plateau. [29–38–4]

CH'ANGSHA, a city in China, on the Hsiang Chiang; capital of Hunan Province. Population, 825,000 (1970). Ch'angsha is a transportation junction. Industry includes food processing, nonferrous metallurgy, the production of textiles (mainly cotton), and machine building (the manufacture of machine tools, instruments, and agricultural equipment). The city is the center of a rice-growing region.

Settlements existed at what is now Ch'angsha as early as the fifth century B.C. The area was a center for the formation of the ancient Chinese Ch'u kingdom, which played an important political role during the Chan Kuo period (fifth to third centuries B.C.). Wood and bronze objects excavated at burials of the period have helped scholars establish the major features of the Ch'u culture, and discoveries of painted human figures have helped in determining the physical type of the people. Ancient Chinese texts inscribed on bamboo tablets have been found near the city. During the rule of the Han Dynasty (third century B.C. to third century A.D.), the production of lacquer ware and bronze mirrors developed in Ch'angsha.

Under the Ch'in Dynasty (221–207 B.C.), Ch'angsha became the seat of a district. Later it was at various times the seat of a district, region, and prefecture. Under the Ch'ing Dynasty (1644–1911) and after the establishment of a republic it was the capital of Hunan Province.

In 1904 one of the first bourgeois revolutionary organizations in China, the Hua-hsing Hui, was established in Ch'angsha. In 1910 a popular uprising known as the rice revolt took place in the city, and in 1920 one of China's first Marxist circles arose in Ch'angsha. In 1941 and in 1944 and 1945 the city was occupied by Japanese troops. In August 1949, Ch'angsha was liberated from the rule of the Kuomintang by the People's Liberation Army of China. [29–46–1]

CHANG SUNG-OP (pseudonym, O Wong). Born 1845; died 1899. Korean painter.

In the 1890's, Chang Sung-op was a member of the Tohwaso, which served as an academy of painting in Seoul. He was a representative of the "birds-and-flowers" school and of the traditional Korean painting technique in india ink and watercolors. His works include *Shepherd With Buffalo and Butterflies* (Central Historical Museum, Pyongyang). [29–43–1]

CHANG T'AI-LEI. Born 1898 in Ch'angchou; died Dec. 12, 1927, in Canton. Figure in the Communist Party of China (CPC).

The son of an office worker, Chang T'ai-lei graduated from Peiyang University in Tientsin in 1919. He took part in the anti-imperialist May Fourth Movement in 1919. In 1920 he joined a Communist circle and helped found the Chinese Socialist Youth League. In 1921 he became a member of the CPC and attended the Third Congress of the Comintern as a delegate of the CPC; there he met V. I. Lenin. Chang helped organize a united anti-imperialist front based on cooperation between the CPC and the Kuomintang.

Chang became a candidate member of the Central Committee of the CPC in 1925 and a member of the Central Committee in May 1927. He took part in the Nanch'ang Uprising of 1927. At the extraordinary conference of the Central Committee of the CPC held on Aug. 7, 1927, he was elected a candidate member of the Central Committee's Provisional Politburo and was appointed secretary of the Kwangtung provincial committee of the party. In December he was the principal organizer and leader of an armed uprising in Canton (*see* KUANG-CHOU UPRISING OF 1927). Chang was assassinated by counterrevolutionaries. [29–532–5]

CHANG T'AI-YEN. Born 1868 in Hangchou; died 1936 in Suchou. Chinese political figure.

Chang was a leader of the Kuang Fu Hui, a revolutionary organization founded in 1904. In 1906 he joined the T'ung-meng Hui and became editor of its journal, *Min pao* (The People). His journalism, which called for the overthrow of the Manchu Ch'ing dynasty, reflected the influence of Great Han and Pan-Asian theories. During the Hsinhai Revolution of 1911–13, Chang supported Yüan Shih-k'ai. During the Revolution of 1925–27 he opposed the Communist Party of China and friendship with the USSR. In later life Chang withdrew from politics. [29–533–1]

CH'ANGTE, a city in China, in Hunan Province, in the basin of Tungt'ing Hu. Population, 111,000 (1959). Ch'angte is a logging center. Bamboo is among its products. The city also has a food-processing industry. [29–42–1]

CHANG T'IEN-I. Born 1906 in Nanking. Chinese writer.

Chang T'ien-i served as a deputy in the National People's Congress of China. His published works include the novels *One Year* (1933) and *In the City* (1935), the novellas *Notes From the World of the Spirits* (1931) and *On Ch'ing-ming Day* (1936), and the short-story collections *The Bees* (1933), *Moving* (1934), *Finale* (1935), and *Stories About Strange People* (1936). Chang T'ien-i was psychologically convincing in his depiction of the intellectual who is torn by contradictions. The author voiced his opposition to militarism, corruption, bribery, and careerism. During the Sino-Japanese War of 1937–45 he wrote satirical works, such as the short story "Mr. Hua Wei" (1938).

After the establishment of the Chinese People's Republic in 1949, Chang T'ien-i edited the journal *Jen-min wen-hsueh* (People's Literature). He also wrote children's books—*The Story of Lo Wen-ying* (1954; Russian translation under the title *Young Pioneer Friends*, 1956), *Big Lin and Little Lin* (1949; Russian translation, 1958), and *The Secret of the Precious Pumpkin* (1949; Russian translation, 1958).

Information about Chang T'ien-i has been unavailable since the mid-1960's.

CHANG TSAI. Born 1020; died 1077. Chinese philosopher; one of the founders of neo-Confucianism.

Chang Tsai held that the universe is one but differs in its manifestations; its unifying "material force" is the *ch'i*, which as a result of objective necessity sometimes comes together, forming a multitude of things, and sometimes is dispersed, reverting to the *hsü*, or Great Vacuity. Another one of Chang Tsai's basic tenets was that every human relationship is associated with a particular requirement. Such relationships, however, are always contained within love; consequently, the man who loves becomes identified with Heaven and Earth, which give birth to everything and everyone. Chang Tsai also advocated a return to the *ching t'ien* system, which equalized the availability of land for peasant use.

CHANG TSO-LIN. Born 1876; died June 21, 1928, in Mukden. Chinese general and head of the Fengt'ien clique of warlords.

During the Russo-Japanese War of 1904–05, Chang was head of one of the Hung hu-tzu bands, which aided the Japanese in Manchuria. In 1906 he and his band were incorporated into the Chinese Army, and Chang was soon appointed a division commander. He became de facto ruler of Manchuria during the Hsinhai Revolution of 1911–13 and, after the death of Yüan Shih-k'ai in 1916, absolute dictator; he was supported by the Japanese.

In 1926 and 1927, as commander in chief of an army that united the forces of various warlords of Central and North China, Chang fought against the revolutionary army of the Canton (later Wuhan) government. In April 1927, on his orders, police raided the Soviet embassy in Peking; 25 Chinese Communists, led by Li Tachao, were arrested and executed. In 1928, Chang attempted to align himself with the USA. Chang was killed in a train explosion planned by Japanese intelligence. [29–534–1]

CH'ANGTU, a city in China, in the Tibetan Autonomous Region; situated in the valley of the Lants'ang Chiang (Mekong River), at an elevation of more than 3,000 m. Population, approximately 10,000. Ch'angtu is a commercial and transportation center on the Szechwan-Tibet Highway. Its industries include the repair of motor vehicles and the manufacture of leather products. [29–37–4]

CHANG WEN-T'IEN (pseudonym, Lo Fu). Born 1900 in Nanhui District, Kiangsu Province; died July 1976 (?). Chinese political figure.

A member of a well-to-do family, Chang graduated from an engineering school in Nanking. He studied in the USA from 1921 to 1923, and in 1925 he joined the Communist Party of China (CPC). He studied in Moscow from 1926 to 1930. Chang became a member of the Central Committee of the CPC in 1931 and served on the Politburo of the Central Committee from 1931 to 1956. In 1934 he was elected chairman of the Council of People's Commissars of the Chinese Soviet Republic (*see* SOVIETS IN CHINA). In 1935 he became general secretary of the Central Committee of the CPC, but in 1943, during the Rectification Campaign, he was removed from his post.

Between 1946 and 1950, Chang was successively head of the organizational department of the Central Committee of the CPC, secretary of the Liaotung provincial committee of the party, and a member of the Northeast Bureau of the Central Committee. He was ambassador of the People's Republic of China (PRC) to the USSR from 1951 to 1955 and deputy foreign minister of the PRC from 1954 to 1959. In 1956 he became a candidate member of the Politburo of the Central Committee of the CPC.

In 1959, with P'eng Te-huai and others, Chang opposed the adventurist policy of the "three red banners": the new "general line," the "great leap forward," and the "people's communes." Because of his opposition he was accused at the Eighth Plenum of the Central Committee of the CPC in 1959 of antiparty activity and was removed from his posts. Chang then disappeared from political life. [29–531–5]

CHANHU-DARO, the remains of a multilevel Bronze Age settlement in Pakistan, located near Sarkand, in the northern part of Sind. Chanhu-Daro was investigated in 1931 by the Indian archaeologist N. G. Majumdar and was excavated in 1935 and 1936 by the British archaeologist E. Mackay. The lower layers have been traced back to three periods of the Harappa civilization (23rd to 17th centuries B.C.). After a short interval, the settlement was again populated, by bearers of the Jhukar culture (c. 16th and 15th centuries B.C.) and still later by bearers of the Jhangar culture (12th and 11th centuries B.C.). Information from Chanhu-Daro has been used by a number of researchers to illustrate the displacement of the indigenous population of the Indus Valley (Harappa civilization) by alien tribes of Vedic Aryans.

N. IA. SHCHETENKO [29–43–3]

CHAN KUO (Warring States), a period in the history of ancient China that lasted from 403 B.C. to 221 B.C. and was characterized by an exacerbation of the hegemonic struggle among the major kingdoms (Ch'in, Han, Wei, Chao, Yen, Ch'i, and Ch'u). The Chan Kuo period was also a time of rapid economic, social, and cultural development in China. The wars among the kingdoms ended with the formation of the centralized Ch'in Empire. [29–535–1]

CHANNEL, a beam or strip, usually made of metal, with a squared-off, U-shaped cross section, with a height of 50–400 mm and a wall thickness of 4–15 mm. Steel channels are produced primarily by hot rolling billets in section mills (*see* ROLLED SECTION). Channels with thin flanges are produced on section-bending machines; those made of nonferrous metals are usually manufactured by extrusion through a shaped slot. Several dozen shapes and sizes of channels are produced. They are primarily used in construction. [29–997–4]

CHANSON. (1) Polyphonic songs of the 15th and 16th centuries. The chansons, which were preceded by the ballades, virelays, and rondeaux of Guillaume de Machaut (14th century), were developed by Franco-Flemish composers of the Netherlands school. In the 16th century they took on a strikingly national character and were often imitative and descriptive in nature; at the same time, homophony became more predominant. In this period chansons were written by C. Jannequin, the greatest composer of the French Renaissance, and by such composers as C. Sermisy, P. Moulu, P. Certon, G. Costeley, C. Le Jeune, and C. Goudimel. In the early 17th century the chanson was superseded by the homophonic art song.

(2) Songs of the French music hall of the late 19th and 20th century. The music hall singers—the *chansonniers*—often themselves compose, or help compose, the music and words of the chansons they perform.

V. N. BRIANTSEVA [29–835–1]

CHANSONNETTE (Russian, *shansonetka*), a short song of a playful, even frivolous, nature. The chansonnette is performed with a variety of expressive gestures, and occasionally the vocalist

dances as well as sings. In Russian the term *shansonetka* also refers to a female singer who performs chansonnettes, as in the French cabarets or the cafés chantants of prerevolutionary Russia. [29–835–2]

CHANSONNIER, a French music hall singer who often writes, as well as performs, his material. The art of the *chansonnier* continues a tradition that was developed by the poet P. J. de Béranger and the songwriter P. Dupont (19th century), as well as by G. Montegues (20th century), whom V. I. Lenin heard sing. Among the greatest *chansonniers* are M. Chevalier, G. Brassens, E. Piaf, and C. Aznavour. [29–835–3]

CHANTILLY, a city in northern France, in Oise Department. Population, 11,000 (1968). Chantilly is a transportation junction. Its industries produce precision machinery, photographic materials, and ceramic ware.

The city is famous for the Grand Château de Chantilly, which was erected between 1527 and 1530 under the direction of the architect P. Chambiges in the French Renaissance style. The château passed to the Condé family in 1643 and was thereafter gradually rebuilt according to the plans of F. Mansart and other architects, such as A. Lenôtre, who designed the park. The Grand Château de Chantilly now houses the Musée Condé, a collection of old French art.

Broglie, R. de. *Chantilly*. Paris, 1968. [29–836–3]

CHANY, an urban-type settlement and the administrative center of Chany Raion, Novosibirsk Oblast, RSFSR. Chany is located on the Baraba Steppe and has a railroad station on the Omsk-Novosibirsk line, 402 km west of Novosibirsk. Industry is represented by a butter combine, a meat-packing plant, and a brickyard. [29–47–1]

CHANY, a closed salt lake on the Baraba Steppe, in Novosibirsk Oblast, RSFSR. Lake Chany is at an elevation of 106 m, and its area ranges from 1,990 to 2,600 sq km, depending on seasonal and annual fluctuations in the water level. The average depth is 2.2 m, and the maximum depth is approximately 10 m. The shoreline is highly irregular, and there are many long and narrow islands that are oriented in a northeast-southwest direction. The lake is joined with Lake Maloe Chany by a channel. Lake Chany is fed mainly by snow, and the water level varies by approximately 3 m. The lake freezes over in the second half of October or the first half of November, and the ice breaks up in May. There is local navigation. Fish caught in the lake include Siberian roach, pike, Eurasian perch (*Perca fluviatilis*), crucian carp, and the carp *Cyprinus carpio*. [29–46–4]

CH'AOAN (also Ch'aochou), a city in South China, in Kwangtung Province. Landing on the Han Chiang. Population, 104,000 (1959). Industry includes machine building, food processing, and the manufacture of wood products and paper. The city also has cottage industries. [29–47–3]

CHAOCH'ING, a city in southern China, in Kwangtung Province. Port on the river Hsi Chiang. Population, more than 100,000 (1970). Chaoch'ing is a center for the processing of agricultural produce from throughout the province. It produces machinery, chemical fertilizers, and matches. [29–535–4]

CHAO K'UANG-YIN (temple name, T'ai-tsu). Born 927; died 976. Chinese emperor (960–976); founder of the Sung Dynasty.

From 951 to 960, before becoming emperor, Chao K'uang-yin was an important warlord in the Chou (Hou Chou) kingdom. He took part in the struggle against the combined forces of the Khitans and the Northern Han state. With the support of the troops under his command, he proclaimed himself emperor during his campaign of 960. Chao K'uang-yin fought successfully against feudal fragmentation; he unified South China, and he restricted the rights of warlords and major feudal lords by appointing officials from the central region to the various districts and prefectures. [29–535–3]

CHAO SHU-LI. Born 1906 in Ch'inshui County, Shansi Province. Chinese writer. Member of the Communist Party of China. Deputy to the All-China National People's Congress since 1949.

Chao was educated at a pedagogical school. In his youth he gave performances at which he sang antimilitarist songs, and in 1928 he was imprisoned by the Kuomintang authorities for his work on behalf of the Communist Party of China. In 1936 he headed a people's governmental body for a small rural district in the northern liberated areas. Chao used his experience in agrarian reform as the basis of the short stories "Hsiao Erh-hei's Marriage" (1943) and "Rhymes of Li Yu-ts'ai" (1943), which were written in the traditional style of folk prose. The short stories "Meng Hsiang-ying Starts a New Life" (1944) and "The Marriage Registration" (1950), the novella *Changes in Lichiachuang* (1946; Russian translation, 1949), and the novel *Sanliwan Village* (1955) realistically describe transformations in the countryside and changes in people's mores and in their attitudes toward labor and society. In the early 1960's, Chao published short stories dealing with rural life.

Chao's fate since the mid-1960's is unknown.

CHAPAEV, VASILII IVANOVICH. Born Jan. 28 (Feb. 9), 1887, in the village of Budaiki, now within the city limits of Cheboksary, Chuvash ASSR; died Sept. 5, 1919, near Lbishchensk, now Chapaev, Ural'sk Oblast, Kazakh SSR. Hero of the Civil War of 1918–20. Member of the CPSU from September 1917.

The son of a poor peasant, Chapaev joined the army in 1914 and fought in World War I. For his bravery he was awarded three Crosses of St. George and a medal, and he was promoted to subensign. In 1917 he was hospitalized in Saratov. Later that year he moved to Nikolaevsk (now Pugachev, Saratov Oblast), where in December he was chosen commander of the 138th Reserve Infantry Regiment. In January 1918, Chapaev was appointed commissar of internal affairs of Nikolaevsk District. In early 1918 he formed a Red Guard detachment and suppressed the kulak–Socialist Revolutionary revolts in the district. In May 1918 he became commander of a brigade fighting against the Ural White Cossacks and the White Czechoslovak Corps, and in September 1918 he became head of the 2nd Nikolaevsk Division.

In November 1918, Chapaev was sent to study at the Academy of the General Staff, where he remained until January 1919. He was then sent to the front at his own request and was appointed to the Fourth Army as commander of the Special Aleksandrov Gai Brigade. In April 1919 he took command of the 25th Rifle Division, which distinguished itself in the Buguruslan, Belebei, and Ufa operations during the counteroffensive of the Eastern Front against Kolchak's troops. On July 11 the 25th Division, under the leadership of Chapaev, liberated Ural'sk.

During the early hours of Sept. 5, 1919, White Guards launched a sudden attack on the headquarters of the 25th Division in Lbishchensk. Chapaev and his comrades fought courageously against the enemy's superior forces. After emptying all of his cartridges, the wounded Chapaev tried to swim across the Ural River, but he was struck by a bullet and killed.

Chapaev was awarded the Order of the Red Banner. His legendary deeds have been portrayed in, for example, the film *Chapaev* and D. A. Furmanov's novella *Chapaev* (Furmanov was military commissar of the 25th Division).

CHAPAEV (until 1939, the village of Lbishchensk), a city and the administrative center of Chapaev Raion, Ural'sk Oblast, Kazakh SSR. Chapaev is a landing on the Ural River, 130 km south of Ural'sk. An industrial combine and the V. I. Chapaev Memorial Museum are in the city. [29–48–1]

CHAPAEVKA (also Mocha), a river in Kuibyshev Oblast, RSFSR; a left tributary of the Volga. The Chapaevka is 298 km long and drains an area of 4,310 sq km. It rises on the upland known as the Sinii Syrt and flows through a wide valley before emptying into the Saratov Reservoir. Fed mainly by snow, the river flows intermittently in its upper course. The mean flow rate 179 km from the mouth is 2.53 cu m per sec. The Chapaevka freezes over in November, and the ice breaks up in April. The river is navigable for the 34 km from the city of Chapaevsk to the Volga. [29–48–2]

CHAPAEVO, an urban-type settlement in Kegichevka Raion, Kharkov Oblast, Ukrainian SSR. Chapaevo is 11 km from the Kegichevka railroad station on the Krasnograd-Lozovaia line. The settlement has a sugar factory and an asphalt concrete plant. [29–48–3]

CHAPAEVSK (until 1929, Ivashchenkovo), a city (since 1927) under oblast jurisdiction in Kuibyshev Oblast, RSFSR. Located on the right bank of the Chapaevka River, a tributary of the Volga. Railroad station on the Syzran'-Kuibyshev line, 43 km southwest of Kuibyshev. Population, 87,000 (1976). Chapaevsk has a chemical-fertilizer plant, a silicates plant, a plant for the manufacture of reinforced-concrete products, a cannery, a milk plant, meat-packing and food-processing combines, a clothing factory, and a motor-vehicle transportation combine. Educational institutions include a chemical engineering technicum. Chapaevsk was named for V. I. Chapaev. [29–48–4]

CHAPALA, a lake in Mexico, in the southern part of the Meseta Central. Chapala is approximately 1,500 m above sea level. It has an area of 1,038 sq km, which makes it the largest lake in the country. The average depth of Chapala is about 7 m, and the maximum depth, 33 m. The lake has been drying up in recent decades. The Lerma River flows into Chapala, and the Río Grande de Santiago flows out of it, emptying into the Pacific Ocean. There are lakeshore health resorts on Chapala, and the city of Ocotlán is on its northeast shore. Chapala supplies water to Guadalajara. [29–48–5]

CHAPARRAL, a thicket of primarily hard-leaved evergreen shrubs (mainly 1.5–2 m tall) distributed in the southwestern United States (California, Arizona) and in Mexico. Chaparral is analogous to the European maquis.

Chaparral is usually found on shallow rocky soil on the lower slopes of mountain ranges. It gives way to forest higher up the slope and to prairie and semidesert lower down. Chaparral usually develops in places where forest fires have occurred. (Such vegetation appeared long before man learned the use of fire.) In California chaparral covers 4 million hectares. Chaparral is a plant community consisting of a large number of species, most commonly *Adenostoma fasciculatum*, four species of scrub oak, seven species of bearberry (*Arctostaphylos*), and five species of *Ceanothus*. Many of the plants are capable of forming root undergrowth after being reduced to ashes. Chaparral is sometimes used as pasture and is important in water retention.

T. A. Rabotnov [29–48–6]

CHAPEL (*chasovnia*), in Christian architecture, a small building or structure for prayer without a special place for an altar. Orthodox chapels are usually separate buildings located in cities and villages, on roads, in cemeteries, and elsewhere. [29–75–1]

CHAPELAIN, JEAN. Born Dec. 4, 1595, in Paris; died there Feb. 22, 1674. French writer and literary theorist.

Chapelain was a founding member of the Académie Française. In his *Letter on the Twenty-four Hour Rule* (1630) and his two treatises on representative poetry (1635), he anticipated N. Boileau's work on the literary theory of classicism. He wrote odes, sonnets, madrigals, and works of historiography and literary history. Chapelain's epic poem *The Maid* (cantos 1–12, published 1656; cantos 13–24, published 1882) was burlesqued by Voltaire.

CHAPLIN, BORIS NIKOLAEVICH. Born Sept. 8, 1931, in Moscow. Soviet diplomat. Candidate of technical sciences (1963), docent. Member of the CPSU since 1961.

Chaplin is the son of an office worker. After graduating from the Moscow Mining Institute in 1955, he worked as a foreman and head of a section at mines in the Kuznetsk Coal Basin. From 1965 to 1968 he was second secretary of the Oktiabr'skii raion committee of the CPSU in Moscow, and from 1968 to 1974 he was first secretary of the Cheremushki raion committee of the CPSU in Moscow. In 1974, Chaplin was named ambassador extraordinary and plenipotentiary of the USSR to the Socialist Republic of Vietnam (until 1976, the Democratic Republic of Vietnam). He became a candidate member of the Central Committee of the CPSU in 1976.

Chaplin received the State Prize of the USSR in 1967, and he has been awarded three orders and various medals. [29–51–1]

CHAPLIN, CHARLES SPENCER. Born Apr.16, 1889, in London; died Dec. 25, 1977, in Vevey, Switzerland. American film director, actor, and screenwriter.

A British national by birth, Chaplin was the son of music-hall entertainers. He made his stage debut at the age of eight, and from 1907 to 1912 he worked his way up as a gifted comic actor in the English pantomime troupe of F. Karno. His American film career began in 1914, when he appeared in the comic film short *Making a Living* and in the full-length film *Tillie's Punctured Romance* (Russian title, *A Young Miss*). Chaplin perfected his skills as a comic screen actor by performing in M. Sennett's comedy shorts, and in 1914 he also began working as a director. Thereafter he acted almost exclusively in his own films, of which he was also the director and screenwriter and for which he frequently composed the music.

Chaplin's devices were parody and the grotesque, and he made use of such means of expression as pantomime and the devices of the folk theater, music hall, and circus. He worked at creating the distinctive traits of the character he portrayed—Charlie the tramp, a figure that subsequently gained world fame; gradually the tragicomic aspect of the character became more pronounced.

As a master of comedy, Chaplin reached the highest level of his craft in the films *The Tramp, His New Job, A Night in the Show, The Adventurer, The Pawnshop, Easy Street, The Immigrant, A Dog's Life*, and *Shoulder Arms* (made between 1915 and 1918) and in *The Kid* (1920). In Chaplin's films, the interweaving of the comic and the tragic perception of life grew increasingly evident, and the tendency toward social satire was clearly distinguishable. Chaplin's hero—Charlie the tramp—was an embodiment of the world's poor, the rejects of capitalist society.

Beginning in 1923, Chaplin produced the full-length films *A Woman of Paris* (1923), *The Gold Rush* (1925), and *The Circus* (1928), which are world masterpieces of screen comedy; their criticism of bourgeois society is combined with a profoundly humanist depiction of simple and unfortunate people. Other motifs, explored in greater depth in *City Lights* (1931) and *Modern Times* (1935), are the illusory nature of hope and the tragic fruitlessness of the struggle against social injustice on the part of the "little fellow." The realistic quality of these films is combined with the vividness of comic situations, the hero's touching steadfastness, and the humanistic treatment of the theme of love and the search for happiness.

Chaplin's *The Great Dictator* (1941) was a pointed satire on

fascism, and his political activity during World War II, together with his calls for support of the Soviet people in the war against fascism, placed Chaplin in the ranks of the progressive figures of world culture. His postwar film *Monsieur Verdoux* (1947), which exposed the hypocrisy of capitalist society, evoked a vicious campaign against him as the film's director by reactionary circles in the USA. *Limelight*, made in 1952, expressed Chaplin's thoughts on art, talent, and old age.

Because of the persecutions he was subjected to, Chaplin was forced to leave Hollywood, and in 1952 he settled in Switzerland. *A King in New York*, a film that Chaplin produced in Great Britain in 1957, was a satire on the American way of life; *A Countess from Hong Kong*, made in 1967, was a traditional comedy.

As one of the greatest actors and directors, Chaplin exercised a profound influence on world cinema. In 1954 he was awarded the International Peace Prize for his outstanding contribution to the cause of peace and friendship among nations.

CHAPLIN, NIKOLAI PAVLOVICH. Born Dec. 6 (19), 1902, in the village of Rognedino, in what is now Roslavl' Raion, Smolensk Oblast; died Sept. 23, 1938. Figure in the Communist youth movement in the USSR. Member of the Communist Party from 1919.

The son of a priest, Chaplin studied at a *Realschule*. In 1918 he established one of the first Komsomol cells in Smolensk, and in 1919 he served as chairman of a district committee of the Russian Communist League of Youth (RKSM). In 1920 and 1921, Chaplin was secretary of the Tiumen' Provincial Committee and of the Smolensk Provincial Committee of the RKSM, and he was a member of the Smolensk Provincial Committee of the RCP(B). He became head of the political education department of the Central Committee of the RKSM in 1921 and secretary of the Central Committee in 1922. In 1922 and 1923 he was secretary of the Transcaucasian Krai Committee of the RKSM and a member of the krai committee of the RCP(B). Chaplin served as first secretary of the Central Committee of the Komsomol from 1924 to 1926 and general secretary from 1926 to 1928. In 1930 he served as second secretary of the Transcaucasian Krai Committee of the ACP(B).

Beginning in 1931, Chaplin engaged in party and economic work. He was a delegate to the Twelfth through Sixteenth Congresses of the party, and from 1924 to 1930 he was a candidate member of the Central Committee of the ACP(B) and of the Orgburo of the Central Committee. He was a delegate to the second through eighth congresses of the Komsomol, and from 1921 to 1928 he was a member of the Central Committee of the Komsomol. Chaplin was a member of the Central Executive Committee of the Transcaucasian Federation, the Central Executive Committee of the USSR, and the All-Russian Central Executive Committee. He wrote on problems of the youth movement.

Chaplin was awarded the Order of Lenin.

CHAPLIN, VLADIMIR MIKHAILOVICH. Born 1859; died Nov. 10, 1931. Soviet scientist and teacher, a specialist in heating and ventilation engineering.

Chaplin graduated from the Moscow Higher Technical School; in 1898 he became a professor there. In 1905 he developed Russia's first forced-circulation hot-water heating system; this system is still of value in present-day sanitary engineering. Beginning in 1910, Chaplin dealt with problems of the ventilation of industrial enterprises. [29–51–2]

CHAPLINKA, an urban-type settlement and the administrative center of Chaplinka Raion, Kherson Oblast, Ukrainian SSR. Located 16 km from the Kalanchak railroad station on the Kherson-Dzhankoi line, Chaplinka has a creamery, a mixed-feed plant, a bituminous concrete plant, a poultry hatchery, and a mill. [29–53–1]

CHAPLINO, an urban-type settlement in Vasil'kovka Raion, Dnepropetrovsk Oblast, Ukrainian SSR. Chaplino is a railroad junction for lines to Dnepropetrovsk, Kransnoarmeisk, and Berdiansk. The city has enterprises serving railroad transportation. A state fruit nursery is located in Chaplino. [29–53–2]

CHAPLYGIN, SERGEI ALEKSEEVICH. Born Mar. 24 (Apr. 5), 1869, in the city of Ranenburg, Riazan' Province, now the city of Chaplygin, Lipetsk Oblast; died Oct. 8, 1942, in Novosibirsk. Soviet specialist in theoretical mechanics, one of the founders of modern aerohydrodynamics. Academician of the Academy of Sciences of the USSR (1929; corresponding member, 1924). Hero of Socialist Labor (1941). Student and colleague of N. E. Zhukovskii.

In 1890, Chaplygin graduated from the faculty of physics and mathematics at Moscow University, where he had specialized in applied mathematics. On Zhukovskii's recommendation he was allowed to remain at the university to prepare for a position as a professor. Over a period beginning in 1893, Chaplygin taught physics at a women's secondary educational institution and mechanics at the Moscow Higher Technical School, the Moscow Engineering School, the Moscow Advanced Courses for Women, and Moscow University. He helped organize the Moscow Advanced Courses for Women in 1905 and served as director until 1918; under his leadership the advanced courses developed into a large higher educational institution offering instruction in all the principal branches of knowledge. Chaplygin wrote a university textbook on analytic mechanics—*The Mechanics of a System* (parts 1–2, 1905–07)—and later produced a more concise textbook—*Introductory Course in Mechanics* (1915)—for higher technical educational institutions and for natural science faculties of universities.

Chaplygin's first works were influenced by Zhukovskii and dealt with hydromechanics. The laws of the motion of a body in a fluid had been found in analytic form in a number of studies carried out by Russian and foreign scientists. Chaplygin gave a geometric interpretation of these laws in his two articles under the title "On Certain Cases of the Motion of a Solid Body in a Fluid" (1894, 1897); the second article was his master's dissertation. In its simplicity and completeness his interpretation bears the same classic character as L. Poinsot's famous geometric interpretation of the motion of a body by inertia.

Chaplygin's subsequent scientific works were devoted mainly to two classic problems in theoretical mechanics: the problem of the motion of a body in the presence of nonintegrable constraints and the problem of the motion of a heavy body about a fixed point. In "On the Motion of a Heavy Body of Revolution in a Horizontal Plane" (1897) he gave the first presentation of the general equations for the motion of nonholonomic systems. His equations are generalizations of the Lagrange equations, from which they differ in the presence of additional terms. Other works of Chaplygin's in this field include "On a Certain Possible Generalization of the Theorem of Areas" (1897) and "On the Rolling of a Sphere Along a Horizontal Plane" (1903). In 1899 the St. Petersburg Academy of Sciences awarded Chaplygin an honorary gold medal for his studies on the theory of the motion of a body in a fluid and on the motion of bodies with nonintegrable constraints.

In the late 19th and early 20th centuries Chaplygin did his first work on jet flows. He produced a series of papers on the theory of jets in an incompressible fluid. In 1902 he presented his doc-

toral dissertation, *On Gas Streams*, at Moscow University; it gave a method of studying jet flows of a gas at any subsonic speed (*see* GAS DYNAMICS). At that time the investigation of gas flows at speeds near the speed of sound had no practical application in aviation. Three decades later, however, Chaplygin's dissertation served as a starting point for many studies by aerodynamics specialists and provided a basis for the solution of problems of subsonic flows. After undergoing refinement, the methods developed in the dissertation led to the solution of a number of problems of modern aerodynamics, including the principal problems involved in the behavior of wings at high subsonic speeds.

In 1910, Chaplygin presented a paper at a meeting of the Moscow Mathematical Society in which he advanced a postulate that permitted determination of the rate of circulation flow around a wing section. This postulate constituted the necessary supplement to Zhukovskii's theorem that confirmed the theorem as the fundamental principle explaining the lift acting on a wing.

Problems in aerodynamics became the central concern of Chaplygin's research. His paper "On the Pressure Exerted by a Plane-parallel Flow on an Impeding Body" and Zhukovskii's paper "On the Contours of Airfoils in Airplanes" appeared almost simultaneously in 1910. These two works gave the first presentation of methods for the quantitative determination of the lift on a wing section. They completed the establishment of the principles of aerodynamics and proved of seminal importance in the field's subsequent development. Chaplygin's principle regarding the descent of jet flows from the sharp edge of a wing was applied by him in his paper to the determination of flows around a number of specific profiles. The paper contains the now generally known formulas for determining the lift and moment from the characteristic functions of the flow and provided the first methods for plotting the flow around wing profiles with a sharp trailing edge and a rounded leading edge. In particular, Chaplygin introduced the well-known inverted-parabola profiles that were found in a different way by Zhukovskii and that are often called Zhukovskii, or Joukowski, profiles.

Chaplygin's important work "Theory of Cascaded Airfoils" appeared in 1914. It set forth the fundamentals of the theory of the circulation around cascades; this theory underlies the design of propellers, turbines, and other hydraulic machines. In subsequent works Chaplygin solved a number of complex problems relating to aeromechanics and aviation—for example, the determination of the lift application point, the determination of the forces in unsteady flight, the theory of high-lift wings, and several problems of wing stability in flight.

Chaplygin made important contributions to mathematics. His investigations in the approximate integration of differential equations are major achievements of mathematical thought. His ideas proved applicable not only to the solution of broad classes of differential equations but also to the approximate solution of very general classes of functional equations.

After the October Revolution of 1917, Chaplygin took an active part in the building of a socialist state. In 1918 he was associated with the Commission on Special Artillery Tests of the Main Artillery Directorate and with the Scientific Experimental Institute of Railroad Transport. In late 1918 he was enlisted by Zhukovskii to help organize the Central Aerodynamic and Hydrodynamic Institute (TsAGI), the largest institute of its kind in the world. Chaplygin was chairman of the institute's collegium from 1921 to 1930 and executive director of the institute from 1928 to 1931. From 1931 to 1941, as head of the institute's scientifc work, he supervised the organization of its largest aerodynamic and hydrodynamic laboratories. At the same time, in his capacity as a member of the Academy of Sciences of the USSR, Chaplygin helped the Academy deal with the task of involving science in the building of a socialist state.

Chaplygin received the Zhukovskii Prize in 1925; he was awarded two Orders of Lenin and two other orders.

In 1942 the Academy of Sciences of the USSR established the S. A. Chaplygin Prize "for the best original work in theoretical research in the field of mechanics." A bust of Chaplygin was dedicated in Moscow in 1961, and a monument was erected at the TsAGI in 1959. Chaplygin's name has been given to streets in Moscow and Novosibirsk, an aerodynamic laboratory at the TsAGI, a memorial museum-apartment in Moscow, and a crater on the back side of the moon.

CHAPLYGIN (until 1948, Ranenburg), a city and the administrative center of Chaplygin Raion, Lipetsk Oblast, RSFSR. Chaplygin is situated on the Stanovaia Riasa River in the Don basin and is a railroad junction (Ranenburg) for lines to Bogoiavlensk, Troekurovo, and Lev Tolstoi. It has a plant producing tractor parts, a pig-iron foundry, a plant for the production of starch, a milk plant, a brickyard, and a clothing factory. There is also a sovkhoz technicum and a museum of local lore in the city. The city has renamed in honor of S. A. Chaplygin, who was born in Ranenburg. [29–55–1]

CHAPLYGIN INEQUALITY, one of the most important differential inequalities. Suppose $y'(x) = f(x, y)$ and the functions $u(x)$ and $v(x)$ satisfy the differential inequalities

$$u'(x) - f(x, u) > 0$$

$$v'(x) - f(x, v) < 0$$

where $x_0 \leq x \leq x_1$. If $u(x_0) = v(x_0) = y_0$, then the solution $y(x)$ of the differential equation $y'(x) = f(x, y)$ that passes through the point (x_0, y_0) is contained between the functions $u(x)$ and $v(x)$; that is, $u(x) > y(x) > v(x)$, where $x_0 < x \leq x_1$. This theorem, of which the simplest case is presented here, was proved by S. A. Chaplygin in 1919 and was used by him as the basis of a method for the approximate integration of differential equations. Chaplygin proved a similar theorem for the equation $y^{(n)} - f(x, y, y', \ldots y^{(n-1)} = 0$ and extended the theorem to partial differential equations. [29–56–1]

CHAPLYGIN METHOD, a method of approximate integration of differential equations. Proposed by S. A. Chaplygin in 1919, the method permits an approximate solution to be found for a differential equation to a given degree of accuracy. It involves the construction of sequences of functions $\{u_n\}$ and $\{v_n\}$ that approximate with continually increasing accuracy the desired solution y of a given differential equation and that fulfill the following relations:

$$u_n \geq u_{n+1} \geq y \geq v_{n+1} \geq v_n$$

The construction of the sequences $\{u_n\}$ and $\{v_n\}$ is based on Chaplygin's theorem of differential inequalities and is a generalization of Newton's method to the case of differential equations. The rate of convergence is the same as in Newton's method; that is, $u_n - y$ tends to zero like

$$C/2^{2^n}$$

CHAPMAN, GEORGE. Born 1559 in Hitchin; died 1634 in London. English poet and dramatist.

Chapman, a graduate of Oxford University, was a writer of the Late Renaissance. His comedies reveal traits of the poetic comedy of the 1590's, for example, *The Gentleman Usher* and *Monsieur d'Olive* (both published 1606) and of B. Jonson's comedies of manners, for example, *An Humourous Day's Mirth* (1599) and *All Fools* (published 1605). Chapman's best-known comedy, *Eastward Ho!*, which was written together with J. Marston and Jonson (published 1605), contains elements of political satire.

Chapman's tragedies represent a return to pre-Shakespearean drama, with its romantic pathos; they include *Bussy d'Ambois* (published 1607) and *The Conspiracy and Tragedy of Charles, Duke of Byron* (parts 1–2, published 1608). Chapman's heroes

stoically confront the coincidences of fate in such works as *The Revenge of Bussy d'Ambois* (published 1613) and *Caesar and Pompey* (published 1631).

Chapman also translated Homer, Hesiod, and Juvenal and completed C. Marlowe's narrative poem *Hero and Leander* (1598).

CHAPMAN, SYDNEY. Born Jan. 29, 1888, in Eccles, Lancashire; died June 16, 1970. British mathematician, physicist, and geophysicist. Fellow of the Royal Society of London (1919).

Chapman graduated from the University of Manchester in 1907 and from Cambridge University in 1911. He was a professor at the University of Manchester from 1919 to 1924, at the Imperial College of Science and Technology from 1924 to 1946, and at Oxford University from 1946 to 1953. He served as president of the London Mathematical Society from 1929 to 1931, of the Royal Meteorological Society from 1932 to 1934, and of the International Association of Meteorology and Atmospheric Physics from 1936 to 1948. From 1953 to 1959 he was president of the central organizing committee for the International Geophysical Year.

Chapman's principal works deal with the kinetic theory of gases, terrestrial magnetism, the investigation of the ionosphere and the upper atmosphere, atmospheric electricity, and mathematics. In 1919 he developed the dynamo theory of lunar daily variations of the geomagnetic field (the theory of drift currents). In 1930 he proposed a new photochemical theory of the formation of ozone, and in 1931 he set forth a theory of the formation of the electron-concentration layers of the ionosphere. Chapman developed a theory of the particle fluxes continuously emitted by the sun. With V. Ferraro, he used this theory in 1931 and 1932 to construct a theory of geomagnetic storms and of auroras. He studied airglow and investigated the influence of the X-radiation of auroras on the ionization of the lower ionosphere layers that leads to absorption of radio waves.

In 1957, Chapman analyzed the extent of the solar corona and investigated the influence of the corpuscular radiation of the sun on the thermal conditions of the earth's atmosphere. He made an important contribution to the development of the kinetic theory of gases. He proposed methods of solving the Boltzmann transport, or kinetic, equation. Chapman gave a theoretical demonstration, independently of the Swedish scientist D. Enskog, of thermal diffusion in gases and subsequently, with F. Dootsen, found experimental confirmation of such diffusion.

CHAPULTEPEC DECLARATION, a declaration adopted on Mar. 6, 1945, as the principal statement of the Inter-American Conference on Problems of War and Peace, which was held at Chapultepec Castle, Mexico City.

The preamble to the Chapultepec declaration discusses mutual aid and inter-American solidarity. The first part of the declaration, which deals with questions of legal equality and independence, asserts that any encroachment on the integrity, territorial sovereignty, or political independence of any American nation will be regarded as an act of aggression against all the nations and will be answered by collective action, subsequent to consultation among all the nations.

The second part of the declaration contains recommendations on a procedure for applying sanctions in response to threats and acts of aggression. The third part proclaims that the principles underlying a regional consensus pertaining to the peace and security of the western hemisphere shall reflect the goals and principles of the future international organization (the UN).

The USA used the Chapultepec declaration to establish under its domination a military and political bloc of American nations.

CHAPYGIN, ALEKSEI PAVLOVICH. Born Oct. 5 (17), 1870, in the village of Bol'shoi Ugol, in what is now Kargopol' Raion, Arkhangel'sk Oblast; died Oct. 21, 1937, in Leningrad. Soviet Russian writer.

The son of a peasant, Chapygin was self-educated. His work was first published in 1903. The novella *The White Monastery* (1913) and the collection *Along the Beastly Path* (1918) display a tragic world outlook and are permeated with antiurbanism and an intense feeling for nature; in these works the author depicted the spontaneous protest of people against the social structure of prerevolutionary Russia. Chapygin's epic works *Razin Stepan* (parts 1–3, 1926–27) and *Idle People* (parts 1–4, 1935–37) greatly influenced the development of the Soviet historical novel. The hero of these works is the people as a whole, rising to fight for freedom. These books demonstrate Chapygin's familiarity with the popular speech and customs of 17th-century Russia.

CHARA, a river in Chita and Irkutsk oblasts and the Yakut ASSR; a left tributary of the Olekma River. The Chara measures 851 km in length and drains an area of 87,600 sq km. It originates on the southern slope of the Kodar Range, flows along the Chara Depression, and crosses the range, forming rapids. It is fed by rain, snow, glaciers, and subterranean sources. High water is from May to September. The mean flow rate is 900 cu m per sec.

The Chara freezes over in October, and the ice breaks up in May. Its main left tributary is the Zhuia, and its main right tributary is the Tokko. The river is navigable for a distance of 416 km.

The Udokan Ore Region is located in a basin near the river's upper course. The Baikal-Amur Railroad will pass along the lower course of the Chara. [29–58–1]

CHARA, an old Russian metal drinking vessel used for alcoholic beverages. *Chary* were short and round, without a base, and featured a flat, horizontal handle attached at the side. They were in common household use in the 16th and 17th centuries. [29–57–2]

CHARACTER READER, a device for the automatic identification of characters—that is, letters, numerals, or other symbols—that are printed or written on paper in the usual form by a human being. Character readers are intended mainly for automatic data input into computers or other automatic systems that process data directly from a sheet without the preliminary rerecording of the data on information carriers, for example, punched cards.

In character readers, character recognition is based on the following two procedures: the measurement of the "blackness"—that is, the absorption coefficient—of individual tiny (for example, 0.1×0.1 mm^2) squares, into which a field containing a character to be read is divided, and a subsequent comparison of the results obtained against standard characters, which are idealized and generalized. As a rule, exact agreement between a written or printed character and a standard character is not necessary, since the comparison is usually continued until the least permissible value of a quantity characterizing the similarity of the written or printed character and the standard character is reached. As a result of the comparison, a code is generated that corresponds to the number of a standard character, the name of a character, or the position of a letter in an alphabet. The generated codes are usually obtained as electrical signals at the output of the reader.

Blackness is measured by using either a scanning system similar to that employed in a television camera or a photocell matrix, in which the blackness of the many tiny squares that make up a character is measured simultaneously by means of miniature photocells, for example, photodiodes. In its design, a photocell matrix resembles the retina of the eye.

In contrast to both a television camera and a facsimile apparatus, a character reader not only converts a visual image into an electrical signal but also rejects signals that correspond to unrecognizable characters, discards insignificant elements, and extracts the most important information concerning the assignment of a character being read to a specific class of characters. The simplest character readers are designed to read stylized characters, which are given a special form. An example of such characters is the numerals of the postal codes that are used on envelopes and postcards in the USSR. More complicated character readers are used to identify the font of a standard typewriter. However, the presence in an alphabet of letters with a similar outline—for example, the Russian letters ш and щ or э and з—and the poor quality of characters printed with a typewriter make it difficult to obtain a high reliability in the automatic identification of typewriting.

The most advanced character readers are multifont readers, which are designed to read texts printed in various fonts or typewriter fonts. A multifont reader consists of the following components: an on-line storage device, in which standard characters of one or two fonts are stored; an auxiliary storage device for the storage of up to several dozen other fonts; an arithmetic unit, in which a character to be identified is compared with a standard character; and a program-control unit. In complexity, a multifont reader is comparable to a medium-capacity general-purpose computer. With time expended on such operations as the movement of a document and line searching taken into account, the reading rate of a multifont reader may be as high as several hundred characters per second.

As of 1976, experimental models of character readers for the identification of handwritten characters, mainly stylized numerals, had been developed. In such character readers, various methods of analyzing the geometric structure of a character are used rather than the method of direct comparison with a standard character.

Character readers are used in the processing of, for example, bank checks, bills, statements, bills of lading, supply orders, and statistical reports.

CHARADE, a type of riddle. In a charade, a word is divided, usually syllabically, into two or more parts, each of which has its own meaning, for example, *vino* ("wine") + *grad* ("city" or "hail") for *vinograd* ("grapes"), or *sem'* ("seven") + *ia* ("I") for *sem'ia* ("family"). Each of the component words is described in the manner of periphrasis.

Practically unknown in folklore, charades originated when writing made word division visually recognizable. They were especially popular in salons in the 17th and 18th centuries, read as poems or acted out.

An anonymous example of a charade follows.

Edva primetnyi cherv', no dlia mekhov opasnyi
Est' pervoe moe. Znak v azbuke bezglasnyi—
Vtoroe. A poet i komik-charodei
Est' tseloe sharady sei (Mol'-er).

A worm that's barely noticeable but dangerous to furs
Is my first part. A mute symbol in the alphabet
Is the second. And a poet and comic wizard
Is the whole of this charade. (*Mol'* ["moth"] + *er* [a silent letter in Old Russian] = *Mol'er* [Molière].) [29–853–3]

CHARBONNAGES DE FRANCE, a government-owned French fuel and chemical company, one of France's largest industrial companies (in 1975 it was the 13th largest in turnover). The firm was formed in 1946 from nationalized coal companies, and it began petrochemical production in the 1960's. In 1968 the company joined its chemical enterprises under the control of its subsidiary CDF Chimie, one of the chief French chemical companies. Charbonnages de France controls virtually all coal mining and a significant portion of the coke production in France; it is a major producer of ammonia and nitrogen fertilizers, polyvinyl chloride, and several other chemical products, and also participates in petroleum production. It supplies coal to the leading power and metallurgical companies, and also uses coal in its own industrial and power enterprises. Charbonnages de France owns more than 20 chemical enterprises that produce fertilizers, basic organic chemistry products, large semifinished products, and plastics. In 1975 it registered a turnover of $2.2 billion, employed 100,000 persons, and mined 24 million tons of coal. [29–854–6]

CHARCOT, JEAN-BAPTISTE (also Jean-Baptiste-Etienne-Auguste Charcot). Born July 15, 1867, in Neuilly-sur-Seine; died Sept. 16, 1936. French polar explorer. Son of J.-M. Charcot.

From 1903 to 1905, J.-B. Charcot led an antarctic expedition on the *Français* that conducted scientific research along the western coast of the Antarctic Peninsula. From 1908 to 1910 he led an expedition on the *Pourquoi Pas?* that continued the research and charting of the Antarctic Peninsula and did similar work for Alexander I Land and Peter I Island. Charcot named the area of ocean near Peter I Island the Bellingshausen Sea. In 1911 he conducted oceanographic work in the English Channel.

From 1920 to 1927, Charcot made soundings in various parts of the Atlantic Ocean, including the North Sea, the Baltic Sea, and the Bay of Biscay. Between 1926 and 1936 he took part in several expeditions of the *Pourquoi Pas?* to the shores of Greenland. He died in a shipwreck off the coast of Iceland.

Charcot was an honorary member of the Geographical Society of the USSR and was awarded the Great Litke Gold Medal in 1914. A cape and a bay in Antarctica have been named for Charcot, as have a mountain and strait in the Kerguelen Archipelago.

CHARCOT, JEAN-MARTIN. Born Nov. 29, 1825, in Paris; died Aug. 16, 1893, in the Hotel Morvan, Lac des Settons, Nièvre Department. French physician; one of the founders of modern neuropathology and psychotherapy. Member of the Académie de Médecine (1872) and Académie des Sciences (1883).

After graduating from the faculty of medicine of the University of Paris in 1848, Charcot worked as a physician. In 1860 he was named professor of neuropathology at the University of Paris, where he was also (from 1872) professor of pathological anatomy. Beginning in 1862, he worked for thirty years at the Hospital of the Salpêtrière, and in 1882 he was named director of its neurological clinic.

From the 1850's to the 1870's, Charcot's work dealt with various problems of clinical medicine, including chronic pneumonias, cirrhosis of the liver, and diseases of the skin. He was among the first to describe rheumatoid polyarthritis (1853), and he also described intermittent claudication (1858). Charcot discovered the existence of sharp transparent octahedral structures that were later, in 1878, found by the German physician E. von Leyden to be associated with eosinophilia in bronchial asthma, and they were called Charcot-Leyden crystals. Charcot also noted the diverse clinicomorphological manifestations of pulmonary tuberculosis. He described the tremor of the hands, distinctive paresis of the lower extremities, and increased electric conductivity of the skin in thyrotoxicosis.

After 1862, Charcot dealt mainly with nervous disorders. Working in the area of clinical anatomy, he sought to establish the connection between clinical symptoms and the localization of structural changes in the nervous system. Charcot identified a number of diseases, including amyotrophic lateral sclerosis, as independent nosological forms. He described the symptoms of various other diseases, such as syringomyelia, parkinsonism, and multiple sclerosis.

The study of inherited nervous disorders was initiated by Charcot in the 1880's. He proved the existence of male hysteria, thus refuting the earlier belief that hysteria was caused by disorders of the uterus. On the basis of his study of hypnotism, Charcot established the part played by suggestion in the onset of hysterical disturbances, many of which he described. He was the first to make extensive use of hypnosis in the treatment of hysteria. A number of Charcot's works deal with the psychology of creativity in the arts. A hydrotherapeutic method was named after Charcot (the Charcot shower).

Charcot's neurological clinic—with its museum of pathological anatomy, laboratory, and special rooms that housed drawings, sculptures, and photographs—became an international training center for medical students. Members of the scientific school founded by Charcot inciuded J. Babinski, J. Wagner von Jauregg, J. Déjerine, P. Janet, G. Marinescu, and P. Marie. Charcot founded several journals, including *Archives de neurologie* (1880). He was president and a member of various French and foreign academies, universities, and scientific societies. A peninsula in Antarctica was named after Charcot by his son, J.-B. Charcot.

CHARCOT, a peninsula in the northwestern part of Alexander I Land (69°45′ S lat., 75°15′ W long.), in Western Antarctica. Washed by the Bellingshausen Sea, the Charcot Peninsula is connected to the continental land mass by the Wilkins Ice Shelf. The peninsula, which has an area of approximately 2,700 sq km, is almost completely covered by a glacier, whose surface lies 270 m above sea level. In the northwestern part of the peninsula the surface of the glacier is broken by mountain peaks rising to an elevation of 609 m at Mount Monique. The peninsula was discovered in 1910 by the French antarctic expedition of J.-B. Charcot and was named in honor of the explorer's father. [29–861–1]

CHARDARA RESERVOIR, a reservoir formed by the dam of the Chardara Hydroengineering Complex on the Syr Darya River, in the Kazakh SSR and Uzbek SSR. Itself a part of the hydroengineering facilities of a hydroelectric power plant, the reservoir was filled between 1965 and 1968. It has an area of 900 sq km, a capacity of 5.7 cu km, and a length of 70 km. Spanning 20 km at its widest point, it has an average depth of 6.5 m. The reservoir was built to improve the supply of water to existing irrigation tracts, to eliminate flooding in the lower course of the Syr Darya, and to irrigate new lands. It has improved the navigability of the Syr Darya and has increased the power output of the Farkhad and Kairakkum hydroelectric power plants. Carp, pike perch, and pike are fished commercially on the reservoir. [29–59–1]

CHARDIN, JEAN BAPTISTE SIMÉON. Born Nov. 2, 1699, in Paris; died there Dec. 6, 1779. French painter.

Chardin was the son of a joiner. He studied under the academic painter P. J. Cazes and in the school of the Royal Academy of Painting and Sculpture. He worked under N. N. Coypel and J. B. Van Loo. In 1728 he was elected to the academy for his presentation of still lifes.

Although Chardin's early works are ornamental and superficially appealing, thorough study of nature led to a change in his style, a preference for classic simplicity and clarity. His genre paintings are pervaded by profound lyricism and love for the world of the common people. They accurately depict the physical appearance and inner world of the townspeople, for example, *The Peddler Woman* (1739, the Louvre, Paris), *The Laundress* (1774, the Hermitage, Leningrad), and *Grace Before Meat* (1774, the Hermitage).

Chardin is also known for his portraits, which include *Boy With a Top* (1738, the Louvre) and other paintings of children, his self-portraits of 1771 and 1775, and his 1775 pastel portrait of his wife, all of which are housed in the Louvre. These works are noted for their vitality, simplicity, and sincerity.

Chardin's still lifes reveal an inner regularity and rhythm of composition. The common objects of everyday use that they depict radiate warmth and seem to quiver with almost human emotions. Notable examples include *The Copper Fountain* (the Louvre), *Still Life With Brioche* (the Louvre), *The Attributes of the Arts* (1760's, A. S. Pushkin Museum of Fine Arts, Moscow).

Chardin's paintings are distinguished for their compositional integrity, due in part to the predominance of silvery grays in the color scheme. They are known for their rich use of reflexes and subtle, barely perceptible transitions from light to shade, as well as the skillful play of value gradations. Chardin's works represent the pinnacle of 18th-century realism.

CHARDZHOU, a city and the administrative center of Chardzhou Oblast, Turkmen SSR. Landing on the left bank of the Amu Darya at the place where the river is crossed by the Krasnovodsk-Tashkent railroad line. Starting point of the Chardzhou-Kungrad-Makat railroad line. Population, 113,000 (1977; 51,000 in 1939).

Chardzhou originated in the 1880's as a Russian fortified settle-

ment in the Bukhara Khanate. In 1886 it became a city—Novyi Chardzhui—and a commercial and transportation center of Middle Asia; since 1888 it has been served by the Middle Asian Railroad. Part of the Turkestan ASSR from 1918 to 1924, the city became part of the Turkmen SSR in 1924 and acquired its present name in 1937. Chardzhou has been an oblast capital since 1939, with an interruption from 1963 to 1970.

Chardzhou has a silk combine, a factory for the spinning and weaving of wool, a cotton-ginning plant, and enterprises for the production of wadding, knitwear and other clothing, footwear, and Karakul skins. The food-processing industry is represented by a meat-packing plant, a milk plant, a winery, and a licorice factory. The city also has a superphosphate plant, a repair shop, a furniture factory, and a factory for the production of building materials.

In addition to a pedagogical institute, Chardzhou has textile, medical, and river transport technicums and medical and music schools. The city's cultural and scientific institutions include a museum of history and local lore, the Turkmen Sericulture Experiment Station, and a land-reclamation experiment station.

[29–59–3]

CHARDZHOU OBLAST, part of the Turkmen SSR. Formed on Dec. 14, 1970 (existed earlier from Nov. 21, 1939, through Jan. 10, 1963). Located in the eastern part of the republic. Area, 93,800 sq km. Population, 565,000 (Jan. 1, 1977). Chardzhou Oblast is divided into 11 raions and has two cities and 22 urban-type settlements. The administrative center is the city of Chardzhou. The oblast was awarded the Order of Lenin on Jan. 10, 1974.

Natural features. Chardzhou Oblast lies along the middle course of the Amu Darya. The area along the left bank is occupied by part of the Karakum, which in the extreme southwest adjoins the northern periphery of the Karabil' Uplands. The northwestern part of the area along the right bank is occupied by the periphery of the Kyzylkum. The sands of the Sundukli lie in the central part of the oblast, and part of the Kugitangtau Range, with elevations to 3,139 m, occupies the southeast.

The climate is markedly continental and extremely arid. Summers are hot, and winters moderately cold; the average July temperature is 29.5°C, and the average January temperature ranges from −4° to 2°C. Annual precipitation ranges from 100 mm in the north at Dargan-Ata to 160 mm in the southeast at Kerki. The growing season lasts 203–235 days. The oblast's principal river is the Amu Darya, whose waters are used extensively for irrigation.

The soils of the desert regions are sierozems, solonchaks, and takyr-like soils. The Amu Darya valley has meadow sierozems, alluvial-meadow soils, and cultivated and irrigated soils; the mountains have light sierozems, mountain cinnamon-colored soils, and mountain meadow soils. The sparse vegetation of the desert expanses includes sand sedge, the saxaul *Haloxylon persicum, Ammodendron*, and *Calligonum*. In the Amu Darya valley there is *tugai* (gallery-forest) vegetation, including Euphrates poplar, willow, cattail, licorice, and *Elaeagnus*. There are juniper forests in the mountains.

The deserts are inhabited by such mammals as the goitered gazelle, the African wildcat (*Felis libyca*), *Felis margarita*, fox, wolf, golden jackal, and various rodents, including gerbils and susliks. The desert contains such birds as Pander's ground jay and the white-winged woodpecker, and reptiles are represented by snakes, lizards, and turtles. Mammals encountered in the Amu Darya valley include the Bukhara deer and wild boar.

Population. According to the 1970 census, Turkmens constituted 68.8 percent of the oblast's population, Russians, 12.5 percent, and Uzbeks, 11.2 percent; the oblast is also inhabited by such peoples as Tatars, Ukrainians, and Kazakhs. The average population density is six persons per sq km (Jan. 1, 1977) and ranges from less than one person per sq km in the Karakum to 100 persons per sq km in parts of the Amu Darya valley. As of Jan. 1, 1977, the urban population made up 46 percent of the total. The oblast's cities are Chardzhou and Kerki.

Economy. The economy of Chardzhou Oblast is dominated by light industry and the food-processing industry, which is devoted to the processing of agricultural products. Of particular importance are cotton ginning, silk winding, the initial processing of Karakul sheepskins, and the production of vegetable oil. The extraction of natural gas and sulfur and the production of mineral fertilizers are developing rapidly. The oblast's largest enterprises are located in Chardzhou, and there are cotton-ginning mills in Kerki, Kerkichi, Moskovsk, Saiat, and Sakar. Kerki has a meat-packing plant, a carpet factory, and a repair shop for agricultural machinery; a sulfur plant is located in Gaurdak. A large petrochemical complex is being built north of Chardzhou.

Of the total land, 1.8 percent is under cultivation, and 76.3 percent is pastureland. As of Jan. 1, 1977, the oblast had 81 kolkhozes and eight sovkhozes. Agriculture is based on irrigation farming: large tracts of land are irrigated directly from the Amu Darya and from such canals as the Karakum, Bosaga-Kerki, and Karabekaul. The principal crop grown on irrigated land is long-staple and medium-staple cotton. The total sown area in 1976 was 161,100 hectares (ha), of which 100,900 ha were planted to cotton; in that year 250,000 tons of raw cotton were harvested. The cotton yield is 29.1 quintals per ha, as compared to 21.3 quintals per ha for the republic as a whole. Perennial grasses, including medic, take up 23,300 ha and are used in crop rotation with cotton. Grains, including maize, *Sorghum cernuum*, and barley, occupy 18,600 ha; melons and gourds, including the famous Guliabi varieties, occupy 4,700 ha; and vegetables occupy 2,500 ha. There is viticulture and the cultivation of such fruits as peaches, apricots, apples, and pears.

Animal husbandry is dominated by the raising of Karakul sheep in desert regions and of cattle and swine in areas along the Amu Darya. As of Jan. 1, 1977, the livestock population included 910,000 sheep and goats, 180,000 cattle (including 65,000 cows), and 38,000 swine. Chardzhou Oblast is the principal sericultural region of the Turkmen SSR.

In 1976 the oblast had 680 km of railroads; it is crossed by the Krasnovodsk-Tashkent, Chardzhou-Kungrad-Makat, and Karshi-Dushanbe lines. In 1976 there were 2,324 km of roads, including 1,613 km of hard-surface roads. The principal motor-vehicle routes are Chardzhou-Mary, Chardzhou-Tashauz, and Chardzhou-Kerki. There is navigation on the Amu Darya and the Karakum Canal; the main landings are at Kerkichi and Chardzhou. The city of Chardzhou is linked by air with various cities, including Moscow and the major cities of Middle Asia and the Caucasus.

Education, cultural affairs, and public health. In 1914 the territory that is now Chardzhou Oblast had 2 general-education schools, with a total of 430 students, and no secondary or higher educational institutions. In the 1976–77 academic year there were 386 general-education schools of all types, with 146,800 students, and nine vocational-technical educational institutions, with more than 5,000 students; in the latter category were six secondary vocational-technical educational institutions, with 3,702 students. There were seven specialized secondary educational institutions, with 3,900 students; in addition, 6,100 students attended the Turkmen Pedagogical Institute. In 1976 more than 29,900 children were enrolled in 259 preschool institutions.

As of Jan. 1, 1977, the oblast's educational and cultural institutions and facilities included 361 public libraries, with 1,786,000 copies of books and periodicals; a museum of history and local lore in Chardzhou; 259 clubs; 322 motion-picture projection units; and 23 extracurricular institutions.

Chardzhou Oblast has two oblast-level newspapers: the Turkmen-language *Lenin yoli* (Leninist Path), founded in 1931, and the Russian-language *Chardzhouskaia pravda*, founded in 1938. Two programs of All-Union Radio are broadcast for a total of 19 hours daily; they are supplemented by republic and oblast broadcasts in Turkmen and Russian, which are transmitted for a total of 24 hours daily. With regard to television, the program *East* of Central Television is broadcast for 12.9 hours daily, the Orbita system carries broadcasts for 8 hours daily, and republic broadcasts are offered in Russian, Kazakh, and Turkmen for 24 hours daily.

As of Jan. 1, 1977, the oblast had 52 hospitals, with 5,800 beds, or 10.2 beds per 1,000 inhabitants; there were 1,500 physicians,

or one physician per 388 inhabitants. Chardzhou Oblast has a children's sanatorium.

CHARENTE, a department in France, in the basin of the Charente River. Area, 6,000 sq km. Population, 337,000 (1975). The capital of Charente Department is the city of Angoulême.

In 1968, 30 percent of Charente's economically active population was employed in agriculture, and 24 percent in industry. Viticulture and wine-making are important activities; brandy is distilled from wine in the cities of Cognac, Jarnac, and Rouillac. Livestock is raised for dairy products and meat. The machine-building industry is represented by electrical-equipment and military plants. Charente also has wool, paper, leather, and cement industries. [29–854–3]

CHARENTE, a river in western France. The Charente River is 360 km long and drains an area of approximately 10,000 sq km. The river rises in the western part of the Massif Central, flows along the northern edge of the Garonne Lowland, and empties into the Bay of Biscay of the Atlantic Ocean, where it forms an estuary approximately 15 km long. High water occurs in winter and spring; low water occurs in summer and autumn. The river is tidal as far as the city of Saintes, where the mean flow rate is approximately 140 cu m per sec. The seaport of Rochefort is situated near the Charente's mouth. [29–854–2]

CHARENTE-MARITIME, a department in France, in the basin of the Charente River, on the Bay of Biscay. Area, 7,200 sq km (including the islands of Oléron and Ré). Population, 498,000 (1975).

The capital of Charente-Maritime is La Rochelle. In 1968, 28 percent of the department's economically active population was employed in agriculture, and 15 percent was employed in industry. Viticulture and wine-making accounted for 47 percent of the value of the agricultural output in 1974. Cattle and other livestock are raised in the department. Salt is extracted from seawater. The department has food-processing, shipbuilding, aviation, and glass industries. La Rochelle is the chief port and the most important center of industry and fishing. Oyster culture is carried on along the coast. [29–854–4]

CHARENTS, EGISHE ABGAROVICH (pen name of Egishe Abgarovich Sogomonian). Born Mar. 13 (25), 1897, in Kars; died Nov. 29, 1937, in Yerevan. Soviet Armenian poet. Member of the CPSU from 1918.

Charents, the son of a shopkeeper, studied at the Kars Realschule. In 1915 he went to the front as a volunteer and served in the Red Army during the years 1918–19. Estrangement from reality is characteristic of his early works, such as the collection *Three Songs of a Pale and Mournful Girl* (1914), the narrative poems *The Blue-eyed Homeland* (1915) and *The Dante Legend* (1916), and the lyric cycle *The Rainbow* (1917).

Charents' romantic narrative poems *Soma* (1918) and *The Furious Multitudes* (1919) were the first works of Armenian literature to deal with the October Revolution of 1917. *The Furious Multitudes* combines features of a new revolutionary epos with forms of folk poetry. Charents developed this style further in the extensive cycle *Sacrificial Fire* (1918–20). In the narrative poems *To All, All, All* (1921), *The Omnipoem* (1922), and *Charents-nameh* (1922) he revealed his mastery of the theme of revolutionary heroism, consummately integrating revolution and the fate of Armenia. The years 1915–18, a complex period in Armenia's history, are described in the satirical novel *Land of Nairi* (published separately 1926). The main theme of *Memories of the Yerevan Reformatory* (1927) is the birth of Soviet humanism and the socialist concept of man.

Zealous party spirit and an intense creative quest are characteristic of Charents' cycle of verse and narrative poems devoted to Lenin: *Lenin* (1924), *Uncle Lenin* (1924), *Ballad of Vladimir Il'ich, a Peasant, and a Pair of Boots* (1924), *Lenin and Ali* (1925), *The Communard Wall in Paris* (1926), *Funeral March* (1927), and *Cast-iron Man* (1928).

An important landmark in Charents' work was the collection *The Epic Dawn* (1930), a model of lofty political poetry in which the influence of Pushkin and Nekrasov is particularly evident. Man and nature, art and reality, poetry and work—these are the most important themes of the collection *Voyage Book* (1933).

Of special importance are Charents' translation of works by A. S. Pushkin, V. V. Mayakovsky, Goethe, E. Verhaeren, W. Whitman, and M. Gorky. Charents also translated the *Internationale* into Armenian. He wrote articles on O. Tumanian, A. Isaakian, V. Ter'ian, and M. Gorky and on modern poetry. Charents did much to cultivate Soviet Armenian literature and was one of the organizers of Noiember, a union of proletarian writers (1925). His works have been translated into many foreign languages.

In 1974 the Charents House Museum was opened in Yerevan.

CHARENTSAVAN (until 1967, Lusavan), a city in Razdan Raion, Armenian SSR; situated on the left bank of the Razdan River, a tributary of the Araks River. Railroad station on the Yerevan-Sevan line, 30 km north of Yerevan. Population, 21,000 (1974).

Charentsavan was founded as a settlement in 1948 in connection with the construction of the Giumushskaia Hydroelectric Power Plant. It was reorganized as a city in 1961. Enterprises include a machine-tool plant, a production association for tool manufacture, the Tsentrolit Plant, the Lizin Production Association, a plant producing reinforced-concrete structural members, the Bzhni Mineral-water Plant, and a clothing factory. Charentsavan has a machine-tool technicum. The city was renamed in honor of E. A. Charents. [29–63–1]

CHARGAFF, ERWIN. Born Aug. 11, 1905, in Czernowitz, Austria-Hungary (now Chernovtsy, Ukrainian SSR). Biochemist. Austrian by nationality; a resident of the USA since 1928 (US citizen since 1940). Member of the National Academy of Sciences (1965); member of the American Academy of Arts and Sciences (1961).

Chargaff received his doctorate from the University of Vienna in 1928. He conducted research at Yale University from 1928 to 1930, at the University of Berlin from 1930 to 1933, and at the Pasteur Institute in Paris in 1933 and 1934. In 1935 he joined the staff of Columbia University, where he held a professorship in biochemistry from 1952 to 1974.

Chargaff has devoted his research primarily to the biochemistry of nucleic acids and the interrelationships of the nitrogenous bases in these acids. He discovered that the deoxyribonucleic acids (DNA) in different biological species differ from one another in the molar amounts of the constituent bases they contain, and between 1950 and 1953 he discovered a rule concerning base-pairing regularities in DNA. Chargaff's rule states that there is a constant ratio of purines to pyrimidines in DNA (that is, the total amount of purine bases—adenine and guanine—is in constant ratio to that of the pyrimidine bases thymine and cytosine); ribonucleic acids, however, usually contain somewhat larger amounts of purines than pyrimidines.

WORKS
Essays on Nucleic Acids. Amsterdam–New York–London, 1963.
[29–58–4]

CHARGE, a French term used in some languages (in Russian, *sharzh*) to describe a satirical or humorous likeness, usually of a person, that renders the model's outer appearance while emphasizing essential traits of character. The *charge*, a special type of caricature, is broader than the English term "cartoon," as it may be executed in various media, including scultpure.

Outstanding masters of the *charge* have included L. Bernini, H. Daumier, and the Russian artists B. M. Kustodiev, V. A. Serov, and N. A. Stepanov. The genre has been developed in the USSR by V. N. Deni, B. E. Efimov, I. I. Igin, Kukryniksy, D. S. Moor, and F. P. Reshetnikov. Methods of the *charge* have often been applied to literature, mainly in lampoons, feuilletons, and epigrams. [29–856–2]

CHARGE, a mixture of materials in specific proportion, subjected to treatment in metallurgical, chemical, and other plants. The charge is designed for the manufacture of products with specified physical and chemical properties. Metallurgical charges may contain ores, ore concentrates, agglomerates, recycled slag, dust from a collection device, metals (mainly as scrap), fluxes, and sometimes fuel, for example, in the smelting of pig iron and ferrous alloys in blast furnaces. The charge is loaded into the processing unit in the form of a homogeneous mixture (as a powder, in lumps, or as briquettes) prepared outside the unit or as separate, proportioned quantities of the individual components. The charge materials are usually stored in stockyards. [29–1242–5]

CHARGING, impregnation of the surface of a lap with particles of an abrasive powder or paste. The surface may be charged before the lap is used (direct method) or during use (indirect method). [29–856–4]

CHARI (also Shari), a river of Central Africa whose course lies in the Central African Republic, in the Republic of Chad, and along the Chad-Cameroon border.

Formed primarily by the Ouham (Bahr Sara) and Gribingui rivers, the Chari empties into Lake Chad. Its length is variously given at between 1,400 and 1,500 km, as measured from the Ouham, and it drains an area of approximately 700,000 sq km. The Gribingui has a large number of tributaries on the right—among them the Bamingui, the Bahr Aouk, and the Bahr Kéita—and an inland delta in the vicinity of Sarh (Fort-Archambault). After the Ouham and the Gribingui, the Chari receives the Bahr Salamat from the right and, farther downstream, the Logone River, its largest left tributary. At Lake Chad, the Chari and the Logone form a common, branching delta.

Water levels in the rivers of the Chari basin rise during the summer rainy season and remain high for several months. Since freshets move downstream slowly, the highest water levels in the middle and lower courses of the Chari and the Logone occur in the autumn months; at Ndjamena (Fort-Lamy), they occur in November. The Chari and the Logone flood extensively, forming temporary lakes and linking with the rivers of the Niger basin. The Chari is fished commercially. Navigation is possible for more than 860 km—from the mouth of the Chari to the city of Batangafo on the Ouham. [29–857–1]

CHARIKAR, a city in eastern Afghanistan, on the Kunduz-Kabul highway. Capital of Parwan Province. Population, 100,000 (1973). Pottery is produced in the city. [29–64–1]

CHARINOV, MUGUTIN. Born May 23, 1893, in the village of Khurukra, in what is now Laka Raion, Dagestan ASSR; died 1936. Soviet Lak poet.

Charinov studied at the Baku Agricultural Institute from 1921 to 1927 and became a research worker at the Dagestan Scientific Research Institute in the early 1930's. Charinov began his literary career in 1910. he wrote lyric poetry, as well as the first Lak plays, for example, *Gabibat and Gadzhiiav* (1919) and *Shagalai* (1929), which deal with women's education. Charinov also translated the fables of I. A. Krylov and the poetry of N. A. Nekrasov and M. Iu. Lermontov.

CHARKA. (1) A vessel for alcoholic beverages; a small *chara*, sometimes with a base or a spherical stem. Various forms of *charka* with niello, enamel, or engraved ornamentation were common in Russia in the 17th and 18th centuries.

(2) A Russian liquid measure used before the introduction of the metric system; also called *sotka*. One *charka* was equal to 1/10 of a *shtof* 1/100 of a *vedro*, and 2 *shkaliki*. One *charka* was also the equivalent of 0.12299 liter. [29–64–3]

CHARKESAR, an urban-type settlement in Pap Raion, Namangan Oblast, Uzbek SSR. Charkesar is situated 35 km northwest of the Pap railroad station on the Kokand-Uchkurgan line. Granite is quarried in the vicinity. [29–64–4]

CHARLEROI, a city in Belgium, in Hainaut Province. Population, 22,500 (1975). A transportation junction and port on the Sambre River, Charleroi is connected by ship canal with Brussels. It is the center of a major industrial and coal-mining region. Industry includes ferrous metallurgy, machine building (particularly the manufacture of electrical equipment), and the production of glass and refractories. The city also has a chemical industry. [29–861–3]

CHARLESTON, a city in the southeastern USA, in the state of South Carolina. Port on the Atlantic coast, near the mouth of the Ashley River. Important center of trade and transportation. Population, 60,000 (1975; including suburbs, 350,000). In 1974, 16,000 people were employed in industry. The city manufactures wood products, food products, tobacco, ships, and such chemical products as mineral fertilizers. [29–64–6]

CHARLESTON, a city in the eastern USA; capital of the state of West Virginia. Located on the Great Kanawha River. Population, 67,000 (1975; including suburbs, 260,000).

Charleston is a transportation junction and mining center. Hard coal, salt, and natural gas are extracted in the vicinity. In 1974, 4,500 persons were employed in mining, and 18,500 in manufacturing. The city has a chemical industry, which produces primarily synthetic rubber, plastics, and synthetic fibers. Other industries in Charleston include metalworking and the manufacture of wood products and building materials. [29–64–7]

CHARLESTON, an American ballroom dance. It first appeared in the 1920's in Charleston, S.C., and then spread to Europe. Based on Negro dances, the Charleston is accompanied by music in 4/4 time with a syncopated rhythm. It became popular again in the late 1960's and mid–1970's. [29–64–5]

CHARLIER, CARL WILHELM LUDWIG. Born Apr. 1, 1862, in Östersund; died Nov. 4, 1934, in Lund. Swedish astronomer.

Charlier's principal works are devoted to celestial mechanics and stellar astronomy. Charlier applied techniques of mathematical statistics to the study of the spatial distribution of stars in the galaxy and the true motions of stars in the solar neighborhood. Between 1908 and 1922, Charlier proposed a theory of the structure of the universe.

CHARLOTTE, a city in the southeastern USA, in the state of North Carolina. Population, 250,000 (1975; including suburbs, 600,000). Charlotte is the center of a major agricultural region

that produces tobacco and peanuts. In 1975 industry employed 88,000 persons. Machine building, including the manufacture of electronic and aerospace equipment, is of considerable importance. The city also has metalworking, chemical, textile, tobacco, food-processing, and clothing industries. Charlotte is the seat of the University of North Carolina. [29–861–4]

CHARLOTTE AMALIE (formerly St. Thomas), a city in the West Indies, on the island of St. Thomas. Capital and chief port of the US Virgin Islands. Population, 13,000 (1975). Charlotte Amalie has fueling facilities and is a seaside resort. [29–861–5]

CHARNOCKITE (named for the founder of Calcutta, J. Charnock), a hypersthene granite typical of Precambrian assemblages that contain migmatites. Charnockite is composed of orthoclase, oligoclase, quartz, and hypersthene; it also often includes the garnets almandine and pyrope, as well as biotite, magnetite, and other minerals. Two types of charnockites are distinguished: ferrohypersthene charnockite and garnet charnockite.

The composition of charnockite varies. It is currently believed that ferrohypersthene charnockites occur in relatively shallow facies, whereas garnet charnockites are typical of more deep-seated metamorphic facies. The formation of garnet charnockites whose outcroppings are observed in the most deeply eroded Precambrian shields (Indian, Sinian, Aldan, Baltic, and Canadian), is distinguished. The origin of charnockites is linked with magmatism and metamorphism; charnockites are associated with anorthosites and other plutonic rocks, forming the charnockite-anorthosite series.

The term "charnockite" was first proposed by the British geologist T. Holland in 1900 for the intrusive rocks of the Madras area, which contain ferruginous hypersthene as the chief mineral.

CHAROLAIS, a breed of beef cattle developed in the 18th century in the Charolais region of France from spotted mountain cattle. In the 19th century the Charolais was crossed with the Shorthorn. Its coloration is creamy white.

Charolais bulls weigh 1,000–1,200 kg, cows 700–800 kg, and 18-month-old calves, 450–650 kg. The dressed yield is 60–65 percent. The animals are undemanding and adaptable, and they fatten rapidly. The breed is found in many countries of Europe and North and South America. In the USSR purebred Charolais are produced for commercial crossbreeding and for improving other beef breeds.

CHAROT, MIKHAS' (pen name of Mikhail Semenovich Kudzel'ka). Born Oct. 26 (Nov. 7), 1896, in the settlement of Rudensk, in what is now Minsk Oblast; died Dec. 14, 1938. Soviet Byelorussian poet. Member of the CPSU from 1920.

Charot, the son of poor peasants, served in the Civil War of 1918–20. He was one of the leaders of the literary organization Molodniak. Charot first published his works in 1918. The poetry collections *The Snowstorm* (1922) and *The Sunny Ways* (1929) and the narrative poems *The Barefoot Fire-Walkers* (1922), *Lenin* (1924), and *Byelorussia in Lapti* (1924) reflected the heroic deeds accomplished during the Great October Socialist Revolution and the great changes that took place in the life of the Byelorussian people in the years of Soviet power. Charot was also the author of the collection of short stories *Spring Has Come* (1924) and the folk drama *On St. John's Night* (1921).

CHARPENTIER, GUSTAVE. Born June 25, 1860, in Dieuze, Lorraine; died Feb. 18, 1956, in Paris. French composer and musician. Member of the Institut de France (1912).

In 1887, Charpentier graduated from the Paris Conservatory, where he had studied with J. Massenet. His work developed the traditions of the French lyric opera and the verists. The opera *Louise* (1900, libretto by the composer), based on the life of a Parisian working woman, achieved great popularity. Charpentier's other works include the opera *Julien* (1913), whose music was taken from the symphonic drama *La Vie du poète* (1892); the suite *Impressions d'Italie* (1890; reworked as a ballet, 1913); and the song cycle *Les Fleurs du mal* (1895), based on the poems by C. Baudelaire. Charpentier organized festivals of folk music and in 1902 founded a people's conservatory.

CHARSHANGA, an urban-type settlement and the administrative center of Charshanga Raion, Chardzhou Oblast, Turkmen SSR. Charshanga is situated on the right bank of the Amu Darya. The settlement has a railroad station on the Karshi-Termez line. [29–73–2]

CHARSK, a city (until 1963, the settlement of Charskii) and the administrative center of Charsk Raion, Semipalatinsk Oblast, Kazakh SSR. The city is situated on the Char River, a tributary of the Irtysh, and it has a railroad station on the Semipalatinsk-Aiaguz line. Charsk has railroad transport enterprises and a clothing accessories factory. The Charsk Sovkhoz, which specializes in dairy and grain farming, is located in the city. [29–65–3]

CHARTAK, a city (since 1976) and the administrative center of Iangikurgan Raion, Namangan Oblast, Uzbek SSR. Chartak is situated on the Chartaksai River and is traversed by the Bol'shoi Namangan Canal. The city has a railroad station on the Kokand-Uchkurgan line, 19 km northeast of Namangan. Industry is represented by a cotton-ginning plant, a clothing factory, and a mineral water plant. A balneological health resort is located 7 km from the city.

The summers at the health resort are hot, with a mean July temperature of 27°C, and the winters are mild, with a mean January temperature of −3°C. There are approximately 225 mm of precipitation a year. An important therapeutic agent is highly mineralized thermal water containing nitrogen, silicon, chloride, sodium, and calcium; this water, which also has a high iodine content, has a temperature of approximately 47°C and is used for baths. Another therapeutic agent is chloride-sulfate-sodium water, which is used for drinking. Treatment is given at the health resort for disorders of motor and support organs, gynecological and skin diseases, and disorders of the peripheral nervous system. The health resort also has a sanatorium and a bathhouse. [29–65–4]

CHARTIER, ALAIN. Born circa 1385, in Bayeux; died circa 1433, in Avignon. French poet.

Chartier was secretary to King Charles VII. As a diplomat, he visited many countries, including Italy. In ballades and rondeaux and in such narrative poems as *The Book of the Four Ladies* (1424) and *La Belle Dame sans merci* (1424), Chartier surmounted the linguistic conventions of late medieval love lyrics.

Chartier's political tracts *The Quadrilogue Invective* (1422) and *The Curial* (mid-1420's) sharply and eloquently addressed France's problems, especially the decay of the nobility and the suffering of the people, who bore the brunt of the Hundred Years' War of 1337–1453.

CHARTISM, a movement of the workers of Great Britain in the 1830's, 1840's, and 1850's that fought to implement the People's Charter—hence the name "Chartism." Engendered by the sharpening class contradictions brought about by the completion of the industrial revolution in Great Britain, Chartism constituted, according to V. I. Lenin, "the first broad, truly mass and politically organised proletarian revolutionary movement" (*Poln. sobr. soch.*, 5th ed., vol. 38, p. 305).

The Chartist movement was the highest stage in the development of the working-class liberation struggle during the period preceding the rise of Marxism. It was a revolutionary protest by the workers against political disenfranchisement, capitalist oppression, and the monopoly of power by the landlords and the big bourgeoisie. Chartism reflected the profound discontent of the proletarian masses with the limited parliamentary reform of 1832, which had lowered the property qualification only to the extent that members of the bourgeoisie could be elected, and with the anti-working-class policy of the postreform Parliament. The movement demonstrated the revolutionizing effects of the economic crises of the 1830's and 1840's and indicated dissatisfaction with the limited aims of earlier proletarian struggles, which had been content to pursue the interests of particular trades.

Chartism, which emerged, for the most part, before scientific communism became an integral part of the proletarian movement, manifested a political incoherence characteristic of the proletarian struggle at that time, whose participants were influenced considerably by nonproletarian views and utopian socialism. Despite its immaturity, however, Chartism proved that even at this early stage the working class was capable of independent political action, and it revealed an impulse among the working class toward solidarity and organization. As Lenin stated, Chartism "in many respects was something preparatory to Marxism, the 'last word but one' before Marxism" (*ibid.*, 5th ed., vol. 40, p. 290).

Although Chartism absorbed many traditions of the democratic movement that preceded it, the Chartists brought to the struggle for the democratization of the British governmental system a proletarian opposition to capitalism. F. Engels stressed that in Chartism "the entire working class rose against the bourgeoisie, attacking first of all the latter's political power, the wall of laws with which it had surrounded itself" (K. Marx and F. Engels, *Soch.*, 2nd ed., vol. 2, pp. 451–52).

Chartism emerged as an organized movement with the establishment in 1836 of the London Working Men's Association, among whose leaders was W. Lovett. The leaders of the LWMA drafted a program that was published in May 1838 as a bill entitled *The People's Charter*; it included such demands as universal manhood suffrage and vote by ballot. Agitation for the charter became widespread, especially in central and northwestern England and in the industrial areas of Scotland and Wales, and was accompanied by mass demonstrations and meetings. The notion of exerting outside pressure on Parliament, along with the submitting of a petition, gained widespread popularity. The possibility of using revolutionary force was not ruled out: the Great Northern Alliance, founded in 1838 by F. O'Connor, advocated revolutionary methods. The LWMA's proletarian wing, which was headed by G. J. Harney and supported resolute action, split from the association, which was dominated by petit bourgeois and artisan elements, and formed the independent London Democratic Association. The *Northern Star*, published by O'Connor from its inception in 1837, became the central organ of the Chartists.

Initially, Chartism was tied to the bourgeois democratic movement. The bourgeois radicals, notably such leaders of the Birmingham Political Union as T. Attwood, sought to restrict the movement to a campaign for further parliamentary reform. The moderates and bourgeois fellow travelers, committed to the principle of "moral force," hoped to limit the struggle to peaceful propaganda. Some of the proponents of "physical force," such as O'Connor and J. O'Brien, considered revolutionary struggle a means of self-defense. The left wing believed that the workers would have to use revolutionary force in order to win; this view was maintained by Harney, who was subsequently joined by such figures as E. Jones.

Bitter disputes flared up at the Chartist National Convention, which met in London in February 1839. Attempts by the revolutionary wing to turn the convention into a center of revolutionary struggle frightened many bourgeois radicals, whose representatives quit the convention. The remaining delegates failed to work out a genuine program for mass action.

On July 12, 1839, Parliament rejected the Chartist petition, which bore 1,280,000 signatures. The convention and the movement's supporters were unprepared to carry out contingency measures, which included the organization of a general strike; nevertheless, the convention's call for a strike to begin on August 12 was answered by workers in Manchester, Bolton, Macclesfield, and numerous other localities. On November 4, Welsh miners staged the Newport uprising, which was put down by troops.

In the 1840's, the Chartist movement entered a new phase. On July 20, 1840, the National Charter Association was founded in Manchester; it reached a membership of 50,000 in 1842. The association was the first mass working-class party in history. Although it was unable to clearly define goals and tactics and suffered from a certain lack of organization, the National Charter Association waged a struggle to enable the working class to assume political power and use that power to transform society. The line was drawn between the Chartists and the bourgeois radicals. The convention that met in April 1842 reflected the desire of most Chartists to create an independent class movement. Several social demands were included in the new petition, notably the abrogation of the Poor Law of 1834, whose only provision providing relief to the poor was the workhouse. The petition also demanded a reduction in taxes, a shortened workday, and higher wages. For the first time, British workers demanded the dissolution of the union of Britain and Ireland that had been imposed in 1801.

More than 3.3 million signatures were gathered for the new petition, which was nevertheless rejected by Parliament. In response, miners, textile workers, and pottery workers in Staffordshire, Worcestershire, and Scotland went on strike in August 1842. From August 9 to August 16 the strike engulfed Lancashire and part of Cheshire and Yorkshire, assuming the character of a general strike in these areas. Uprisings broke out spontaneously in several places, and bloody clashes took place in Preston, Blackburn, and Halifax, with workers fighting police and troops.

In late 1842 the Chartist movement temporarily went into decline owing to the failure of the strike, to internal separatist tendencies, and to the immature social and political views of its members. Many Chartist leaders believed, with O'Brien, that a crucial means of solving social problems lay in land nationalization. Others saw the solution in the workers' returning to the land; to accomplish this goal, O'Connor helped found the National Land Company in 1845.

The revolutionary trend nevertheless gained strength as the Chartist leaders tended toward proletarian socialism and internationalism. Left-wing Chartists, notably Harney, established close ties with K. Marx and F. Engels. In 1845 left-wing Chartists and revolutionary exiles from Germany and other countries founded the Fraternal Democrats, an international society, in London. Harney and Jones, the most progressive Chartist leaders, joined the Communist League.

In 1847 and 1848 the Chartist movement took on a wider scope under the influence of the economic crisis and disturbances in Ireland and revolutionary events on the Continent. In response to the upsurge in the proletarian struggle, Parliament in 1847 was compelled to pass a bill establishing a ten-hour workday. O'Connor was elected to the House of Commons. Harney and Jones were unable, however, to persuade the convention that met in April 1848 to plan an armed struggle. A peaceful demonstration by the Chartists on April 10 was broken up by the government, and a third Chartist petition met with the same response as its

predecessors. An attempt by the left wing to prepare an armed uprising proved unsuccessful. Most of the Chartist leaders, including Jones, were arrested, and on Aug. 14, 1848, a Chartist uprising in Ashton-under-Lyne was put down.

After 1848 the Chartist movement declined, and the adherents of O'Brien and O'Connor split into two mutually hostile sects. In response, the left-wing Chartists, supported by Marx and Engels, sought to revive Chartism on a socialist basis. The first English translation of *The Communist Manifesto* was published in the Chartist press. A new Chartist program was adopted in 1851. In it the movement proclaimed socialist goals for the first time; they included the establishment of the political hegemony of the working class through the implementation of the demands of the People's Charter, the nationalization of land and banks, and the cooperation of labor.

The Chartists sought to take part in the strike movement and to combine economic struggle with political agitation. On their initiative the Labour Parliament convened in March 1854; it was attended by representatives from the trade unions and nonorganized workers. The Chartists failed to create, however, a mass organization. Using Great Britain's worldwide industrial and colonial monopoly, the bourgeoisie, by creating a privileged stratum, the labor aristocracy, were able to divide the working class and thereby temporarily weaken its revolutionary energy. As reformist tendencies in Great Britain's working-class movement became dominant, Chartism steadily lost its influence among the working class, and at the end of the 1850's it finally disappeared from the historical stage.

Chartism, which Lenin described as "the revolutionary period of the English labour movement" (*Poln. sobr. soch.*, 5th ed., vol. 16, p. 25), strongly influenced Great Britain's social development. The ruling classes were compelled to implement in one form or another the main democratic demands of the Chartist program. Great Britain's working-class movement, despite the malign influence of reformism, preserved the traditions of Chartism. Chartism and its lessons were of international importance.

CHARTIST LITERATURE, literature written during the Chartist movement that reflected the struggle of the British proletariat in the revolutionary-democratic stage of the working-class movement.

Chartist literature was rooted in the mass democratic literature of the late 18th and early 19th centuries and in working-class folklore; it also reflected the influence of Lord Byron and P. B. Shelley. The leading revolutionary-democratic trend in Chartist literature countered the reformism favored by the poets E. Elliot, T. Hood, and T. Cooper. Such poets as E. Jones, W. J. Linton, and G. Massey came to the fore, and poems written by workers were published, often anonymously, in Chartist newspapers and journals.

Building on the achievements of British critical realism, such prose writers as T. M. Wheeler and Jones sought to depict popular revolutionary movements. An important place in Chartist literature is occupied by journalism, by satirical sketches (D. J. Jerrold), and by literary criticism (G. J. Harney, Jones, and Massey), which attempted to create a proletarian aesthetics.

K. Marx and F. Engels valued Chartist literature highly; its traditions were adopted by writers of the socialist movement, notably W. Morris, and may be seen today in progressive British literature.

CHARTRES, a city in northern France, situated on the Eure River. Capital of Eure-et-Loir Department. Population, 72,000 (1975). Chartres is a transportation junction and commercial center of an agricultural region. It has enterprises for the manufacture of agricultural machinery, electrical equipment, fertilizers and other chemical products, pharmaceuticals, and food products, mainly flour and beer. The city also produces decorative glassware and ready-to-wear clothing.

The center of Chartres has preserved its medieval plan. Its numerous buildings dating from the 13th to 18th centuries include the Romanesque abbey of St. Pierre (12th–13th centuries), the churches of St. Brice (11th century) and St. André (12th century), the Gothic cathedral of St. Pierre, and the Renaissance cathedral of St. Aignan (16th–17th centuries).

Chartres is famous for the cathedral of Notre Dame, originally built in the Romanesque style in the 11th century. The old cathedral was destroyed by fire in 1194; only the crypt and the base of the west tower were preserved. It was rebuilt in the High Gothic style by 1260, and additional construction was carried out between the 14th and 16th centuries. The cathedral is also known for the rich sculptural work of its Romanesque royal portal on the west (1145–1155) and the Gothic portals on the north and south. It is especially noted for its stained-glass windows (12th–13th centuries).

[29–870–7]

CHARTRES, SCHOOL OF, a medieval school of Scholastic philosophy in Chartres. In the first half of the 12th century the school, then at its zenith, was an international center of Platonic thought colored by natural philosophy. Outstanding among the school's teachers were Bernard of Chartres, Gilbert of Porrée, and Thierry (or Theodoric) of Chartres; followers of the school included William (or Guillaume) of Conches, John of Salisbury, Bernard Silvestris, and Alan of Lille.

The philosophy of the school of Chartres was an unusual phenomenon in the context of medieval Scholasticism. In their delight with nature as a creative force, the school's adherents ap-

proached pantheism—a doctrine that was incompatible with Christian orthodoxy—and were impelled to resort to forms of literary exposition far removed from the dryness and strictness of Scholasticism. The school's ideas are most vividly expressed in two extant examples of philosophical narrative poetry—*De mundi universitate* by Bernard Silvestris and *Nature's Plaint* by Alan of Lille.

CHARUSHIN, EVGENII IVANOVICH. Born Oct. 29 (Nov. 11), 1901, in Viatka (present-day Kirov); died Feb. 18, 1965, in Leningrad. Soviet graphic artist and writer. Honored Art Worker of the RSFSR (1945).

From 1922 to 1926, Charushin studied at the Vkhutein (Higher Art and Technical Institute) in Leningrad under A. I. Savinov and A. A. Rylov. He was influenced by V. V. Lebedev. Charushin's drawings of animals are pervaded by a warm humor and are notable for their free style reminiscent of watercolor. They have appeared as illustrations for young children's books, including Charushin's own books, such as *The Little Wolf and Others* (1931), *Nikitka and His Friends* (1938), and *About Tomka* (1957), as well as works of other authors, for example, S. Ia. Marshak's *Tots in a Cage* (published 1935).

While cultivating sensibility and judgment in the child, Charushin's drawings promote an understanding of right and wrong and awaken a love of nature. This is also true of his prose works, as well as his prints and miniature porcelain works. Charushin's books have been translated into the languages of the peoples of the USSR and several foreign languages.

CHARUSHIN, NIKOLAI APOLLONOVICH. Born Dec. 23, 1851 (Jan. 4, 1852), in Orlov (now Khalturin); died Mar. 6, 1937, in the city of Kirov. Russian revolutionary and Narodnik (Populist).

The son of a *dvorianin* (nobleman), Charushin studied at the St. Petersburg Technological Institute in 1871 and 1872. In October 1871 he joined the Chaikovskii circle and carried out propaganda among the workers. On Jan. 5, 1874, he was arrested, and at the Trial of the 193 he was given a sentence of nine years' hard labor, which he served at the Kara Penal Colony. Charushin was required to live in Eastern Siberia from 1881 to 1895. In 1895 he took up residence in Viatka, where he was associated with the *zemstvo* (organ of local self-government). From 1905 to 1917 he headed the newspaper *Viatskaia zhizn'*. Charushin adhered to the positions of the Popular Socialists and later to those of the Constitutional Democrats. He abandoned political activity in 1918. In 1922, Charushin joined the Society of Former Political Prisoners and Exiles.

WORKS
O dalekom proshlom, 2nd ed. Moscow, 1973. [29–73–1]

CHARVAK, an urban-type settlement in Bostanlyk Raion, Tashkent Oblast, Uzbek SSR. Charvak is situated on the Chirchik River, a tributary of the Syr Darya. The terminus of a railroad branch line from Tashkent, Charvak was established in 1964 during the construction of the Charvak Hydroelectric Power Plant. [29–58–2]

CHARVAKA, a materialist doctrine in ancient and medieval India—a late variant of, and sometimes identified with, the Lokayata. No written work by followers of this school, or Charvakas, has been preserved.

The Charvakas rejected the orthodox Indian religious-philosophical systems whose authority was derived from the Vedas and Vedic principles; they not only denied the existence of an absolute god and of the soul (the *brahman* and *atman*) but also rejected the concepts of *dharma* and *karma* as the basis of morality. The Charvakas held that only what is directly perceived is true; this world is all that exists, and matter is the only reality. Concentrating on the development of ethical concepts, the Charvakas regarded the notion of good and evil as an illusion created by the human imagination. In their view, only the pain and pleasure of sensory existence are real. They rejected the ascetic restrictions imposed by the rules of the Indian religious-philosophical systems, asserting that the achievement of pleasure is the one goal of human existence. They held that one should strive toward the goal even though the pleasure may be coupled with suffering.

The Charvaka's consistent materialism and hedonism make it a unique phenomenon in the history of Indian thought, even with respect to unorthodox Indian philosophical systems.

CHARYN (also Sharyn; in the upper course, Sholkodagsu; in the middle course, Kegen), a river in Alma-Ata Oblast, Kazakh SSR; a left tributary of the Ili. The Charyn measures 427 km in length and drains a basin of 7,720 sq km. It originates on the southern slopes of the Ketmen' Range and divides into several arms in the lower course. It is fed by snow and groundwater. The mean flow rate 84 km from the mouth is 35.4 cu m per sec. The river freezes over between November and February, and the ice breaks up in March or early April. The Charyn is used for irrigation. [29–73–3]

CHARYSH, a river in Altai Krai, RSFSR; a left tributary of the Ob'. The Charysh measures 547 km in length and drains a basin 22,200 sq km in area. It originates on the slopes of the Korgon Range, flowing through hilly and later flat terrain. It is fed primarily by snow. The mean flow rate 82 km from the mouth is 192 cu m per sec. The river freezes over in the lower course in late October or November and in the upper course in December; the ice breaks up in late March or April. The main tributaries are the Inia, Belaia, and Loktevka on the left and the Maralikha on the right. The Charysh is navigable 83 km from the mouth. It is used for irrigation. [29–73–4]

CHASE, STUART. Born Mar. 8, 1888, in Somersworth, N.H. American economist.

Chase attended the Massachusetts Institute of Technology (1907–08) and Harvard University (1910). He served as a consultant to various US government agencies from the 1920's to the 1940's. In 1925 he published *The Tragedy of Waste*, in which he cited an abundance of evidence regarding the plundering of productive forces under capitalism. Chase defends the erroneous theory of the possibility of reforming and improving capitalism. In *Technocracy* (1933), Chase maintained that the main role in this regard must be played by the technical intelligentsia. Chase was forced to acknowledge the underutilization of production capacities in the USA and the existence of a constant army of unemployed. However, he considers these phenomena to stem not from capitalist production relations but from human psychology and dominant ideas and concepts. Chase expressed these idealist views in *The Tyranny of Words* (1938). He was an active proponent of the bourgeois reformist theory of a mixed economy (*see* MIXED ECONOMY, THEORY OF) in *Goals for America* (1942).

Chase considers government economic regulation to be the principal means of curing capitalism's ills. In Chase's opinion, the

capitalist economy becomes mixed as a result of the combination of private enterprise with government regulation. In actuality, Chase's "mixed economy" is nothing but an apology for state-monopoly capitalism. Declaring that the reduction of unemployment requires the expansion of personal consumption and of military production, Chase essentially justifies the militarization of the economy. Chase's advocacy of broad public works programs (for example, construction of airports and important highways) serves the same goals. [29–125–4]

CHASE MANHATTAN BANK, N. A., a commercial US bank and the principal center of the Rockefeller financial group. The bank was created in its present form in 1955 by the merger of the Bank of the Manhattan Company (founded 1799) and the Chase National Bank (founded 1877). The bank's board of directors and approximately 50 of its divisions are located in New York City. The bank has close ties with major petrochemical concerns (Standard Oil Company, Allied Chemical Corporation), electronics firms, machine-building companies (American Telephone and Telegraph Company, Honeywell Inc.), and insurance corporations. In the 1970's the bank stepped up its program of foreign expansion in Latin America, Asia, and Europe through its specialized subsidiary Chase International Investment Corporation.

As of 1976, the Chase Manhattan Bank had approximately 70 divisions, subsidiaries, and associated (amalgamated) banks in various countries, 15 representative facilities in foreign countries, including Moscow, and approximately 40 financial companies specializing in long-term investment and equipment leasing. The bank's total balance at the close of 1976 was $44.7 billion. Loans totaled $30.2 billion; securities, $3.4 billion; deposits and current accounts, $37.6 billion; and capital and reserves, $2.0 billion.

E. D. ZOLOTARENKO [29–126–1]

CHASHA, a round vessel with a wide mouth and narrow bottom, used for wine and other beverages. The Russian term *chasha* is usually applied to vessels without feet and whose body sits directly on a base. [29–111–1]

CHASHNIK (also *chashnichii*), from the 14th to 18th centuries, a rank and position at the court of the grand prince of Moscow and later the tsar.

The *chashnik* was originally the head of the special court institution that was in charge of drinking establishments and wild-hive beekeeping. The *chashnik* also supervised the economy, administration, and judicial system of crown hamlets and villages inhabited by wild-hive beekeepers and managed the crown's wild-hive forests. The *chashnik* was among the closest advisers of the prince.

In the 16th and 17th centuries the administrative functions of the *chashnik* passed to the Sytnyi Dvor, which prepared beverages for the tsar's household, and the duties of the *chashnik* were reduced to serving the tsar at banquets and the holiday feasts. The rank of *chasnik* was abolished in the early 18th century. [29–111–5]

CHASHNIKI, a city since 1966 and the administrative center of Chashniki Raion, Vitebsk Oblast, Byelorussian SSR. Chashniki is situated on the Ulla River, a tributary of the Zapadnaia Dvina. Railroad station on the Orsha-Lepel' line. The city has an alcohol plant, a flax-processing plant, and a paper factory.

In the final stage of the Patriotic War of 1812, battles were fought near Chashniki between the Russian I Separate Corps under General P. Kh. Vitgenshtein and the French II and IX Corps of marshals L. de Gouvion-Saint-Cyr and C. Victor-Perrin. On orders from Napoleon I to reinforce the northwestern axis, Victor-Perrin set out for the Ulla River, joining Gouvion-Saint-Cyr's corps on October 18 (30). On October 19 (31), Vitgenshtein attacked Gouvion-Saint-Cyr, driving him across the Ulla. Upon learning that units from Victor-Perrin's corps had also fought in the battle, Vitgenshtein decided not to continue the offensive and stopped near Chashniki, awaiting the approach of the forces of Field Marshal M. I. Kutuzov and Admiral P. V. Chichagov. After the French retreated to Senno, Napoleon ordered them to drive Vitgenshtein beyond the Zapadnaia Dvina River. Victor-Perrin's and Gouvion-Saint-Cyr's troops took the offensive on November 2 (14) and initially forced the Russian vanguard back toward Chashniki. In bitter fighting, the village of Smol'nia changed hands several times. After losing as many as 3,000 men, the French retreated along the road to Beshenkovichi. [29–112–1]

CHASLES, MICHEL. Born Nov. 15, 1793, in Epernon; died Dec. 18, 1880, in Paris. French mathematician and historian of mathematics. Member of the Académie des Sciences (1851; corresponding member, 1839).

Chasles became a professor at the Ecole Polytechnique in Paris in 1841 and at the University of Paris in 1846. His most important works deal with geometry. He contributed to the development of projective geometry with, for example, his textbook *Treatise on Higher Geometry* (1852). Chasles's works on the history of mathematics, particularly his *Historical Survey of the Origin and Development of Geometric Methods* (1837; Russian translation, vols. 1–2, 1883), helped establish the relations between individual studies and clarified the historical relationship of scientific ideas in the field.

CHASOV IAR, a city (since 1938) in Donetsk Oblast, Ukrainian SSR; under the jurisdiction of the Artemovsk city soviet. Railroad station. Population, 23,000 (1974). Chasov Iar is an important center for the production of refractory clay. The city is the site of the Gidrozhelezobeton plant, a pilot plant, and a refractory-products plant that is part of the Ukrogneupornerud industrial association. Chasov Iar has a museum of local lore. [29–73–6]

CHASSELASE, a group of early-ripening table grape varieties native to Egypt and France. The bunches are medium-sized, weighing 120–180 g; they are cylindrical or conical in form and of average or loose compactness. The fruit is round. Its coloration is light green to golden yellow in white chasselase, dark pink in pink chasselase, or light amber in muscadine chasselase. The productivity is 6–20 tons per hectare. The grapes are usually eaten fresh or processed into juice or wine. They are distributed in almost all grape-growing regions, including those of rhe USSR. [29–873–4]

CHASSEY, a Neolithic archaeological culture (fourth and third millennia B.C.) in the southern part of central France. Named after the finds near the village of Chassey in the department of Saône-et-Loire, the Chassey culture was contemporaneous with the Lagozza culture of northwestern Italy and the Cortaillod culture of eastern France and Switzerland. It is characterized by implements made of small flint plates and by polished axes made of hard rocks. The pottery had simple shapes (plates, bowls, spherical vessels), mostly with rounded bottoms and with no decorations. Copper objects are rare. Initially the settlements were in caves and under the open sky. In the later stages, settlements built on high ground or on promontories and fortified with earthen banks and ditches appeared. Burials were in caves, dolmens, or cists.

CHASSIS. (1) In reference to a motor vehicle or a tractor, a chassis is the aggregate of assemblies comprising the power train, the undercarriage (or running gear), and the control mechanisms. In a motor vehicle with a load-carrying (frameless, or unitized) body, the bottom of the body is considered part of the chassis, and the above-mentioned assemblies are fastened to it. In a vehicle with a frame, the chassis is the structure that, when completed, can move on its own wheels or tracks. The frame-type chassis is used mainly in tractors and trucks; its configuration depends on whether wheels or tracks are used. For wheeled vehicles, the design of the chassis is determined by the vehicle's total number of axles and the number of driving axles. The chassis of some vehicles are equipped for off-road travel.

(2) The chassis of a device such as a radio, computer assembly, or rectifier is the panel on which the individual parts are mounted. The chassis is usually made of sheet material, such as aluminum, brass, Micarta, or textolite. S. IA. MAKAROV [29–873–6]

CHASTII, NIKOLAI ANDREEVICH. Born Mar. 25 (Apr. 7), 1905, in the city of Valki, in what is now Kharkov Oblast; died Nov. 18, 1962, in Kiev. Soviet Ukrainian singer (bass). People's Artist of the Ukrainian SSR (1941).

In 1929, Chastii graduated from the Kharkov Institute of Music and Drama, where he studied under N. L. Chemezov. He was a soloist at the Kharkov Theater of Opera and Ballet from 1927 to 1934, at the Georgian Theater of Opera and Ballet from 1941 to 1944, and at the Ukrainian Theater of Opera and Ballet from 1934 to 1941 and from 1944 to 1958. Chastii excelled in the title role in Glinka's *Ivan Susanin* and as Tsangala in Paliashvili's *Daisi*, Karas' in Gulak-Artemovskii's *The Zaporozhian Cossack Beyond the Danube*, the Elected Official in Lysenko's *Natalka from Poltava*, Mephistopheles in Gounod's *Faust*, and Kecal in Smetana's *The Bartered Bride*. He also gave concerts and recitals of folk songs and works of Russian and Soviet composrs.

Chastii was awarded the State Prize of the USSR in 1950. [29–79–2]

CHASTIKOVAIA RYBA (also *chastik*; literally, "fine-mesh fishes"), the commercial name for a group of fishes of moderate size, used mainly in southern fishing regions of the USSR on the Caspian, Aral, Azov, and Black seas. The term originated because of the use of fine-mesh nets for catching certain species of fish, in contrast to large-mesh nets used for catching fish of the sturgeon family, for example.

Chastikovye ryby are distinguished by size. The larger species include sheatfish, carp, pike, and pike perch, and the smaller ones include sabre carp, crucian carp, and others, excluding sprats, anchovies, and related species. [29–79–3]

CHASTNYI POVERENNYI (private attorney), in tsarist Russia, the second of the two categories of lawyers created by the Judicial Reform of 1864, the first category being that of *prisiazhnyi poverennyi* (sworn attorney).

The position of *chastnyi poverennyi* was introduced in order to force out of the courts the private intercessors known as *khodatai po chuzhim delam*, who were slipping beyond the government's control. The *chastnye poverennye* could practice only in courts from which they had received formal permission. Unless they had received a higher legal education, they were subject to an examination. They were also checked for "reliability and morality." The *chastnye poverennye* had the right to conduct no more than three civil cases a year, but the number of criminal cases they could conduct was unlimited. [29–83–1]

CHASTUSHKA (a ditty), a literary and musical genre of Russian folklore; a short song usually having four lines and performed at a rapid tempo.

The *chastushka*, which became established as an independent genre in the last third of the 19th century, is historically related to traditional songs, especially those with a quick tempo. It achieved its greatest popularity in the first half of the 20th century. Composed primarily by rural youth, *chastushki* are performed in a series to a single melody; they may be accompanied by an accordian or balalaika or sung a cappella. *Chastushki* are sung at parties and usually communicate an emotional buoyancy. They generally deal with love or everyday concerns, but even before the October Revolution there were topical *chastushki*, usually with satiric overtones. In the Soviet period the proportion of such songs increased, and the range of subjects expanded. A response to events of the day, the *chastushka* is generally improvised.

Chastushki, which are addressed to a particular person or to the audience as a whole, are characterized by their simple idiom, their concern with everyday reality, and their expressiveness. Written in a trochaic meter, they generally follow the pattern abcb, although sometimes paired rhymes or alternate rhymes are used. The melody, usually for one voice but sometimes in two-part harmony, either is sung or is partly sung and partly spoken. In recent decades the output of *chastushki* has declined somewhat.

Literary *chastushki*, influenced by folk *chastushki*, have been composed by such writers as D. Bednyi, V. V. Mayakovsky, and A. A. Prokofiev. *Chastushki* are often created by amateur arts groups. Although they originated in Russian folklore, *chastushki* subsequently spread to the Ukraine, Byelorussia, and other republics of the USSR.

CHATEAUBRIAND, FRANÇOIS RENÉ (Vicomte de Chateaubriand). Born Sept. 4, 1768, at Saint-Malo; died July 4, 1848, in Paris. French writer and political figure.

Chateaubriand studied at Dôle and Rennes. He entered military service in 1786; at court he was close to a group of writers in the opposition. In 1792 he joined the royalist forces against the republic. He then emigrated to England, where he lived from 1793 to 1800. Called into the diplomatic service by Napoleon Bonaparte, Chateaubriand was sent to Rome in 1803; he resigned his post in 1804, when imperial rule was proclaimed in France. During the Restoration he served as ambassador to Berlin and then to London. He withdrew from political activity after 1830.

Chateaubriand's literary heritage constitutes the foundation of "conservative" romanticism. Some early indications of the author's disillusionment with the concept of "natural man" can be found in his sketches *Journey to America* (published 1827). His *Essay on Revolutions* (1797) marks Chateaubriand's further retreat from the materialist and atheist traditions of the Enlightenment; man's yearning for the absolute fullness of being turns into the triumph of elemental destructive forces. To this fatal cycle of irrational human aspirations Chateaubriand juxtaposes the romantic ideal of creative individuality, which acquires harmony and spiritual equilibrium by communicating with nature.

In the short novel *Atala, or the Love of Two Savages* (1801), Chateaubriand argues against the "state of nature" of J.-J. Rousseau. In another work, *The Genius of Christianity* (1802), Chateaubriand proposes religious fervor as a foil to the egotistical acts of the individual. Apologizing for Christianity, the author argues that religious feeling, rather than cold rationalism, nourished the great writers of the past, inspiring every true work of art. The tale *René, or the Results of Passion* (1802) introduced the image of the romantic suffering hero in French literature. As represented by Chateaubriand, the traditional opposition between duty and destructive passion is erased by the acknowledged uselessness of any kind of action under bourgeois social conditions. *The Martyrs* (1809), a "Christian epic" conceived as a literary illustration of the basic theoretical propositions of *The Genius of Christianity*, sings the praises of the first Christians. *The Adventures of the Last of the Abencérages* and *The Natchez* (both published 1826) affirm the superiority of the Christian ethic and are filled with exotic images, myths, and miracles.

Chateaubriand's artistic and philosophical quest was summarized in his *Memoirs From Beyond the Grave* (1848–50). He also wrote many articles on historical, literary, and political subjects. In Russia, Chateaubriand was held in high esteem by K. N. Batiushkov and A. S. Pushkin, and V. G. Belinskii began a critical reassessment of his work.

CHÂTEAUROUX, a city in central France. Capital of Indre Department. Population, 64,000 (1975). Châteauroux is a transportation junction. Its industries produce agricultural machinery, automobile parts, and tobacco products. Châteauroux also has wool, food-processing, and furniture industries. [29–880–2]

CHATHAM, a city in Great Britain, in the county of Kent; situated on the Medway River, which empties into the Thames estuary. Population, 144,500 (1976). Together with the city of Rochester, Chatham forms the adminstrative district of Medway. Chatham is the site of a major naval base. [29–106–4]

CHATHAM, a group of volcanic islands in the Pacific Ocean, east of New Zealand. The Chatham Islands—which include Pitt Island and Chatham Island—belong to New Zealand. The group has a total area of 963 sq km and a combined population of 500 (1968). The maximum elevation is 291 m. The islands have an oceanic climate, and there are vast swamps, meadows, and heaths. The economy is based on sheep raising. The Chatham Islands were discovered in 1791 by the British navigator W. R. Broughton. [29–106–3]

CHATHAM, a strait in the Alexander Archipelago, in the northeastern part of the Pacific Ocean. Chatham Strait separates Baranof Island and Chichagof Island from Kuiu Island and Admiralty Island. The strait has a length of 203 km, a width of 7 to 25 km, and depths ranging from 530 to 691 m. The coasts are steep and occasionally precipitous, with elevations of as much as 1,000 m above sea level. The velocity of the tidal currents reaches 2 km per hr. Chatham Strait was discovered in 1741 by the Russian navigator A. I. Chirikov. [29–106–2]

CHATKAL (also Karakul'dzha), a river in the Kirghiz and Uzbek SSR's. Before the construction of the Charvak Reservoir, the Chatkal was the left fork of the Chirchik River (Syr Darya basin). The Chatkal is 223 km long and drains an area of 7,110 sq km. It rises on the southwestern slopes of the Talasskii Alatau and flows through a broad valley with steep slopes; below the place where the Ters empties into it, the Chatkal flows through a deep gorge. The river is fed mainly by snow. It has a mean flow rate of 122 cu m per sec near the mouth; the maximum flow rate is 920 cu m per sec. [29–106–5]

CHATKAL MOUNTAIN AND FOREST PRESERVE, a nature preserve located in the western spurs of the Chatkal Range, 70 km from Tashkent. The preserve has two sectors, Bashkyzylsai and Maidantal, with a total area of 35,256 hectares (1976). It was established in 1947 to protect the natural complexes of the western Tien-Shan, which range from the steppes and the zone of tree and shrub vegetation (juniper stands with apple, hawthorne, pear, mountain ash, cherry, and other tree species) to alpine meadows. The preserve has gallery forests in which the predominant species are birch (in the Maidantal sector) and willow and poplar (in the Bashkyzylsai sector). Pistachio trees grow on the mountain slopes individually and in small stands.

Mammals commonly encountered include the Asiatic ibex (*Capra sibirica*), roe deer, wild boar, *Marmota sibirica*, a relict suslik, porcupine, Eurasian brown bear, wolf, fox, badger, stone marten, ermine, and weasel. Snow leopards are occasionally encountered. Common birds include the Himalayan snowcock, snow partridge, griffon vulture, black vulture (*Aegypius monachus*), bearded vulture, Egyptian vulture, and blue whistling-thrush.

Ancient cliff drawings depicting people and deer and other animals have been found along the banks of the Tereksai River.

CHATKAL RANGE, a mountain range in the western Tien-Shan, in the Kirghiz and Uzbek SSR's; borders the northwestern part of the Fergana Valley. The Chatkal Range is approximately 200 km long, with an average elevation of 3,500 m and a maximum elevation of 4,503 m. The mountains are composed of shales, limestones, and granites. The northern slopes are short and steep; on the south the mountains are more gently sloping and have thickets of English walnut, Schrenk's spruce, fir, and juniper. Meadows are found at the higher elevations. [29–107–1]

CHATKAL VALLEY, a valley along the upper course of the Chatkal River in the western Tien-Shan in the Kirghiz SSR. The valley is situated between the Chatkal Range on the southeast and the Pskem and Sandalash ranges on the northwest; it is bounded by the Talasskii Alatau on the north. Elevations range from 2,500 at the "upstream" end of the valley to 1,000 m farther downstream. Mountain pastures, fields, and forests of English walnut and juniper are found on the floor and slopes of the valley. [29–106–6]

CHATTANOOGA, a city in the southeast USA, in the state of Tennessee. Population, 145,000 (1975; with suburbs, 390,000). Chattanooga is a port on the Tennessee River and a transportation junction. Industry employed 61,000 people in 1974. Chattanooga has enterprises of the chemical, wood-products, metalworking, machine-building, and textile industries; ferrous alloys are produced. A university is located in the city. [29–107–2]

CHATTERJI, BANKIM CHANDRA (also Chatterjee, Cattopadhyay). Born June 26, 1838, in Katalpara, near Calcutta; died Apr. 8, 1894, in Calcutta. Indian Bengali-language writer.

Chatterji, a romanticist, was the author of the first historical novels in Bengali. His poem "Hail to Thee, Mother" ("Bande Mataram") was the hymn of the national liberation movement from 1905 to 1947. His novels *Candrasekhar* (1873), *Ananda Math* (1882), and *Raj Singh* (1893; Russian translation, 1960) enthusiastically supported the struggle for independence. The social position of Indian women, deprived of rights, is the main theme of the novels *Bishka Brikka* (also known as *The Poison Tree*, 1872; Russian translation, 1962) and *Krishnakanter Uil* (1875).

Chatterji also wrote the collections of satirical short stories *Popular Amusements* (1874) and *Kamalakanter Daptar* (1875), as well as articles on literary history, sociology, science, philosophy, and religion. As an educator, publicist, and editor of the journals *Banga Darshan* and *Prochar*, Chatterji played an important role in the cultural life of Bengal.

CHATTERJI, SUNITI KUMAR. Born Nov. 26, 1890, in Sibpur, near Calcutta; died May 29, 1977, in Calcutta. Indian philologist, Orientalist, and public figure.

Chatterji graduated from the Calcutta District College in 1913 and from 1919 to 1922 studied Indo-European, Indian, Iranian, Slavic, Austro-Asiatic, and classical linguistics at the University of Paris, the Collège de France, and the School of Oriental Studies at the University of London. He became a professor at the

University of Calcutta in 1922 and National Professor of India in Humanities in 1964. He was named vice-president of the National Academy of Letters in New Delhi in 1968 and became president the following year.

Chatterji published some 900 works in Bengali, Hindi, Sanskrit, and English. His research dealt with the history of Bengali phonetics and morphology, the development of the Indo-Aryan languages (particularly the Prakrits), and the influence of the substratum (Dravidian and Austro-Asiatic languages) on the lexicon of the Middle and Modern Indic (Indo-Aryan) languages. His principal work, *The Origin and Development of the Bengali Language* (1926), initiated the development of Indian linguistics on a modern scientific basis. In his linguistic studies Chatterji used historical, cultural, anthropological, and philosophic data. He wrote a book about his trip with R. Tagore to Malaya, Indonesia, and Thailand, and he is the author of works in Bengali on literary subjects.

Chatterji served on many committees that dealt with educational, cultural, and linguistic problems. From 1952 to 1965 he was chairman of the upper house of the legislative body of West Bengal. He was an honorary member of many academies, institutes, and scientific societies in Europe, Asia, and America. In 1969, Chatterji became president of the International Phonetic Association in London and of the West Bengal division of the Indian-Soviet Cultural Society.

A. S. BARKHUDAROV [29–107–3]

CHATTERTON, THOMAS. Born Nov. 20, 1752, in Bristol; died Aug. 24, 1770, in London. English poet.

Chatterton was the author of literary forgeries that expressed a reaction against the rationalism of Enlightenment literature and an interest in the age of chivalry characteristic of preromanticism. Writing in pseudomedieval English under the name Thomas Rowley (an imaginary 15th-century monk), Chatterton composed ballads ("An Excelente Balade of Charitie"), epic poems ("The Tournament," "The Parliament of Sprites," and "Battle of Hastings"), eclogues, satires, apocryphal biographies, and treatises ("The Ryse of Peyncteynge in Englande"). The poetic works are marked by a longing for tradition, mystery, and solemnity. Chatterton was also the author of dramas (the tragic interlude *Ælla* and the burlesque *The Revenge*, staged in 1770), poems, and other works in the comtemporary style, as well as political essays.

In April 1770, Chatterton moved to London, where extreme poverty and the discovery by Walpole of his forgeries drove the young poet to suicide. Almost all of Chatterton's work was published posthumously. His tragic fate attracted the interest of many writers, including Wordsworth, Keats, Rossetti, and de Vigny.

A. B. GORIANIN [29–107–4]

CHATURANGA, an ancient table game; one of the oldest forerunners of chess. *Chaturanga* originated in India in about the fifth century. According to Indian and Arabic sources, it was a four-handed game in which each player had a set of pieces of four types: elephants, horses, chariots, and foot soldiers. The object of the game was to take the opponents' pieces. The moves were made alternately, and the number of moves was determined by throwing a die. The exact rules of *chaturanga* are not known. The game became popular in Iran and Middle Asia and then in the Arab Caliphate. It eventually evolved as the game called in Arabic *shatranj* and in Persian *chatrang*, a two-handed game with rules similar in part to those of modern chess and without the use of the die. [29–108–1]

CHATYRDAG (also Shater-gora), a plateau-like massif in the Glavnyi (southern) Ridge of the Crimean Mountains, northwest of the city of Alushta. Chatyrdag, which rises to a maximum elevation of 1,527 m, is composed of limestones and has karst landscapes. The slopes are covered with forests of beech, hornbeam, and pine. [29–108–2]

CHATYRKEL', a closed lake in the central Tien-Shan, Kirghiz SSR. Chatyrkel' is situated in a depression at an elevation of 3,530 m, between the Atbashi Range in the north and the Torugarttau in the south. It has an area of approximately 175 sq km and a maximum depth of 3.8 m. Chatyrkel' is a fresh-water lake, with brackish water in the eastern part. It is ice-covered from November to April. It is fed mainly by snow. [29–108–3]

CHAUCER, GEOFFREY. Born circa 1340 in London; died there Oct. 25, 1400. English poet.

Chaucer fought in the Hundred Years' War (1337–1453), and in the 1370's he carried out various diplomatic missions in France and Italy. He held a number of administrative posts and was made a member of Parliament in 1386. He was buried in Westminster Abbey.

In the words of J. Dryden, Chaucer was the "father of English poetry"; from the very beginning, contrary to the traditions of his formative environment, he wrote only in English (the London dialect). The first period of Chaucer's creative work—approximately until 1379—is usually called his French period because of the strong influence on him of the courtly literature of France, as exemplified in his translation of the *Roman de la Rose* and in his narrative poem *Book of the Duchess* (1369).

Chaucer's second period began after his travels to Italy and lasted approximately from 1380 to 1386; it was during this Italian period that all his major works prior to the *Canterbury Tales* were written—namely, the narrative poems *Parliament of Fowls, House of Fame*, and *Troilus and Criseyde*. The *Legend of Good Women* was Chaucer's first collection of tales and the first long narrative poem in English written in decasyllabic verse form—later used in the *Canterbury Tales* as well. The few examples of Chaucer's prose are inferior in expressiveness to his poetry.

The English style of Chaucer's third period appears in its final form in the *Canterbury Tales*. This work, begun in the late 1380's, was never completed. It consists of a *General Prologue*, followed by more than 20 tales—told by pilgrims as a way of shortening their journey to the tomb of St. Thomas à Becket—and an equal number of linking interludes. Most of the social groups living in England at the time are represented in the *Tales*. The general tone of the book is one of good-natured humor that is tolerant of human weaknesses; only the parasitic monks are consistently depicted in the satiric vein. The marvelous quality of Chaucer's humanism is vividly revealed in the *Tales'* optimistic affirmation of life, loving interest in man, sense of social justice, feeling for the common people, and democratic spirit.

Chaucer's influence is most clearly evident in the realistic depiction of everyday life as it evolved in English literature. His influence was also very great in the development of the literary language and national poetry of England. The *Canterbury Tales* were first published by W. Caxton, the first English printer, in 1478(?). The first edition of selected works by Chaucer appeared in 1532. In 1866, W. Morris began working on a "medieval-style" edition of Chaucer's works. The first and most complete Russian translation of the *Canterbury Tales* was done by I. A. Kashkin and O. B. Rumer.

CHAUDA HORIZON (after Cape Chauda on the Kerch' Peninsula), the lower Pleistocene of the Black Sea region. Established by the Russian geologist N. I. Andrusov (1889), the Chauda horizon is represented by sands, coquinas, conglomerates, and clays (layers up to 15–20 m thick) containing *Didacna tschaudae, D. pseudocrassa*, and the like, which were deposited in an isolated brackish basin. It is found on the Kerch' and Taman' peninsulas, along the Caucasian coast of the Black Sea (a terrace 100–110 m high) and the shores of the Sea of Marmara, and in the Dardanelles. The Chauda horizon corresponds to the Baku horizon of the Caspian region. The Chauda basin occupied the basins of the Black Sea and the Sea of Azov, which received the outflow from the Baku Sea through the Manych Valley. It discharged into the Sea of Marmara and the Aegean Sea with no back-flow.

CHAUMETTE, PIERRE-GASPARD (during the revolution, Anaxagoras Chaumette). Born May 24, 1763, in Nevers; died Apr. 13, 1794, in Paris. Figure in the French Revolution; left Jacobin.

Chaumette joined the political club known as the Cordeliers in 1790. He took part in the preparations for the popular uprising of Aug. 10, 1792. After the insurgents' victory, he became first a member of the Paris Commune and then, in December 1792, its procurator. He sought to introduce a tax on the rich, end unemployment, and increase the wages of workers. He opposed the Girondins.

Chaumette advocated the arrest of the Enragés; nevertheless, to strengthen the democratic revolutionary dictatorship, he appropriated some of their slogans and led a demonstration of the Parisian lower classes on Sept. 4 and 5, 1793. He insisted on the implementation of egalitarian measures, including an agrarian program that in many respects anticipated that of the Ventose Decrees. He favored state control of the production and sale of agricultural commodities. He also demanded the nationalization of all enterprises that had ceased to function because of the big bourgeoisie's sabotaging of the Maximum.

Chaumette helped initiate the policy of dechristianization, but he renounced the policy after M. Robespierre condemned it in November 1793. During the period of intense struggle within the Jacobin bloc, Chaumette denounced the actions of the Hébertists. Nevertheless, shortly after the Hébertists were arrested, he too was arrested. Accused of attempting to transform the Commune into a legislative organ opposed to the Convention, Chaumette was guillotined.

CHAUN BAY, a bay (*guba*) of the eastern part of the East Siberian Sea, to which it is connected by the Malyi Chaun and Srednii straits. The bay is 150 km long, 100 km wide, and approximately 25 m deep. The western coast is low-lying; the eastern coast is more elevated. The entrance into the bay from the sea is blocked by two islands: Aion and Chenkul'. Chaun Bay receives many small rivers. In the summer the Aion Ice Massif forms in the bay's entrance from old ice that is carried from high latitudes by currents. The port of Pevek is situated on Chaun Bay. [29–109–2]

CHAUSH, the Russian term for any one of several early-ripening varieties of table grapes native to Asia Minor. There are white, pink, and black varieties. The medium-sized bunches, which weigh 100–250 g, are cylindrical-conical and vary from dense to loose in compactness. The large oval or slightly ovate grapes are greenish white, pink, or black. They have a pleasant taste reminiscent of muscat grapes. The yield may reach 16 tons per hectare. The grapes are eaten fresh and are easily transported. They are grown in Bulgaria, Rumania, Turkey, Greece, and Algeria. White varieties are grown in the USSR, mainly in the southern Ukraine, the Lower Volga Region, and Kirghizia (Chu and Talas valleys). [29–109–5]

CHAUSSON, ERNEST. Born Jan. 20, 1855, in Paris; died June 10, 1899, in Limay. French composer.

In 1883, Chausson graduated from the Paris Conservatory, where he had studied with J. Massenet and C. Franck. In 1889 he became a secretary of the Société Nationale de Musique. Chausson was influenced by the French lyric opera and by R. Wagner. In its expressiveness, grace, and refined harmony, his work shows an affinity with the impressionist composers. Chausson's most famous composition is his *Poème* (1896), a work for violin and orchestra; other works include several operas, of which only *Le Roi Arthus* was staged (1903; Théâtre de la Monnaie, Brussels). Chausson composed a symphony (1890), music for Shakespeare's *The Tempest* (1888), choral works, works for the piano, and works for voice and orchestra, notably *Poème de l'amour et de la mer* (1882–92).

CHAUSY, a city and the administrative center of Chausy Raion, Mogilev Oblast, Byelorussian SSR. Chausy is situated 38 km southeast of Mogilev and 4 km from the Chausy railroad station on the Mogilev-Krichev line. Industry is represented by a building-materials combine, a plant for the production of reinforced concrete articles, a flax-processing plant, a creamery, and a vegetable-drying plant. [29–109–3]

CHAUTEMPS, CAMILLE. Born Feb. 1, 1885, in Paris; died July 1, 1963, in Washington, D.C. French political and state figure. A leader of the Radical Socialist Party.

Between 1924 and 1940, Chautemps frequently held ministerial posts, including that of minister of internal affairs in 1924–25, 1925–26, 1930, and 1932–34. He served as premier four times: in 1930, 1933–34, 1937–38, and 1938. He supported the creation of the Popular Front; however, as head of the Popular Front government he prevented the implementation of the front's program and contributed to the organization's collapse.

As vice-premier from April 1938 to July 1940, Chautemps favored collaboration with the fascist aggressors. In November 1940, Pétain sent him on a diplomatic mission to the USA, where he chose to remain and retire from political activity. Because of his work for the Pétain government, Chautemps was sentenced in absentia in 1947 to five years' imprisonment; in addition, his property was confiscated, and he was stripped of his rights as a citizen. [29–1361–3]

CHAUVAI, an urban-type settlement in Frunze Raion, Osh Oblast, Kirghiz SSR. Chauvai is situated on the northern slopes of the Alai Range, 32 km south of the Kyzyl-Kiia railroad station. The settlement has a mine of the Khaidarken Mercury Combine.
[29–108–4]

CHAUVINISM, an extreme form of nationalism, involving the advocacy of national exclusivity. Chauvinists place the interests

of their own nation above the interests of all others, promote national arrogance, and exacerbate national hatreds and animosities.

The term "chauvinism" first appeared in France. It derives from the name of an aggressive and bellicose recruit in the comedy *The Tricolor Cockade* (1831), by the brothers J.-H. and C.-T. Cogniard. The recruit, Nicolas Chauvin, was apparently based on a real Nicolas Chauvin, a veteran of the Napoleonic Wars who was known for his worship of Napoleon and his belief that the emperor had made France great.

The word "chauvinism" was eventually applied to many types of exaggerated nationalism. "Jingoism" came into use in Great Britain in the 1870's as a synonym. Terms such as "social chauvinism" and "great power chauvinism" have been devised to identify particular types of chauvinism.

Chauvinism flourishes in imperialist countries. Its most extreme manifestation is the antihuman ideology and policies of fascist states. The struggle against chauvinist ideologies and their proponents has always been one of the most important tasks confronting Marxist-Leninist parties.

CHAUVIRÉ, YVETTE. Born Apr. 22, 1917, in Paris. French ballerina.

From 1927 to 1931, Chauviré studied at the Paris Opéra school, and from 1941 she was a leading soloist with the Paris Opéra Ballet. She also appeared with Les Ballets des Champs-Elysées, La Scala Opera Ballet, and the Festival Ballet. She was an outstanding representative of the French school of classical dance. Her dancing, highly refined and dramatic, was characterized by high mastery, a keen sense of style, and meticulous attention to detail. Chauviré became particularly known for her interpretations of contemporary works, such as one of the mirages in the allegorical ballet *Les Mirages* by Sauguet, and for her performances in other ballets of the choreographer S. Lifar, including d'Indy's *Istar* and Leleu's *Nautéos*. In the classical repertoire, her best role was the title role in Adam's *Giselle*.

In the 1960's, Chauviré was director of the Paris Opéra school. She made her last stage appearance in 1972, at the Paris Opéra. A prize named for her was established in France in 1972. Chauviré performed in the USSR many times.

CHAVANNES, ÉDOUARD. Born Oct. 5, 1865, in Lyon; died Jan. 20, 1918, in Paris. French sinologue. Member of the French Académie des Inscriptions et Belles-Lettres (1903); the academy's president from 1915.

Chavannes's most important works deal with the history, archaeology, and culture of China. An annotated translation of 50 of the 130 chapters of Ssu-ma Ch'ien's *Historical Records* was Chavannes's most outstanding achievement. He made an important contribution to the deciphering and translation of inscriptions and documents in China and Central Asia that dated from the first millenium of the Common Era. Chavannes became a corresponding member of the Imperial St. Petersburg Academy of Sciences in 1913. [29–794–4]

CHAZOV, EVGENII IVANOVICH. Born Oct. 6, 1929, in the city of Gorky. Soviet doctor of internal medicine. Academician of the Academy of Sciences of the USSR (1979) and Academician (1971) and member of the presidium (since 1972) of the Academy of Medical Sciences of the USSR. Honored Scientist of the RSFSR (1974). Hero of Socialist Labor (1978). Member of the Communist Party of the USSR since 1962.

After graduation from the Kiev Medical Institute in 1953, Chazov worked at the First Moscow Medical Institute and the Institute of Internal Medicine of the Academy of Medical Sciences of the USSR (directed by A. L. Miasnikov). He was appointed professor and director of the latter institute in 1965. Three years later Chazov became deputy minister of health of the USSR and head of the emergency cardiology division of the A. L. Miasnikov Institute of Cardiology. In 1976 he helped establish and became general director of the All-Union Cardiology Research Center of the Academy of Medical Sciences of the USSR.

Chazov's work has focused mainly on thrombosis, myocardial infarction, myocardial metabolism, and circulatory insufficiency. Since 1973, Chazov has been editor of the journal *Terapevticheskii arkhiv*, and since 1975 he has served as president of the All-Union Society of Cardiologists. Chazov is an honorary member of the American Heart Association, the Swedish Society of Medical Sciences, and the Academy of Sciences of the German Democratic Republic. He was awarded the State Prize of the USSR in 1969 for developing new methods of treating myocardial infarction. Chazov was a delegate to the Twenty-fifth Congress of the Communist Party of the Soviet Union. He has also been a deputy to the Supreme Soviet of the USSR since 1974. Chazov has been awarded two Orders of Lenin and various medals.

CHEBAN, TAMARA SAVEL'EVNA. Born Oct. 9 (22), 1914, in the village of Berezlozhi, in what is now Orgeev Raion, Moldavian SSR. Soviet Moldavian singer (soprano); leading figure in public life and in the world of music. People's Artist of the USSR (1960). Member of the CPSU since 1953.

Cheban graduated from the Kishinev Conservatory in 1946. She was a soloist with Moldavian Radio from 1944 to 1951. She sang with the Fluerash Folk Orchestra and performed with the orchestra on foreign tours. Cheban began teaching voice classes at the Institute of Arts in Kishinev in 1973, becoming a docent in 1976. Since 1973 she has been honorary chairman of the Music and Choir Society of the Moldavian SSR. She is an outstanding performer of Moldavian folk songs and songs by Moldavian composers.

Cheban was a deputy to the third through fifth convocations of the Supreme Soviet of the USSR. She has been awarded the State Prize of the USSR (1950), the Order of Lenin, and two other orders. [29–113–4]

CHEBARKUL', a city under oblast jurisdiction and the administrative center of Chebarkul' Raion, Cheliabinsk Oblast, RSFSR; situated on the shore of Lake Chebarkul'. The city has a railroad station, 78 km southwest of Cheliabinsk. Industry includes metallurgy, machine repair, fish processing, and the production of clothing. Cherbarkul' also has a confectionery factory and a poultry farm; and there are sanatoriums and houses of rest near the city. [29–114–2]

CHEBARKUL', a lake in Cheliabinsk Oblast, RSFSR. Lake Chebarkul' occupies an area of 19.8 sq km. It is located on the eastern slopes of the Southern Urals, at an elevation of 320 m. The lake is fed by various sources, with snow predominating. The water level does not vary by more than 1.25 m; it reaches its

height in June. The lake freezes over in the first half of November, and the ice breaks up in May. The Koelga River of the Ob' basin flows out of Chebarkul'. The shores of the lake are picturesque and are the site of a number of sanatoriums and houses of rest. The city of Chebarkul' is also situated on the lake. [29–114–1]

CHEBOKSAROV, NIKOLAI NIKOLAEVICH. Born Apr. 23 (May 6), 1907, in Harbin; died Feb. 1, 1980, in Moscow. Soviet ethnographer and anthropologist. Doctor of historical sciences (1947).

Cheboksarov was a professor at Moscow State University from 1951 to 1956. He became a staff member of the Institute of Ethnography of the Academy of Sciences of the USSR in 1943 and director of the institute's section on Australia, Oceania, and non-Soviet Asia in 1957.

Cheboksarov's most important works deal with ethnic history, with East Asian anthropology and ethnography, and with general problems of anthropology and ethnography. He edited and helped write the general works *Studies in General Ethnography* and *The Peoples of the World*.

Cheboksarov received the N. N. Miklukho-Maklai Prize in 1947 and 1966; he was awarded the Badge of Honor and various medals.

CHEBOKSARY (in Chuvash, Shupashkar), the capital of the Chuvash ASSR. Situated on the right bank of the Volga. A river port and highway junction, Cheboksary is the terminus of a 103-km branch line of the Moscow-Kazan railroad line; it has an airport. Population, 292,000 (1977; 5,000 in 1897, 9,000 in 1926, 31,000 in 1939, 104,000 in 1959, 216,000 in 1970). Cheboksary is divided into three urban districts.

First mentioned in 1469, Cheboksary became a fortress of the Muscovite state in 1555. In 1611 and 1612 the residents of the city fought in the people's volunteer corps of Minin and Pozharskii. In the late 17th and the 18th century the city was an important commercial center of the Volga Region. Cheboksary became a district capital of Kazan Province in 1781. Soviet power was established in the city on Oct. 30 (Nov. 12), 1917. Cheboksary became the administrative center of Chuvash Autonomous Oblast in 1920 and the capital of the Chuvash ASSR in 1925.

In the Soviet period Cheboksary has become a major industrial and cultural center of the Volga Region. The principal industries are machine building and textiles. In addition to a motor-vehicle assembly plant and a casting and metalworking plant, the city has factories producing tractor parts, machinery, electrical equipment, electrical measuring devices, cable, metal goods, and spare parts for the electric power industry.

The textile industry is represented by a cotton combine, a hosiery and knitwear factory, a ribbon-weaving factory, and the Rassvet Clothing Production Association. Also located in the city are the Prompribor and Chuvashmebel' production associations, a meat-packing combine, and a milk plant. The building-materials industry includes a wood-products factory and plants producing reinforced-concrete structural members, modular units of ceramic stone, *keramzit* (an artificial porous filler), and bonded structures. The city has a district heat and power plant. Under construction in 1978 were a plant for the production of industrial tractors, District Heat and Power Plant No. 2, and the Cheboksary Hydroelectric Power Plant on the Volga.

The Cheboksarka, Kaibulka, Trusikha, and Sugutka rivers divide Cheboksary into six sectors, which fan out toward the Volga, so that the city resembles an amphitheater. The city's street network is laid out on a radial-ring pattern. In the Soviet period Cheboksary has been rebuilt and modernized, and an embankment has been constructed along the Volga. The city's construction is proceeding according to a general plan (1969, architects M. E. Kolosovskii and others). Housing construction has been undertaken on a large scale, and large public buildings have been erected, such as the House of Soviets (1940, architect M. M. Bazilevich), the buildings of the city executive committee (1958, architect F. S. Sergeev) and the building of the city committee of the CPSU (1959, architect F. S. Sergeev); all three buildings are located on the city's central plaza, Lenin Square. In the center of the square is a monument to V. I. Lenin (bronze and granite, 1960, sculptors G. I. Iastrebenetskii and others, architect G. A. Izrailevich); the monument's pedestal is combined with reviewing stands. Other modern structures include the pedagogical institute (1956, architect A. M. Krylov), the agricultural institute (1957, architect E. E. Kalashnikova), and the building of the philharmonic society (1959, architect F. S. Sergeev). Architectural monuments include the Troitskii Monastery (17th century), the Vvedenskii Cathedral (1657), and the houses that formerly belonged to the Zeleishchikov family (17th century) and the Solovtsov family (mid-18th century).

Cheboksary has monuments to V. I. Chapaev (reinforced concrete and cement, 1960, sculptor P. A. Balandin), the Chuvash poet K. V. Ivanov (1952, sculptor I. F. Kudriavtsev, architect V. I. Stupin), and the Chuvash educator I. Ia. Iakovlev (1971, sculptor D. I. Naroditskii, architect G. E. Saevich). Of particular interest is the memorial *Iu. A. Gagarin, Space Pioneer* (1976, sculptor G. O. Postnikov, architect B. M. Shimarev).

Cheboksary's educational institutions include the Chuvash University, pedagogical and agricultural institutes, and a department of the Moscow Cooperative Trade Institute. In addition to an evening machine-building technicum and a cooperative trade technicum, the city has technicums of electrical engineering, construction, textiles, power engineering, economic planning, and electrical communications. There are medical, music, and art schools. The city has an all-Union scientific research institute, a design institute, a technological institute for the construction of relay systems, and a scientific research institute of language, literature, history, and economics.

Cheboksary has an art museum and a museum of local lore with two branches, one devoted to literature and the other to V. I. Chapaev, who was born in the village of Budaiki, now within the city limits of Cheboksary. The city's five theaters are the Chuvash Academic Drama Theater, the Chuvash Music Theater, the Russian Drama Theater, a young people's theater, and a puppet theater. Cheboksary has a philharmonic society.

CHEBOKSARY HYDROELECTRIC POWER PLANT, a power plant of the Volga Hydroelectric System, located near the city of Novocheboksarsk, Chuvash ASSR. The rated power of 1,400 megawatts (MW) is supplied by 18 hydroelectric units with adjustable-blade turbines, each developing 78 MW. The average annual power output is 3.31 billion kilowatt-hours, and the maximum head is 18.9 m. Construction was begun in 1968; the first unit went into operation in 1981.

The hydroengineering complex includes an integrated power house 548 m long; a concrete spillway dam of lightweight design with a spillway face 120 m long; earthen channel and floodplain dams with a total length of 3,355 m; and a single-chamber, double-lane lock with an outer staging area of 1.1 sq km in the upper pond and with a lower approach channel. The face of the support structures is 4,480 m long. The hydroengineering complex forms a reservoir with an area of 2,182 sq km, lying in the Chuvash ASSR, the Mari ASSR, and Gorky Oblast. Power from the plant will be transmitted to the Integrated Electric Power Grid of the USSR over 220-kilovolt and 500-kilovolt lines. [29–114–4]

CHEBOTAREV, ALEKSANDR STEPANOVICH. Born Nov. 15 (27), 1881, in Belebei, in what is now the Bashkir ASSR; died Nov. 5, 1969, in Moscow. Soviet geodesist. Honored Worker in Science and Technology of the RSFSR (1947).

Chebotarev graduated from the Moscow Engineering Institute

of Geodesy, Aerial Photography, and Cartography (formerly the Land Surveying Institute) in 1903. He became a professor there in 1921 and was the head of a subdepartment from 1922 to 1962. Chebotarev helped found the Central Scientific Research Institute of Geodesy, Aerial Photography, and Cartography. He developed a theory for equating traverse networks and leveling grids and applied methods of mathematical statistics and matrix calculus to the analysis of geodetic measurements. Chebotarev's school of geodesy and mathematical analysis of measurements has received wide recognition both in the USSR and abroad. Chebotarev was awarded the Order of Lenin.

CHEBOTAREV, NIKOLAI GRIGOR'EVICH. Born June 3 (15), 1894, in Kamenets-Podol'skii, in what is now Khmel'nitskii Oblast; died July 2, 1947, in Moscow. Soviet mathematician. Corresponding member of the Academy of Sciences of the USSR (1929).

Chebotarev graduated from the University of Kiev in 1916 and became a professor at the University of Kazan in 1928. His principal studies were devoted to modern algebra. In 1924 he solved Frobenius' problem and thereby obtained the most far-reaching generalization of Dirichlet's theorem regarding prime numbers in an arithmetic progression. In 1930 he set forth the first general theorem in resolvent theory. Chebotarev received the State Prize of the USSR in 1948 and was awarded the Order of Lenin, two other orders, and various medals.

CHEBSARA, an urban-type settlement in Sheksna Raion, Vologda Oblast, RSFSR. Chebsara has a railroad station on the Vologda-Leningrad line, as well as a brickyard and a branch of the Sheksna Woodworking Plant. [29–117–3]

CHEBYSHEV, PAFNUTII L'VOVICH. Born May 14 (26), 1821, in the village of Okatovo, Kaluga Province, now Kaluga Oblast; died Nov. 26 (Dec. 8), 1894, in St. Petersburg. Russian mathematician and specialist in mechanics. Academician of the St. Petersburg Academy of Sciences (1859; adjunct, 1853; corresponding member [academician extraordinary], 1856).

After receiving his initial education at home, Chebyshev entered Moscow University at the age of 16. He graduated from the university in 1841 and defended his master's dissertation there in 1846. In 1847 he moved to St. Petersburg and, after defending a dissertation, began teaching algebra and number theory at the University of St. Petersburg. In 1849, Chebyshev defended his doctoral dissertation, which was awarded the Demidov Prize of the St. Petersburg Academy of Sciences in the same year. He became a professor at the University of St. Petersburg in 1850. Chebyshev was long associated with the artillery division of the military academic committee and the academic committee of the Ministry of Public Education. In 1882 he gave up his teaching position at the University of St. Petersburg to devote himself fully to scientific work.

Chebyshev was the founder of the St. Petersburg mathematical school, the most prominent members of which were A. N. Korkin, E. I. Zolotarev, A. A. Markov, G. F. Voronoi, A. M. Liapunov, V. A. Steklov, and D. A. Grave.

Chebyshev contributed to a variety of fields. He was able to obtain important scientific results through elementary means, and he exhibited an unflagging interest in practical problems. The many branches of mathematics and related areas of knowledge in which he worked included probability theory, number theory, integral calculus, the approximation of functions by polynomials, and the theory of mechanisms. In each field mentioned, Chebyshev created a number of fundamental, general methods and set forth ideas establishing the principal directions of its subsequent development. Chebyshev's genius as a scientist consisted largely in his tendency to link problems of mathematics to fundamental problems of the natural sciences and engineering. Many of his discoveries were inspired by the needs of applied sciences. He himself noted this fact several times. He wrote that in the creation of new methods of investigation "the sciences find themselves a reliable guide in practice" and that "the sciences are advancing under the influence of practice as it discovers new objects of study for them" (*Poln. sobr. soch.*, vol. 5, 1951, p. 150).

In probability theory Chebyshev introduced random variables into study on a systematic basis and devised a new procedure for proving limit theorems—the method of moments (1845, 1846, 1867, 1887). He provided a proof of striking simplicity and elegance for the law of large numbers in an extremely general form. He investigated the conditions under which the distribution of sums of independent random variables converges to a normal distribution. By supplementing Chebyshev's methods, A. A. Markov subsequently provided a satisfactory proof of such convergence. Chebyshev also suggested, without rigorous proof, the possibility of refinements in this limit theorem in the form of asymptotic expansions of the distribution function of a sum of independent terms in powers of $n^{-1/2}$, where n is the number of terms. Chebyshev's works on probability theory constitute an important stage in the field's development. They provided the basis for the Russian school of probability theory, which initially consisted of Chebyshev's own students.

In number theory Chebyshev was responsible for the first substantial advances since Euclid in the study of the distribution of prime numbers (1849, 1852). He proved that the function $\pi(x)$—the number of primes that do not exceed x—satisfies the inequalities

$$a\frac{x}{\ln x} < \pi(x) < b\frac{x}{\ln x}$$

where $a < 1$ and $b > 1$ are constants that he calculated ($a = 0.921$, $b = 1.06$). An investigation of the distribution of primes in the sequence of integers led him to the investigation of quadratic forms with positive determinants. A paper by him that was devoted to approximating numbers by rational numbers (1866) played an important part in the development of the theory of Diophantine approximations. Chebyshev was the creator of new fields of study in number theory and of new methods of investigation.

Chebyshev's works in mathematical analysis are the most numerous. In particular, the dissertation he submitted for the right to teach at the University of St. Petersburg deals with this field: in it he investigated the integrability of some irrational expressions in terms of algebraic functions and logarithms. He also devoted a number of other papers to the integration of algebraic functions; in one of them (1853) he derived the well-known theorem on the conditions of integrability of a binomial differential in terms of elementary functions. Chebyshev's works on the construction of a general theory of orthogonal polynomials played a seminal role in the development of this area of mathematical analysis. His starting point in the creation of the theory was parabolic interpolation by the least squares method. Chebyshev's studies on the problem of moments and on quadrature formulas draw on the same range of ideas. Wishing to shorten calculations, he proposed in 1873 the examination of quadrature formulas with equal coefficients, or weights (*see* APPROXIMATE INTEGRATION). His research on quadrature formulas was closely connected with the problems he faced in the artillery division of the military academic committee.

Chebyshev was the founder of the constructive theory of functions, the principal component of which is the theory of best approximation of functions (*see* APPROXIMATION AND INTERPOLATION OF FUNCTIONS and CHEBYSHEV POLYNOMIALS). His simplest statement of the problem (1854) is as follows: given a continuous func-

tion $f(x)$, find among all polynomials of degree n the polynomial $P(x)$ such that in a given interval $[a, b]$ the expression

$$\max_{a \le x \le b} |f(x) - P(x)|$$

is a minimum. In addition to the described best uniform approximation, Chebyshev studied approximation in the quadratic mean, and in addition to approximation by algebraic polynomials he investigated approximation by means of trigonometric polynomials and rational functions.

The theory of machines and mechanisms interested Chebyshev throughout his life. He devoted many papers to linkages, particularly Watt's parallel motion (for example, 1861, 1869, 1871, 1879), and he designed and built several devices. Of particular interest are his plantigrade machine, which simulated the motion of a walking animal, and his automatic calculating machine. While studying Watt's linkage and seeking to improve it, Chebyshev formulated the problem of the best approximation of functions.

Chebyshev's works of an applied nature include an original study (1856) in which he posed the problem of finding for a given country the conformal cartographic projection under which the maximum difference in scale at different points of the map is a minimum. He voiced without proof the opinion that in such a projection the scale at the border must be constant. This conjecture was subsequently proved by Grave.

Chebyshev's position in the development of mathematics rests not only on his research but on the assistance he provided to young mathematicians, to whom he suggested problems for study. For example, it was on Chebyshev's advice that A. M. Liapunov began his series of studies on the figures of equilibrium of a rotating fluid whose particles are attracted according to the law of universal gravitation.

During his lifetime Chebyshev's works won broad recognition both in Russia and abroad. He was elected a member of the Berlin Academy of Sciences in 1871, of the Bologna Academy of Sciences in 1873, of the Académie des Sciences in 1874 (correspondent, 1860), of the Royal Society of London in 1877, and of the Swedish Academy of Sciences in 1893. In addition, he was named an honorary member of many Russian and foreign scientific societies, academies, and universities.

An award for outstanding research in mathemetics was established in honor of Chebyshev by the Academy of Sciences of the USSR in 1944.

CHEBYSHEV FORMULA, a formula for the approximate computation of a definite integral:

$$\int_{-1}^{1} f(x)\,dx \approx \frac{2}{n} \sum_{i=1}^{n} f(x_i)$$

The formula is accurate for polynomials of degree not greater than $n - 1$, where n is the number of nodes. The values of the x_i have been computed for some n. In the case of $n = 9$, for example, $x_1 = -x_9 = 0.911589$, $x_2 = -x_8 = 0.601019$, $x_3 = -x_7 = 0.528762$, $x_4 = -x_6 = 0.167906$, and $x_5 = 0$. For $n = 8$ and $n > 9$, the x_i have complex values; the Chebyshev formula can therefore be used only for $n = 1, 2, 3, 4, 5, 6, 7$, and 9. The formula was derived by P. L. Chebyshev in 1873. [29–121–2]

CHEBYSHEV INEQUALITY. (1) A basic inequality for monotonic sequences or functions. In the case of the finite sequences $a_1 \le a_2 \le \ldots \le a_n$ and $b_1 \le b_2 \le \ldots \le b_n$ it has the form

$$\sum_{k=1}^{n} a_k \sum_{k=1}^{n} b_k \le n \sum_{k=1}^{n} a_k b_k$$

In integral form we have

$$\int_a^b f(x)\,dx \int_a^b g(x)\,dx \le (b - a) \int_a^b f(x)g(x)\,dx$$

Here, $f(x) \ge 0$ and $g(x) \ge 0$; in addition, the functions are either both increasing or both decreasing. The inequality was derived by P. L. Chebyshev in 1882.

(2) An inequality that provides an estimate of the probability that the deviation of a random variable from its mathematical expectation exceeds some given limit. Let ξ be a random variable, $\mathsf{E}\xi = a$ its mathematical expectation, and $\mathsf{D}\xi = \sigma^2$ its variance. The Chebyshev inequality asserts that the probability of the inequality

$$|\xi - a| \ge k\sigma$$

does not exceed the quantity $1/k^2$. If ξ is the sum of independent random variables and some additional restrictions are made, then the estimate $1/k^2$ can be replaced by the estimate $2 \exp(-k^2/4)$, which decreases with increasing k much more rapidly.

The inequality is named for P. L. Chebyshev, who used it in 1867 to establish extremely broad conditions for the application of the law of large numbers to sums of independent random variables. (*See* LARGE NUMBERS, LAW OF; LIMIT THEOREMS.) [29–120–2]

CHEBYSHEV PARALLEL MOTION, a linkage, proposed by P. L. Chebyshev in 1868, such that some point on it describes a nearly straight line.

A straight-line mechanism, the Chebyshev parallel motion is a four-bar linkage $ABCD$ (Figure 1) in which the lengths of the links satisfy the relation $3d - a = 2b$. An increase in AB results in an increase in the length of the approximately rectilinear segment of the path traced by point M; at the same time, however, the deviation from a true straight line also increases.

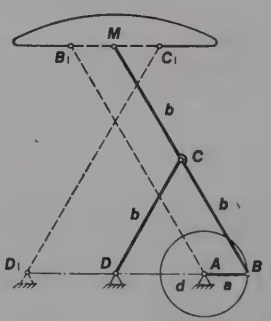

Figure 1. Chebyshev parallel motion

When in middle position, the Chebyshev parallel motion shown by solid lines in Figure 1 is reminiscent of the Greek letter lambda (λ); for this reason, it is referred to as lambda shaped. Chebyshev also proposed the variant $AB_1C_1D_1$, which is shown in Figure 1 by broken lines. In this crossed-bar mechanism, the path of M coincides with the path of the same point in the lambda-shaped mechanism, and the lengths of the links satisfy the following relations: $AB_1 = C_1D_1 = 2b$, $B_1C_1 = 2a$, $B_1M = a$, and $AD_1 = 2d$. In another variant of the Chebyshev parallel motion, the angle between the lines CB and CM is not 180°.

The Chebyshev parallel motion is employed in devices for obtaining rectilinear motion of a point without the use of guides.

CHEBYSHEV POLYNOMIALS. Chebyshev polynomials of the first kind are a special system of polynomials of successively in-

creasing degree. For $n = 0, 1, 2, \ldots$ they are defined by the formula

$$T_n(x) = \cos(n \arccos x) = \sum_{k=0}^{[n/2]} (-1)^k \frac{n}{n-k} C_{n-k}^k 2^{n-2k-1} x^{n-2k}$$

In particular, $T_0 = 1$, $T_1 = x$, $T_2 = 2x^2 - 1$, $T_3 = 4x^3 - 3x$, and $T_4 = 8x^4 - 8x^2 + 1$.

The polynomials $T_n(x)$ are orthogonal with respect to the weight function $(1 - x^2)^{-1/2}$ on the interval $[-1, +1]$ (*see* ORTHOGONAL POLYNOMIALS). They satisfy the differential equation

$$(1 - x^2)y'' - xy + n^2y = 0$$

and the recursion formula

$$T_{n+1}(x) = 2xT_n(x) - T_{n-1}(x)$$

Chebyshev polynomials of the first kind are a special case of the Jacobi polynomials $P_n^{(\alpha,\beta)}(x)$:

$$T_n(x) = \frac{2^{2n}(n!)^2}{(2n)!} P_n^{(-1/2, -1/2)}(x)$$

Chebyshev polynomials of the second kind $U_n(x)$ are a system of polynomials that are orthogonal with respect to the weight function $(1 - x^2)^{1/2}$ on the interval $[-1, +1]$. The relation between Chebyshev polynomials of the second kind and Chebyshev polynomials of the first kind is given by, for example, the recursion formula

$$(1 - x^2)U_{n-1}(x) = xT_n(x) - T_{n+1}(x)$$

CHECHEL'NIK, an urban-type settlement and the administrative center of Chechel'nik Raion, Vinnitsa Oblast, Ukrainian SSR. Chechel'nik is situated on the Savranka River, a tributary of the Iuzhnyi Bug. It is the rail terminus of a spur from the Rudnitsa-Gaivoron line. Chechel'nik has a sugar combine, a distilling plant, a mixed-feed plant, a brickyard, and an industrial combine. [29–506–3]

CHECHEN (self-designation, *Nakhcho*), a people living in the Northern Caucasus, predominantly in the central and eastern parts of the Chechen-Ingush ASSR (Chechen make up about 50 percent of the population) and in Khasav"iurt Raion of the Dagestan ASSR. The total number of Chechen in the USSR is 755,800 (1979 census). The Chechen speak the Chechen language. Believers are Sunni Muslims.

The Chechen, like the related Ingush, are the indigenous population of the Northern Caucasus. They are mentioned in seventh-century Armenian sources, which refer to them as the Nakhchamat'ian. Originally, the Chechen lived in the mountains in individual territorial groups. In the 15th and 16th centuries they descended to the plains and into the valleys of the Terek River and its tributaries the Sunzha and Argun. Before the October Revolution of 1917, the Chechen were divided into two groups according to their place of habitation—Greater and Lesser Chechnia. Those living on the plain were primarily engaged in land cultivation, while those living in the mountains engaged in stock raising. The production of hand-crafted goods, such as felt coats, leather goods, and pottery, is also developed.

During the years of Soviet power, the culture of the Chechen has undergone a radical transformation: illiteracy has been eliminated, a writing system has been created, a national intelligentsia has emerged, and literature and other forms of art have been widely developed.

(For information about the history, economy, and culture of the Chechen, *see also* CHECHEN-INGUSH AUTONOMOUS SOVIET SOCIALIST REPUBLIC.)

CHECHEN', an island in the northwestern part of the Caspian Sea, north of the Agrakhan Peninsula. The island measures 12 km in length and as much as 5 km in width. Sand spits overgrown with reeds extend from the shore into the sea. [29–522–2]

CHECHEN, the language of the Chechen. According to the 1970 census, there are approximately 613,000 speakers of Chechen, mainly in the central and eastern raions of the Chechen-Ingush ASSR and in the Khasav"iurt Raion of the Dagestan ASSR.

Chechen belongs to the Nakh group of the Caucasian (Ibero-Caucasian) languages. Its dialects are Ploskostnoi, Akka, Cheberloi, Melkha, Itumkala, Galanchog, and Kista. Chechen has a rich vowel system that includes dipthongs and long and mutated vowels; there are abrupt (glottalized) and pharyngeal consonants. The six nominal classes have one type of declension, and cardinal and local cases are distinguished. The verb has the categories of class, number, tense, mood, and aspect. Aspect is marked by internal inflection, as in *lalla* ("to drive away" [perfective]) and *liella* ("to drive" [imperfective]). The counting system is vigesimal. The syntax of the simple sentence is distinguished by its great variety of constructions. A writing system based on Arabic script was developed after the October Revolution; it was superseded by a Latin script in 1927. Since 1938, Chechen has used a Cyrillic alphabet.

CHECHEN-INGUSH AUTONOMOUS SOVIET SOCIALIST REPUBLIC (Chechen-Ingushetia), part of the RSFSR. Established as an autonomous oblast on Jan. 15, 1934; designated an autonomous Soviet socialist republic on Dec. 5, 1936. Situated in the eastern part of the northern slopes of the Greater Caucasus and the adjoining Chechen Plain and the Terek-Kuma Lowland. Area, 19,300 sq km. Population, 1.159 million (as of Jan. 1, 1977). The republic is divided into 14 raions and has five cities and four urban-type settlements. The capital is the city of Groznyi.

Constitution and government. The Chechen-Ingush ASSR is a socialist workers' and peasants' state and an autonomous Soviet socialist republic. Its present constitution was adopted on May 26, 1978, by the Extraordinary Eighth Session of the Supreme Soviet of the Chechen-Ingush ASSR. The highest body of state power is the unicameral Supreme Soviet of the Chechen-Ingush ASSR, composed of 175 deputies elected from precincts of equal population size, and its presidium. The Supreme Soviet of the republic forms the government—the Council of Ministers of the Chechen-Ingush ASSR. The Chechen-Ingush ASSR is represented in the Soviet of Nationalities of the Supreme Soviet of the USSR by 11 deputies. Local bodies of state power—the city, raion, settlement, and village soviets of people's deputies—are elected by the population for 2½-year terms.

The Supreme Soviet of the Chechen-Ingush ASSR elects the Supreme Court of the republic for a term of five years. The Supreme Court comprises two judicial collegiums—one for criminal cases and one for civil affairs—and the Presidium. The procurator of the Chechen-Ingush ASSR is appointed by the procurator-general of the USSR for a term of five years.

Natural features. Stretching along the southern border of the republic is the Bokovoi Range, with Mount Tebulosmta, which at 4,493 m is the highest peak in the republic, and Mount Diklosmta, which rises to 4,285 m. To the north are several parallel cuestas—the Skalistyi and Pastbishchnyi ranges and the Chernye Mountains. Further north lies the Chechen Plain. The northernmost part of the republic is occupied by the Terek-Kuma Lowland, with sandy ridges and hills. Located in the west is the

Terek-Sunzha Upland, which consists of the Terek and Sunzha ranges, separated from one another by the Alkhanchurt Valley.

The climate in the north is continental. In the Terek-Kuma Lowland the average temperature is −3°C in January and 25°C in July, and the annual precipitation is 300–400 mm; the growing period is 190 days. On the Chechen Plain the average temperature is −4°C in January and 22°–24°C in July, and the annual precipitation is 400–600 mm. In the mountains, the average January temperature varies from −5°C at the lower elevations to −12°C and lower at the higher elevations, while the average July temperatures vary from 21°C to 5°C; the annual precipitation here is 600–1,200 mm.

Almost all the rivers belong to the Terek River basin. The largest ones—the Terek, Sunzha, Argun, and Assa—originate from the glaciers in the high mountains. High water occurs in the spring and early summer as a result of the thawing of seasonal snow and glaciers. The rivers that originate in the low mountains are marked by summer flash floods. The rivers are extensively used for irrigation.

The Terek-Kuma Lowland has chestnut and light chestnut soils, and the Terek-Sunzha Upland, carbonate chernozems. The Chechen Plain is dominated by meadow soils, with leached chernozems in the more elevated areas. The river valleys have alluvial and meadow-bog soils, and the mountains have mountain-forest and mountain-meadow soils.

Wormwoods and saltworts are common in the Terek-Kuma Lowland; the wetter sections are occupied by dry steppes of fescue and feather grass, with associations of shrubs, including hawthorn and plants of the genus *Elaeagnus*, occurring in sandy depressions. The Chechen Plain is covered with steppe and forest-steppe vegetation. The mountains are covered with broad-leaved forests up to elevations of 1,800–2,200 m, above which they give way to subalpine and alpine meadows.

Forests cover 361,000 hectares (ha), or 18.7 percent, of the republic's territory. The most common trees are beech (48.8 percent of the forest-covered area), birch (10.9 percent), hornbeam (9.9 percent), and oak (9.6 percent).

Rodents and reptiles abound in the steppe and forest steppe, as well as such birds as bustards, wild ducks, and geese; pheasants are found in the river valleys. The mountains are inhabited by the stone and pine marten, brown bear, boar, mountain goat, roe deer, European wildcat, wolf, chamois, and badger. The alpine meadows are the habitat of the Egyptian black vulture (*Aegypius monachus*), snow pheasant, Caucasian blackcock (*Lyrurus mlokosiewiczi*), and chukar partridge. There are eight game reserves in the republic.

N. V. PRIBYTKOV

Population. The Chechen-Ingush ASSR is inhabited by Chechen (611,400; figures here and below from the 1979 census), Ingush (134,700), Russians (366,000), and nationalities of Dagestan, including Kumyks, Nogai, Avars, Laks, and Darghins (22,000), as well as by Armenians (14,600), Ukrainians (12,000), Tatars, and other nationalities.

Between 1926 and 1977, the population increased by a factor of 2.2. The average population density is 60 persons per sq km (as of Jan. 1, 1977). The foothill plain is the most densely populated region, while the steppe and high mountains are the least populated. Between 1926 and Jan. 1, 1977, the urban population increased from 19 percent to 44 percent. All the cities except Groznyi (population, 387,000; as of Jan. 1, 1977) were founded during the Soviet period, including Gudermes, Malgobek, Nazran', and Argun.

Historical survey. The area now occupied by Chechen-Ingushetia was settled as early as the Paleolithic period. Most of the remains dating from the Bronze Age (second millennium B.C.) are burials, found in the mountains and on the plain. The economy of the population was based on transhumance and land cultivation; the primitive communal system prevailed. The remains of the late Bronze and early Iron ages (end of the second millennium to the first half of the first millennium B.C.) attest to a high level of social and economic development of the tribes, to advanced metallurgy, first of copper, then of iron, and to contacts with Scythia, Transcaucasia, and Southwest Asia.

In the early Middle Ages most of the plain and certain parts of the foothill region of Chechen-Ingushetia were part of the early feudal state federation of Alania. The mountains were inhabited by the direct ancestors of the Chechen and the Ingush, among whom the primitive communal system was rapidly declining. Chechen-Ingushetia was subjected to devastating Mongol-Tatar raids in the 13th century and was invaded by Tamerlane in the late 14th century. Vestiges of the primitive communal system survived for a long time because of the low level of development of the productive forces. Chechen-Ingushetia was inhabited by individual clans and by groups (mainly in the plain) that united several frequently feuding clans. The blood feud existed until the early 20th century.

Christianity spread to Chechen-Ingushetia from Georgia after the tenth century. Islam penetrated from Dagestan in the late 16th century and by the first half of the 19th century was the dominant religion. Feudal relations arose in Chechen-Ingushetia in the 16th century. In the early 18th century, the Nakhcho tribe came to be known under the ethnic name of Chechen, after the *aul* (mountain village) of Chechen, and in the second half of the 19th century, the Galgai tribe came to be known as the Ingush, after the *aul* of Angush, or Ingush.

In 1722, during the Persian Campaign, Peter I spent some time in Chechnia. This period saw the beginning of cultural and economic ties between Russia and the Chechen and the Ingush, especially those living on the plain. However, the colonial policy of tsarism fostered the growth of the national liberation struggle, particularly the popular movement in the northern Caucasus in 1785, under the leadership of the Chechen Ushurma. In 1810, the Ingush voluntarily became Russian subjects, and thus their lands were spared colonization. The tsarist government encouraged the resettlement of the Ingush to the plain, with the result that the majority did not participate in the war against Russia. Military colonization of the Northern Caucasus intensified, in the course of which fortresses were built, the Chechen and other mountain peoples were driven into the mountains, and the fertile lands were settled by the cossacks; all of this provoked a movement of the mountaineers under the leadership of the imams Gazi-Magomed, Gamzat-Bek, and Shamil (*see* CAUCASIAN WAR OF 1817–64).

After Shamil's capitulation in 1859, all of Chechnia was definitively incorporated into Russia. This promoted the economic and cultural development of the Chechen and Ingush peoples and undermined the patriarchal clan system and the natural economy in the mountain villages. A commercial and industrial bourgeoisie, owning the oil fields, industrial plants, and trade enterprises, emerged in the late 19th century. The Vladikavkaz Railroad was built across Chechen-Ingushetia in the early 1890's. The Groznyi oil industry developed rapidly after the first oil well was drilled in 1893. The growing working class was composed of new arrivals, mostly Russians. By 1905 there were more than 10,000 workers in Groznyi, and by 1917, as many as 20,000. Commercial farming and animal husbandry developed. In 1913 alone, 6.816 million poods (111,646,080 kg) of grain were transported out of Chechen-Ingushetia.

Social Democratic circles arose in Groznyi in the early 1900's, and a Bolshevik organization was formed in 1903, in whose founding I. T. Fioletov played a leading role. The proletariat of Groznyi participated in the Revolution of 1905–07. The spring and summer of 1905 saw a wave of peasant unrest, primarily in Vedeno District.

After the February Revolution, a civilian committee was organized in Groznyi on Mar. 4 (17), 1917, as a body of the bourgeois Provisional Government. The Groznyi soviet of workers', soldiers', and cossacks' deputies was formed on March 5 (18). The Chechen Congress, held in Groznyi on March 14 (27), elected the bourgeois nationalist Chechen National Soviet, composed of sheikhs, merchants, and officers, as well as the Ingush National Soviet. By the autumn of 1917, the Bolsheviks, headed by N. A. Anisimov, had gained the majority in the Groznyi soviet, and the Groznyi garrison came out in support of the October Revolution. Soviet rule was proclaimed in the city on October 26 (November 8).

The establishment of Soviet power in Chechen-Ingushetia was accompanied by a bitter class struggle. In mid-November, two officers and several horsemen of the Chechen Cavalry Regiment of the Caucasian Native Cavalry Division (known as the Wild Division) were murdered at the Groznyi railroad station. The cossack

and mountaineer counterrevolution, headed by the ataman of the Terek Cossack Host, M. A. Karaulov, and by the Chechen oil industrialist A.-M. A. Chermoev, took advantage of the incident to issue an ultimatum on November 23 (December 6) demanding that the Groznyi soviet disarm the workers and revolutionary soldiers. On November 24 (December 7), counterrevolutionary units captured Groznyi, but on Dec. 31, 1917, (Jan. 13, 1918), they were driven out with the help of revolutionary troops that had arrived from Mozdok; power passed to the military revolutionary committee.

The first congress of the peoples of Terek Oblast, at which S. M. Kirov played a leading role, was held in Mozdok on Jan. 25–31 (Feb. 7–13), 1918. The congress formed the Terek People's Soviet and forestalled a war between the various nationalities of the oblast, which the cossack elite was planning to unleash. On March 17, the second congress of the peoples of Terek Oblast, held in Piatigorsk on Mar. 1–18, 1918, recognized Soviet power and formed the Terek Soviet Republic as part of the RSFSR. After the congress, the working people of Chechnia convened a congress of the Chechen people in the settlement of Goity and elected the Goity People's Soviet, with T. E. El'darkhanov as chairman. The Ingush National Soviet was reorganized, and G. Akhriev became its chairman. The Goity People's Soviet and the Ingush National Soviet declared their support of Soviet power.

In the summer of 1918, the cossack counterrevolutionaries of Terek Oblast, under the leadership of G. F. Bicherakhov, organized an anti-Soviet revolt. Bicherakhov's forces were defeated in battles fought at Groznyi between Aug. 11 and Nov. 12, 1918. The defense of the city was led by N. F. Gikalo, A. Sheripov, and A. Z. D'iakov. G. K. Ordzhonikidze was extraordinary commissar of Southern Russia in the Northern Caucasus.

General A. I. Denikin's White Guard troops captured Chechen-Ingushetia in February 1919; Soviet troops left Groznyi on the night of February 2. Partisan detachments were formed in the mountains of Chechen-Ingushetia, which continued the struggle against the counterrevolution. On the night of Dec. 22, 1919, an uprising of workers and political prisoners broke out in Groznyi but was crushed by Denikin's forces.

As the Red Army approached the Northern Caucasus, the Caucasian Krai Committee of the RCP(B) in January 1920 adopted a decision to organize the Terek Oblast Group of Rebel Troops under the command of Gikalo. The 11th Army and the rebel troops launched an offensive on Groznyi in March, and the city was liberated on March 17. By the end of March 1920, Soviet power was established in all of Chechen-Ingushetia.

On Nov. 17, 1920, the congress of the peoples of Terek Oblast held in Vladikavkaz (now the city of Ordzhonikidze) proclaimed the formation of the Gortsy ASSR (a decree of Jan. 20, 1921, of the All-Russian Central Executive Committee), which included Chechnia and Ingushetia under the names of Chechen and Nazran' okrugs. On Nov. 30, 1922, Chechen Okrug was separated from the Gortsy ASSR and organized as an autonomous oblast of the RSFSR. A July 7, 1924, decree of the All-Russian Central Executive Committee abolished the Gortsy ASSR and established the Ingush Autonomous Oblast on part of its territory.

Soviet power freed the working people of Chechen-Ingushetia from national oppression and eliminated national inequality in all spheres of social, political, economic, and cultural life. Between 1921 and 1926 the economy in Chechen-Ingushetia was restored with the help of the Russian people and other fraternal peoples. In 1924 the proletariat of Groznyi was awarded the Order of the Red Banner for the heroic struggle against the counterrevolution and for the restoration of the oil industry.

During the prewar five-year plans, the industry and the oil fields of Groznyi were completely reconstructed, and new huge oil refineries and chemical and machine-building plants were built, as well as canneries and other enterprises of the food-processing industry. Collectivization proceeded successfully. In 1933 collectivized peasant farms accounted for 40.5 percent of all farms in Ingushetia and 32.4 percent in Chechenia. In 1939 there were 472 kolkhozes, which encompassed 73,744 farms, or 96 percent of all farms. The successes in agriculture were achieved amid a struggle with kulaks and mullahs, who made use of vestiges of the clan system and religious prejudice in their struggle against collectivization.

A culture national in form and socialist in content was created in the republic under Soviet power. In 1920 the literacy rate was only 0.8 percent among the Chechen and 3 percent among the Ingush. Chechen and Ingush writing systems were developed in the period 1923–25. In 1940 the literacy rate was 85 percent among the Chechen and 92 percent among the Ingush. A national intelligentsia emerged. Much work was done to eradicate the vestiges of the patriarchal clan system. Steps were undertaken to involve the Chechen and the Ingush in industrial production.

In view of the achievements in economic and cultural development, the Chechen and Ingush autonomous oblasts were merged on Jan. 15, 1934, into the Chechen-Ingush Autonomous Oblast, which was transformed on Dec. 5, 1936, into the Chechen-Ingush ASSR.

During the Great Patriotic War (1941–45), the working people of the Chechen-Ingush ASSR aided the front. The oil industry worked hard to supply the front with gasoline and lubricants. Agricultural output was maintained at the 1940 level, and food was supplied to the army. Fascist German troops invaded the western part of the republic in the fall of 1942, but they were soon stopped at the distant approaches to Groznyi. The republic was liberated in January 1943. During the war, the Chechen and the Ingush fought on the fronts and participated in the partisan struggle against the fascist invaders. Several thousand people were awarded orders and medals, and the title of Hero of the Soviet Union was conferred on 36 people. The Chechen-Ingush ASSR was abolished in 1944. A Jan. 9, 1957, decree of the Presidium of the Supreme Soviet of the USSR restored the national autonomy of the Chechen and Ingush peoples.

In the 1960's and 1970's, the Chechen-Ingush ASSR attained new successes, with the constant selfless aid of the peoples of the entire Soviet Union. By 1977, there were 32 Heroes of Socialist Labor in the republic, and a total of 13,060 working people had been awarded orders and medals of the USSR. For achievements in the development of the economy, the Chechen-Ingush ASSR was awarded the Order of Lenin in 1965 and the Order of the October Revolution and the Order of Friendship of Peoples in 1972.

V. B. VINOGRADOV and N. P. GRITSENKO

Economy. Socialist construction transformed Chechen-Ingushetia into a republic with a highly developed industry and diversified agriculture. The economy is based on oil extraction, oil refining, and petrochemical production, as well as on power production, machine building, and metalworking. The building-materials and food-processing industries are also greatly developed.

INDUSTRY. In the period 1940–76 the industrial output increased by a factor of 9. Table 1 gives the output of the most important types of industrial products.

The republic has four heat and power plants, which are linked up with the power system of the Northern Caucasus. Oil and gas deposits are concentrated around the cities of Groznyi, Malgobek, and Gudermes. Almost all the oil and gas extracted in the republic is refined at the oil and gas refineries in Groznyi. The oil-refining and petrochemical industries produce motor fuels, lubricants, petroleum bitumens, paraffin, synthetic ethyl alcohol, phenol, acetone, and polyethylene.

Machine-building and metalworking enterprises produce equipment for the oil industry, sludge pumps, cement-making machines, tractor trailers, electrographic machines, various industrial instruments, bottling assembly-line equipment, and electrical and medical instruments. The largest enterprises are the Krasnyi Molot, Transmash, and Elektropribor plants, a repair and machinery plant, an electromechanical plant, and the experimental plant of the Neftegazpromavtomatika Special Planning and Design Office in Groznyi, the Elektroinstrument Plant in Nazran', the Medinstrument Plant in Gudermes, and the Pishchemash Plant in Argun. The building-materials industry is represented by a cement plant in Chiri-Iurt and by plants for the production of bricks, limestone, and reinforced-concrete structural members and by a large-panel housing-construction plant in Argun.

The leading branches of the food-processing industry are meat packing and the production of milk, sugar, wine, beer, flour, bread, confectionery and macaroni products, and canned goods; the bottling of mineral water is also important. There are canner-

Table 1. Output of major types of industrial products

	1940	1950	1960	1976
Electricity (million kW-hr)	398	458	1,736	3,142
Petroleum equipment (thousand tons)	1.5	3.4	9.1	16.9
Pumps (units)	531	367	575	747
Tractor trailers (thousand units)	—	—	1,875	13,858
Electrical instruments (thousand units)	—	—	—	222
Export of commercial timber (thousand cu m)	79	94	229	59
Precast reinforced-concrete structural members and products (thousand cu m)	—	—	89	262
Construction bricks (million units)	34.7	53.9	148.3	201
Construction limestone (thousand tons)	12.9	9.3	19.8	30.2
Knit underwear (thousand items)	42	101	513	4,191
Leather footwear (thousand pairs)	364	250	1,084	988
Vegetable oil (thousand tons)	2.3	5.6	3.7	7.1
Canned goods (million standard cans)	20.9	17.7	54.5	140
Granulated sugar (thousand tons)	—	—	—	4.9

ies in Groznyi, the Assinovskaia Stanitsa, and the village of Samashki and a sugar refinery in Argun.

The lumber and wood-products industry is represented by ten logging enterprises, the Terek furniture production association, and the Ermolov wood-products combine. The largest enterprises of light industry are the Nazran' Knitwear Factory, the Groznyi Garment Production Association, and the Groznyi Footwear Factory.

AGRICULTURE. In 1976 agricultural lands totaled 1,166,100 ha, of which arable land occupied 426,300 ha (including 98,200 ha under irrigation), perennial plantings 38,100 ha, hayfields 71,600 ha, and pastures 630,100 ha. As of Jan. 1, 1977, the republic had 45 kolkhozes and 100 sovkhozes. In 1976 agriculture accounted for 8,135 tractors (1,519 in 1940), 1,178 grain-harvesting combines (485 in 1940), and 4,707 trucks (2,122 in 1960). Table 2 shows the distribution of sown area.

Agriculture specializes in the production of fruits, grapes, and vegetables. Between 1945 and 1976 the area occupied by orchards, berry plantings, and vineyards increased from 3,900 ha to

Table 2. Sown acres
(hectares)

	1913	1940	1976
Grain crops	262,500	292,800	239,300
Winter wheat	89,000	79,300	117,600
Winter barley	15,700	21,700	56,000
Corn for grain	56,000	126,200	32,400
Rice	100	200	6,600
Industrial crops	7,600	38,300	26,500
Sunflowers	4,400	16,500	15,300
Sugar beets	—	—	9,100
Tobacco	—	—	1,700
Total	288,800	402,200	467,800

44,600 ha, of which 23,500 ha were occupied by vineyards. In 1976 the gross harvest totaled 519,800 tons of grain (190,000 in 1940), 177,000 tons of vegetables (43,900 in 1940), 207,000 tons of sugar beets, 80,100 tons of fruit, and 112,300 tons of grapes.

The raising of fine-wooled sheep, animals for meat and dairy purposes, and poultry is developing. At the beginning of 1977, the republic had 301,500 head of cattle (249,700 in 1941), including 118,100 cows (106,200), as well as 148,300 hogs (45,100) and 744,800 sheep and goats (470,400). Efforts are under way to mechanize animal husbandry. From 1940 to 1976 the meat output increased from 10,200 tons to 30,500 tons (in dressed weight), the milk output from 78,000 tons to 206,900 tons, egg production from 52.9 million eggs to 110 million eggs, and wool production from 451,000 tons to 3.592 million tons.

In 1976 the state purchases were as follows: 174,200 tons of grain (72,500 tons in 1940), 131,000 tons of vegetables (18,300), 192,000 tons of sugar beets, 8,100 tons of sunflower seeds (5,700), 70,400 tons of fruit (1,100), 110,600 tons of grapes (400), 2,700 tons of tobacco, 32,100 tons of livestock and poultry (8,300), 78,700 tons of milk (6,100), 65.7 million eggs (15.2 million), and 4.306 million tons of wool (369,000).

TRANSPORTATION. The operational length of railroads was 362 km in 1976, compared to 150 km in 1913. The republic is traversed by the Rostov-on-Don–Beslan-Baku trunk line and by the Prokhladnaia-Mozdok-Astrakhan' line. Gudermes is a major railroad junction. In 1976 there were 3,181 km of highways, of which 2,574 km were hard-surfaced. The Moscow-Baku Highway passes through the republic. Groznyi is linked by air with Moscow, Sochi, Rostov-on-Don, and other cities.

The pipeline network is well developed.

The Chechen-Ingush ASSR supplies other parts of the USSR with products of the oil-refining, chemical, and machine-building industries; it receives coal, metals, and some building materials, oil, and gas from other regions.

STANDARD OF LIVING. The standard of living of the republic's population is steadily rising owing to the successful fulfillment of the programs of economic and cultural development. The state and cooperative retail trade turnover, including the food service industry, increased by a factor of 1.4 in the period 1971–76, reaching 600 million rubles. New housing built in the same period by the state, kolkhozes, and private individuals amounted to 2.005 million sq m. E. V. BRYKSIN

PUBLIC HEALTH. In 1913 there were ten fee-charging hospitals, with 236 beds, and 21 private physicians in what is now the Chechen-Ingush ASSR; there were no medically trained personnel from among the indigenous population. As of Jan. 1, 1977, there were 83 hospitals, with 11,200 beds (9.7 beds per 1,000 population), 556 feldsher and obstetrics centers, gynecological consultation centers, and children's polyclinics and other dispensaries and polyclinics, and 19 public health epidemiological stations. There were 2,700 physicians (one doctor per 430 population) and 7,800 secondary medical personnel.

Resorts and health facilities include the balneological resort of Sernovodsk, the climatic resort of Armkhi, nine sanatoriums, and one house of rest.

TOURISM. The main tourist itineraries, which include seven all-Union itineraries, lead from the Caucasian Mineral Waters Region to the Caspian Sea and from the city of Groznyi through the Glavnyi Range of the Caucasus to Georgia. There are tourist centers in the city of Groznyi and in the village of Benoi.

Education and culture. In the 1914–15 academic year, there were 153 general-education schools, with 12,800 pupils and students, in what is now the republic; there were no specialized secondary or higher educational institutions. In the 1977–78 academic year, there were 574 general-education schools of all types, with 288,100 pupils and students, 29 vocational-technical schools, with 15,000 students, and 12 specialized secondary schools, with 14,800 students; there were also two higher educational institutions—the Chechen-Ingush University and the Petroleum Institute—both in Groznyi, with 12,000 students. In 1976 the republic numbered 326 preschool institutions, caring for 31,000 children.

As of Jan. 1, 1977, there were three theaters, a philharmonic society, and 475 public libraries in the republic, with more than 6.2 million books and journals. The republic has two museums—

the Chechen-Ingush Museum of Local Lore and the Museum of Fine Arts, both in Groznyi—as well as 403 clubs, 358 motion-picture projection units, and 41 extracurricular institutions. (*See below:* Music and Theater.)

Scientific institutions. All scientific research institutions have been founded during the Soviet period. The oldest research institutes are the Groznyi Scientific Research Institute (GrozNII; founded 1928) and the Institute of History, Sociology, and Philology (1926). The Northern Caucasus Scientific Research and Design Institute of the Petroleum Industry was founded in 1965, the Chechen-Ingush State Agricultural Experimental Station in 1944, and the Scientific Research Station for Vegetable and Fruit Growing in 1973. Scientific work is conducted at the Chechen-Ingush University and the Groznyi Petroleum Institute. In 1976 there were more than 2,000 scholars and scientists in the republic.

Press, radio, and television. In 1979 the republic's publishing houses released 105 titles of books and pamphlets in a printing of 622,000 copies. Republic newspapers include the Chechen-language *Leninan nek"* (The Leninist Path; since 1923), the Ingush-language *Serdalo* (The Light; 1923), and the Russian-language *Groznenskii rabochii* (Groznyi Worker; 1917) and *Komsomol'skoe plemia* (The Komsomol Tribe; 1928). Almanacs include the Ingush-language *Loaman Iuire* (The Mountain Morning; 1958) and the Chechen-language *Orga* (Argun; 1958). Radio broadcasts of the First Program of the All-Union Radio, as well as broadcasts of Maiak, are relayed for 32 hours a day; republic programs are broadcast for 11 hours a day. Two television programs are broadcast for 15.9 hours a day, of which 12.9 hours are programs relayed from Central Television and three hours are local broadcasts in Chechen, Ingush, and Russian.

Literature. Both Chechen literature and Ingush literature, close in historical development and written in kindred languages, developed after the October Revolution of 1917 as written Soviet literature based on folklore, on the one hand, and on classical Russian and Soviet literature, on the other.

The founder of Chechen literature is S. Baduev (1904–43), author of the first published Chechen work of fiction, the novella *Hunger* (1925); of the first Chechen novel, *Petimat* (1930), which was devoted to the fate of a woman mountaineer; and of the plays *The Law of the Fathers* (1929) and *The Red Fortress* (1930). Sh. Aiskhanov (1907–37) wrote plays, including *The Struggle* (1932), and short stories, and M. Muzaev (born 1913) wrote the play *A Seed Sprouts in Our Epoch* (1934) and the narrative poem *The Forest Clearing* (1933). The early 1930's saw the first poems of M. Mamakaev (1910–73) and the literary sketches and plays of Kh. Oshaev (1898–1977), creator of the first Chechen alphabet, based on the Latin alphabet. The historical novel *Two Generations* (1930) by S. Arsanov (1889–1968) was devoted to the prerevolutionary period in Chechnia.

Chechen works of the 1940's include the patriotic plays *Anger* (1940) and *To the Native Aul* (1941) by A. Mamakaev (1918–58), Muzaev's poetry collection *In the Flash of Lightning* (1940), and the narrative poem *The Sun Will Triumph* (1944) by M. Sulaev (born 1920). Literature developed rapidly in the 1950's. *Friendship*, a collection of works by Chechen writers, was published in Alma-Ata. Arsanov published the historical novel about the revolution *When Friendship Becomes Known* (in Russian), a landmark work of Chechen prose. Other works of the period include the poetry collections *The Valley of the Terek* (1958) by A. Mamakaev, *The Roads of the Motherland* (1960) by M. Mamakaev, *A Handful of Earth* (1960) by Muzaev, and *Difficult Love* (1963) by R. Akhmatova (born 1928). Chechen poets of the 1960's and 1970's remained true to traditional civic, patriotic, internationalist, and lyrical themes, striving for profound philosophical solutions, epic scale, and perfection of language and artistic form.

Chechen prose of the 1960's and 1970's was marked by the development of the literary sketch and novella. Novels on contemporary themes were published with increasing frequency. The theme of the beauty of constructive labor and the theme of the individual versus society are developed in the novels *In the Valley of the Argun* (1965) and *The Power of Imagination* (1971) by Muzaev, the novels *The Root of Happiness* (books 1–2, 1964–70) and *The Creators* (1970) by M. Isaeva (1898–1977), and the novella *On the Banks of the Assa* (1975) by Z. Abdulaev (born 1296). The problems of moral upbringing and the development of communist morality are the themes of several novels, including *Tavsultan Leaves the Mountains* (1966) by Sulaev, *After the Shot* (1969) by M. Musaev (born 1915), and *Who Are You?* (books 1–2, 1969–71) by U. Gaisultanov (born 1920). An artistic reevaluation of the past marks the novels *Miurid of the Revolution* (1962) and *Zelimkhan* (1968) by M. Mamakaev, *In the Name of Freedom* (1968) and *Long Nights* (1973) by A. Aidamirov (born 1933), and the tetralogy *Flaming Years* (books 1–4, 1959–64) by Oshuev.

Chechen writers of children's works include Gaisultanov, author of the collection of novellas and short stories *Let the Sun Smile for Everyone* (1968), Kh. Edilov (born 1922), author of the fairy-tale narrative poem *The Iron Wolf* (1966), and Musaev, author of the novella *Anzor* (1966).

Since the late 1950's, Chechen dramaturgy has dealt with a wide range of topics. The Civil War of 1918–20 is the topic of *Aslanbek Sheripov* (1958) by Oshaev and *The Girl From the Mountains* (1960) by A. Khamidov (1920–69); life in a kolkhoz village is depicted in Muzaev's *The Bright Path* (1961) and Musaev's *In One Aul* (1962); the Great Patriotic War is the theme of Musaev's *The Waves of the Terek* (1961) and Khamidov's *The Immortals* (1969); and moral and ethical problems and problems of everyday life are treated in Muzaev's *Trust in Man* (1961) and Khamidov's *Sovdat and Daud* (1958) and his satirical comedy *The Fall of Bozh-Ali* (1967).

The first published Ingush literary work was the play *Abduction of a Girl* (1923) by Z. Mal'sagov (1894–1935). The newspaper *Serdalo* published Ingush poetry and prose, including excerpts from the novella *Early Spring* by T. Bekov (1873–1938) and the narrative poem *Kalym and Tamara* by S. Oziev (born 1904). Among the writers who emerged in the 1930's were the poets Kh. Mutaliev (1910–64), Dzh. Iandiev (born 1916), and A. Oziev (1902–37), the prose writer A. Goigov (1896–1948), author of literary sketches and novellas about the revolution, and the dramatist and prose writer I. Bazorkin (born 1911). During the Great Patriotic War (1941–45), Iandiev, M. Khashagul'gov (1904–77), and Kh. Osmiev (born 1919) published patriotic and antifascist poems. The war is depicted in Bazorkin's plays *Captain Ibragimov* (1941) and *The Birth of Hate* (1942).

Ingush literature developed rapidly in the 1950's. Mutaliev, Iandiev, and S. Oziev published poetry collections. Prose writers confidently mastered the genre of the novella, represented by *The First Days* (1960) by Mutaliev, *In the Name of the Republic* (1962) and *Nine Days in the Life of a Hero* (1964) by B. Ziazikov (1908–65), and *At the Fork* (1965) by A. Vedzizhev (born 1919). The problems of moral upbringing and the development of communist morality in the struggle against the vestiges of the past are treated in the first Ingush novel, *The Golden Pillars* (1966) by S. Chakhkiev (born 1938). The novel *Wolves' Nights* (1970) by Chakhkiev and the novels *Beka's Sons* (1967) by A. Bokov (born 1924) and *The Difficult Crossing* (1974) by M. Pliev (born 1929) are devoted to the revolution. Bazorkin's historical epic *From the Darkness of the Ages* (1968) traces more than 100 years of the life of the people.

Ingush writers of children's works include Vedzizhev (novella *Gapur—the Hero's Namesake*, 1968) and Chakhkiev (novella *Enver*, 1966).

Ingush dramaturgy, which emerged in the 1920's with the plays of Z. Mal'sagov and Mutaliev, made great strides in the late 1950's and the subsequent decades. Among the important plays are *The Roads of Love* (1966) by Bazorkin, *When Sons Perish* (1968) by Chakhkiev and G. Rusakov, and *I Shall Not Be Alone* (1973) by Akh. Mal'sagov (born 1922).

LITERARY SCHOLARSHIP AND LITERARY CRITICISM. Chechen and Ingush literary scholarship and literary criticism, which have developed closely with one another, have found expression, in particular, in the publication of the joint *Outline of the History of Chechen-Ingush Literature* (1963). Abu Mal'sagov (born 1939), a scholar of Ingush literature, and Kh. Turkaev (born 1938), a scholar of Chechen literature, started their careers in the early 1970's. *Chechen-Ingush Soviet Drama From 1920 to 1940* by Iu. Aidaev (born 1938) was published in 1973 and *Ingush Literature* by I. Dakhkil'gov (born 1936) in 1975. The center of research for literary scholarship and literary criticism is the Chechen-Ingush Institute of History, Sociology, and Philology.

Works of Chechen and Ingush writers have been translated into Russian and the national languages of the USSR. Chechen and Ingush translations of classical Russian and foreign works have been published in the republic, as have translations of the works of many writers of the peoples of the USSR. The creative work of writers is organized by the writers' organization of the Chechen-Ingush ASSR, based in the city of Groznyi.

M. A. SULAEV

Architecture and art. The oldest artistic remains in what is now Chechen-Ingushetia date from the third to first millennia B.C. They include remains of the Kura-Araks Aeneolithic, the Maikop culture, the Northern Caucasus culture, the Kaiakent-Khorochoi culture, and the Koban culture (*see* KURA-ARAKS AENEOLITHIC; MAIKOP CULTURE; NORTHERN CAUCASUS CULTURE; KAIAKENT-KHOROCHOI CULTURE; and KOBAN CULTURE).

The Scythian and Sarmatian period (seventh century B.C. to fourth century A.D.) is represented by works in the animal style (*see* ANIMAL STYLE), the Alani period (eighth to 13th centuries) by catacomb burials (near the villages of Alkun and Duba-Iurt), and the Mongol-Tatar period (13th to early 15th centuries) by the Borga-Kash mausoleum near the village of Plievo (1405).

Christian religious architecture from the 11th to 13th centuries (the Tkhaba-Erdy Church near the village of Khairakh), which combines Georgian and local architectural elements, is characterized by simple geometric forms and austere and elegant decor. In the mountain regions of Chechen-Ingushetia, crudely dressed stones were used in the Middle Ages to build defensive walls (near the village of Verkhnii Alkun), two- or three-tiered residential towers, with flat roofs and arched openings, and four- or five-tiered fortification towers, with embrasures, machicoulis, and pyramidal-stepped roofs, which sometimes formed majestic complexes, as in the villages of Kezenoi, Targim, Khoi, Egikal, and Erzi (all 14th to 18th centuries). Mountain hamlets, forming picturesque terrace-like compositions on the slopes, stood side by side with numerous aboveground, semisubterranean, and underground crypts (rectangular, square, or round, with gabled, pyramidal-stepped, or conical smooth roofs), as well as tomb stelae (for instance, the City of the Dead of Tsoi-Pede, near the village of Malkhista, 11th to 18th centuries). Almost all the villages had sanctuaries identical to the gabled aboveground crypts.

From the 18th to early 20th centuries, the traditional dwellings in Chechen-Ingushetia were, in the mountains, one- or two-story multiroom stone and wood dwellings, with flat roofs and separate exits to an open terrace, and, on the plain, rectangular houses of adobe (later of brick), faced with tiles and surrounded by galleries.

The decorative applied folk art of Chechen-Ingushetia includes stone and wood carving, artistic metalworking (embossing, engraving, and niello), jewelry-making, the production of wood, clay, and copper utensils, felt cloaks, and felt carpets, embroidery with gold and silver thread (astrological, zoomorphic, and floral designs), and leather tanning. P. Z. Zakharov, a Chechen easel painter and portraitist, began painting in the second quarter of the 19th century.

The reconstruction and development of Groznyi were begun after the October Socialist Revolution; it proceeded intensively in the 1950's under the direction of the architects Z. S. Berkovich, Ia. S. Berkovich, B. N. Fedotov, and L. I. Khait. Large-scale construction of housing and cultural and service facilities is currently under way in the cities of Gudermes and Malgobek. Spacious modern residential and farm buildings are being erected in the villages. The Groznyi section of the Architects' Union of the USSR was founded in 1939, and the Chechen-Ingush section, in 1967.

During the years of Soviet power, the art of Chechen-Ingushetia has been marked by the development of historical, genre, portrait, and landscape painting, as represented by the works of the painters E. N. Gaidukova, A. G. Grigor'iants, Kh. Iu. Dadaev, D. G. Idrisov, N. G. Latyshev, V. V. Livn, P. V. Mironov, O. M. Mishin, V. K. Mordovin, F. N. Sachko, Sh. A. Shamurzaev, and G. Iu. Ianakov and the graphic artists Kh. A. Akhmedov, O. R. Chubarov, and L. I. Tsaritsynskii. Sculptors include V. P. Astapov, I. D. Bekichev, V. D. Maliukov, R. I. Mamilov, and A. N. Safronov (the last is also a painter and graphic artist). Book illustration, as represented by E. M. Tokarev and A. A. Tuladze, and stage design have also developed. The Union of Soviet Artists of the Chechen-Ingush ASSR was founded in 1939 and was renamed the Artists' Union of the Chechen-Ingush ASSR In 1968.

Decorative applied folk art is being enriched with new themes.

V. B. BESOLOV

Music. Chechen and Ingush folk music have much in common. Both are characterized by the diatonic scale, by a juxtaposition of the harmonies of neighboring steps, by harmonies of fourths and fifths, and by harmonies of seconds and fifths. Many choral and instrumental works are characterized by two- or three-part harmonies. Chromaticism is absent, and there are no augmented seconds in melodies. The rhythm is well-defined, often with frequent changes of measure and alternation of triplets with an even rhythmic division, especially in dance melodies; the *lezghinka* is the most popular dance.

Folk melodies encompass a variety of genres. They include heroic and epic songs, called *illi* or *illesh*, which are often in the form of a recitative and are performed by men. Male choral singing also includes the *nazma*, usually for two or three voices. Among lyrical women's and girls' songs are the *esharsh* and *khalkharan iish*, of which there are many local variants. Instrumental music includes the *laduga iish*.

The principal musical instruments are the *dechk-pondur*, a plucked stringed instrument; the *atukh-pondur*, a bow stringed instrument; various wind instruments, such as the *shedag* (a pipe), *zurna*, and *maa* (made of horn); percussion instruments, such as the *vota* (a drum with two heads) and *zhirgia* (a tambourine); and the *tsuzam*, an instrument made of goose feathers producing a squeaky sound. The oriental accordion has become very popular. In the early 20th century, Abdul Muslim Magometovich Magomaev sought to popularize folk music; he composed several works based on Chechen melodies.

New interest in the notation of folk music was aroused after the October Revolution of 1917. A. Sheripov's collection *Selected Chechen Songs* was published in 1918. In the 1920's the music of the Chechen and the Ingush was studied by A. A. Davidenko and E. A. Kolesnikov. Much work to popularize folk music was done by the composers V. Sh. Dagaev, A. E. Khamkhoev, S. L. Magomedov, and S. Ts. Tsugaev, as well as by A. I. Aleksandrov. Leading folk musicians included the accordion players U. Dimaev and E. Ganukaeva and the *ashugs* (folk singers and storytellers) B. Suleimanov, I. Bataev, and I. Tsitskiev. The composer and conductor G. Kh. Mepurnov, one of the founders of professional music in the republic, made a great contribution to the collection of Chechen folk music. Mepurnov made use of folk melodies in his *Poem About Sheripov* and *Fantasy on Chechen-Ingush Themes* and in music to several productions of the Kh. Nuradilov Chechen-Ingush Dramatic Theater. He also helped found a music school (1936) and an orchestra of reconstructed folk instruments (1935).

U. A. Beksultanov, whose works are quite popular, wrote the symphony *For Soviet Rule* (1967), the symphonic poems *The Tale of the Mountains* (1963) and *Gomar* (1966), a concerto for piano and orchestra (1973), and *Vainakh Sketches* (1974). Vocal and instrumental chamber music is represented by the works of S. U. Dimaev, and variety music, by the works of A. M. Shakhbulatov. Chechen-Ingush folk music forms the basis of several works by Davidenko, N. S. Rechmenskii, M. V. Koval', S. N. Riauzov, Iu. S. Biriukov, O. B. Fel'tsman, and L. I. Kuliev.

Performers include Honored Artists of the RSFSR M. A. Aidamirova, V. Sh. Dagaev, and A. E. Khamkhoev and People's Artist of the USSR M. E. Esambaev, a performer of folk dances.

Among the musical institutions in the republic are (1977) a philharmonic society (1938) and its symphony orchestra (1939), the Vainakh Dance Ensemble (1939), the House of Folk Art (1938), a music school (1936, Groznyi), the Republic Cultural-Educational School (1961), and 31 children's music schools.

V. A. TATAEV and S. V. TATAEV

Theater. The theatrical art of the Chechen and the Ingush is rooted in antiquity, attested to by the songs and legends of wandering musicians and singers glorifying the exploits of national folk heroes and by the ancient customs accompanying various festivities and wedding and funeral rituals. Both amateur theatrical arts and the professional theater developed after the October

Revolution of 1917. In the early 1920's progressive members of the national intelligentsia of the cities of Groznyi and Vladikavkaz (now the city of Ordzhonikidze) formed small amateur groups, which staged plays of the Russian and other fraternal peoples in Russian. The national dramaturgy was created mainly by members of amateur circles. Chechen plays included I. El'darkhanov's *The Young Wife of an Old Man*, D. Sharipov's *Ali-Bek-Khadzhi of Zandak*, M. Iandarov's *The Makazhoev Imam*, and S. Baduev's *Not Every Day Is a Bairam for the Mullah* and *The Political Department*. Ingush plays included Z. Mal'sagov's *The Abduction of a Girl* and *Vengeance*, A. Kh. Goigov's *The Funeral Repast*, O. Mal'sagov's *Selikhat* and *Class Struggle in the Aul*, and Kh. Mutaliev's *Eye for an Eye, Tooth for a Tooth* and *The Soldiers of Culture*. These successful plays were topical and of great educational value. At the Northern Caucasus Olympiad of the Arts of the Autonomous Oblasts in 1931, the Ingush drama circle won first place, and the Chechen circle, second place.

The origin of the professional theater dates to the founding in 1931 of the Chechen Theatrical Studio in Groznyi, which combined training with actual stage performances in cities and rural areas. In 1933 the theatrical studio was reorganized into the Chechen Dramatic Theater. An Ingush theatrical studio opened the same year in the city of Ordzhonikidze. The following year, the studio joined the troupe of the Chechen Dramatic Theater, which assumed the name Chechen-Ingush Dramatic Theater. The training of professional performers was greatly assisted by the Rustaveli Georgian Theater, the State Institute of Theatrical Arts, and the Leningrad Institute of Theater, Music, and Cinematography, where the Chechen and Ingush studios worked at one time or another.

The core of the Chechen-Ingush Dramatic Theater comprised graduates of the studios and performers associated with the theater from its inception. They included Honored Artist of the RSFSR Ia. M. Zubairaev, People's Artist of the Chechen-Ingush ASSR and Honored Artist of the RSFSR T. Sh. Alieva, People's Artists of the Chechen-Ingush ASSR A. M. Isaeva, Kh. S. Khakisheva, A. Kh. Khamidov, and V. A. Tataev, Honored Artists of the Chechen-Ingush ASSR Kh. Iu. Mustapaeva, A. D. Tashukhadzhieva, Z. M. Bagalova, I. D. Khadzhieva, Z. Minkailova, M. A. Davletmirzaev, A. A. Deniev, and N. Tsitskiev, Honored Artist of the Severnaia Ossetia ASSR D. Amaev, and the actor M. Dudaev. The first professional stage directors included G. M. Batukaev, M. M. Soltsaev, and R. Sh. Khakishev. In 1942 the theater was named for Kh. Nuradilov (Hero of the Soviet Union).

The most popular national plays are S. Baduev's *The Red Fortress, Petimat, The Law of the Fathers, The Golden Lake, The Shepherd's Family*, and *Tsaeba's Marriage*, M. Gadaev and G. Batukaev's *Adi Surkho*, I. Bazorkin's *Captain Ibragimov* and *Tamara*, A. Khamidov's *The Fall of Bozh-Ali*, Kh. Oshaev's *Aslanbek Sheripov*, M. Soltsaev's *Beshto*, N. Muzaev's *Aset*, B. Saidov's *Zeinap*, and S. Chakhkiev and G. Rusakov's *When Sons Perish*. In addition to staging national plays, the theater produces classical Russian, Soviet, and foreign plays and plays of dramatists of other republics. The rise and development of the Chechen-Ingush theater owe a great deal to the stage directors A. Tuganov, M. Alili, A. Chkhartashvili, G. Batukaev, V. E. Vainshtein, P. Kharlip, M. Minaev, and L. Gorkaia, the composers G. Kh. Mepurnov and A. Aleksandrov, and the stage designers M. Saginian, I. Gamrekeli, M. Magomaev, and E. Berngard.

The theaters of the republic include (as of 1977) the Kh. Nuradilov Chechen-Ingush Dramatic Theater, the Lermontov Russian Dramatic Theater (founded 1938), and the Chechen-Ingush Puppet Theater (1936), which has Russian, Chechen, and Ingush troupes. There are about 30 people's amateur theaters and about 4,500 smaller amateur groups. V. A. TATAEV

CHECHEN-INGUSH UNIVERSITY (full name, L. N. Tolstoy Chechen-Ingush University), a university in Groznyi, founded in 1972 on the basis of a pedagogical institute established in 1938. The university has (1977) nine departments: physics, mathematics, biology and chemistry, geography, history, philology, Romance and German philology, economics, and physical education. It also has evening, correspondence, and preparatory divisions, as well as a graduate program and 34 subdepartments. The library houses a collection of 467,000 volumes. During the 1977–78 academic year, the university had 5,790 students of 30 nationalities; the teaching staff numbered 325, including 13 doctors of sciences and professors and 125 candidates of sciences and docents. The university publishes *Uchenye zapiski*. In the period 1973–77, the university awarded degrees to 4,370 specialists. [29–521–1]

CHECHEN PLAIN (also Groznyi Plain), a sloping plain on the right bank of the Sunzha River, at the foot of the Greater Caucasus in the Chechen-Ingush ASSR. It is 120 km long and reaches 40 km in width. Elevations range from 70 to 400 m. The plain is composed of coarse gravel covered with loess-like loams. Meadow and chernozem soils predominate; most of the plain is tilled. [29–521–2]

CHECHERSK, a city (since 1971) and administrative center of Chechersk Raion, Gomel' Oblast, Byelorussian SSR. Chechersk is situated on the Sozh River, a tributary of the Dnieper, 37 km from the Buda-Koshelevskaia railroad station and 65 km north of Gomel'. Checherk's industrial enterprises include a butter factory, a winery, a vegetable cannery, and a factory for the production of *objets d'art*. [29–522–3]

CHECHULIN, DMITRII NIKOLAEVICH. Born Aug. 9 (22), 1901, in Shostka, in present-day Sumy Oblast, Ukrainian SSR.

Soviet architect. People's Architect of the USSR (1971); Hero of Socialist Labor (1976). Member of the CPSU since 1945.

Chechulin graduated from the architecture school of the Moscow VKhutein (Higher Art and Technical Institute) in 1929. He studied with A. V. Shchusev. As chief architect of the city of Moscow from 1945 to 1949, Chechulin made major contributions to the reconstruction of the city. His designs for the Komsomol'skaia (first line, 1935), Kievskaia (second line, 1937–38), and Dynamo (ground-level vestibule, 1938) subway stations were awarded the State Prize of the USSR in 1941. Chechulin also designed the Tchaikovsky Concert Hall (1940, with K. K. Orlov), the new Moscow Council building (1945, with others), a high-rise apartment house on Kotel'nicheskaia Esplanade (1948–52, with A. K. Rostkovskii; State Prize of the USSR, 1953), the Hotel Rossiia and the Central Concert Hall (1967–74, with P. P. Shteller and others), the Library of Foreign Literature (1967, with V. A. Sitnov and others), and the Hall of Councils of the RSFSR (begun in 1968, with P. P. Shteller and others).

Chechulin was a deputy to the second convocation of the Supreme Soviet of the USSR. He was awarded the Order of Lenin, four other orders, and various medals. [29–522–5]

CHECHULIN, NIKOLAI DMITRIEVICH. Born Nov. 3 (15), 1863, in Cherepovets; died Feb. 14, 1927, in the village of Borisoglebsk, Cherepovets District, Novgorod Province. Soviet Russian historian. Corresponding member of the Russian Academy of Sciences (1921).

In 1885, Chechulin graduated from the faculty of history and philology of the University of St. Petersburg. Between 1896 and 1915 he was on the staff of the Imperial Public Library; in 1906 he became head of the library's fine arts department.

Chechulin's most important works deal with the domestic and foreign policy, social thought, and culture of 18th-century Russia. On the basis of 16th-century *pistsovye knigi* (systematic compendiums of documents pertaining to economic matters), he wrote in 1889 "The Cities of the Muscovite State in the 16th Century"; in 1894 he published *Pistsovye Knigi of the Muscovite State*. A collection of Old Russian manuscripts assembled by Chechulin is now housed in the Saltykov-Shchedrin State Public Library in Leningrad.

CHECK, a monetary document of a standard form wherein the person writing the check orders the issuing agency to pay the indicated sum to the bearer; a type of security.

In the USSR, checks are written on blank forms, as prescribed by the State Bank of the USSR, in accordance with the statute on checks ratified on Nov. 6, 1929, by the Central Executive Committee and the Council of People's Commissars of the USSR (*Collected Laws of the USSR*, 1929, no. 73, art. 697). Every check must bear such information as the date and place of issue, the name of the payer, and the account from which payment is to be made. Checks are valid for a period of ten days, not counting the day of issue. In the USSR, only a credit agency (usually a bank) may cash a check, which must always be fully covered by the amount available in the account (either in cash or in the form of a credit account). A bank's acceptance of a check means that the bank agrees to pay the amount of the check within the stated time limit.

Checks circulating in the economy of the USSR may be payable in cash, or they may be used for noncash transactions between organizations in settling accounts for goods received, services rendered, or work performed. This second category is made up of several types of checks—namely, bank-accepted checks, which are used by the budgetary organizations to settle local, or intracity, accounts for goods and services; checks without bank acceptance, which are used to settle local accounts for goods and services and, in addition, are used by financial bodies for reimbursement of budget revenues; and checks from either limited or unlimited checkbooks, which are used to settle both local and nonlocal accounts for goods and services (particularly the accounts of transport and communication enterprises). Checks are also used in relations involving citizens; for example, payments for municipal services may be made out of depositors' current accounts in the form of noncash transactions.

The use of checks in the system of international payments is governed by various regulations—specifically, those formulated by the Geneva convention of 1931 on uniform laws for checks; the English Bills of Exchange Act of 1882, which is applied throughout the Commonwealth and in various other countries, such as the USA, Israel, and the Philippines; and the provisions of the Uniform Commercial Code of 1962, which is in effect in the United States and in a number of Latin American countries. The USSR is not a signatory to international checking agreements. [29–127–2]

CHECK, in land reclamation, a carefully flattened section of field bounded by earth dams, intended for growing rice by the flooding method (*see* SURFACE WATERING). A check is 1–4 hectares in area; a large check is 12–16 hectares in area. [29–128–1]

CHECKBOOK, an assembled booklet of checks, which may be used in exchange for money or in settlement of an account. In the USSR, checkbooks are made by banks and issued by the credit institutions in which the check writer (whether an organization or an individual citizen) has an account. The checkbook bears the name of its owner, the number of the bank account on which the checks are drawn, and the numbers of the checks. In addition, limited checkbooks (which are made out for a specified sum of money, covered by the payer's funds on deposit) and unlimited checkbooks (for unlimited amounts, covered by bank loans in special loan accounts) indicate the effective period of the checkbook, allocation of payments, and—where applicable—the established limit.

In the case of checks used for the settlement of accounts, the checkbook may be valid for a limited period that is fixed by bank regulations (up to one year); a limit may also be imposed on the amount available for writing checks from a given checkbook. Unless a checkbook is issued for the settlement of accounts with certain designated organizations, the checks may be used to settle accounts with any supplier or transport organization. [29–132–2]

CHECKERS, a board game for two players. The checkerboard is usually square in shape and is divided into numerous dark and light squares; the men are usually round. Like chess, the game simulates the actions of combatants following specified rules of competition.

The earliest evidence of checkers is found in remains of ancient Egypt. The game was known to the people who populated the territory of what is now the USSR as early as the third century. Various forms of the game are distinguished by the number of squares on the board, the number of men, and different rules. The best-known forms are Russian draughts (*shashki*), English draughts or checkers, German draughts (*Damenspiel*), and Spanish checkers, all of which are played with 12 pieces on a board of 64 squares; the French game called Polish draughts (*dames à la polonaise*), played with 20 pieces on a board of 100 squares; and Canadian draughts or checkers, played with 30 pieces on a board of 144 squares.

National checkers championships were first held in the 19th century. The first Russian championship, held in 1896, was won by S. A. Vorontsov, who died undefeated. A. I. Shoshin, V. I. Shoshin, N. A. Kukuev, and others later won the championship numerous times. Polish draughts spread from France to many countries and later became the modern game of international checkers.

According to the rules of play, the men are moved diagonally

forward on the dark squares in either direction, one square at a time. The opponent's pieces can be captured by jumping forward and backward onto unoccupied squares. A man that reaches the last row of squares on the board becomes a king (in some languages, a queen) and has the right to move any number of squares. The object of the game is to capture the opponent's pieces or to create a situation in which they cannot be moved.

Three rules in international 100-square checkers create greater opportunities for performing intricate positional maneuvers and combinations: (1) the player must take the larger number of pieces where there are several possible jumps; (2) a piece that reaches the last row of the board by jumping is not kinged until the next move; and (3) when a piece reaches the last row and is forced to take more of the opponent's pieces, it is not kinged.

World championships in 100-square checkers have been held since 1894. The first world champions were the Frenchmen I. Weiss (1894–1912), S. Bizot (1925–26), M. Fabre (1926–28, 1931–33), M. Reichenbach (1933–45), and P. Ghestème (1945–47) and the Dutchmen G. Haugland (1912–25) and B. Springer (1928–31). The World Checkers Federation (FMJD) was founded in 1947 and comprised 22 national organizations in 1977. The Soviet Union joined in 1956. The official FMJD competition for men is conducted in four stages over a course of four years. In the first year the Great Olympic Tournament is held; the national champions and the world champion participate, and the winner is declared world champion. In the second year there is a match for the world championship between the former world champion (if the world champion who participated in the first-year tournament lost the title) and the tournament winner. In the third year a tournament of challengers is held. In the fourth year a match is held for the world championship between the champion and the winner of the tournament of challengers.

World champions have included P. Rozenburg (1948–55), T. Sijbrands (1972–76), and H. Wiersma (1976), all of the Netherlands; M. Delorier of Canada (1956–58); and I. I. Kuperman (1958–68, 1975–76), V. I. Shchegolev (1960–61, 1964–65), and A. G. Andreiko (1968–72), all from the Soviet Union.

European Championships for men, originally called the European Cup, have been held since 1965. Champions have included Kuperman (1965), Sijbrands (four times, 1967–71), Andreiko (1974), and R. S. Leschinskii (1977). World youth championships, held since 1972, have been won by the Soviet masters N. N. Mishchanskii (1972) and E. M. Skliarov (1976). Tournaments for the women's world championship have been held since 1974, and E. K. Mikhailovskaia of the USSR has won four times.

In 1947 two honorary titles were instituted: international grandmaster (Jan. 1, 1977), which has been awarded to 12 persons, including the Soviet players Kuperman, Shchegolev, and A. A. Gantvarg, and international checkers arbiter, awarded to 17 persons, five of them Soviet. Representatives of the USSR have been elected vice-president of the FMJD: S. G. Tambiev (1955–64), G. Ia. Torchinskii (1964–72), and L. A. Chubarov (since 1972).

Championships have been held in the USSR since 1924 in Russian *shashki* and since 1954 in international 100-square checkers. The USSR Checkers Federation was founded in 1924 and has been an independent all-Union federation since 1960. The title Grandmaster of the USSR was instituted in 1961, and there were 14 persons with the title in 1977. Outstanding champions in Russian *shashki* include V. A. Sokov, Z. I. Tsirik, V. Medkov, V. R. Gabrielian, and A. M. Plakkhin. Andreiko, Kuperman, and Shchegolev have all won more than one competition in international 100-square checkers. The top women checkers players are I. V. Spasskaia, E. K. Mikhailovskaia, and E. V. Sorkina in *shashki* and L. G. Travina in international checkers.

In 1977 the USSR Checkers Federation had approximately 3 million members, including about 900 masters of sport and more than 1.7 million players with official sports ratings. Each year all-Union youth championships are held in *shashki* and 100-square checkers, as well as team competitions among republics and sports societies for the USSR cup and the Wonder Checkers and Great Checkers tournaments and other games for Pioneers and schoolchildren.

Checkers composition is an independent area of checkers.

CHEDER, a pelotherapeutic health resort in the Tuva ASSR. Cheder is situated in the Tuva Basin, on Lake Cheder, 45 km from Kyzyl. Summers are moderately cool, with an average July temperature of approximately 14°C, and winters are cold, the January temperature ranging from −27° to −32°C. Patients are treated with the mud and brine of the lake for diseases of the musculoskeletal system, gynecological disorders, and diseases of the peripheral nervous system. Cheder has a sanatorium and a pelotherapeutic treatment facility. [29–124–2]

CH'EERHCH'EN HO (also Cherchen Darya), a river in West China. The Ch'eerhch'en Ho rises in the Arka Tagh of the Przheval'skii Ridge; after emerging from the Kunlun Mountains, it flows along the southeastern edge of the Takla Makan Desert. The river empties into Kara Buran Kol and, during the high water in July and August, into the swamps southwest of Lop Nor. Measured from its source to Kara Buran Kol, the river has a length of 725 km. The mean flow rate is approximately 20 cu m per sec at the place where the river emerges from the mountains. The Ch'eerhch'en Ho brings water to the Ch'eerhch'en oasis. The lower course of the river is waterless most of the year. [29–333–4]

CHEFOO CONVENTION OF 1876, an agreement imposed on China by Great Britain, which used the murder of a British official in Yünnan as a pretext for making its demands. The agreement was signed Sept. 13, 1876, in Chefoo (Yent'ai). The Chefoo Convention granted Great Britain a number of privileges; in particular, it opened the ports of Ich'ang, Wuhu, Wenchou, and Pakhoi (Peihai) to English trade.

CHEGDOMYN, an urban-type settlement and the administrative center of Verkhniaia Bureia Raion, Khabarovsk Krai, RSFSR. Situated on the left bank of the Chegdomyn River of the Amur basin, the settlement is the terminus of a railroad branch line that runs from the Izvestkovaia station. Chegdomyn has a sausage factory, a brickyard, and two logging and timber distribution establishments; the Urgalles Production Association is also located in the settlement. Hard coal is mined in the area. [29–123–1]

CHEJU, a city and port in South Korea, on the island of Cheju-do in the Korea Strait. Capital of Cheju-do, which has the status of a province. Airport. Population, more than 100,000 (1970). Economic activities include cottage industry, the catching of marine fish and shellfish, and food processing, including the processing of seafood. [29–124–3]

CHEJU-DO, a South Korean island in the northern part of the East China Sea. Separated from the Korean Peninsula by the Cheju Strait and from the Japanese islands by the Korea Strait, the island occupies an area of 1,850 sq km.

The coast of Cheju-do consists mainly of cliffs that drop precipitously to the sea. The island is composed of volcanic rocks. The volcano Halla-san, which erupted in the tenth century, is located in the central part of Cheju-do; it has an elevation of 1,950 m. The island has a subtropical monsoon climate, with as much as 2,000 mm of precipitation a year. Evergreen and deciduous forests give way to coniferous forests at elevations higher than 1,600 m. Where forests have been felled, there are now meadows. Rice, barley, and the foxtail millet *Setaria italica maxima* are cultivated. Other economic activities include the catching of fish and mollusks. The city of Cheju is the capital of Cheju-do. [29–124–4]

CHEKALIN, ALEKSANDR PAVLOVICH. Born Mar. 25, 1925, in the village of Peskovatskoe, in what is now Suvorov Raion, Tula Oblast; died Nov. 6, 1941, in the city of Likhvin (now Chekalin). Partisan in the Great Patriotic War of 1941–45. Hero of the Soviet Union (awarded posthumously Feb. 4, 1942). Member of the Komsomol from 1939.

Chekalin was enrolled in a secondary school in Likhvin in 1938. He volunteered for a paramilitary fighting detachment in July 1941 and later joined the partisan detachment Peredovoi as a scout. Denounced by a traitor, he was seized by the fascists, tortured, and hanged. A monument was erected on Chekalin's grave in 1958.

CHEKALIN (until 1944, Likhvin), a city in Suvorov Raion, Tula Oblast, RSFSR. Chekalin is situated on the left bank of the Oka River, 7 km from the Chekalin and Cherepet' railroad stations on the Tula-Kozel'sk line. It has a milk plant, a logging and timber distribution establishment, and an industrial combine. The city was renamed in honor of A. P. Chekalin. [29–128–4]

ČEKANAUSKAS, VITAUTAS AL'GIRDO (Vytautas Algirdas Čekanauskas). Born May 13, 1930, in Šiauliai. Soviet architect. People's Architect of the USSR (1975).

Chekanauskas graduated from the Art Institute of the Lithuanian SSR in Vilnius in 1955. He has designed an art exhibition pavilion in Vilnius (1967) and collaborated on plans for the residential district of Lazdynai, also in Vilnius (1967–early 1970's; Lenin Prize, 1974). [29–128–7]

CHEKANOVSKII, ALEKSANDR LAVRENT'EVICH. Born Feb. 12 (24), 1833, in the city of Kremenets, in what is now Ternopol' Oblast, Ukrainian SSR; died Oct. 18 (30), 1876, in St. Petersburg. Explorer of Central Siberia.

A Pole by nationality, Chekanovskii was exiled to Siberia for his participation in the Polish Uprising of 1863–64. Commissioned by the Siberian division of the Russian Geographic Society, Chekanovskii conducted geological investigations of the southern part of Irkutsk Province from 1869 to 1871. He provided the first reliable data on the geology of the region of the Nizhniaia Tunguska River in 1873 and of the lower course of the Lena and, particularly, the Olenek in 1874 and 1875. Chekanovskii discovered deposits of hard coal and granite along the Nizhniaia Tunguska.

In 1876, Chekanovskii was permitted to go to St. Petersburg, where he began an analysis of the data he had gathered on the geography, geology, and paleontology of the places he had visited. His botanical and zoological collections have been described in the works of a number of scientists. The ridge Chekanovskii discovered between the Lena and Olenek rivers was named after him, and many fossil plants—especially of the Jurassic—have been named in his honor.

CHEKHONIN, SERGEI VASIL'EVICH. Born 1878 in the village of Lykoshino, in what is now Kalinin Oblast; died Feb. 23, 1936, in Lörrach, in what is now the Federal Republic of Germany. Russian graphic artist and painter.

Chekhonin studied in St. Petersburg at the Drawing School of the Society for the Promotion of the Arts from 1896 to 1897 and under I. E. Repin at M. K. Tenisheva's school from 1897 to 1900. He was a member of the World of Art. Chekhonin worked mainly on book and magazine graphics and in painting on ceramics and enamel. He also created miniature sculptures and ceramics and worked as an interior and stage designer. During the Russian Revolution of 1905–07, Chekhonin edited a satirical political journal and drew political caricatures. One of the first artists to design ceramics on agitational themes, he served as artistic director of the State Ceramics Factory in Leningrad from 1918 to 1923 and from 1925 to 1927. He also took part in competitions to design the Soviet state emblems.

Chekhonin developed a distinctive and calligraphically refined brushwork manner employing garlands, bouquets, and other decorative motifs of the Russian Empire style. In the Soviet period he often combined these motifs with revolutionary slogans and emblems. In the 1920's, certain artistic devices in Chekhonin's graphics revealed the influence of futurism. In 1928, Chekhonin moved to France.

CHEKHOV, ANTON PAVLOVICH. Born Jan. 17 (29), 1860, in Taganrog; died July 2 (15), 1904, in Badenweiler, Germany; buried in Moscow. Russian writer.

Chekhov's father, a merchant of the third guild, owned a grocery store. As a boy, Chekhov helped his father in the store; he entered the Taganrog *Gymnasium* in 1868. In 1876 the father went bankrupt and left for Moscow, followed by his family. Left to himself, Chekhov continued his studies, earning his living by tutoring. In 1879 he finished school and moved to Moscow. He studied medicine at the University of Moscow, graduated in 1884 with the title of district physician, and for some time practiced medicine.

Chekhov began writing in the late 1870's. He contributed to various humor magazines, such as *Oskolki*, using different pen names—for example, Antosha, A Man Without a Spleen, Brother of My Brother, and, most frequently, Antosha Chekhonte. A collection entitled *At Leisure* (later called *The Prank*) was prepared for publication in 1882 but never appeared in print, apparently because of censorship. Chekhov's first book of short stories, *Tales of Melpomene*, was published in 1884; it was followed in 1886 by *Motley Tales*.

In March 1886, D. V. Grigorovich wrote Chekhov a letter

praising his "real talent" and urging him to "give up working under a deadline" and save "[your] impressions for a well-considered work" (see *Slovo*, collection no. 2, Moscow, 1914, pp. 199–200). This letter was one of the factors that hastened Chekhov's shift from "trifling" to "well-considered work." The transition from the purely humorous to the "realm of the serious" occurred between 1885 and 1887. "The Steppe" and "The Name-Day Party" appeared in 1888, followed in 1889 by "An Attack of Nerves" and "A Dreary Story." This period also saw the publication of several collections of Chekhov's short stories—namely, *In the Twilight* (1887; awarded half of the Pushkin Prize in 1888), *Innocent Speeches* (1887), *Tales* (1888), and *Gloomy People* (1890).

Chekhov's journey to the island of Sakhalin in 1890 made a deep impression on him, which left its mark in his journalistic essay of 1893–94, *The Island of Sakhalin* (published as a book in 1895), in the short stories "In Exile" (1892) and "The Murder" (1895), and in the novella "Ward No. 6" (1892), which summed up the entire experience. Imbued with a spirit of protest against the horrors of prison life, "Ward No. 6" represented the high point of Chekhov's critical realism of the late 1880's and early 1890's. This is how V. I. Lenin described his impression of the work: "When I finished this story last night I was genuinely terrified, I couldn't stay in my room, I got up and went out. I felt as though I were locked up in ward no. 6 myself" (cited in *Reminiscences of V. I. Lenin by His Family*, 1955, p. 36).

In the second half of the 1880's Chekhov wrote extensively for the theater. His plays included *Ivanov* (1887–89), the one-act comedy *The Wedding* (1889; published 1890), *The Wood Demon* (1889; published 1890, later revised and reissued as *Uncle Vanya*), and the one-act farces *The Bear, The Proposal*, and *The Anniversary*.

In the 1890's and early 1900's Chekhov made a number of trips abroad. In 1892 he bought the estate of Melikhovo in the Serpukhov District, 13 versts from the Lopasnia Station (now Chekhov). He administered medical aid to the local peasants, built schools for the peasants' children, visited some of the famine-stricken provinces in 1892, worked as district physician during the cholera epidemic of 1892–93, and helped in the national census of 1897.

In approximately 1893, Chekhov's work moved in a new direction. In 1894 he wrote the story "The Student," in which he asserts that "truth and beauty . . . have continued uninterruptedly to the present day and, it appears, have always been the most important thing in human life and on the earth in general" (*Poln. sobr. soch. i pisem*, vol. 8, 1947, p. 348). The crowning work of this period is the play *The Seagull* (1896). As staged at the Aleksandrinskii Theater, however, the play failed, and the lyricism that colored Chekhov's works gave way to a different kind of writing. In his novella of 1897, "Peasants," and in the short stories written in the same year, Chekhov sought to reveal the unembellished truth and even the harshness of life and to show its terrible underside.

In the 1898 trilogy "The Man in a Shell," "Gooseberries," and "About Love," in the stories and novellas of the late 1890's and early 1900's, and in his last story, "The Betrothed" (1903), Chekhov depicted spiritual stagnation and a hero striving toward a better life.

Chekhov's skill as a dramatist came into full flower in the 1890's and early 1900's. In 1896, after *The Seagull*, he wrote the play *Uncle Vanya* (published 1897), followed in 1900–01 by *Three Sisters* (awarded the Griboedov Prize) and in 1903–04 by *The Cherry Orchard*. The four plays were all produced at the Moscow Art Theater, which opened in 1898; the triumphant premiere of *The Seagull* took place on December 17 of that year.

In 1898, after the death of his father and because of his own deteriorating condition (due to tuberculosis), Chekhov moved from Melikhovo to Yalta, where he built a house. There he met with L. N. Tolstoy, M. Gorky, I. A. Bunin, A. I. Kuprin, and I. I. Levitan. Chekhov's position during the Dreyfus trial, his break with A. S. Suvorin's reactionary newspaper *Novoe Vremia*, and his sympathetic attitude toward student disturbances were indicative of his rapid ideological development and heightened interest in public life. Chekhov was elected an honorary academician in 1900, but together with V. G. Korolenko he renounced the title in 1902 in protest against Nicholas II's refusal to grant the same title to Gorky.

Chekhov's work mirrors a broad cross section of postreform and prerevolutionary Russian life. Even his early comic pieces cannot be reduced to pure humor. In all the kaleidoscopic variety of his early stories, the author increasingly reveals his basic themes—man and his rank, poetry and prose, life's facade and its reverse side. Many of Chekhov's early stories show the triumph of the mercantile spirit. Antosha Chekhonte's characters belong entirely to the banal and philistine world that has given them birth; these are "the fat and the thin," the "chameleons," "windbags," "philistines," "bridegrooms and papas," and "barroom philosophers" who never dream of opposing their environment.

The creative turning point that Chekhov experienced in the mid-1880's resulted in the appearance of new protagonists who do oppose their environment and who suffer precisely because of their humanity, such as the characters in "An Upheaval," "Aniuta," and "Misery." The basic direction of Chekhov's mature work of the late 1880's and early 1900's is clearly apparent; the author strives to analyze what N. G. Chernyshevskii called the influence "of social relations and everyday conflicts on character" (*Poln. sobr. soch.*, vol. 3, 1947, pp. 422–23). Chekhov's unique field of inquiry is the soul of modern man. Hence his main theme—man's indifference, or his "somnolent stupor," as represented by the peculiar ordeal of a hero who either rouses himself from spiritual slumber or else gives up and submits to it.

The two basic groups on which Chekhov's mature work was focused were the intelligentsia and the common people. Likewise, the theme of indifference is developed in two different ways: the hero is either an educated man who is spiritually content and has locked himself up inside a "shell," or a man of the people—downtrodden, worn out by life, and made dull and indifferent. For Chekhov, the "shell" is the symbol of a life built on lies and violence, on the gluttonous satiety of some, and on the hunger and suffering of others. "The Student," in which the hero Ivan Velikopol'skii finds the way to the heart of two peasant girls, Vasilisa and Luker'ia, was the prototype of the two types of works that Chekhov wrote between 1890 and 1900. The hero of "The Student" is followed by the characters in the novellas "Three Years" (1895), "The House With the Attic," or "An Artist's Story" (1896), and "My Life" (1896), the short trilogy consisting of "The Man In a Shell," "Gooseberries," and "About Love," and the stories "Ionych" (1898), "The Lady With the Dog" (1899), and "The Betrothed." Vasilisa and Luker'ia, on the other hand, are followed by the peasants in the novella "Peasants" and in the story "The New Country House" (1899), the rural police assistant in the story "On Official Business" (1899), and the heroes of the novella "In the Ravine" (1900).

The gulf between the intelligentsia and the common people is a theme that pervades Chekhov's work and is closely linked to the theme of the "shell." During these years Chekhov wrote distinctive cycles of works on this theme—"artistic investigations" of life. In addition to the "intelligentsia" and "peasant" cycles, he wrote stories depicting the world of the merchant and the shopkeeper's storehouse, as well as the inhumanly harsh life of the factories. "Three Years" (1894), "A Woman's Kingdom" (1894), and "A Doctor's Visit" (1898) belong to this group of stories.

In his late works, including the short story "A Visit to Friends" (1898) and the play *The Cherry Orchard*, Chekhov develops the theme of the impoverishment and ruin of the "nests of the gentlefolk." Thus the theme of human indifference is resolved not only in moral and psychological terms but also on the scale of different social situations.

The Chekhovian image of "the man in a shell" grows into a symbol of callousness and conventionalism, simultaneously intimidating and fearful. V. I. Lenin often referred to this satirical symbolic image.

The essence of Chekhov's thoughts on faith in man and on the truthfulness of artistic portrayal is conveyed by an entry in the writer's notebooks: "Man will become better when you have shown him what he is" (*Poln. sobr. soch. i pisem*, vol. 12, 1949, p. 270). Chekhov believed in the possibility of human renewal and the victory of man over the "shell." In Chekhov, man is constantly being tested by the harsh truth of life. Another important aspect of Chekhov's observation is that literature should show

man his own image, without trying to persuade and without resorting to ennobling deceptions, generalized arguments, or attempts by the author to sway the reader's emotions.

Chekhov's artistic style is profoundly and organically linked to the ideological direction of his work—that is, the desire to awaken "the living soul" in modern man. His writing firmly establishes the principle of restrained and outwardly unemphatic narration: the greater the author's objectivity, the stronger the impact. Chekhov's terseness of expression, conciseness, and condensed narration ("Brevity is the sister of talent," *ibid.*, vol. 14, 1949, p. 342) stemmed from his faith in the reader's ability to catch the author's hidden and complex meaning. Linked to this is the heightened role of details that at first glance seem minor and of little importance; such details, which are not in the least incidental, are psychologically and emotionally significant. Chekhov's details not only hint at what is important and characteristic but also serve as vehicles for the internal movement of the story, novella, or play. Examples of such details are Iuliia's umbrella in "Three Years," the carriage in which Dr. Startsev rides in "Ionych," and the dead bird in *The Seagull*.

The mature Chekhov avoided tense action, intrigue, and external diversion, shifting the center of gravity to the internal plot, the story of the hero's soul, and the hidden dynamics of the hero's struggle against circumstance, the environment, and the mire of a parochial existence. The tragic meaning of many of Chekhov's works lies precisely in the fact that nothing happens—everything remains as it was. Complex plotting, which played an important role in the anecdotal novellas of Antosha Chekhonte, is put aside in the works of the mature Chekhov. Events "dissolve" into the flow of daily life or into psychology. In this respect the plot structure of Chekhov's prose works resembles that of his plays.

An integral trait of Chekhov the artist is the profound realization that tragedy does not consist of what is terrible, exceptional, or out of the ordinary but of what is prosaic, everyday, and commonplace. The "tragedy of the prosaic" is all the more dangerous because it destroys the hero imperceptibly, by lulling him to sleep and convincing him that a different kind of life—one that is not prosaic—is impossible. For Chekhov, terror lies in that which is not terrible; the benign and the bloodless are what is fatal. This is also related to the evolution of Chekhov's humor. The writer's development as an artist did not consist of the transition from the comic to the serious but rather of his deeper understanding of the comic as tragicomic, uniting laughter, irony, and sadness. Few of the Russian satirical writers have created such a complex yet outwardly simple mixture of laughter and seriousness, satire and lyricism. Chekhov's laughter is not a separate facet of his art; it is the very atmosphere of his works, representing a complex gamut of feelings. What is encompassed in his laughter ranges from accusation, derision, and disdain aimed at an entire way of life to the revelation of the grievous rootlessness and humanity of the "little souls" who are Chekhov's protagonists.

Chekhov laid out new paths for the development of Russian and world drama. He refused to divide his characters into angels and villains, or one-sided representatives of good and evil. Just as in his prose works, he avoided plot intrigue and shifted the center of gravity to the hidden, internal plot involving the mental world of the hero. Plot emerges not as a chain of events but as the story of man's desire to act and his attempts to break out of his daily routine—out of the bonds of "prosaic tragedy."

Chekhov's plays are built around many themes and leitmotifs that unfold on many different levels and are associated with various men's fortunes. The theme developed in Chekhov's prose works emerges in his plays as well—namely, the loss of inner connections between people. The characters in Chekhov's plays are separated from each other by invisible barriers; each is immersed in his own condition. The dialogue in Chekhov's plays tends toward monologue; each character speaks his own particular "micromonologue." Nevertheless, the overall lyrical atmosphere unites the seemingly isolated heroes.

Even in his early plays Chekhov did more than re-create everyday reality. But *The Seagull* marks a new advance. Running through the entire play is an image that is raised to a symbol and is pregnant with meaning—the image of the seagull, symbolizing Treplev's and Nina Zarechnaia's dream of a new kind of art, pure and bold; also related to this image is the theme of wounded and tragic love. There is yet another side to the multifaceted image of the dead bird, representing a soulless, lifeless, mediocre art.

Discouraged by the failure of *The Seagull*, Chekhov retreated somewhat from the use of such devices. In *The Cherry Orchard*, however, he turned to them once again. Chekhov's notion of the dramatic genre acquired new content as well. *The Seagull* and *The Cherry Orchard* were called comedies by their author, but the comic components of these plays are inseparable from the tragic ones. The past experience of Russian and world theatre attests to the failure of those directors who view Chekhov as a "mere satirist" whose writing is based on farce or of those who go to the opposite extreme and adopt a lyrical approach to the plays while ignoring their comic elements. We are now entering the stage of integrated and multifaceted analysis of Chekhov the dramatist in all his dialectical complexity and inimitable mixture of lyricism and satire.

Chekhov inherited and carried forward the best realistic traditions of Russian literature. L. N. Tolstoy's definition—"Chekhov is Pushkin in prose" (*Ezhemesiachnyi zhurnal dlia vsekh*, 1905, no. 7, p. 427)—illuminates the role of A. S. Pushkin's poetry as an influence on Chekhov the prose writer and dramatist. Pushkin's perfect sense of rhythm and his attempt to achieve harmonious integrity, clarity, and musicality were interpreted by Chekhov in his own way. Chekhov was profoundly influenced by M. Iu. Lermontov, the author of "Thought" and of the novel *A Hero of Our Time*, who wrote of the "cooling" of the soul of modern man. Lermontov's "Taman'" was for Chekhov an unsurpassed model of prose. It has also been noted that I. S. Turgenev's plays foreshadowed the hidden lyricism characterizing Chekhov's dramatic work.

Among Chekhov's predecessors and contemporaries, the one who took first place in the writer's creative consciousness was Leo Tolstoy, whose brilliant artistic creations invariably earned Chekhov's enthusiastic praise. Although Chekhov was definitely influenced by Tolstoy's philosophy, the ideological differences between the two writers became more pronounced in the late 1890's. Tolstoy's concept of nonviolent resistance to evil aroused Chekhov's opposition. Tolstoy reproached Chekhov for his lack of a consistent moral position—in other words, for his skeptical attitude toward faith; he had, however, a high opinion of Chekhov's writing talent and called him "an incomparable artist." "Thanks to his sincerity," said Tolstoy, "Chekhov has created forms of writing that are new—entirely new, in my opinion—for the entire world [and] the likes of which I have not encountered anywhere" (cited in P. Sergeenko, *Tolstoi i ego sovremenniki: Ocherki*, Moscow, 1911, p. 226).

Chekhov exerted a strong influence on Russian and world literature—both prose and drama. His pupils included the young Gorky (particularly in drama), Bunin, Kuprin, and to some extent L. N. Andreev. K. A. Trenev and A. N. Arbuzov have written about Chekhov's role in the education of Soviet dramatists, and many European and American writers have noted the part he played in the art of the 20th century. G. B. Shaw's play *Heartbreak House*, published in 1919, was clearly written under Chekhov's influence; Shaw called it "a fantasy in the Russian style on English themes" (*Izbr. proizv.*, vol. 2, Moscow, 1956, p. 286). J. Galsworthy wrote of Chekhov's salutary effect on English literature. A. Wurmser, F. Mauriac, E. Triolet, and the French directors J.-L. Barrault and J. Vilar have pointed to the impact of Chekhov's work. In "A Word on Chekhov," T. Mann revealed in depth the Russian writer's unique position in terms of his creative ideology and his unpretentious and selfless goal—namely, the use of unvarnished artistic truth in the people's service.

Chekhov is one of the most popular playwrights of contemporary Soviet and foreign theater. Many of his works have been filmed for the cinema and television, including *The Wedding, The Lady With the Dog, The Seagull, Uncle Vanya, The Cherry Orchard*, and the early drama *Without Fathers*.

Russian prerevolutionary and Soviet studies of Chekhov have produced a wealth of textual information and commentary. In articles appearing even before the Revolution, Chekhov's prose works and plays were searchingly analyzed by such writers as M. Gorky, V. G. Korolenko, N. K. Mikhailovskii, F. D. Bati-

ushkov, D. N. Ovsianiko-Kulikovskii, and the Marxist critics V. V. Vorovskii and A. A. Divil'kovskii. In the Soviet period, enormous efforts have been devoted to the collection and publication of Chekhov's literary legacy and the study of his life and work. Among those who have contributed to this undertaking are A. V. Lunacharskii, S. D. Balukhatyi, Iu. V. Sobolev, A. B. Derman, A. I. Roskin, K. I. Chukovskii, I. S. Ezhov, G. A. Bialyi, E. N. Konshina, N. I. Gitovich, M. L. Semanova, V. V. Ermilov, and G. P. Berdnikov. New works and publications (such as *Literaturnoe nasledstvo*, vol. 68) were issued in commemoration of the 100th anniversary of Chekhov's birth.

The A. M. Gorky Institute of World Literature of the Academy of Sciences of the USSR is publishing the complete works and letters of Chekhov in 30 volumes. A series of collected research studies is being published to accompany the academy edition: the first such collection, *In Chekhov's Creative Laboratory*, was issued in 1974; the second, *Chekhov and His Times*, in 1977; the third, *Chekhov and Leo Tolstoy*, is being prepared for publication.

There are Chekhov museums in Taganrog and in Moscow (in the house where the Chekhov family lived from 1886 to 1890), as well as in Melikhovo, in the village of Luka in Sumy Oblast, and in Yalta.

Z. S. PAPERNYI [29–400–3]

CHEKHOV, MIKHAIL ALEKSANDROVICH. Born Aug. 16 (28), 1891, in St. Petersburg; died Sept. 30, 1955, in Beverly Hills, Calif. Russian actor, director, and teacher. Honored Artist of the Republic (1924).

Mikhail A. Chekhov was A. P. Chekhov's nephew. In 1911 he graduated from the A. S. Suvorin Theatrical School in St. Petersburg; he worked in the Suvorin theater, where he played Fedor in A. K. Tolstoy's *Tsar Fedor Ioannovich*. In 1913 he joined the Moscow Art Theater and worked in its First Studio. The views on theater and ethics held by K. S. Stanislavskii, L. A. Sulerzhitskii, and E. B. Vakhtangov had a decisive influence on Chekhov. His acute perception of the world, infectious emotionality, brilliant gift for improvisation, and virtuoso talent marked Chekhov as one of the most prominent Russian actors.

Chekhov's best roles include Fräzer in Berger's *The Deluge*, Malvolio in Shakespeare's *Twelfth Night*, the title roles in Strindberg's *Erik XIV* and Shakespeare's *Hamlet*, Ableukhov in Belyi's *Petersburg*, and Khlestakov in Gogol's *The Inspector-General*. From 1919 to 1922, Chekhov was in charge of his own studio—the Chekhov Studio. In 1924 he became the head of the Moscow Art Theater's First Studio, which was reorganized and renamed the Second Moscow Art Academic Theater, or Second MKhAT, in the same year. In 1928, however, the disagreements within the theater, as well as the contradictions in Chekhov's own world view, led him to quit the Second MKhAT. In the same year, Chekhov went abroad.

The alien theater environment and language had a disastrous

effect on Chekhov's creative work; he enacted only two important stage roles—the title role in A. K. Tolstoy's *The Death of Ivan the Terrible* and the role of Foma Opiskin in *The Village of Stepanchikovo* (adapted from Dostoevsky). Chekhov's attempts to organize repertory theaters in Paris, Prague, and New York ended in failure. He directed actors' studios in Lithuania, Latvia (1932–34), and Great Britain, as well as an actors' training group in Hollywood in the 1940's. He also acted in films. Chekhov's students included the English actor P. Rogers and the American film actors G. Peck and Y. Brynner.

Chekhov wrote two books, *The Actor's Path* (1928) and *To the Actor, on the Technique of Acting* (1953).

CHEKHOV, NIKOLAI VLADIMIROVICH. Born June 15 (27), 1865, in St. Petersburg; died Nov. 8, 1947, in Moscow. Soviet educator. Professor from 1923; doctor of pedagogical sciences from 1940; Honored Scientist of the RSFSR from 1940. Full member of the Academy of Pedagogical Sciences of the RSFSR (1944).

After graduating in history and philology from the University of St. Petersburg in 1888, Chekhov taught at the school of the Ekaterinoslav Railroad and at various schools in Tula and Moscow provinces, Tver', St. Petersburg, and Moscow. He was also active in the *zemstvo* school movement. A democratic educator, he organized several public courses and teachers' conferences. During the Revolution of 1905–07 he was one of the leaders of the All-Russian Union of Teachers and Workers in Public Education. In 1910 he was named chairman of the Moscow council of the D. I. Tikhomirov pedagogical courses for women.

After the socialist revolution of October 1917, Chekhov was given a responsible position in the People's Commissariat of Education of the RSFSR; he taught education and Russian language teaching methods in the faculty of pedagogy of the Second Moscow State University and in the Higher Courses of Scientific Pedagogy, and he did research work at the Institute of Children's Reading and at the Institute of Scientific Pedagogy. His principal works are on the history of the Russian school, the organization of children's reading programs, and the methods of teaching Russian in school. Chekhov was awarded the Order of Lenin in 1945.

CHEKHOV (until 1954, Lopasnia), a city under oblast jurisdiction and administrative center of Chekhov Raion, Moscow Oblast, RSFSR. Situated on the Moscow-Simferopol' highway; railway station 77 km from Moscow. Population, 43,000 (1974). Chekhov's industrial plants include a power engineering machine-building plant, a regeneration plant, the Gidrostal'konstruktsiia Plant, printing and furniture combines, a mixed-feed plant, and a candy factory. The city was renamed in honor of A. P. Chekhov. A literary museum-preserve memorializing the writer is located at Melikhovo, 12 km from the city.

CHEKHOV (until 1947, Noda), a city in Kholmsk Raion, Sakhalin Oblast, RSFSR. Situated on the western coast of southern Sakhalin Island, along the Sea of Japan (Tatar Strait). Railway station. The city has a cellulose and paper plant, a ship repair plant, a wine and vodka plant, and a milk plant. There is also a fishing kolkhoz in the city. [29–410–2]

CHEKHOV PRINTING COMBINE, the largest printing establishment for periodicals in the USSR, located in the city of Chekhov, Moscow Oblast. Construction was begun in 1959; the first stage began operations in 1966, and the second stage in 1972. In 1975 the Chekhov Printing Combine became the leading enterprise of the production association Periodika. The combine is equipped with modern, high-efficiency facilities and uses advanced technology for letterpress and offset printing and gravure as well as phototypesetting and automatic transfer machines for the production of books and pamphlets. In 1975 the combine printed 235 periodicals of different titles in Russian and in foreign languages, with a daily production of 900,000 copies. Since 1975 it has also printed a large number of hard-cover books and pamphlets. Between 1970 and 1975 production volume increased by 280 percent. The first stage of an automated production control system based on the Minsk-32 digital computer began operation in 1975. [29–410–4]

ČHEKIANG, a province in East China, on the coast of the East China Sea. Area, 100,000 sq km. Population, 30.2 million (1976). The capital is Hangchou.

The topography of Chekiang is largely mountainous, with an average elevation of approximately 1,000 m; the maximum elevation is 1,859 m above sea level. The mountainous regions are dissected by river valleys. There are plains in the northern part of the province, along the seacoast, and in the vicinity of the lake T'ai Hu, and there are many islands just off the jagged coastline. Chekiang has a subtropical monsoon climate. The average January temperature is 5°C, and the average July temperature is 27°C. Annual precipitation generally exceeds 1,000 mm, and typhoons often strike the region. The numerous rivers of Chekiang flow mainly through the mountains; the most important rivers are the Fuch'un Chiang and the Wu (Ou) Chiang. Subtropical forests are found on the slopes of the mountains.

Agriculture dominates the economy of Chekiang, with three-fourths of the economically independent population engaged in agricultural work. One-fourth of the land of the province is under cultivation, and approximately 80 percent of that area is irrigated. Rice is the main crop; sweet potatoes, wheat, and maize are also grown. The province has orchards of subtropical fruits, including citrus fruits. Industrial crops include sugarcane, fine-fiber cotton, and jute. More jute is raised in Chekiang than in any other province of the People's Republic of China; it is cultivated primarily in the vicinity of Hangchou. Fine-fiber cotton is grown on the Ningpo-Shaohsing plain. Chekiang produces more tea than any other Chinese province; tea is grown near the cities of Hangchou, Shaohsing, Suich'uan, and Wenchou. Animal husbandry—including the raising of cattle, swine, sheep, and poultry—is of secondary importance in the province's agriculture. Sericulture, logging, and fishing are also of some importance in the province's economy.

In 1971, Chekiang's industry accounted for 3.5 percent of the gross industrial output of the People's Republic of China. Fluorite, alunite, pyrite, lithographic stone, and iron ore are mined in the province. Chekiang is also a major supplier of salt from evaporated sea water. Electricity is produced primarily by hydroelectric power plants on such rivers as the Hsinan Chiang and the Wu Chiang.

The most highly developed branches of light industry are the processing of silk, jute, and cotton; tea processing is the most highly developed branch of the food-processing industry. The machine-building industry in Chekiang includes shipbuilding and the manufacture of textile machinery, agricultural equipment, and machine tools. The city of Wenchou has a porcelain factory, and Hangchou and Chiahsin have paper factories. The main industrial centers of the province are the cities of Hangchou, Ningpo, and Chiahsin, all of which are located in the northern part of

the province and linked with the Shanghai industrial complex. The seaports of the province are Hangchou, Wenchou, and Chenhai, which is the outport of Ningpo. I. M. FEDOROV

The area that is now Chekiang Province was inhabited in ancient times by Man tribes. From the sixth to fourth centuries B.C., various parts of the area belonged to the Wu, Yüeh, and Ch'u kingdoms. During the fourth through sixth centuries A.D., the area was settled increasingly by Chinese. It was part of the Chiangnan Region in the seventh and eighth centuries and part of Chetung and Chehsi regions in the ninth through 11th centuries. From 1127 to 1179, Hangchou was the capital of the Southern Sung Empire. In the 12th and 13th centuries, the area was part of Chiangche Region. In the 13th century it was linked with Peking by the Grand Canal.

The area received the name "Chekiang" in the 14th century, and in the mid-17th century it was made a province. Chekiang long played an important role in the maritime commerce of China and in the country's fishing and silk industries. After China's defeat in the Anglo-Chinese War of 1840–42 (First Opium War), foreign capital began penetrating the province. From 1860 to 1864 virtually all of Chekiang was under the control of Taiping rebels.

From 1930 to 1934, the western part of Chekiang Province provided a base for the movement to establish soviets, or local centers of revolutionary democratic power. From 1937 to 1945 the province was occupied by the Japanese. In May 1949 the mainland part of Chekiang was liberated from the Kuomintang by the People's Liberation Army of China; the island of Choushan was liberated in May 1950. V. P. ILIUSHECHKIN [29–542–4]

CHEKMAREV, ALEKSANDR PETROVICH. Born Aug. 30 (Sept. 12), 1902, in the village of Bol'shaia Znamenka, in what is now Kamenka-Dneprovskaia Raion, Zaporozh'e Oblast; died Mar. 11, 1975, in Dnepropetrovsk. Soviet scientist; specialist in pressure shaping. Academician of the Academy of Sciences of the USSR (1968). Academician of the Academy of Sciences of the Ukrainian SSR (1948). Hero of Socialist Labor (1972). Member of the CPSU from 1945.

After graduating from the Dnepropetrovsk Mining Institute in 1927, Chekmarev worked as an engineer and as an instructor. He became a professor at the Dnepropetrovsk Metallurgical Institute in 1934. From 1948 to 1975 he was also a staff member at the Institute of Ferrous Metallurgy in Dnepropetrovsk. Chekmarev's principal works were devoted to the theory of metal rolling, the improvement of rolling equipment, and the development of new production processes. Chekmarev received the State Prize of the USSR in 1941 and 1949 and was awarded two Orders of Lenin, five other orders, and various medals.

CHELEK, an urban-type settlement in Paiaryk Raion, Samarkand Oblast, Uzbek SSR. Chelek is situated 35 km north of Samarkand. It has a cotton-ginning plant. [29–133–1]

CHELEKEN, a city (since 1956) under oblast jurisdiction in Krasnovodsk Oblast, Turkmen SSR. Cheleken is located in the western part of the Cheleken Peninsula, on the Caspian Sea, 70 km south of Krasnovodsk. There are oil and gas fields in the area. Cheleken has a chemical plant that produces iodine, bromine, potassium iodide, and iodoform and a plant that manufactures carbon black. There is an evening division of the Krasnovodsk Chemical Engineering Technicum in Cheleken. [29–133–3]

CHELEKEN, a peninsula on the eastern edge of the Caspian Sea, in the Turkmen SSR. In the 1930's, Cheleken—which had been an island up to that time—was joined to the mainland as a peninsula as a result of the lowering of the level of the Caspian Sea. With an area of approximately 500 sq km, the peninsula is basically flat; elevations reach 100 m. It consists primarily of sands and solonchaks. Oil and ozokerite are extracted on Cheleken, and there is commercial fishing. [29–133–2]

CHELEKEN, IUZHNYI, the northern part of the Turkmen Gulf of the Caspian Sea, off the southern coast of the Cheleken Peninsula. It is separated from the sea by the low-lying Dervish Peninsula and by the Iuzhnyi Cheleken spit. Iuzhnyi Cheleken is approximately 20 km long, 35 km wide, and 5–7 m deep. The port of Aladzha is situated on the bay. [29–133–5]

CHELEKEN, SEVERNYI, the southeastern part of the Krasnovodsk Gulf of the Caspian Sea, off the northern coast of the Cheleken Peninsula. Severnyi Cheleken is separated from the sea by the Severnyi Cheleken spit. It is 20 km long, approximately 25 km wide, and as much as 3.8 m deep. The entrance to the bay is very shallow and inaccessible to ships. [29–133–4]

CHELIABINSK, a city and the administrative center of Cheliabinsk Oblast, RSFSR; an important economic, cultural, and scientific center of the Soviet Union and a major transportation junction. Situated on the eastern slopes of the Southern Urals, on the banks of the Miass River of the Ob' River basin. Area, 486 sq km. Population, 1,007,000 (1977; 20,000 in 1897, 59,000 in 1926, 273,000 in 1939, 689,000 in 1959, 875,000 in 1970). The city is divided into six urban districts.

Cheliabinsk was founded in 1736 as a Russian fortress on the site of the Bashkir settlement of Seliaba (Cheliaba). In 1743 it was designated a city and the capital of the subprovince of Iset'. In early 1774 it was occupied by detachments of E. I. Pugachev. In 1781, Cheliabinsk became a district capital of Ekaterinburg Subprovince, in Perm' (later Ufa) Namestnichestvo (Vicegerency); in 1796 it became the capital of Orenburg Province.

In the 1890's, with the construction of the Trans-Siberian Railroad and a rail line to Ekaterinburg, Cheliabinsk became a major transportation and commercial center, through which grain from Western Siberia was shipped. Industry underwent rapid development. At the beginning of the 20th century the city had several metallurgical plants, 15 tanneries, and three railroad depots; these establishments employed a total of 1,500 workers. In 1896 the Ural Labor Union was organized in Cheliabinsk, and in 1903 a group of the Ural Union of the RSDLP was formed. Soviet power was established in the city on Oct. 26 (Nov. 8), 1917. In May 1918, Cheliabinsk was captured by White Czechs (*see* CZECHOSLOVAK CORPS MUTINY OF 1918). The city was liberated during the Cheliabinsk Operation of 1919.

In the Soviet period Cheliabinsk has become a major industrial and cultural center of the Urals. In 1933 the Cheliabinsk Tractor Works went into operation. The city became the administrative center of Cheliabinsk Oblast in 1934. During the Great Patriotic War of 1941–45 approximately 60 industrial enterprises were evacuated to the city, whose industries produced a wide variety of war matériel.

Cheliabinsk is one of the country's major industrial centers, with ferrous metallurgy, machine building, and food processing constituting the leading industries. The largest plants include the fully integrated Cheliabinsk Metallurgical Plant, the Teplopribor Plant, the Cheliabzhivmash Plant, a zinc refinery, a machine shop, and a watch factory. Other major plants produce steel pipes and pressings, road-construction machinery, machine tools, truck trailers, electric machines, and abrasives. The city's production association for the manufacture of tractors includes a tractor factory and a plant for the production of tractor parts; both turn out tractors for industry and for construction work.

The chemical industry is represented by a paint and varnish plant and a chemical and pharmaceuticals plant. Light industry is represented by a tannery and by spinning and weaving, footwear, and knitwear factories. Enterprises of the food-processing industry include a meat-packing combine, a flour mill, a milk combine, and pasta and confectionary factories. The highly developed building-materials industry includes brickyards and plants for the manufacture of metal structural members, houses assembled from precast panels, and gypsum-plaster products; there are also wood-products combines. The city has several district heat and power plants, and electricity is provided by the Ural Power Grid.

Cheliabinsk is situated at the junction of two railroad trunk lines: the Moscow-Kuibyshev-Ufa-Cheliabinsk-Kurgan-Omsk-Novosibirsk line, which runs from east to west, and the

Polunochnoe–Serov–Nizhnii Tagil–Sverdlovsk–Cheliabinsk–Orsk–Kandagach line, which runs from north to south. An additional line to the Northern Urals passes through Kamensk-Ural'skii. Cheliabinsk is a junction for highways that serve the oblast and republic, and it has an airport. Two pipelines that pass through the city, the Middle Asia–Urals and the Northern Tiumen' Oblast–Urals, supply the city with natural gas.

In the Soviet period Cheliabinsk has been rebuilt and modernized. The city center has grown up around the intersection of two main arteries—Kirov and Lenin streets—and Revolution Square, which has a monument to V. I. Lenin (bronze and granite, 1959, sculptors L. N. Golovnitskii and V. S. Zaikov, architect E. V. Aleksandrov). The downtown area includes the building of the oblast executive committee (1936–37, architects P. V. Kukhtenkov and A. P. Maksimov, engineer D. G. Vinogradov), the building of the oblast committee of the CPSU (1938, architect I. A. Golombek), the M. I. Glinka Theater of Opera and Ballet (1954, architect N. P. Kurennoi), and the Palace of Sports (1967, architects S. D. Filimonov, V. N. Malyshev, and T. M. Erval'd, engineer V. V. Korzhevskii). Of particular interest is the monument to the Komsomol heroes of the October Revolution and the Civil War in the Urals, entitled *Young Eagle* (bronze and granite, 1958, sculptor L. N. Golovnitskii, architect E. V. Aleksandrov).

Housing construction, which is being carried out on a large scale, has resulted in numerous *mikroraions* (basic units in city planning), including those along Gorky Street (1958–59, architects T. N. Druzhinina and others) and along Salute and Turist streets (1963–76, architects E. V. Aleksandrov and others). Large public buildings have been constructed, including a trade center (1975, architects F. Kh. Selitskii, V. I. Zhdanovskaia, and L. A. Ragozin), a complex of residential buildings and shops on Lenin Prospect (1975, architects B. V. Petrov, I. V. Talalai, and B. A. Baranov), and the complex that comprises the house of political education, the archives of the oblast committee of the CPSU, and a headquarters of the central district committee of the CPSU (1975, architect I. V. Talalai).

In addition to a university, Cheliabinsk has a polytechnic institute, an institute of the mechanization and electrification of agriculture, and institutes of medicine, physical culture, pedagogy, and culture. The city also has numerous scientific research and design institutes, the largest of which include Cheliabgiprotiazhmash and Cheliabgipromez, and 22 secondary specialized educational institutions.

In 1903 a theater, the People's House, was built in Cheliabinsk; performances were staged primarily by amateur companies. In 1976 the city's cultural institutions included the S. Tsvilling Cheliabinsk Drama Theater; the M. I. Glinka Cheliabinsk Theater of Opera and Ballet, which had moved from its old building; the Puppet Theater (founded 1935); the Young People's Theater (founded 1965); and a philharmonic society, which has its own concert hall. The city has a museum of local lore and an art gallery.

As of Jan. 1, 1977, Cheliabinsk had 50 hospitals, with a total of 14,600 beds (14.2 beds per 1,000 inhabitants). By contrast, in 1913 it had 4 hospitals, with a total of 175 beds (2.8 beds per 1,000 inhabitants), and in 1940 it had 15 hospitals, with a total of 2,700 beds (9.7 beds per 1,000 inhabitants). As of Jan. 1, 1977, there were 5,200 physicians, or one physician per 198 inhabitants, as opposed to 14 physicians (one per 4,400 inhabitants) in 1913 and 400 physicians (one per 686 inhabitants) in 1940. The city also had 11,700 secondary medical personnel in 1977, as opposed to 1,400 in 1940. Cheliabinsk has 487 preschool institutions, and eight childrens' sanitoriums are located within the city limits.

CHELIABINSK, UNIVERSITY OF, a university founded in 1974. In 1980 the university comprised departments of history, philology, physics, mathematics, and economics. The University of Cheliabinsk has 1,626 students. [29–169–1; updated]

CHELIABINSK DRAMA THEATER (full name, S. Tsvilling Cheliabinsk Drama Theater), a theater in the city of Cheliabinsk.

Before the October Revolution of 1917 performances in Cheliabinsk were staged, primarily by amateur companies, in a room of the People's House, which had been established in 1903. In 1920 an "agitational and demonstration troupe to aid the front" was formed as part of the political section of the Fifth Army. The actress and playwright L. N. Seifullina and the playwright V. P. Pravdukhin began their careers in the troupe, which staged their plays *Egorkin's Life* and *The New Schoolteacher*. On Oct. 21, 1922, the newly equipped theater of the People's House officially opened its doors. The finest productions of the late 1920's and early 1930's included Trenev's *Liubov' Iarovaia* (1927), Bill'-Belotserkovskii's *The Gale* (1927), Faiko's *Man With a Briefcase* (1928), Kirshon's *The Rails Are Humming* (1928), V. Ivanov's *Armored Train 14–69* (1929), and Romashov's *The Fiery Bridge* (1930).

In the 1930's Cheliabinsk developed into a major industrial center. The theater added to its repertoire plays that dealt with heroes of large construction projects, especially projects in the Urals; the new plays included Pogodin's *Tempo* and *My Friend*, Bezymenskii's *The Shot*, and Afinogenov's *The Eccentric*. Notable actors of this period were E. I. Ageev, S. P. Vadova, P. A. Garianov, M. V. Kochubei, and E. O. Preis.

An important place in the theater's repertoire was occupied by plays about V. I. Lenin, such as Pogodin's *Man With a Gun* (1938), *The Kremlin Chimes* (1940), and *Third Pathétique* (1959); *The Bolshevik*, by Del' (1940); Popov's *The Family* (1965); and Shtein's *Between Downpours* (1966). During the Great Patriotic War of 1941–45, the theater staged Simonov's *The Russian People*, Leonov's *Invasion*, and Korneichuk's *Partisans in the Ukrainian Steppes*. In the 1950's and 1960's the theater often turned to classical Russian and Soviet plays, for example, Trenev's *Liubov' Iarovaia*, Chekhov's *The Three Sisters*, an adaptation of L. N. Tolstoy's *Anna Karenina*, and Mayakovsky's *The Bedbug*.

Productions of the 1970's included Salynskii's *Mariia* (1970), an adaptation of Dostoevsky's novella *The Village of Stepanchikovo* (1971), Vasil'ev's *The Final Day* (1971), Dvoretskii's *The Man From the Outside* (1972), Bokarev's *The Steelworkers* (1973), and Simonov's *The Russian People* (1975). Members of the theater's company include Honored Artist of the RSFSR L. I. Varfolomeev, T. O. Zolotarev, O. V. Klimova, V. Ia. Konoplianskii, P. I. Kuleshov, and V. I. Miloserdov. In 1975, Honored Art Worker of the Tatar ASSR N. Iu. Orlov became principal director of the Cheliabinsk Drama Theater. [29–166–1]

CHELIABINSK METALLURGICAL PLANT, a leading fully integrated enterprise of the USSR for the production of quality steels. Located in the city of Cheliabinsk, the plant specializes in the production of sheets and standardized rolled products; steel for ball bearings; and stainless, structural, and transformer steels. The plant also manufactures coke by-products, products obtained from the processing of metallurgical slags, and consumer goods.

Construction of the Cheliabinsk Metallurgical Plant began during the Great Patriotic War of 1941–45, and the first metallurgical unit began operating in 1943. The plant has high-output metallurgical equipment and makes extensive use of the latest production processes. On several occasions it has occupied first place in socialist competition with other enterprises of its branch of industry. The plant was awarded the Order of the October Revolution in 1976 and the Order of the Red Banner of Labor in 1966.

O. A. Labunovich [29–167–1]

CHELIABINSK OBLAST, part of the RSFSR. Formed on Jan. 17, 1934. Area, 87,900 sq km. Population, 3,403,000 (1977). Cheliabinsk Oblast is divided into 24 administrative districts and has 27 cities and 25 urban-type settlements. The administrative center is the city of Cheliabinsk. The oblast was twice awarded the Order of Lenin, on Oct. 23, 1956, and on Dec. 4, 1970.

Natural features. Most of the oblast lies on the eastern slopes of the Southern Urals and in the adjacent territories of the Trans-Ural Plain. In the northwest, which includes some of the moun-

tain ranges of the Urals, the oblast reaches its highest elevation, at Mount Nurgush (1,406 m). Cheliabinsk Oblast may be divided into two topographic areas: the western region has ridges and a hilly terrain, with an average elevation of 300–500 m; the eastern plain has numerous *zapadinas* (flat-bottom step depressions) and gently sloping parallel ridges (elevations of approximately 20 m) separated by depressions. The central part of the oblast is hilly, with elevations of approximately 100–200 m.

Cheliabinsk Oblast has a continental climate, with long, cold winters. The average January temperature ranges from −15°C in the northwest to −17°C in the southeast. Summers are warm or, in the southeast, hot. The average July temperature is 16°C in the northwest and 18°C in the southeast. The growing season lasts 130 days in the northwest and 150 days in the southeast. Annual precipitation ranges from 600 mm in the mountains to 350 mm in the plains; the greatest amount of precipitation falls in summer. The oblast's rivers, the largest of which are the Ural and the Miass, are capable of producing 0.3 gigawatt of hydroelectric power. The Verkhneural'sk, Cheliabinsk-Argazi, and Shershni reservoirs have been built to supply water to Magnitogorsk. The oblast has numerous freshwater and saltwater lakes, the largest being Uvil'dy, Irtiash, Turgoiak, Bol'shie Kasli, and Chebarkul'.

The predominant soils are typical and highly leached chernozems; gray-forest, mountain-forest gray, and meadow-chernozem soils are also found. More than one-fourth of the oblast is forested, with total timber reserves of 185 million cu m. Pine forests and forests of aspen and birch are found in the north. Most of the central part of the oblast is forest-steppe; the south is predominantly forb and grass steppe. The mountains have spruce and fir forests with an admixture of pine, larch, linden, and oak.

Fauna is represented primarily by forest and steppe animals, including such mammals as the elk, fox, wolf, blue hare, and squirrel. The most common birds are ducks, geese, grouse, willow ptarmigan, and hazel hens. The V. I. Lenin Il'men Preserve is located in the oblast.

Population. According to the 1970 census, Russians constitute approximately 81 percent of the oblast's population, with the remaining 19 percent made up of various peoples, including Tatars, Ukrainians, and Bashkirs. The average population density is 38.7 persons per sq km; 82 percent of the population is urban. The oblast's principal cities are Cheliabinsk, Zlatoust, Kopeisk, Korkino, Magnitogorsk, Miass, and Troitsk.

Economy. Cheliabinsk Oblast is one of the most highly industrialized areas in the USSR. Most of the economy's output comes from industry, principally heavy industry. The main industrial branches are ferrous and nonferrous metallurgy, machine building, metalworking, and the chemical industry. Power engineering is only partly based on local fuel, which comes from the Cheliabinsk Coalfield (brown coal). A variety of fuels are shipped into the oblast, such as coking coals from the Kuznetsk and Karaganda coal basins, power-generating coal from the Ekibastuz Coalfield, natural gas from Western Siberia, and petroleum products from other oblasts in the Urals, from the Volga Region, and from Western Siberia. The electric power industry of the oblast forms part of the Ural Power Grid. Most of the electric power is generated at local electric power plants, such as the Iuzhno-Uralsk and Troitsk state regional electric power plants and the fossil-fuel–fired steam power plants at Magnitogorsk, Cheliabinsk, and Argaiash.

The main enterprises of ferrous metallurgy are the V. I. Lenin Magnitogorsk Metallurgical Combine, the Magnitogorsk Sizing Plant, and the Magnitogorsk Hardware and Metallurgical Plant. Other large enterprises are metallurgical, pipe-rolling, and ferroalloys plants in Cheliabinsk and metallurgical plants in Zlatoust, Asha, and Chebarkul'. Refractories are produced at the Magnezit Plant in Satka. Nonferrous metallurgy includes the Karabash Copper-smelting Combine, the Verkhnii Ufalei Nickel Combine, and the Cheliabinsk Electrolytic Zinc Refinery.

Mining is represented by the extraction of iron ore (the Bakal, Magnitogorsk, and Zlatoust iron ore deposits), magnesite (the Satka group of deposits), graphite (the Taiginka deposit), brown coal (the Cheliabinsk Coalfield), and refractory clays (the Nizhneuvel'skoe deposit). Other major industrial branches are the transportation industry, which produces tractors and motor vehicles, and agricultural machine building; the oblast also produces construction and highway machinery and machinery for the mining industry. The machine-tool and instrument-making industries are highly developed. Major enterprises are the Cheliabinsk Tractor Works, the Urals Automotive Plant (Miass), the Kopeisk Machine-building Plant, and the Koliushchenko Cheliabinsk Plant, which manufactures road-paving machinery.

The chemical industry, which is concentrated in Cheliabinsk, Magnitogorsk, and Kyshtym, is integrated with ferrous and nonferrous metallurgy. The principal centers of the building-materials industry are Cheliabinsk, Magnitogorsk, and Korkino. The principal enterprises of light industry and the food-processing industry are located in the large cities; there are meat-packing plants, butter factories, leather-processing enterprises, garment factories, knitwear factories, and enterprises for the production of animal fats. The oblast is known for the artistic cast-iron articles produced at Kasli and Kusa, the engraved metal articles produced in Zlatoust, and watches.

In 1976, Cheliabinsk Oblast produced 31.2 billion kilowatt-hours of electricity, 5,000 metalcutting machine tools, 135 million standard slate tiles, 12.6 million pairs of leather footwear, and more than 214,000 radios.

The oblast's large-scale, mechanized agriculture is oriented toward animal husbandry and the cultivation of grains. Near the main industrial centers (Cheliabinsk and Magnitogorsk), agriculture specializes in supplying the urban market. In 1976 the oblast had 163 sovkhozes and 64 kolkhozes. Of the 5 million hectares (ha) of agricultural lands (56 percent of the oblast's territory), plowland occupies 3.2 million ha, hayfields 0.6 million ha, and pastureland 1.2 million ha. In 1976 the total sown area was 2.9 million ha, of which 1,828,000 ha were sown to grains and leguminous crops, including spring wheat (1,160,000 ha), feed crops (1,007,000 ha), potatoes (68,000 ha), and melons and gourds (12,300 ha).

Livestock is raised primarily for dairy products and meat. At the beginning of 1977 the livestock population included 1,114,000 cattle (of which 40 percent were cows), 773,000 sheep and goats, 382,000 swine, and 8,295,000 poultry. In 1978 several livestock-raising complexes, including the Uvel'skii Complex, were being constructed for the production of meat on an industrialized basis.

In 1976 the oblast had 1,800 km of railroad lines. The principal east-west lines are Ufa-Cheliabinsk-Kurgan and Beloretsk-Magnitogorsk-Kartaly-Tobol. Of major importance is the Orsk-Kartaly-Troitsk-Cheliabinsk-Sverdlovsk line, which runs from north to south. Motor-vehicle transportation is also highly developed: in 1976 there were 6,100 km of hard-surface roads. The main highways are Ufa-Asha-Miass-Cheliabinsk-Kurgan and Troitsk-Cheliabinsk-Sverdlovsk. The oblast is served by a network of transit petroleum and natural-gas pipelines and by air transportation.

Internal differences. Cheliabinsk Raion is the oblast's most densely populated and industrialized region, with numerous enterprises of heavy industry. Of particular note are the Cheliabinsk, Miass, Zlatoust, and Troitsk industrial complexes. Agriculture is oriented toward production for the urban market.

Magnitogorsk Raion is highly industrialized and contains most of the oblast's metallurgical enterprises. Agriculture is oriented toward animal husbandry and the cultivation of grains.

O. A. KIBAL'CHICH

Education, cultural affairs, and public health. In the 1914–15 academic year Cheliabinsk Oblast had 809 general-education schools, with 59,400 students; three specialized secondary educational institutions, with 173 students; and no higher educational institutions. In the 1976–77 academic year there were 1,513 general-education schools of all types, with more than 542,000 students; 127 vocational-technical schools, with 69,900 students; and 70 secondary specialized educational institutions, with more than 77,000 students. In that year 57,600 students were enrolled in the oblast's ten higher educational institutions, which include the Cheliabinsk Polytechnic Institute, the Cheliabinsk Institute of the Mechanization and Electrification of Agriculture, the Cheliabinsk Medical Institute, the Cheliabinsk and Magnitogorsk pedagogical institutes, the Magnitogorsk Institute of Ore Mining and Metallurgy, and the Troitsk Veterinary Institute.

Dozens of scientific institutions are located in the oblast, in-

cluding the Urals Branch of the F. E. Dzerzhinskii All-Union Scientific Research Heat Engineering Institute, the Scientific Research and Design Institute of the Opencut Mining of Minerals, and the All-Union Scientific Research Institute of Labor Protection and Accident Prevention in Ferrous Metallurgy.

In 1976, 209,000 children were enrolled in 1,976 preschool institutions. There were 976 public libraries, with more than 22 million copies of books and periodicals. The oblast's 13 museums are the oblast art gallery and oblast museum of local lore in Cheliabinsk; museums of local lore in Troitsk, Miass, Satka, Zlatoust, Verkhneural'sk, Magnitogorsk, and the village of Uiskoe; the Museum of the Il'men Preserve in Miass; the Museum of Artistic Casting in Kasli; the Museum of the History of Varna Raion in Varna; and a branch of the Cheliabinsk Oblast Museum of Local Lore in Kopeisk.

The oblast's seven theaters are a theater of opera and ballet, a drama theater, a young people's theater, and an oblast puppet theater, all in Cheliabinsk; a drama theater and puppet theater in Magnitogorsk; and a drama theater in Zlatoust. Cheliabinsk Oblast has 1,267 clubs, 1,532 stationary motion-picture projection units, and 50 extracurricular institutions.

The two oblast-level newspapers are *Cheliabinskii rabochii*, published since 1917, and *Komsomolets*, published since 1931. Three programs of All-Union Radio are broadcast for a total of 58 hours daily and are supplemented by oblast broadcasts for 2.5 hours daily. The television program *East* is transmitted for 12.9 hours daily, and local television programs are carried for 3.5 hours daily.

As of Jan. 1, 1977, Cheliabinsk Oblast had 284 hospitals, with 45,300 beds, or 13.3 beds per 1,000 inhabitants; there were 9,900 physicians, or one physician per 343 inhabitants. The climatic and balneological health resorts of Kisegach and Uvil'dy are located in the oblast, and Troitsk Raion offers climatic and koumiss therapy. The oblast has 30 sanatoriums, as well as houses of rest and a boarding hotel.

CHELIABINSK OPERATION OF 1919, combat actions by Soviet forces of the Eastern Front carried out between July 17 and August 4 against Admiral A. V. Kolchak's White Guard troops during the Civil War of 1918–20.

Having captured Zlatoust and Ekaterinburg, the troops of the Eastern Front (commander, M. V. Frunze; members of the revolutionary military council, M. M. Lashevich, K. K. Iurenev, and N. I. Muralov) mounted an offensive moving the First and Fourth armies to the south and southeast, and the Third and Fifth armies to the east. M. N. Tukhachevskii's Fifth Army (approximately 32,000 foot soldiers and cavalry), while continuing to pursue the enemy, was to capture the areas near Cheliabinsk and Troitsk, drive the enemy south of the Trans-Siberian Railroad, and reach the Tobol River between Kustanai and Ikovskaia. The Fifth Army was opposed by General K. V. Sakharov's Western Army of White Guards (approximately 27,500 foot soldiers and cavalry), which in July had been renamed the Third Army.

The White Guard command, attempting to capitalize on the somewhat exposed position of the Soviet Fifth Army, planned a series of flank attacks west of Cheliabinsk designed to annihilate the Soviet force. Two assault groups were formed for this task: the assault group of General S. N. Voitsekhovskii, north of Cheliabinsk (approximately 16,000 foot soldiers and cavalry), and the assault group of General V. O. Kappel', south of Cheliabinsk (approximately 10,000 foot soldiers and cavalry).

The Fifth Army, pursuing the enemy, reached Cheliabinsk, and on July 24 the army's 27th Rifle Division, aided by insurgent workers, captured the city. Voitsekhovskii moved to the offensive on July 25, and Kappel' on July 27. Heavy defensive fighting ensued. Northwest of Cheliabinsk the enemy was able to push back the 35th Rifle Division and break through between it and the 27th Rifle Division. The White Guards were unable to penetrate the front from the south owing to the unwavering defense of the 26th Rifle Division, which repulsed all attacks by the troops under Kappel'.

The command of the Fifth Army then executed a bold countermaneuver: the 27th Division, reinforced by reserves and workers' detachments from Cheliabinsk, ignored the threat from the flanks and struck at the left flank of the northern group of White Guard forces. In bitter fighting, the Soviet troops regained the initiative and threatened to encircle the White Guard troops northwest of Cheliabinsk. On July 29 the Fifth Army mounted a final offensive. At the same time, the command of the Eastern Front ordered the 21st Rifle Division of the Third Army to proceed in a forced march to the Trans-Siberian Railroad near the Shumikha station and cut off the sole line of communications of the White Guards. Kolchak's troops, routed near Cheliabinsk, retreated in panic beyond the Tobol River. On August 4, units of the 24th Rifle Division liberated Troitsk.

The Cheliabinsk Operation completed the liberation of the Urals by the Red Army, which was now assured of access to Siberia. Kolchak's forces were split into two groups, which were unable to communicate with one another: an eastern group, comprising the First and Third armies, and a southern group, comprising the Second Army. On August 15, Soviet troops reached the Tobol River.

CHELIABINSK POLYTECHNIC INSTITUTE (full name, Lenin Komsomol Cheliabinsk Polytechnic Institute), one of the largest higher technical-education institutions in the USSR. Founded in 1943 as an institute of mechanics and machine building, it was reorganized as a polytechnic institute in 1951. In 1968 the institute was given the name "Lenin Komsomol."

As of 1977, the Cheliabinsk Polytechnic Institute comprised departments of metallurgy, machine technology, automated machinery, motor vehicles and tractors, engines, instruments and automation, construction engineering, instrument-making, electric power, and industrial and civil construction. The institute has a branch in the city of Zlatoust and nine evening departments and divisions, five of which are located in the cities of Miass, Kopeisk, and Kyshtym, at the Cheliabinsk Tractor Plant, and at the Cheliabinsk Metallurgical Plant. There is a correspondence department, a preparatory division for workers, and a graduate program.

The institute has 76 subdepartments, a scientific computer center, two student computer centers, and a scientific research section that includes one special-problems laboratory, nine laboratories for research connected with branches of the national economy, and a student bureau of design. There are five specialized councils for the defense of doctoral and candidate's dissertations. The research library contains 1.3 million volumes.

In the 1976–77 academic year enrollment at the Cheliabinsk Polytechnic Institute was approximately 21,000, and there were more than 2,300 instructors and research workers, including one academician of the Academy of Sciences of the USSR, 34 professors and doctors of sciences, and 560 docents and candidates of sciences. Since its founding, the institute has trained more than 45,000 engineers.

V. V. MEL'NIKOV [29–167–2]

CHELIABINSK THEATER OF OPERA AND BALLET (full name, M. I. Glinka Cheliabinsk Theater of Opera and Ballet), a theater founded in 1956. Construction of the theater building, which seats 1,205, was completed in 1955 (architect N. P. Kurennoi). In 1956 the theater was named in honor of M. I. Glinka. The principal members of the opera company are students in

their final year at musical educational institutions; last-year students at the Leningrad and Moscow schools of choreography make up the nucleus of the ballet troupe.

The theater's repertoire includes works by Russian and Western European composers, with the works of Soviet composers occupying an important place. The theater has staged such Soviet operas as Shantyr's *City of Youth* (1957), Spadavecchia's *The Gadfly* (1959), Magidenko's *The Path of Thunder* (1961), and Meitus' *Stolen Happiness* (1962). Ballets staged at the theater include Asaf'ev's *The Fountain of Bakhchisarai* (1956), Morozov's *Doctor Ouch-It-Hurts* (1957), Iarullin's *Shurale* (1959), *The Flower of Happiness* by Mushel' (1959), Prokofiev's *The Stone Flower* (1960) and *Romeo and Juliet* (1963), Biriukov's *The Last Ball* (1961), and Laptunin's *Masquerade* (1962). The Cheliabinsk Theater of Opera and Ballet was the first in the USSR to produce B. Smetana's opera *The Brandenburgers in Bohemia* (1963).

Numerous artists, who have been associated with the theater at various times, have contributed to the development of the Cheliabinsk Theater of Opera and Ballet; these include the conductor I. A. Zak (1955–68), the stage directors D. N. Smolich and N. K. Dautov, the singer V. A. Dikopol'skaia, and the principal dancers V. M. Postnikov, L. S. Ratenko, and M. Ia. Shchukin.

The theater's finest opera productions since the mid-1960's have been Meyerbeer's *The Huguenots* (1964), Shantyr's *The Two Captains* (1965), Moussorgsky's *Boris Godunov* (1965), Dargomyzhskii's *The Stone Guest* (1966), Verdi's *Don Carlos* (1966), Katsman's *Liubava* (1967), Tchaikovsky's *Mazepa* (1969), Dzerzhinskii's *The Quiet Don* (1970), Glinka's *Ivan Susanin* (1970), Bizet's *Carmen* (1973), Verdi's *Un Ballo in maschera* (1974), Molchanov's *The Dawns Here Are Quiet* (1975), Rimsky-Korsakov's *Mozart and Salieri* (1975), and Smetana's *The Bartered Bride* (1976).

Outstanding ballets from this period are *Peer Gynt* (1964; music by Grieg), Prokofiev's *Cinderella* (1965), Melikov's *The Legend of Love* (1968), Vlasov's *Asel'* (1969), Pugni's *La Esmeralda* (1972), Khachaturian's *Spartacus* (1974), and Adam's *Giselle* (1976).

In 1976 the theater's company included the following singers: Honored Artist of the RSFSR V. Ia. Agafonov, Iu. M. Gorbunov, V. I. Drozdova, V. Ia. Kurochkin, N. I. Shaidarova; and actors V. D. Grichenko, Iu. P. Morozov, and K. I. Sidorova. Dancers included People's Artist of the RSFSR G. M. Boreiko, V. A. Dmitriev, E. M. Popov, and I. D. Sarametova. The principal conductor is V. M. Vasil'ev, the principal stage director is G. S. Miller, the principal choreographer is V. N. Butrimovich, the principal chorus master is V. M. Tolstov, and the principal stage designer is Ia. Z. Korsunskii.

CHELIABINSK TRACTOR WORKS (full name, V. I. Lenin Cheliabinsk Tractor Works), a major enterprise of the tractor-building and agricultural machine-building industries of the USSR that manufactures crawler tractors. Located in the city of Cheliabinsk, the works began operating in 1933 and until 1937 turned out S-60 tractors equipped with a 60-hp ligroin engine. In 1937, after retooling, it began producing the first diesel tractors in the USSR, with a 65-hp engine.

During the Great Patriotic War of 1941–45, the works was modified for the production-line manufacture and conveyer assembly of tanks. It produced various types of tanks, self-propelled guns (SPG), diesel tank engines, and semifinished parts for ammunition and supplied the front with the KV, IS, T-34, and SPG combat vehicles. After the war the works manufactured the 92-hp S-80 tractor until 1958 and the 100-hp S-100 tractor until 1963, when it began producing the 108-hp T-100M tractor and its modified versions: a swamp tractor for land reclamation work and hydraulic industrial and farm tractors. In 1961 the works began producing the 310-hp DET-250 diesel-electric tractors. The Cheliabinsk Tractor Works produces general-purpose tractors that operate with 120 trailer-type or toolbar-mounted implements; 90 percent of the tractors are supplied to industry.

The shops of the works are equipped with special unit-head machine tools, mechanized production lines, and automatic transfer machines. In 1970 general retooling began for the lot production of the 160-hp T-130 tractor. In the 1970's the works manufactured the standardized T-330 and T-500 industrial tractors, with 330-hp and 500-hp engines, respectively. In 1971 the V. I. Lenin Cheliabinsk Tractor Works Production Association was created; in addition to the main works, it includes four branch plants.

The Cheliabinsk Tractor Works exports to 70 countries, and its tractors won the Grand Prix at the Paris Exposition of 1937 and gold medals at international expositions at Leipzig in 1965 and Moscow in 1966. The works was awarded the Order of Lenin in 1970, the Order of Kutuzov First Class in 1945, and the Order of the Red Star in 1944. The pilot plant (now the pilot-production shop) at the works and the diesel design bureau (now the section of the chief diesel designer) were awarded the Order of Lenin in 1944 and 1945.
G. V. ZAICHENKO [29–168–1]

CHELIAD', a term used to designate the whole or a part of the Russian dependent population from about the sixth to 19th centuries.

From about the sixth to ninth centuries, the term referred to enslaved prisoners of war who lived and worked in their masters' households. In Kievan Rus' it was applied to the dependent population in general; in the ninth and tenth centuries, *cheliad'* became subject to purchase and sale. In the 11th century the term came to refer to that part of the dependent population employed in the feudal economy. In the 18th and 19th centuries, the landowners' domestic serfs were called *cheliad'*.

CHELIDONIUM (celandine), a genus of herbaceous plants of the family Papaveraceae. There is a single species, *Chelidonium majus*, a perennial with bright orange milky sap. The leaves are deeply pinnatifid, and the tetramerous flowers are gathered in umbels. The fruit is a pod-like capsule.

The plant grows in the subtropical and temperate climates of the northern hemisphere. It is widespread throughout the USSR except in the northern regions and in Middle Asia. The plant grows in damp ravines, in undergrowth, in timber-felling areas, and in deciduous forests. Most commonly it occurs as a weed in parks, gardens, pastures, and weed-infested areas. A poisonous plant, it contains chelidonine and other alkaloids. There have been cases of celandine poisonings of goats and hogs. The sap is used externally to eliminate warts and to treat ulcers, wounds, and certain skin diseases. Tinctures from the grass act as bile-expelling agents.

CHELIDZE, OTAR SILOVANOVICH. Born Sept. 8, 1925, in Tbilisi. Soviet Georgian poet. Member of the CPSU since 1958.

The son of a worker, Chelidze graduated from the department of philosophy of the University of Tbilisi in 1950 and studied at the M. Gorky Institute of Literature from 1950 to 1954. His work was first published in 1943. Chelidze's lyric epic ballads and narrative poems continue the traditions of the classical Georgian epos and occupy an important place in Georgian poetry. He has translated A. S. Pushkin's *Eugene Onegin* and A. T. Tvardovskii's *Vasilii Terkin* and *Distance Beyond Distance* into Georgian. Chelidze has been awarded the Order of the Red Banner of Labor and the Order of the Badge of Honor.

CHELIEV, EGOR GERASIMOVICH. Born 1771; died circa 1839. Russian builder.

In his youth, Cheliev worked as a land surveyor in Saratov. Around 1801 he went to live in Moscow, where he helped plan and rebuild the city after the fire of 1812. He invented a hydraulic binder having properties similar to those of portland cement. In 1825, Cheliev published *Complete Instructions on the Preparation of a Cheap and Superior Mortar or Cement of Great Strength for Underwater Constructions*, in which he described the composition and method of preparation of the cement. [29–134–1]

CHÉLIFF (Oued Chéliff), the largest river in Algeria, North Africa. The Chéliff is 700 km long, as measured from the source of its farthest tributary, the Oued Touil (Oued Sebgag), and drains an area of approximately 35,000 sq km. It originates on the northern slopes of the Djebel Amour of the Saharan Atlas. Crossing a rock desert, the upper course of the Chéliff carries little water and dries up in places in the summer. Farther downstream, the river turns west and flows through a broad, well-developed alluvial valley before emptying into the Mediterranean Sea. Water levels are high in the winter, with the occurrence of sometimes disastrous freshets and a flow rate that can exceed 4,000–5,000 cu m per sec. The high water levels of winter are followed by a period of very low water, during which the flow rate may drop to several hundred or even tens of cubic meters per second. The Ghrib Reservoir and a hydroelectric power plant are on the Chéliff, whose waters are used extensively for irrigation. [29–1102–2]

CHELINTSEV, VLADIMIR VASIL'EVICH. Born Feb. 10 (22), 1877, in Saratov; died there Apr. 3, 1947. Soviet organic chemist. Corresponding member of the Academy of Sciences of the USSR (1933).

Chelintsev became a professor at Moscow University in 1910 and at the University of Saratov in 1917. His principal works dealt with heterocyclic and organomagnesium compounds. He isolated individual organomagnesium compounds, and in 1904 he showed that ether and tertiary amines catalyze the Grignard reaction. He proposed methods for synthesizing a number of derivatives of pyrrole, α-keto acids, and unsaturated ketones. Chelintsev also developed methods for detecting small amounts of such compounds as acetone, furfural, formaldehyde, and acetaldehyde.

CHELIUSKIN, SEMEN IVANOVICH. Born circa 1700; died sometime after 1760. Russian arctic explorer; naval officer.

The son of a nobleman who held a small *pomest'e* (fief) in Kaluga Province, Cheliuskin enrolled in the School of Mathematical and Navigational Sciences in Moscow in 1714 and became a navigator's assistant in the Baltic Fleet in 1726. He was promoted to navigator in 1733 and assigned to the Second Kamchatka (Great Northern) Expedition, with which he remained until 1743. Cheliuskin worked in detachments led by V. V. Pronchishchev and Kh. P. Laptev.

In the spring of 1741, Cheliuskin journeyed overland from the Khatanga River to the Piasina River, charting the western shore of the Taimyr Peninsula as far as the Gulf of Middendorf. He then traveled from the mouth of the Piasina to the mouth of the Enisei. In the winter of 1741–42, journeying from Turukhansk to the mouth of the Khatanga, Cheliuskin charted the northern coastline of the Taimyr Peninsula from the Cape of Faddei in the east to the mouth of the Taimyr River in the west. En route he discovered the northernmost point of Asia, which in 1843 A. F. Middendorf named Cape Cheliuskin, in his honor. Cheliuskin was discharged from the Baltic Fleet in 1760 with the rank of captain third class.

CHELIUSKIN, a Soviet steamship with a displacement of 7,500 tons, built in Denmark in 1933 and named in honor of S. I. Cheliuskin.

The *Cheliuskin* set out in 1933 to make a voyage from Murmansk to Vladivostok by way of the Northern Sea Route during one navigation season. The head of the expedition was O. Iu. Shmidt, and the captain of the ship was V. I. Voronin; 111 persons sailed on the voyage. After becoming ice-bound in the Bering Strait, the *Cheliuskin* was carried into the Chukchi Sea, where it was crushed by the ice and sank on Feb. 13, 1934. In a rescue that concluded on April 13, the members of the expedition were taken from the ice to Cape Vankarem on the mainland. Their rescuers, Soviet pilots A. V. Liapidevskii, S. S. Levanevskii, V. S. Molokov, N. P. Kamanin, M. T. Slepnev, M. V. Vodop'ianov, and I. V. Doronin, were the first to be honored with the title Hero of the Soviet Union. [29–154–3]

CHELIUSKIN, CAPE, the northernmost point of the Taimyr Peninsula and continental Asia (77°43′ N lat. and 104°18′ E long.). It was first reached by S. I. Cheliuskin in May 1742. [29–154–4]

CHELKAR, a city and the administrative center of Chelkar Raion, Aktiubinsk Oblast, Kazakh SSR. Chelkar has a railroad station on the Orenburg-Tashkent line, 363 km southeast of Aktiubinsk. The city has railroad transport enterprises and a butter factory. [29–134–4]

CHELLEAN CULTURE (also Abbevillian culture), a Lower Paleolithic archaeological culture widespread in Europe, Africa, Southwest Asia, and southern Asia 300,000 to 700,000 years ago. The Chellean culture, which replaced the Olduvai (pre-Chellean) culture, was identified in the 1860's by G. de Mortillet from the finds at Chelles, near Paris. Primitive implements are characteristic, including *coup de poings*, crude chopping tools (choppers), axe-like implements with a lateral cutting edge (cleavers), thick stone flakes (usually with trimmed edges), and spherical and cubic cores. The physical type of the inhabitants was Archanthropinae, including *Pithecanthropus* and *Sinanthropus*. Chellean man settled in open stations or in caves and engaged in hunting and gathering.

The Chellean culture belongs to the initial stage of the primitive communal system. It was replaced by Acheulean culture.

CHELNOKOV, NIKOLAI VASIL'EVICH. Born Apr. 26 (May 9), 1906, in Irkutsk; died July 16, 1974, in Moscow. Twice Hero of the Soviet Union (June 14, 1942, and Aug. 19, 1944). Major general of aviation (1949). Member of the CPSU from 1940.

Chelnokov joined the Red Army in 1928. He graduated from the Sevastopol' School for Naval Pilots in 1931, academic courses at the Naval Academy in 1945, and the K. E. Voroshilov Higher Military Academy in 1949. He was a flight commander during the Soviet-Finnish War of 1939–40. During the Great Patriotic War of 1941–45, Chelnokov served as a squadron commander and as the deputy commander and, beginning in August 1942, commander of the 1st Guards Mine and Torpedo Air Regiment of the

Baltic Fleet. He commanded the 8th Guards Ground-attack Regiment of the Black Sea Fleet from June to August 1943, reassuming the post in December. From August to October 1944 he was the commander of the 9th Ground-attack Air Division of the Baltic Fleet. Chelnokov himself flew more than 270 missions.

After the war, Chelnokov served in command and staff capacities and held a teaching position, leaving active duty for the reserves in 1954. He was a deputy to the second convocation of the Supreme Soviet of the USSR and was awarded three Orders of Lenin, four Orders of the Red Banner, the Order of Ushakov Second Class, the Order of the Red Star, the Order of the Badge of Honor, and various medals. A bust of Chelnokov stands in Leningrad. [29–136–4]

CHELO. (1) In Russian, an archaic term for *lob* ("forehead"); the phrase *bit' chelom* (literally, "to beat with the forehead") means to bow deeply (as if all the way to the ground).

(2) The front part of a traditional Russian stove. [29–137–2]

CHELOBITNYE (also *chelobit'ia*), in Russia of the 15th to early 18th centuries, written addresses—particularly requests, complaints, or denunciations—submitted to central and local government institutions by individuals and by groups of, for example, *dvoriane* (nobles), *posadskie liudi* (merchants and artisans), or peasants. Persons to whom *chelobitnye* were addressed included the tsar, *pomeshchiki* (fief holders), *votchinniki* (owners of patrimonial estates), and church leaders.

CHELOMEI, VLADIMIR NIKOLAEVICH. Born June 17 (30), 1914, in Sedlets. Soviet scientist in mechanics and control processes. Academician of the Academy of Sciences of the USSR (1962; corresponding member, 1958); twice Hero of Socialist Labor (1959 and 1963). Member of the CPSU since 1941.

After graduating from the Kiev Aviation Institute in 1937, Chelomei taught at the institute. In 1941 he joined the staff of the P. I. Baranov Central Institute of Aircraft Engine Construction. In 1942, independently of efforts in Germany, he developed the USSR's first pulse-jet engine. The engine was installed in a number of aircraft designed by Chelomei and in various airplanes, including the La-11; aircraft powered by Chelomei's engine were exhibited at the Tushino air show in 1947. Chelomei became a master aeronautical designer in 1944 and a chief aeronautical designer in 1959. He directed the development of a number of major rockets, spacecraft, and aircraft. In 1952 he became a professor at the N. E. Bauman Moscow Higher Technical School.

Chelomei's main works deal with the design and dynamics of machines, oscillation theory, the dynamic stability of elastic systems, and the theory of servomechanisms.

Chelomei became a member of the International Academy of Astronautics in 1974. He was a deputy to the ninth convocation of the Supreme Soviet of the USSR. He received the Lenin Prize in 1959 and the State Prize of the USSR in 1967 and 1974. He has been awarded four Orders of Lenin, the Order of the October Revolution, and various medals, including the N. E. Zhukovskii Gold Medal for the Best Work on the Theory of Aviation (1964) and the A. M. Liapunov Gold Medal of the Academy of Sciences of the USSR for distinguished work in mathematics and mechanics (1977).

CHELOVEK I ZAKON (Man and the Law), a magazine issued monthly by the Ministry of Justice of the USSR and written for people who are not specialists in the law; published in Moscow since 1971. The main tasks of the magazine are to increase people's knowledge and understanding of Soviet law, propagate the Soviet way of life, and encourage socialist morality among the broad masses of the working people. *Chelovek i zakon* regularly presents discussions of legal problems and prints answers to questions asked by working people. The magazine also contains literary works by Soviet and foreign authors dealing with the fight against crime and has a section devoted to the history of the state and the law. Circulation, 4.9 million (January 1980). [29–149–1]

CHELPANOV, GEORGII IVANOVICH. Born Apr. 16 (28), 1862, in Mariupol'; died Feb. 13, 1936, in Moscow. Russian psychologist, philosopher, and logician.

Chelpanov was a professor at the universities of Kiev (1892–1907) and Moscow (1907–23). In 1912 he founded the Moscow Institute of Psychology—an important center of experimental psychology—and was its director until November 1923. As a philosopher, Chelpanov was close to neo-Kantianism and positivism. Criticizing materialism in such works as *The Brain and the Soul* (1900), he attempted to substantiate psychology by means of the "empirical parallelism" of the soul and the body—a concept that went back to the psychophysical parallelism of W. Wundt.

Chelpanov performed some important experiments on the perception of space and time and developed procedures for laboratory research (*Introduction to Experimental Psychology*, 1915). His textbooks on psychology and logic have been reprinted more than once. After the October Revolution, Chelpanov believed that Marxism could be applied to social but not to general psychology, which, in his opinion, must be free of any kind of philosophy.

CHEL'TSOV, IVAN MIKHAILOVICH. Born 1848 in Egor'evsk, in what is now Moscow Oblast; died 1904 in St. Petersburg. Russian chemist.

Chel'tsov graduated from the University of St. Petersburg in 1876 and began teaching at the Mine Officers' Class in 1880. He was a staff member of the Scientific and Technical Laboratory of the Naval Ministry, where, under the direction of D. I. Mendeleev, a new type of smokeless gunpowder known as pyroxylin powder was obtained and methods for its production were developed. In collaboration with the Russian inventor L. G. Fedotov, Chel'tsov designed the first pyroxylin factory in Russia.

Chel'tsov's principal works dealt with explosives and the process of explosion. Chel'tsov was the author of the textbook *Explosives* (2nd ed., 1880–83), which was highly regarded by Mendeleev. [29–154–1]

CHEMAL, a climatic koumiss health resort in the mountains of Altai Krai, RSFSR. It is situated at an elevation of 410–620 m, 186 km southeast of the Biisk railroad station. The winter is moderately cold, with a mean January temperature of −13°C, and the summer is warm, with a mean July temperature of 18°C. Precipitation is about 515 mm a year. Chemal has a sanatorium for patients with active cases of pulmonary tuberculosis. [29–169–4]

CHEMBAR, until 1948, the name of the city of Belinskii, in Penza Oblast, RSFSR. [29–169–7]

CHEMENZEMINLI (real name, Iusif Vezir Mirbaba ogly). Born Aug. 31 (Sept. 12), 1887; died 1943. Soviet Azerbaijani writer.

Chemenzeminli was born in the city of Shusha, in what is now the Azerbaijan SSR. He graduated from the law faculty of the University of Kiev in 1915. His work first appeared in print in 1907. Chemenzeminli's first publicistic articles, stories, and feuilletons were published in such periodicals as the satirical magazine *Molla Nasreddin*. In these early works, he criticized religious fanaticism, ignorance, and backwardness and portrayed the bitter fate of the common man and the difficult lot of Azerbaijani women.

Chemenzeminli lived in Istanbul and Paris between 1919 and 1925; he returned to Azerbaijan in 1926. In such short-story collections as *Pages From the Past* (1926) and *From Darkness to Light* (1933), he condemned the social vices of feudal-bourgeois society and depicted the new Soviet man and the upsurge in the social and cultural life of the people. In his two-part work *The Students* (1914–35) and in *1917* (1931–34) he portrayed the student revolutionary movement in tsarist Russia. He subsequently wrote the novel *Maiden Spring* (1934) and the novel *Covered with Blood* (published 1960–61), which describes 18th-century Azerbaijan and portrays the humanist poet Vagif. Chemenzeminli also wrote on the history of Azerbaijani literature and folklore.

CHEMEROVTSY, an urban-type settlement and administrative center of Chemerovtsy Raion, Khmel'nitskii Oblast, Ukrainian SSR. Chemerovtsy is situated on the Zhvanchik River (Dnestr River basin), 15 km from the Zakupnoe railroad station on the Kopychintsy-Iaromolintsy line. The settlement has a butter plant. [29–173–1]

CHEMESOV, EVGRAF PETROVICH. Born in 1737 in the province of Nizhny Novgorod; died Aug. 30 (Sept. 10), 1765, in St. Petersburg. Russian engraver and draftsman.

Chemesov studied with G. F. Schmidt at the St. Petersburg Academy of Arts. In 1762 he became an academician and organized an engraving class at the academy. He directed the engraving class from 1762 to 1765. Chemesov's works, which include engraved, etched, and drypoint portraits, emphasize the subject's intellect and personality. Marked by confident line and a gentle stroke, they demonstrate Chemesov's mastery of various graphic techniques. Noteworthy examples are a portrait of F. G. Volkov (engraving, 1764–65), derived from A. P. Losenko's original, and portraits of I. I. Shuvalov (engraving, 1760) and Empress Elizaveta Petrovna (etching, drypoint, and engraving; 1761), both based on originals by P. Rotari.

CHENAB, a river in India and Pakistan. The Chenab measures approximately 1,100 km in length and drains an area of 138,000 sq km. Originating in the glaciers of the Western Himalayas, it flows through a deep valley in India and over the plains of Punjab in Pakistan. The main tributaries are the Jhelum and the Ravi, below the influx of which the Chenab is called the Trimab. The Chenab empties into the Sutlej River (Indus River basin).

The Chenab is fed by melting firn fields and glaciers and by rain, mainly during the summer monsoon season. The water level rises from June through October and is low in winter. The mean flow rate at the point where the river flows from the mountains is 890 cu m per sec; lower it decreases owing to the distribution of water through numerous irrigation canals (about 200,000 hectares of agricultural land is irrigated). Cities in the densely populated valley include Wazirabad, Chiniot, and Multan, all in Pakistan. [29–603–1]

CHENCHIANG (also Chinkiang), a city in East China, in Kiangsu Province. Population, more than 200,000 (1953). Chenchiang, a transportation junction and industrial center, is a port on the right bank of the Yangtze, near the intersection of the river and the Grand Canal. The city produces paper, silk fabric, and machinery for the lumber industry and has rice-polishing plants and flour mills. Chenchiang is situated in a rice-growing and sericultural region, and marble is quarried in the area.

[29–542–3]

CHENG CH'ENG-KUNG (in European sources, Koxinga or Coxinga). Born 1624; died 1662. Chinese general.

The son of a merchant, Cheng Ch'eng-kung in 1646 joined the struggle against the Manchu Ch'ing Dynasty, which at that time controlled nearly all China. Having established his power along the seacoast in Fukien, Kwangtung, and Chekiang provinces, Cheng won back from the Manchus a large part of Southeast China; in 1659, however, he was defeated at Nanking. In 1661 and 1662, Cheng drove the Dutch colonialists from the island of Taiwan and established a base there from which he fought against the Ch'ing Dynasty. Cheng's son and grandson ruled Taiwan until 1683, when the island was captured by the Ch'ing. [29–542–2]

CHENG CHEN-TO. Born Dec. 19, 1898, in the city of Wenchou, Chekiang Province; died Oct. 17, 1958. Chinese literary scholar, writer, and public figure.

Cheng Chen-to graduated from the Peking Institute of Railroad Transportation. He edited progressive journals and took part in the May Fourth liberation movement of 1919. In 1921 he helped found the Society of Literary Studies. He taught at the universities of Peking and Shanghai beginning in 1931 and also directed the institutes of literature and archaeology of the Academy of Sciences of the People's Republic of China. Cheng wrote poetry collections, short stories, and essays. He advocated the study of Chinese literature as a distinct form of world literature; he also studied literary genres that had previously been ignored by literary historians. He was the author of *Illustrated History of Chinese Literature* (1932), *History of Chinese Folk Literature* (1938), and *The Problem of Periodizing the History of Chinese Literature* (1958). Cheng translated A. P. Chekhov's *The Seagull*, A. N. Ostrovskii's *Poverty Is No Crime*, Goethe's *Reynard the Fox*, and poems by R. Tagore.

CHENGCHOU, a city in North China and the capital of Honan Province. Population, 1 million (1974). A transportation junction and important industrial center, Chengchou has enterprises of the cotton, food-processing, chemical, textile, and machine-building industries. The city has a university.

Chengchou, an ancient Chinese city, was for many centuries a district capital. It grew rapidly after the construction of the Peking-Hank'ou railroad was completed in 1906, and it experienced particularly intense growth in the 1950's. In 1953 it became the capital of Honan Province. In 1952, remains dating from the Shang (Yin) period were uncovered near Chengchou (*see* SHANG). Archaeologists discovered a fortified settlement surrounded by a pisé wall (2 km by 1.7 km), numerous burials, and workshops in which artisans produced bronze castings, inscribed bones, and pottery.

The site at Chengchou is divided stratigraphically into four periods, the latest of which is contemporary with the Shang capital in the 13th to 11th centuries B.C. near Hsiaot'un (*see* ANYANG). Chengchou has tentatively been identified in its earlier period

with Ao, the capital of the Shang ruler Chung Ting. Finds at the site, such as crucibles and ceramic molds, have made it possible to reconstruct the main features of metallurgical production in the middle Shang. It has been established that bronze tools were used extensively to inscribe bones. The lower strata of the Chengchou site seem to correspond to the period when the Shang ethnopolitical community first emerged in the basin of the Huang Ho; some researchers, however, link these strata with the culture of the Hsia tribe. [29–541–5]

CH'ENG HAO. Born 1032; died 1085. Chinese philosopher; a founder of neo-Confucianism.

Ch'eng Hao, together with his brother Ch'eng I, developed one of the fundamental ideas of neo-Confucianism—the concept of *li*. *Li* is a universal law that is both singular and diverse; it is inherent in and governs all people, things, and phenomena. *Li* is self-evident and independent, and it can be neither increased, or strengthened, nor diminished, or weakened. Ch'eng Hao was greatly concerned with the idea of existence as a continual process of birth and rebirth; all things possess a "life-giving principle"—namely, *jen*, or "humaneness." *Jen* eliminates the barriers between the self and all else, and it unites the heavens, earth, and man.

CH'ENG I (also Ch'eng I-ch'uan). Born 1033; died 1107. Chinese philosopher; a founder of neo-Confucianism. Brother of Ch'eng Hao.

As compared to Ch'eng Hao, Ch'eng I placed greater emphasis on the harmony between the oneness and the diversity of *li*, or "principle"; his thesis, "principle is one but its manifestations are many," is one of the best-known philosophical tenets in China. Ch'eng I held that *ch'i*, or "material force," always possesses a physical form, whereas "principle" precedes and is therefore devoid of physical form. According to Ch'eng I, *yin* and *yang* (the basic categories in Chinese natural philosophy) do not exist outside of "principle," and all things have both a corporeal and a nonmaterial aspect, corresponding to "material force" and "principle."

CH'ENGTU, a city in Southwest China, in the valley of the Min Chiang. Capital of Szechwan Province. Population, 2.2 million (1975).

Ch'engtu is a major transportation junction and industrial center. The city's machine-building industry manufactures such products as radios, machine tools, instruments, precision tools, and transportation equipment. There is copper and aluminum smelting. The city also manufactures rolled pipes, chemical products, textiles, food products, wood products, and leather goods. A fossil-fuel-fired steam power plant is located in the city. Ch'engtu, which is noted for its fine handicrafts, has a university.

Ch'engtu was founded in the fourth century B.C. It was the capital of the Shu state from A.D. 221 to A.D. 263 and the capital of the Earlier and Later Shu kingdoms from 908 to 965. From 1644 to 1646 the city was occupied by the rebel army of Chang Hsien-chung. In the second half of the 17th century, after the Manchu conquest of China, it became the capital of Szechwan Province. In September 1911 the city was besieged by nationalist rebels (*see* SZECHWAN UPRISING OF 1911). The city was freed from Kuomintang rule by the People's Liberation Army of China on Dec. 27, 1949.

Early in the Common Era, Ch'engtu was renowned for its brocades and was often called Chinch'eng, or "city of brocade." The city has numerous gardens and parks, and its architectural monuments include the Wu-hou Tz'u shrine (16th–18th centuries), the temple Ch'ing Yang Kung (literally, "Black Sheep Palace"; 13th century), and the monastery Pao Kuang Ssu. The Tu Fu House-Museum and the Szechwan Provincial Museum are located in Ch'engtu. [29–782–5]

CH'ENGTZUYAI, the site of an ancient settlement of the Lungshan culture (third and early second millennia B.C.), located near the city of Lungshangch'eng, Shantung Province, People's Republic of China (*see* LUNGSHAN). Discovered in 1928, Ch'engtzuyai was enclosed by clay walls with a palisade. The dwellings, which were round and coated with clay, had a clay hearth in the center. Tools and weapons were made of stone, bone, and shells. No metal articles were found. There was a great variety of black and yellow, often glazed, pottery. The inhabitants engaged in land cultivation and the raising of cows, horses, sheep, hogs, and dogs. Settlements of the Ch'engtzuyai type belong to the late stage of the primitive communal system in China. [29–783–3]

CH'EN I (also Chen Yi, Ch'en Yi). Born 1901 in Leshan District, Szechwan Province; died Jan. 6, 1972, in Peking. Chinese political and state figure.

The son of a civil servant, Ch'en I graduated from the University of Shanghai; from 1919 to 1921 he studied in France. He joined the Communist Party of China (CPC) in 1923 and took part in the Nanch'ang Uprising of 1927. From 1928 to 1936, Ch'en held command posts in the Chinese Red Army. During the Chinese people's war against the Japanese invaders (1937–45) he served in the New Fourth Army, first as commander of the First Detachment, then as acting commander of the army, and finally as commander. In 1945 he became a member of the Central Committee of the CPC.

From 1946 to 1949, Ch'en commanded the Third Field Army. From 1949 to 1954 he was a member of the Central People's Government Council of the People's Republic of China (PRC) and commander of the military district of East China. Ch'en served as mayor of Shanghai from 1949 to 1958 and in 1954 became a deputy premier of the National Defense Council. From 1955 to 1965, when military ranks were abolished in the PRC, he held the title of marshal of the PRC. From 1956 to 1969 he was a member of the Politburo of the Central Committee of the CPC. In 1958, Ch'en became minister of foreign affairs of the PRC. [29–784–2]

CHÉNIER, ANDRÉ MARIE DE. Born Oct. 29, 1762, in Constantinople; died July 25, 1794, in Paris. French poet and publicist. Brother of M.-J. de Chénier.

A. M. de Chénier graduated from the Collège de Navarre in Paris in 1781. His poems deal with the naïve joys and sorrows of people living in harmony with nature and with the charm of their daily labor and cares. Chénier derived the themes and forms of his poetry from classical authors, but the sincerity and freshness of feeling in his lyric poems led the romantics to consider him their precursor.

Chénier shared the Enlightenment's abstract love of freedom, and he welcomed the French Revolution in the ode "The Tennis Court Oath" (1791). Frightened by the progress of revolutionary events, however, he adopted a hostile attitude toward the Jacobins and wrote biting pamphlets for the liberal monarchist press. He was arrested in 1793 and executed several months later. While in prison, Chénier wrote the anti-Jacobin cycle *Iambics* (1794) and the ode "The Young Captive" (1795). His poetry was not published until 1819. In Russia, some of Chénier's poems were translated by A. S. Pushkin, who devoted the poem "André Chénier" (1825) to him, and by E. A. Baratynskii, A. A. Fet, A. K. Tolstoy, and V. Ia. Briusov.

CHÉNIER, MARIE-JOSEPH DE. Born 1764 in Constantinople; died Jan. 10, 1811, in Paris. French dramatist, poet, and publicist. Brother of A. M. de Chénier. Member of the Académie Française (1803).

Chénier graduated from the Collège de Navarre in Paris. His tragedy *Charles IX, or a Lesson to Kings* (staged 1789, published 1790; later called *Charles IX, or St. Bartholomew's Eve*) established revolutionary classicism in the French theater. During the French Revolution, Chénier was a Jacobin and a deputy to the National Convention. He was the author of many patriotic hymns for national festivals, including "Chant du 14 juillet" (1790) and "Chant du départ" (1794). A member of the moderate wing of the Jacobins, Chénier was opposed to revolutionary terror. After the revolution he remained faithful to his republican beliefs. A steadfast love of freedom pervades Chénier's tragedies *Philip II* (1803) and *Tiberius* (1805), and also his verse satires, which circulated in manuscript copies.

CHENLA, a state of the mid-sixth to the eighth century that was formed by Mon-Khmer tribes living along the middle course of the Mekong River. Chenla, first mentioned as a vassal state of Funan, was situated southwest of Lin-Yi (Champa). Isanavarman I (ruled early seventh century to c. 635) conquered Funan, having extended his authority westward to Angkor, and founded the capital of Chenla at Isanapura, on the Stung Sen. Under Jayavarman I (ruled early eighth century), the last ruler of Chenla, the state split into rival principalities. The culture of Chenla is represented by brick temples, remarkable sculpture, and numerous epigraphs in Old Khmer and Sanskrit that have been preserved.

[29–174–7]

CH'EN SHENG AND WU KUANG, UPRISING OF, a peasant uprising in China in 209 and 208 B.C. The uprising was initiated in August 209 in northern Anhwei Province by a detachment of some 900 peasant recruits under the command of Wu Kuang and Ch'en Sheng, a farmhand called up for military service. The rebel force soon numbered in the tens of thousands and continued to increase steadily. Although peasants constituted the principal driving force of the rebellion, soldiers, artisans, and, according to some sources, slaves also took part.

In early 208 B.C. the insurgent army approached the Ch'in capital of Hsienyang, in Shensi Province. It captured northern and central Anhwei, all of Honan, southern Shansi, and eastern Shensi. Members of ruling-class opposition groups, chiefly from the hereditary aristocracy in the kingdoms destroyed by the Ch'in Dynasty, gradually assumed leadership of the uprising. They hoped to use the popular movement as a means of overthrowing the Ch'in Dynasty and restoring their own rights and possessions. The new leaders pushed aside those close associates of Ch'en Sheng from the peasantry whom they could not use; some, including Wu Kuang, were physically removed. In the winter of 208 B.C., Ch'en Sheng himself was treacherously murdered. In February 208 a Ch'in army crushed the rebellion.

The uprising of Ch'en Sheng and Wu Kuang was the first major popular rebellion in China. Although it met defeat, the uprising dealt the Ch'in Empire a blow from which it never recovered.

CH'EN T'IEN-HUA. Born 1875 in Hsinhua District, Hunan Province; died Dec. 8, 1905, in Tokyo. Chinese bourgeois revolutionary.

In early 1904, Ch'en T'ien-hua helped Huang Hsing form the organization Hua-hsing Hui for the purpose of overthrowing the Manchu Ch'ing Dynasty. After attempts to raise an armed rebellion in Ch'angsha in October 1904 failed, Ch'en fled to Japan. A founder of the T'ung-meng Hui, he wrote patriotic revolutionary pamphlets that played an important role in the ideological preparation for the Hsinhai Revolution. [29–784–3]

CH'EN TU-HSIU. Born 1879; died May 24, 1942. Figure in the Communist Party of China (CPC).

Ch'en Tu-hsiu became editor of the journal *Hsin ch'in-nien* in 1915 and subsequently was a professor at the school of letters at Peking National University. He also served as dean of the school. Ch'en took part in the patriotic anti-imperialist May Fourth Movement of 1919. In 1920 he organized in Shanghai the first Communist circle in China. He was elected secretary of the Provisional Bureau at the First Congress of the CPC in 1921 and general secretary of the party's Central Committee at the Second Congress of the CPC in 1922.

At an extraordinary conference of the Central Committee of the CPC held on Aug. 7, 1927, Ch'en was removed from the post of general secretary because of his errors during the Revolution of 1925–27. In November 1929 the Politburo of the Central Committee of the CPC expelled Ch'en from the party for his Trotskyist positions. [29–784–1]

CHEPETSKII, an urban-type settlement in Zuevka Raion, Kirov Oblast, RSFSR. Chepetskii is situated on the right bank of the Cheptsa River, a tributary of the Viatka, 18 km north of the Zuevka railroad station on the Kirov-Perm' line. It has a logging and timber distribution establishment. [29–175–5]

CHEPIKOV, KONSTANTIN ROMANOVICH. Born Dec. 12, (25), 1900, in Vladimirskoe, in what is now Smolensk Oblast. Soviet geologist. Corresponding member of the Academy of Sciences of the USSR (1953). Member of the CPSU since 1919.

Chepikov graduated from the Moscow Academy of Mines in 1929. Between 1929 and 1939, he served on the staffs of various research and production organizations of the petroleum industry; from 1930 to 1932, he was the director of the Geological Oil Exploration Institute. He was on the staff of the Institute of Geological Sciences of the Academy of Sciences of the USSR from 1939 to 1954, becoming the head of the institute's petroleum laboratory in 1947. From 1954 to 1957, Chepikov was the deputy director of the Institute of Petroleum of the Academy of Sciences of the USSR. After the Institute of Petroleum was reorganized as the Institute of Geology and Fossil Fuel Treatment, he became the head of the institute's laboratory in 1957.

Chepikov's main works deal with problems of stratigraphy, lithology, and tectonics, as well as with formation conditions for reservoir rocks, the migration of oil and gas, and the estimation of oil and gas reserves in the Northern Caucasus, the Volga-Ural region, Siberia, and Sakhalin.

Chepikov received the State Prize of the USSR in 1946. He has been awarded the Order of the October Revolution, two other orders, and various medals. [29–175–6]

CHEPRAK, the Russian term for the middle part of an animal hide and the leather made from it. The *cheprak* is characterized by great density, thickness, and durability; it is used to make shoe soles, thongs, and other articles. [29–176–2]

CHEPTSA, a river in Perm' and Kirov Oblasts and in the Udmurt ASSR, a left tributary of the Viatka River of the Volga basin. The Cheptsa is 501 km long and drains an area of 20,400 sq km. It rises in the upland known as the Verkhnekama Elevation and flows through the upland westward in a deep and broad valley; in its lower course it crosses the Viatka Uval. The Cheptsa is fed mainly by snow. The mean flow rate 85 km from the mouth is 130 cu m per sec. The river freezes over in November, and the ice breaks up in April or early May. The Cheptsa is used for floating timber. It is navigable for 135 km from the mouth. The cities of Glazov and Kirovo-Chepetsk are situated on the Cheptsa. [29–176–4]

CHEPTSOV, EFIM MIKHAILOVICH. Born Dec. 28, 1874 (Jan. 9, 1875), in the village of Medvenka, now in Kursk Oblast; died Jan. 8, 1950, in Moscow. Soviet painter. Honored Artist of the RSFSR (1946).

Cheptsov began his career as an icon painter and illustrator. From 1905 to 1911 he studied at the St. Petersburg Academy of Arts with V. E. Savinskii and V. E. Makovskii. In 1922 he joined the Association of Artists of Revolutionary Russia. He taught at the Leningrad Institute of Painting, Sculpture, and Architecture from 1938 to 1940 and at the V. P. Potemkin City Pedagogical Institute in Moscow from 1945 to 1949.

Cheptsov's prerevolutionary paintings depicted themes from both rural and urban life, for example, *At the Country Fair* (1910, Kursk Picture Gallery) and *At the Doctor's Office* (1911, Art Museum, Krasnodar). Several of his works depict regions in Italy, especially the island of Capri. Cheptsov's most important works include *A Meeting of the Village Party Cell* (1924) and *The Retraining of Teachers* (1925), both housed at the Tret'iakov Gallery. Alive with the spirit of the new phenomena of rural life and marked by a precise rendering of details from everyday life, the paintings played a vital role in the development of Soviet genre painting. Cheptsov's later works include *Weeding the Beets* (1938), *The Last News From the Front* (1942), *The Harvest* (1944), and *On the Day Off* (1946), all at the Kursk Picture Gallery.

CHEPURKOVSKII, EFIM MIKHAILOVICH. Born Jan. 20 (Feb. 1), 1871, in Kiev; died 1950. Russian anthropologist. Master of sciences (1913).

Chepurkovskii emigrated to the USA on the eve of World War II. His major works deal with the geographical distribution of anthropological features and the anthropology of the Russian people. Chepurkovskii also wrote works on general anthropology. He was the first in Russia to make use of statistical methods in the study of anthropological material. He also wrote a critical analysis of anthroposociological theories. Some of Chepurkovskii's general theoretical views are erroneous.

CHER, a department in central France. Area, 7,800 sq km. Population, 316,000 (1975). The capital of Cher is Bourges. Industry employs 32 percent of the economically active population, and agriculture 32 percent (1968). The department's agriculture is diversified. Industry includes agricultural machine building, aircraft construction, food processing, and the production of glass and ceramic ware. The main industrial centers of Cher are Bourges and Vierzon. [29–1134–1]

CHERA, one of three ancient Tamil states, in the southern part of India's Malabar Coast. The Chera state was first mentioned in the third century B.C. It fell in about the ninth century A.D. Chera is the origin of the name Kerala, a historical region and state in India. [29–177–2]

CHERANOVSKII, BORIS IVANOVICH. Born July 1 (13), 1896, in the village of Pavlovichi, Volyn' Province; died Dec. 17, 1960, in Moscow. Soviet aircraft designer.

Between 1924 and 1927, Cheranovskii studied at the Air Force Academy. In 1922 he began to design and construct gliders and airplanes of the "flying wing" type, in which the tail assembly is located on the wing. In 1924 he developed the BICh-2 glider, in which the leading edge of the wing had a parabolic planform. Cheranovskii's BICh-8 glider, which was successfully tested in 1929, was the first to employ a delta wing. Cheranovskii also developed "flying wing" airplanes with a central vertical tail assembly (the BICh-3 in 1926 and the BICh-7A in 1933). He was awarded the Order of the Red Star.

CHERBOURG, a city in northern France, in Manche Department. Population, 83,000 (1975). Cherbourg is a port on the Cotentin Peninsula, on the English Channel. Ships, agricultural machinery, photographic materials, clothing, furniture, and beer are manufactured in the city. [29–1134–7]

CHERBULIEZ, ANTOINE-ELISÉE. Born July 29, 1797, in Geneva; died Mar. 7, 1869, in Zürich. Swiss economist and judge.

Cherbuliez's ideas reflect the process of the replacement of the classical school of bourgeois political economy by the vulgar school. K. Marx called Cherbuliez's views an amazing combination of the mutually exclusive views of Sismondi and Ricardo (see K. Marx and F. Engels, *Soch.*, 2nd ed., vol. 26, part 3, p. 395). Cherbuliez's demand that the state abolish private ownership of land and collect rent as a substitute for taxes was described by Marx as "an open expression of the hatred of the industrialist capitalist for the landowner, whom he regards as useless and superfluous in bourgeois production" (*ibid.*, vol. 4, p. 174). [29–1134–8]

CHERCHE, a balneological and pelotheraputic resort in L'vov Oblast, Ukrainian SSR. Situated 80 km from L'vov and 7 km from the railroad station of Rogatin. The summer is moderately warm (mean July temperature 18°C), and the winter moderately mild (mean January temperature −5°C). The annual precipitation reaches 730 mm. Curative agents include sulfide sulfate-hydrocarbonate-calcium-magnesium water and sulfate calcium water (used for baths) and peat mud. Treatment is available for diseases of the organs of motion and support, gynecological diseases, and diseases of the peripheral nervous system. The resort has a sanatorium and a balneological and pelotherapeutic clinic. [29–333–3]

CHERCHELL, a city in northern Algeria, situated on the Mediterranean Sea. Located on the Algiers-Oran highway. Population, 11,700 (1966). Cherchell, a fishing port, produces canned fish and wine. [29–1153–2]

CHERCHEN (Chinese, Ch'iehmo), a city in Northwest China, in the southern part of the Sinkiang Uighur Autonomous Region, on the Ch'eerhch'en Ho. Population, approximately 15,000 (1957). Cherchen is a freight in-transit center on the North Kunlun Highway. Cottage industry includes the production of carpets and woolen and silk fabrics. Other industry includes the processing of livestock products and fruit products. Gold and marble deposits are found in the area. [29–334–1]

CHERDAKLY, an urban-type settlement and administrative center of Cherdakly Raion, Ul'ianovsk Oblast, RSFSR. Cherdakly has a railroad station on the Ul'ianovsk-Ufa line, 35 km east of Ul'ianovsk. The city has a meat-packing plant, a distillery, a butter factory, a mixed-feed plant, and a grain elevator. [29–185–2]

CHERDYN', a city and the administrative center of Cherdyn' Raion, Perm' Oblast, RSFSR. It is situated on the right bank of the Kolva River, near the confluence of the Kolva and the Vishera River. A landing is located 8 km from the city on the Vishera. Cherdyn' is 111 km north of the Solikamsk railroad station.

Archaeological data show that the inhabitants of a settlement on the site of modern Cherdyn' carried on trade with the Volga Bulgars in the ninth and tenth centuries. The city is known to have existed since at least 1472, when it became part of the Muscovite state. The Cherdyn' Road, an ancient route through the Urals and Western Siberia, began at Cherdyn'. Salt was mined in the Cherdyn' area in the 16th century, and a metallurgical plant was built in the 17th century. Cherdyn' became a district capital in 1781 and part of Perm' Province in 1796. It was an important trade center in the 19th century.

The lumber industry plays an important role in the city's economy. Cherdyn' has a forestry technicum and the A. S. Pushkin Museum of Local Lore, which was founded in 1899, is located in the city.

CHERDYN' ROAD, an ancient road through the Urals to Western Siberia. From the city of Cherdyn', the road went upward along the valleys of the Vishera, Veslui, and Pochmoga rivers. It then went through the drainage divide to the Tal'tia River and down along the Ivdel', Loz'va, Tavda, and Tobol rivers. The Cherdyn' Road was the only road to Siberia established by the government during the first years after the fall of the Siberian Khanate in the late 16th century. Around 1590, Loz'va was founded on the Cherdyn' Road. In 1598 the shorter Babinov Road became the official road, and the Cherdyn' Road lost its importance. [29–185–3]

CHERDYNTSEV, VIKTOR VIKTOROVICH. Born May 4 (17), 1912, in Moscow; died there Aug. 16, 1971. Soviet physicist and geochemist. Doctor of sciences in physics and mathematics (1947).

A student of V. I. Vernadskii and V. G. Khlopin, Cherdyntsev served on the staff of the Radium Institute of the Academy of Sciences of the USSR from 1930 to 1944 and on the staff of the Institute of Astronomy and Physics of the Academy of Sciences of the Kazakh SSR from 1944 to 1960. From 1946 to 1960, he was also the head of the subdepartment of experimental physics at the Kazakh University in Alma-Ata; he became a professor at the university in 1948. In 1960 he became the head of the laboratory of absolute age determination at the Geological Institute of the Academy of Sciences of the USSR in Moscow.

Cherdyntsev's main works dealt with the geochemistry of isotopes, nuclear geophysics, and radiogeology. Cherdyntsev was the first to substantiate the origin of heavy elements in massive stars. In 1954, together with P. I. Chalov, he discovered the spontaneous fission of the uranium isotopes ^{234}U and ^{238}U; the spontaneous fission of the two uranium isotopes is called the Cherdyntsev-Chalov effect. Cherdyntsev demonstrated the importance of radioactive and radiogenic isotopes, such as ^{4}He and ^{40}Ar, in the study of the earth's upper mantle.

CHEREK, a river in the Kabarda-Balkar ASSR, a right tributary of the Baksan River of the Terek basin. The Cherek is 76 km long and drains an area of 3,070 sq km. It is formed by the confluence of the Cherek-Balkarskii and Cherek-Khulamskii rivers, which originate at glaciers on the northern slopes of the Greater Caucasus. The Cherek is fed mainly by glaciers and snow. High water occurs in the summer. The average flow rate below the confluence of the headstreams is 39.5 cu m per sec. The Cherek is used for floating timber. [29–193–3]

CHEREKHA, a river in Pskov Oblast, RSFSR; a right tributary of the Velikaia River. The Cherekha measures 145 km in length and drains an area of 3,230 sq km. It flows through a swampy lowland. It is fed mainly by snow. High water lasts from late March to early May. The mean flow rate 14 km from the mouth is 16.3 cu m per sec. The river freezes in late November to December, and the ice breaks up in late March or April. [29–219–2]

CHEREMISINOVO, an urban-type settlement and the administrative center of Cheremisinovo Raion, Kursk Oblast, RSFSR. Cheremisinovo has a railroad station on the Kursk-Voronezh line, 88 km northeast of Kursk. The settlement has a butter factory. [29–193–4]

CHEREMISOV, VLADIMIR ANDREEVICH. Born May 9 (21), 1871; date of death unknown. Russian general of the infantry (1917).

The son of a nobleman in Baku Province, Cheremisov completed courses at the Moscow Infantry Cadet School in 1891 and at the Academy of the General Staff in 1899. He taught at a military school and at the Academy of the General Staff and served in staff positions.

During World War I, Cheremisov commanded a regiment, was quartermaster general of the Twelfth Army, and served as a specially assigned general with the Seventh Army commander. After the February Revolution of 1917, the democratically inclined Cheremisov was appointed commander of a corps that operated successfully in the June Offensive of 1917. He became commander of the Eighth Army in June 1917 and commander of the Northern Front in September of the same year. During the October Revolution, the troops of the Northern Front did not support the Kerensky-Krasnov Rebellion of 1917, owing to the influence of the Bolsheviks among them as well as to orders from Cheremisov, who reflected the mood of his soldiers. Cheremisov left the service in November 1917, went to Kiev, and emigrated in 1918. He did not engage in political activities abroad.

CHEREMKHOVO, a city under oblast jurisdiction and the administrative center of Cheremkhovo Raion, Irkutsk Oblast, RSFSR. Railroad station on the Trans-Siberian Railroad, 130 km northwest of Irkutsk. Population, 87,000 (1977). Cheremkhovo is one of the coal-mining centers of the Irkutsk Coal Basin. Industry includes a machine-building plant, a mining-equipment repair plant, a paperboard and Ruberoid plant, and building-materials enterprises. Cheremkhovo also has a brewery, a milk combine, a meat-packing plant, a stocking factory, and a clothing factory. Educational and cultural institutions include an evening division of the Irkutsk Polytechnic Institute, a mining technicum, a pedagogical institute, a medical school, and a drama theater. [29–196–4]

CHEREMNYKH, MIKHAIL MIKHAILOVICH. Born Oct. 18 (30), 1890, in Tomsk; died Aug. 7, 1962, in Moscow. Soviet graphic artist. People's Artist of the RSFSR (1952); member of the Academy of Arts of the USSR (from 1958).

Cheremnykh studied with K. A. Korovin and S. V. Maliutin at the Moscow School of Painting, Sculpture, and Architecture from 1911 to 1917. He taught at the V. I. Surikov Moscow Art Institute from 1949 to 1962, becoming a professor there in 1950. Cheremnykh was the creator of the Okna ROSTA and one of the creators of the Okna TASS (*see* OKNA ROSTA and OKNA TASS). He worked for several newspapers and for the magazines *Krokodil* (from 1922), *Bezbozhnik u stanka*, and *Smekhach*.

Cheremnykh's work is rich in satiric allegory and symbolism, tending toward grotesque solutions that have a tremendous effect upon the viewer. In his posters and caricatures dealing with international and domestic topics, he frequently used montages of drawings devoted to related subjects and different graphic techniques (for example, simple stylized silhouetting or great tonal

and linear detail). Examples of his posters are *We Must Be Ready* (Okna ROSTA, no. 744, 1920) and *May the Antifascist World Front Increase That the Knife Might Fall From This Claw* (1938). Cheremnykh also worked as a book illustrator (for example, drawings to the works of M. E. Saltykov-Shchedrin, charcoal and white pigment, 1936–39, Literary Museum, Moscow) and as a stage artist (for A. F. Pashchenko's *Madame de Pompadour*, Leningrad Malyi Opera Theater, 1939). A recipient of the State Prize of the USSR in 1942, he was also awarded the Order of the Badge of Honor and various medals.

CHEREMOSH (also Cheremoshel'), a river in the western Ukrainian SSR, a right tributary of the Prut River. The Cheremosh is 80 km long and drains an area of 2,560 sq km. It is formed by the confluence of the Chernyi Cheremosh (87 km) and Belyi Cheremosh (51 km), which flow from the Eastern Carpathians. The Cheremosh is fed by mixed sources, but mainly by rain. The average flow rate below the confluence of the Chernyi Cheremosh and Belyi Cheremosh is 26.6 cu m per sec. The river is used for floating timber. The cities of Vizhnitsa and Vashkovtsy are situated on the Cheremosh. [29–195–1]

CHEREMSHANKA, an urban-type settlement in Cheliabinsk Oblast, RSFSR, under the jurisdiction of the Verkhnii Ufalei city soviet. Cheremshanka is situated 8 km northeast of the Verkhnii Ufalei railroad station. Nickel ore is mined nearby. [29–196–6]

CHEREMSHINA, MARKO (real name, Ivan Iur'evich Semaniuk). Born June 1 (13), 1874, in the village of Kobaki, in what is now Kosov Raion, Ivano-Frankovsk Oblast; died Apr. 25, 1927, in the city of Sniatin, in what is now Ivano-Frankovsk Oblast. Ukrainian writer.

The son of a peasant, Cheremshina graduated from the law faculty of the University of Vienna in 1901 and received his doctor of law degree in 1906. In 1912 he opened a law office in Sniatin, where he became known as the peasants' attorney. He conducted extensive cultural and educational work among the local population.

Cheremshina's first short story, "The Helmsman" (1896), dealt with the life of raftsmen on the Cheremosh River. His cycle of lyric prose poems *Leaves* (1898) was influenced by modernist aesthetics. Largely under the influence of I. Ia. Franko, Cheremshina subsequently turned to critical realism in such works as *Notches* (1901), a collection of short stories about poor Hutzul peasants. His collection *The Village Perishes* (1925) consisted of antimilitarist short stories dealing with the life of the people during World War I. The short stories Cheremshina wrote during the last years of his life about the poverty of the popular masses in bourgeois Poland appeared in Soviet Ukrainian periodicals and after his death were published in Kiev in 1929 in the collection *The Summit*.

Cheremshina's work was highly valued by Franko, O. Makovei, O. Kobylianskaia, and Lesia Ukrainka. Some of his works have been translated into languages of the USSR and foreign countries. A museum devoted to Cheremshina was established in Sniatin in 1949, and monuments have been erected to the democratic writer in Sniatin and Kobaki.

CHEREMUKHIN, ALEKSEI MIKHAILOVICH. Born May 17 (29), 1895, in Moscow; died Aug. 19, 1918, in Palanga, Lithuanian SSR. Soviet airplane builder. Doctor of sciences in technology (1937), professor (1934); Honored Worker in Science and Technology of the RSFSR (1947).

In 1917 and 1918, Cheremukhin was an instructor at the Kacha Flight Training School. In 1923 he graduated from the Moscow Higher Technical School. From 1918 to 1922, he was on the staff of the Central Aerodynamic and Hydrodynamic Institute, where he helped design and construct the first Soviet airplanes. From 1927 to 1935, Cheremukhin designed and tested the first Soviet helicopters. In 1938 he joined the staff of A. N. Tupolev's experimental design office, becoming a deputy chief designer in 1953.

Cheremukhin received the Lenin Prize in 1957 and the State Prize of the USSR in 1949 and 1952. He was awarded three Orders of Lenin, three other orders, and various medals.

CHEREMUKHOVO, an urban-type settlement in Sverdlovsk Oblast, RSFSR, under the jurisdiction of the Severoural'sk city soviet. Cheremukhovo is situated 32 km north of the Boksity railroad station. Bauxites are mined at Cheremukhovo. [29–196–2]

CHEREMUSHSKII, an urban-type settlement in Kotlas Raion, Arkhangel'sk Oblast, RSFSR. Cheremushskii has a railroad station on the Kotlas-Vorkuta line. Logging plays an important role in the settlement's economy. [29–196–3]

CHERENKOV, PAVEL ALEKSEEVICH (P. A. Čerenkov). Born July 15 (28), 1904, in the village of Novaia Chigla, in what is now Voronezh Oblast. Soviet physicist. Academician of the Academy of Sciences of the USSR (1970; corresponding member, 1964). Member of the CPSU since 1946.

Cherenkov graduated from the University of Voronezh in 1928. In 1930 he joined the staff of the Institute of Physics of the Academy of Sciences of the USSR. He is a professor at the Moscow Physical Engineering Institute.

In 1934, while investigating the luminescence of liquids, Cherenkov discovered a new optical effect that consists in the emission of distinctive optical radiation when a material is bombarded by charged particles traveling at a speed greater than the speed of light in the material (*see* CHERENKOV RADIATION). In 1958, Cherenkov shared a Nobel Prize for the discovery of the effect with I. E. Tamm and I. M. Frank, who developed the theory of the effect. Methods using Cherenkov radiation to detect charged particles have been developed (*see* CHERENKOV COUNTER).

Cherenkov has also carried out research in nuclear physics, high-energy particle physics, the study of cosmic rays, and the development of electron accelerators. He received the State Prize of the USSR in 1946, 1952, and 1977 and has been awarded two Orders of Lenin, three other orders, and various medals.

CHERENKOV COUNTER (or Čerenkov counter), a device that uses Cherenkov radiation to detect charged particles or gamma rays.

If a charged particle moves in a medium at a velocity v that is greater than the phase velocity of light waves in the medium, the particle emits Cherenkov radiation. The phase velocity of light waves in a given medium is equal to c/n, where n is the refractive index of the medium and c is the speed of light in vacuum. Cherenkov radiation is emitted in a specific direction, and the angle θ between the direction of the radiation and the trajectory of the particle is related to v and n. The relationship is given by the equation $\cos \theta = c/vn = 1/\beta n$, where $\beta = v/c$. The yield N of Cherenkov radiation per centimeter of path between wavelength limits λ_1 and λ_2 is specified by the equation

$$N(\lambda_1\lambda_2) = \frac{2\pi Z^2}{137}\left(\frac{1}{\lambda_1} - \frac{1}{\lambda_2}\right)\sin^2\theta$$

where Z is the charge of the particle in units of the charge of the electron.

In contrast to a scintillation counter, in which particles with any velocity are detected and the radiation is both isotropic and delayed, the light in a Cherenkov counter is emitted only by particles whose velocities $v \geq c/n$, that is, by particles for which $\beta \geq 1/n$. The emission occurs at the same time as the passage of the particles and at an angle θ to the trajectory of the particles. The angle θ and the radiation yield increase with increasing particle velocity above a certain threshold velocity. For particle velocities that approach the speed of light—that is, for $(1 - \beta) \ll 1$—the angle attains a maximum value $\theta_{max} = \cos^{-1}(1/n)$. As a rule, the amount of light emitted in a Cherenkov counter is a few percent of a light pulse in a scintillation counter.

The basic components of a Cherenkov counter are a transparent substance in which $v > c/n$; an optical system, which focuses the light; and one or more multiplier phototubes, which convert a light pulse into an electrical signal (see Figure 1). The transparent substance may be a solid, a liquid, or a gas. It should be transparent to Cherenkov radiation and have a low level of scintillation, since scintillations produce background signals. Among the conventional substances used are organic glass ($n = 1.5$), lead glass ($n = 1.5$), and water ($n = 1.33$).

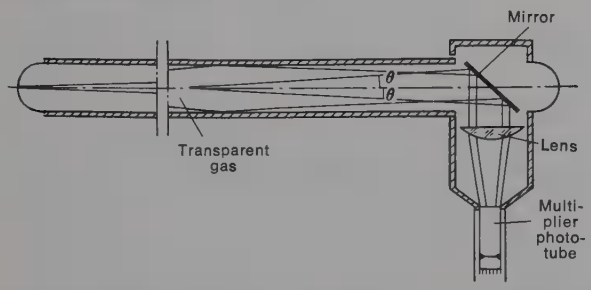

Figure 1. Schematic of a threshold gas Cherenkov counter used with the 70-GeV particle accelerator of the Institute of High-energy Physics (USSR). The Cherenkov light is collected at the cathode of the multiplier phototube by means of an optical system consisting of a plane mirror and a quartz lens.

Cherenkov counters are widely used in experiments employing particle accelerators, since the counters make it possible to pick out particles whose velocity lies in a specific range. As accelerator energies and, consequently, particle energies have increased, gas Cherenkov counters have been especially widely used. Gas Cherenkov counters can single out ultrarelativistic particles, for which $(1 - \beta) \ll 1$. The angle θ at which the radiation is emitted is very small in the case of a gas, and the radiation yield per unit path is low. To obtain a flash of light that is sufficient for the detection of a particle, the length of a gas Cherenkov counter must be increased to 10 m or longer. In gas Cherenkov counters, the refractive index may be varied continuously within a given range by changing the operating gas pressure.

Three types of Cherenkov counters are distinguished: threshold, differential, and total-absorption. The main characteristics of threshold and differential Cherenkov counters are the detection efficiency and the velocity resolution; the latter is a measure of a counter's ability to distinguish two particles moving with nearly the same velocity. A threshold Cherenkov counter should detect all particles with velocities greater than some threshold value. Therefore, a threshold counter's optical system, which is a combination of lenses and mirrors, should—if possible—collect all the emitted light at the cathode of the multiplier phototube.

Differential Cherenkov counters detect particles whose velocity lies between certain limits v_1 and v_2. In conventional differential Cherenkov counters, the desired particles are detected by using the optical system to select the light that is emitted at an angle lying between the corresponding limits θ_1 and θ_2. A lens or a spherical mirror placed in the path of the Cherenkov light focuses the light that is emitted at an angle θ into a ring of radius $R = f\theta$, where f is the focal length of the lens or mirror. If an annular slit diaphragm is placed at the focus of the optical system and one or more multiplier phototubes are placed behind the diaphragm, light will be detected only for particles that radiate at an angle lying within certain limits. A differential Cherenkov counter with a precision optical system makes it possible to single out particles whose velocity differs by just 10^{-6} from the velocity of other particles. Such Cherenkov counters require special control over the gas pressure and the formation of a parallel particle beam.

Total-absorption Cherenkov counters are intended for the detection and spectrometry of electrons and gamma rays. In contrast to threshold and differential Cherenkov counters, in which a particle loses a negligibly small fraction of its energy in the transparent substance, a total-absorption Cherenkov counter contains a very thick slab of transparent material, in which an electron or a gamma ray produces an electron-photon avalanche and loses all or most of its energy. As a rule, the slab is made of glass with a high lead content. An electron with an energy of up to 10 gigaelectron volts (GeV) may be virtually completely stopped in a slab of such glass with a thickness of, for example, 40 cm. The amount of light that is emitted in a total-absorption Cherenkov counter is proportional to the energy of the initial electron or gamma ray. The energy resolution $\Delta\mathcal{E}$ of a total-absorption Cherenkov counter is energy dependent and, for the most sensitive multiplier phototubes, may be specified by the equation $\Delta\mathcal{E} \sim (10\sqrt{\mathcal{E}})\%$, where $\mathcal{E}$ is the electron energy in gigaelectron volts.

CHERENKOV RADIATION (also Čerenkov radiation, Cherenkov effect, or Čerenkov effect), the emission of light by a charged particle when the particle moves in a medium at a velocity greater than the phase velocity of light waves in the medium, that is, greater than the velocity at which light waves propagate in the medium. Cherenkov radiation was discovered in 1934 by P. A. Cherenkov when, during a study of the gamma-ray luminescence of solutions, he observed a faint blue glow in liquids irradiated by gamma rays.

Even the early experiments of Cherenkov, which were undertaken on the initiative of S. I. Vavilov, revealed a number of characteristic features of Cherenkov radiation. The early experiments showed that the glow is observed in all pure transparent liquids, the brightness of the glow is weakly dependent on the chemical composition of such a liquid, and the radiation is polarized with the electric vector preferentially oriented parallel to the direction in which the charged-particle beam propagates. In contrast to luminescence, neither temperature quenching nor impurity quenching (*see* QUENCHING OF LUMINESCENCE) of the glow was observed in the experiments. On the basis of the observational data, Vavilov contended that the phenomenon discovered by Cherenkov was not the luminescence of a liquid and that the light was emitted by high-speed electrons moving in the liquid; during gamma irradiation, such electrons arise as a result of the Compton effect. Therefore, the phenomenon would more correctly be referred to as Vavilov-Cherenkov radiation, or the Vavilov-Cherenkov effect, rather than as the Cherenkov effect, which is the conventional term used, especially in the non-Soviet literature. Cherenkov radiation is also characteristic of solids.

Different types of glows caused by gamma rays were repeatedly observed after the discovery of radium. In particular, the glow in liquids irradiated by gamma rays was investigated between 1926 and 1929 by the French scientist M. L. Mallet, who obtained photographs of the glow's spectrum. However, no evidence that the glow was a new phenomenon was obtained, and the most characteristic property of the radiation—namely, its directivity at an acute angle to the direction of motion of the particle—was not established. The directivity of the radiation was discovered by Cherenkov in 1936.

The mechanism of the Cherenkov effect was explained in a paper published by I. E. Tamm and I. M. Frank in 1937. The paper also contained a quantitative theory based on the equations of classical electrodynamics. A quantum treatment by V. L. Ginzburg in 1940 led to the same results.

The conditions under which Cherenkov radiation occurs and the directivity of the radiation may be explained by means of the

Huygens-Fresnel principle. For this purpose, each point of the trajectory of a charged particle—for example, the point *A*, *B*, *C*, or *D* in Figures 1 and 2—should be regarded as the source of a secondary wave, which is generated when the charge passes through that point. In an optically isotropic medium, such secondary waves are spherical since they propagate in all directions at the same velocity $u = c/n$, where c is the speed of light in vacuum and n is the refractive index of a given medium. Let us assume that a particle moving with velocity v is at point E at the moment of observation. Since the distance between points A and E is equal to vt, t seconds before the particle is observed at E, it passes through A. Consequently, by the moment of observation, the wave emanating from A is a sphere of radius $R = ut$ (the circle 1 in Figures 1 and 2 corresponds to the sphere). Light is emitted from *B*, *C*, and *D* at increasingly later moments in time; the waves emanating from these points are represented by the circles 2, 3, and 4, respectively. According to Huygens' principle, as a result of interference, secondary waves cancel one another everywhere except at their common envelope. The wavefront of the light propagating in the medium corresponds to the common envelope.

Let the particle velocity v be less than the speed of light u in a medium (Figure 1). Then, the earlier the emission of forward-propagating light, the greater the distance at which the light overtakes the particle. In this case, the secondary waves do not have a common envelope; that is, all the circles 1, 2, 3, and 4 lie inside one another. This situation corresponds to the obvious fact that an electric charge undergoing uniform rectilinear motion at a speed less than the speed of light in a medium should not emit light.

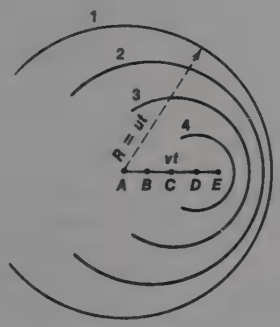

Figure 1. The motion of a charged particle in a medium at a velocity of $v < u$: the circles 1, 2, 3, and 4 represent the locations of the secondary waves emitted by the particle from points *A*, *B*, *C*, and *D*, respectively

However, the situation is different if

$$v > u = c/n, \text{ or } \beta n > 1 \tag{1}$$

where $\beta = v/c$, that is, if the particle moves faster than the light waves. In this case, the spheres corresponding to the light waves intersect (Figure 2). The common envelope of the light waves, or the wavefront, is a cone with its vertex at E, which coincides with the instantaneous position of the particle. The normals to the generators of the cone give the wave vectors, that is, the direction in which the light propagates. The angle that a wave vector makes with the direction of the particle's motion (see Figure 2) satisfies the relation

$$\cos\theta = u/v = c/nv = 1/\beta n \tag{2}$$

The same method may be used to consider optically anisotropic media. However, the fact that the speed of light in such a medium depends on the direction in which the light propagates must be taken into account. Therefore, the secondary waves are not spheres. In this case, different cones correspond to ordinary and extraordinary rays and, in accordance with equation (2), the radiation is emitted at various angles θ to the direction in which the particle propagates. For optically anisotropic media, criterion (1) is formulated somewhat differently. In all cases, the basic equations of the theory are in good agreeent with experiments.

Theory has shown that, in an optically isotropic medium, a particle of charge e traveling a distance of 1 cm at a velocity of $v > u$ radiates an energy of

$$E = \frac{e^2}{c^2} \int_{\beta n(\omega)>1} \omega \left[1 - \frac{1}{\beta^2 n^2(\omega)}\right] d\omega$$

where $\omega = 2\pi c/\lambda$ is the circular frequency of the light; here, λ is the vacuum wavelength of the emitted light. The integrand gives the spectral energy distribution of the Cherenkov radiation, while the bounds of the domain of integration are specified by criterion (1).

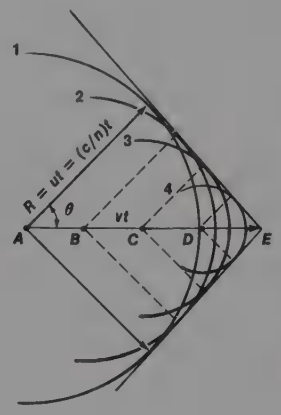

Figure 2. The motion of a charged particle in a medium at a velocity of $v > u$: the angle θ indicates the direction of the emitted radiation

Cherenkov radiation is produced not only when an electron moves in a medium but when any charged particle moves in a medium, provided criterion (1) is satisfied for the particle. For electrons in liquids and solids, criterion (1) is satisfied at energies of as low as $\sim 10^5$ electron volts (eV); many electrons associated with radioactive processes have such energies. Heavier particles should have higher energies. For example, to attain the required velocity, a proton, whose mass is ~2,000 times greater than the mass of an electron, should have an energy of $\sim 10^8$ eV. Such protons may be produced only in present-day accelerators.

Cherenkov radiation has been used to develop experimental methods that are widely employed in nuclear physics both to detect particles and to study the nature of particles (*see* CHERENKOV COUNTER). The velocity of a particle may be obtained from equation (2) or from criterion (1) by measuring θ in a medium or transparent substance for which n is known or by determining the radiation threshold. After a particle's velocity is obtained and its energy is determined on the basis of its deflection in a magnetic field, the mass of the particle may be calculated. Such a procedure was used, for example, in the discovery of the antiproton. For ultrarelativistic particles, criterion (1) is satisfied in compressed gases, such as those used in gas Cherenkov counters. The Cherenkov radiation that is produced in the earth's atmosphere is used to study cosmic rays.

Cherenkov radiation may be observed in pure form only in ideal cases, where a particle moves with constant velocity in a transparent substance of unlimited length. When a particle traverses the surface of a transparent substance, transition radiation is produced. Such radiation was predicted theoretically by Ginzburg and Frank in 1946 and was later investigated experimentally. The essence of transition radiation consists in the fact that the electromagnetic field of a particle is different in a vacuum and in a medium. Any change in the particle's field always results in the emission of light. For example, in the case of bremsstrahlung, the emission is caused by a change in the particle's velocity; in the case of transition radiation, the emission results from a change in the electromagnetic properties of the medium along the particle's trajectory. In a thin transparent substance that satisfies criterion (1), transition radiation is indistinguishable from Cherenkov radiation to a certain extent. At the surface of an opaque substance, the emitted transition radiation is more in evidence since the intensity of the Cherenkov radiation is reduced by absorption.

Transition radiation is also produced when criterion (1) is not satisfied—for example, at low particle velocities or, in contrast, when an ultrarelativistic particle radiates in the X-ray region, where $n < 1$ and, consequently, βn is always less than unity. The intensity of transition radiation is low and is usually inadequate for the detection of an individual particle. For the effective detection of transition radiation, the radiation emitted by a particle as it traverses several interfaces in succession may be summed.

In 1940, E. Fermi, taking into account the ability of a real medium to absorb light in at least several spectral regions, generalized the theory of Cherenkov radiation. The results obtained by Fermi substantially improved the theory of ionization losses by charged particles, which deals with the effect of the polarization of a medium.

Cherenkov radiation is an example of "faster-than-light" optics and is of fundamental importance. It is studied experimentally and theoretically not only in optically isotropic media but also in crystals, which are optically anisotropic media. Electric and magnetic dipole and multipole radiation is considered theoretically. The expected properties of the radiation of a moving magnetic charge have been used to search for magnetic monopoles. The radiation of a particle in a channel within a medium—for example, the radiation of a particle beam in a wave guide—has been examined. When Cherenkov radiation is emitted, the Doppler effect in a medium takes on new characteristics, as shown by the occurrence of anomalous and complex Doppler effects. It may be assumed that any system of particles that is capable of interacting with an electromagnetic field will emit light owing to its own kinetic energy if the velocity of the system exceeds the phase velocity of light waves.

The theoretical concepts that underlie Cherenkov radiation are closely associated with other phenomena of importance in contemporary physics, such as Mach waves in acoustics, some aspects of the stability of particle motion in a plasma and of wave generation in a plasma, certain problems in the theory of particle accelerators, and the generation and amplification of electromagnetic waves.

CHEREPANOV, EFIM ALEKSEEVICH AND MIRON EFIMOVICH. Efim Alekseevich, born 1774 at the Vyiskii Zavod; died June 15 (27), 1842, in Nizhnii Tagil. Miron Efimovich, born 1803 at the Vyiskii Zavod; died Oct. 5 (17), 1849, in Nizhnii Tagil. Russian machine builders. Father and son were serfs of the Demidovs, a family of factory owners. Efim and his wife were freed in 1833; Miron and his wife were freed in 1836.

In the 1810's, Efim Cherepanov established a machine-building plant (the Vyia Metalworking Plant) completely equipped with metal-cutting machine tools, some of original design (in particular the screw lathes, gear-cutting lathes, and planers). From 1822 until his death he was chief mechanic of all the Nizhnii Tagil plants. Miron Cherepanov first studied with his father and in 1819 was named his assistant; he took his father's place after the latter's death.

The Cherepanovs developed equipment for blast furnace operations, ironworking, copper smelting, sawmilling, flour milling, and gold mining. Their work on steam engines, which they persistently promoted, was of great interest. In all, beginning in 1820, they constructed approximately 20 steam engines, varying in power from 2 to 60 horsepower. They developed Russia's first steam locomotive in 1833 and 1834 and the second, of greater power, in 1835; the latter incorporated the leading technological ideas of the time. A cast-iron railway was laid from the Vyia Plant to the Mednyi Mine. Despite the successful operation of the steam locomotives, the innovation received no support, and the steam locomotives were replaced with horse traction. The railway operated in this manner until the early 1900's.

CHEREPANOV, SERGEI ALEKSANDROVICH. Born Mar. 19 (31), 1881, in Kungur; died August 1918 in Tiumen'. Participant in the Russian revolutionary movement. Member of the Communist Party from 1903.

Cherepanov was the son of a worker. He conducted party work, which he first undertook in 1903, in Ekaterinburg (now Sverdlovsk), Samara (now Kuibyshev), Ufa, and Perm'. In 1916 he was drafted into the army, where he conducted revolutionary work among the soldiers. After the February Revolution of 1917, Cherepanov was one of the leaders of the military organization of the St. Petersburg Committee of the RSDLP(B). In June 1917 he became a member of the All-Russian Bureau of the Military Organization of the Central Committee of the RSDLP(B). Cherepanov took part in the October Armed Uprising in Petrograd. In 1918 he helped organize the Tomsk provincial council of the national economy and became the council's chairman. In the summer of 1918 he joined the Bolshevik underground in Sibera. Cherepanov was arrested and shot by White Guards.

CHEREPANOVO, a city and the administrative center of Cherepanovo Raion, Novosibirsk Oblast, RSFSR. Cherepanovo has a railroad station 109 km southeast of Novosibirsk. Industry is represented by a building-materials plant, a meat-packing plant, a milk combine, a clothing factory, and a furniture factory. [29–210–2]

CHEREPASHINSKII, MIKHAIL MIKHAILOVICH. Born 1845; died Apr. 30, 1916. Russian scientist; specialist in structural mechanics.

Cherepashinskii graduated from the University of Technology, Vienna, in 1873. He became a professor at the Moscow Higher Technical School in 1885 and an honored professor in 1907. His principal works dealt with design problems of engineering structures (in particular, he developed methods of calculating statically indeterminate systems), the history of structural mechanics, and bridge design. He was the inventor of an original slide rule. [29–213–1]

CHEREPASHKA, a reed instrument equipped with a single keyboard; a type of small, diatonic accordion. The *cherepashka* was popular in the late 19th century and in the 1920's. It has from two to six keys on the right headboard and two on the left. The body is up to 70 mm in height. The scale is diatonic, and the sound produced can be altered by changing the movement of the bellows. Reconstructed variants of the *cherepashka* include the P. E. Nevskii *cherepashka*, which has chromatic semitones added, and the V. S. Varshavskii *cherepashka*, which produces a full chromatic scale on the right headboard (up to ten keys) and a bass chord accompaniment on the left.

CHEREPET', an urban-type settlement in Suvorov Raion, Tula Oblast, RSFSR. Cherepet' is situated on the Cherepet' River, a tributary of the Oka. It has a railroad station on the Tula-Kozel'sk line. The settlement has enterprises of the railroad industry. [29–214–1]

CHEREPET' STATE REGIONAL HYDROELECTRIC POWER PLANT, a steam power plant in the city of Suvorov, Tula Oblast, RSFSR. The plant has an installed capacity of 1,500 megawatts (MW), supplied by four 150-MW and three 300-MW turbines in unit with boilers. Brown coal from fields near Moscow is used as

fuel in the 150-MW units, and hard coal from the Kuznetsk Coal Basin is used in the 300-MW units. The water supply circulates from a reservoir and cooling plant on the Cherepet' River. Construction of the plant began in 1950; the first unit went into operation in 1953, and the seventh in 1966. Power is transmitted over high-voltage lines at voltages of 110 and 220 kilovolts to the Integrated Electric Power Grid of the USSR. [29–213–4]

CHEREPNIN, LEV VLADIMIROVICH. Born Mar. 30 (Apr. 12), 1905, in Riazin'; died June 12, 1977, in Moscow. Soviet historian specializing in Russian history of the feudal period, the study of sources, historiography, and subsidiary historical disciplines. Academician of the Academy of Sciences of the USSR (1972); Honored Scientist of the RSFSR (1970). Member of the CPSU from 1957.

Cherepnin passed his university examinations in 1925, and in 1929 he completed graduate study at the Institute of History of the Russian Association of Scientific Research Institutes of Social Sciences. In 1946, Cherepnin became a senior research worker at the Institute of History of the Academy of Sciences of the USSR (after reorganization in 1968, the Institute of the History of the USSR of the Academy of Sciences of the USSR). In 1951 he was made head of the section dealing with the feudal period in the territory now encompassed by the USSR. In 1969 he became head as well of the department for the history of precapitalist formations on the territory of the USSR. Cherepnin taught at various higher educational institutions, including Moscow State University; he became a professor in 1947.

Cherepnin wrote more than 350 scholarly works. A central concern of his research was the formation of the centralized Russian state; in addition to problems of sources and general theoretical questions, he dealt with specific historical problems of the state's formation. He studied the periodization of Russian history of the feudal period and the socioeconomic and political history of old Russian society during the tenth to 13th centuries. He also studied the development of estate monarchy and absolutism in Russia, the class and political struggle of the 14th to 17th centuries, and the typology of the historical process during the period of feudalism.

Cherepnin was one of the first Soviet scholars to work on the theoretical and methodological problems connected with the study of sources. In a series of works he dealt with important problems of historiography, with leading Russian and Soviet historians, and with major issues in the development of Soviet historical science. He subjected contemporary bourgeois historiography to criticism. Cherepnin wrote both scholarly works and textbooks dealing with subsidiary historical disciplines. He founded one of the Soviet schools of Russian medieval history. In 1970 he became vice-president of the International Commission for the History of Representative and Parliamentary Institutions.

Cherepnin received the M. V. Lomonosov Prize in 1957 and the State Prize of the Moldavian SSR in 1972. Cherepnin was also awarded the Order of the Red Banner of Labor and various medals.

CHEREPNIN, NIKOLAI NIKOLAEVICH (also N. K. Tcherepnin). Born May 3 (15), 1873, in St. Petersburg; died June 27, 1945, in Issy-les-Moulineaux, near Paris. Russian composer, conductor, and teacher.

Cherepnin graduated from the faculty of law at the University of St. Petersburg in 1895; in 1898 he graduated from the St. Petersburg Conservatory, where he had studied with N. A. Rimsky-Korsakov. He conducted concerts of the Russian Society of Music and the Beliaev Symphony Concerts; he was a conductor at the Mariinskii Theater from 1906 to 1909 and at the St. Petersburg People's House from 1908 to 1913. From 1909 to 1914, Cherepnin took part in the Russian Seasons Abroad.

In 1905, Cherepnin began teaching classes in conducting at the St. Petersburg Conservatory, where he became a professor in 1909; his pupils included A. K. Gauk, V. A. Dranishnikov, and S. S. Prokofiev. From 1918 to 1921 he was director of the Tbilisi Conservatory. In 1921 he emigrated to Paris, where he founded the Russian Conservatory.

Although Cherepnin was in his later career influenced by the impressionist composers, his music, especially his early works, reflects the classic traditions of Russian music. His finest works are symphonic program compositions, such as the prelude *La Princesse lointaine* (1896), and such ballets as *Le Pavillon d'Armide* (1903; staged 1907) and *Narcissus and Echo* (1911). Cherepnin also composed operas, instrumental and vocal chamber works, and choral works, including *Do Not Weep Over the Corpses of Fallen Warriors*.

CHEREPOVETS, a city under oblast jurisdiction and the administrative center of Cherepovets Raion, Vologda Oblast, RSFSR. Located on the Volga-Baltic Waterway. Port on the Rybinsk Reservoir. Railroad station on the Vologda-Leningrad line. Population, 246,000 (1977; 32,000 in 1939). The city is divided into two districts.

Cherepovets originated as a *sloboda* (tax-exempt settlement) near the Voskresenskii Monastery, which was founded in the 14th century. Cherepovets became a city in Novgorod Namestnichestvo (vicegerency) in 1777 and the capital of a district of Novgorod Province in 1780. The population of the city, which is situated on the Sheksna River, worked on the Mariinskaia Water System. Cherepovets was the administrative center of Cherepovets Province from 1918 to 1927 and then became the administratuve center of a raion in Leningrad Oblast. Since 1937 it has been the administrative center of a raion in Vologda Oblast. During the Soviet period the city has become an industrial center.

Cherepovets is an important center of ferrous metallurgy and the chemical industry; in addition to the Cherepovets Metallurgical Works, these industries are represented by a steel-rolling mill, a chemical plant, and a nitrogenous fertilizer plant. The city has a plywood and furniture combine and ship-building and ship repair yards. It also produces metal structural components, garage equipment, and building materials. Cherepovets has a pedagogical institute, a branch of the Northwest Correspondence Polytechnic Institute, metallurgical and forestry machinery technicums, and medical and music schools. There is a museum of local lore with an art department featuring paintings by V. V. Vereshchagin, a native of Cherepovets.

Cherepovets consists of a small old section, whose main street is Sovetskaia, and a new section, dating from the late 1950's, where the Leningrad State Institute for the Design of Metallurgical Plants is located. The new section was built according to a general plan (1951–58, architects A. A. Ol' and others), and its principal streets, such as Lenin, Metallurgi, Lomonosov, and Stalevary, are lined with large-block and large-panel buildings. Mass housing construction is under way, and a number of large public buildings have been erected, including a motion-picture theater (1958, architects I. V. Zholtovskii and others) and the Palace of Metallurgists. Cherepovets was awarded the Order of the Red Banner of Labor in 1977.

[29–216–3]

CHEREPOVETS METALLURGICAL PLANT (full name, 50th Anniversary of the USSR Cherepovets Metallurgical Works), one of the largest enterprises of ferrous metallurgy in the USSR, working on a complete, closed metallurgical cycle. Located in the city of Cherepovets, Vologda Oblast, on the V. I. Lenin Volga-Baltic Waterway, the plant is part of the coal and metallurgical base of the Northwestern Region of the RSFSR; it was designed to use iron-ore concentrates from the Kola Peninsula deposits, coking coals of the Pechora Coal Basin, and ferrous scrap metal. Plant construction began in 1948, and the first pig iron was produced in 1955.

The plant specializes in the production of coke, pig iron, and sheet and standardized rolled products made of carbon and low-alloy steels, as well as curved sections. Approximately 10 percent of the output is exported to 45 countries. Construction of the second stage of the plant, designed to double plant capacity, was undertaken in 1974. The second stage includes a model 2000 wide-strip sheet mill with a capacity of 6 million tons per year (its first stage was put into operation in 1976), oxygen furnaces with a capacity of 350 tons each, and a blast furnace with a usable capacity of 5,580 cu m. In 1966 the Cherepovets Metallurgical Plant was awarded the Order of Lenin. [29–217–1]

CHEREPOVETS RESERVOIR (Sheksna Reservoir), a reservoir formed by the dam of the Cherepovets Hydroengineering Complex on the Sheksna River, Vologda Oblast, RSFSR. It consists of two sections: the river section and the Lake Beloe section. The reservoir was filled in 1963 and 1964. It has an area of 1,670 sq km, a volume of 6.5 cu km, and a length of 167 km; the greatest width is 20 km, and the average depth is 4 m. The water level varies over a range of 1.2 m as a result of seasonal regulation of runoff. The reservoir was created for water transport (it is part of the Volga-Baltic Waterway) and electric power generation. The cities of Belozersk and Kirillov are located on the Cherepovets Reservoir. [29–217–2]

CHEREVICHENKO, IAKOV TIMOFEEVICH. Born Sept. 30 (Oct. 12), 1894, in the village of Novoselovka, in what is now Orlovskii Raion, Rostov Oblast; died July 4, 1976, in Moscow. Soviet military commander; colonel general (1941). Member of the CPSU from 1919.

The son of a peasant, Cherevichenko fought in World War I as a senior noncommissioned officer. He entered the Red Guards in November 1917, later joining the Red Army. Cherevichenko served in the Civil War of 1918–20 as a platoon leader, a squadron commander, and a cavalry regiment commander. He graduated from cavalry courses in 1921, the Higher Cavalry School in 1924, and the M. V. Frunze Military Academy in 1935. In July 1940 he was appointed commander of the Odessa Military District.

During the Great Patriotic War of 1941–45, Cherevichenko was commander of the Ninth Army from June to September 1941, the Twenty-first Army from September to October 1941, the Southern Front from October to December 1941, and the Briansk Front from December 1941 to February 1942. He served as deputy commander of the Crimean and Northern Caucasus fronts from April to August 1942, commander of the Black Sea Group of Forces from September to October 1942, troop commander of the Fifth Army from October 1942 to February 1943, deputy troop commander of the Northwestern Front from April to September 1943, and commander of the Kharkov Military District in 1943 and 1944. In April 1945, he was appointed commander of a rifle corps on the First Byelorussian Front. Cherevichenko held various command positions after the war, retiring in May 1950.

Cherevichenko was a deputy to the first convocation of the Supreme Soviet of the USSR. He was awarded two Orders of Lenin, the Order of the October Revolution, four Orders of the Red Banner, the Order of Kutuzov First Class, the Order of Suvorov Second Class, the Order of the Red Star, and various medals. [29–186–4]

CHEREVICHNYI, IVAN IVANOVICH. Born Mar. 18 (31), 1909, in Ol'viopol', now Pervomaisk, Nikolaev Oblast; died Feb. 15, 1971, in Moscow. Soviet polar aviator. Hero of the Soviet Union (1949). Member of the CPSU from 1932.

From 1928 to 1930, Cherevichnyi studied at the Moscow Aviation School of the Society for Assistance to Defense, Aviation, and Chemical Construction; he later worked as a flight instructor. He became involved in polar aviation in 1934. Cherevichnyi reconnoitered several air routes in Siberia, including the Yakutsk-Kolyma route, and participated in the removal of I. D. Papanin's expedition from the ice island research station SP-1 in 1938. He also conducted ice reconnaissance in the Kara Sea and Laptev Sea and piloted vessels along the Northern Sea Route. In 1941 he headed an air expedition that made several ice landings in the airplane *SSSR N-169* in the Arctic Basin, and he was the first to reach the relatively inaccessible polar area. In 144 hours of flight time, the airplane piloted by Cherevichnyi covered a distance of 26,000 km. Cherevichnyi was a member of many high-latitude air expeditions (1948–55 and 1958–60). He commanded the air squadron in the first Soviet antarctic expedition (1955–57). Cherevichnyi was awarded three Orders of Lenin, five other orders, and various medals. [29–187–1]

CHEREVIKI, an old Russian name for leather footwear. In the Ukraine, *chereviki* are colored or, on occasion, black leather shoes with high heels and sharply pointed toes. In the northern areas of Russia, women wear shoes called *chereviki* on holidays. The Russian *chereviki* are frequently similar in design to the Ukrainian. [29–186–3]

CHERGA, a mountain range in the northwestern Altai; drainage divide between the Peschanaia and Sema rivers. The Cherga Range is approximately 120 km long and, in the south, up to 2,009 m high. The range is composed primarily of intensively dissected mountains of medium elevation, which are made up of sandstones and shales. Forest steppes and pine forests are found on the slopes. At higher elevations, mountainous taiga featuring larch and nut pine–fir forests is encountered. [29–185–1]

CHERGUI, CHOTT ECH, a *sebkha* (closed salt lake) in Algeria, north of the Saharan Atlas Mountains; situated at an elevation of 987 m. Chott Ech Chergui is actually a chain of three lakes joined together by narrow channels that dry up seasonally. The lakes stretch for a total of about 150 km; their width varies from a few kilometers to several dozen kilometers. The salt layer that forms on the surface during dry periods reaches a thickness of several dozen centimeters in some places. [29–1379–3]

CHERIKOV, a city and the administrative center of Cherikov Raion, Mogilev Oblast, Byelorussian SSR. Cherikov is located on the Sozh River, 32 km from the Krichev railroad junction, from which lines run to Mogilev, Orsha, Vorozhba, and Roslavl'. The city has a canned goods and starch combine, a branch of the Chausy creamery, and a brickyard. [29–220–2]

CHERIN'KO, IVAN IVANOVICH. Born July 22 (Aug. 4), 1908, in the village of Den'gi, in what is now Zolotonosha Raion, Cherkassy Oblast; died Oct. 6, 1948, in Ashkhabad. Soviet painter. Honored Art Worker of the Turkmen SSR (1945).

Cherin'ko studied at the Kiev Art Institute from 1926 to 1931 under B. F. Uits and M. D. Bernshtein. He was chairman of the administrative board of the Artists' Union of Turkmenistan in 1938 and from 1945 to 1948. He taught in the Sh. Rustaveli Turkmen Art School from 1933 to 1936 and from 1938 to 1940.

Cherin'ko played an important role in educating professional Turkmen artists and in promoting the method of socialist realism in the art of Soviet Turkmenistan. He painted thematic pictures, portraits, and landscapes dealing with social transformations in Soviet Turkmenia, such as *The Smithy* (1928), *The Bey: The*

Powers That Be (1940), *The Daring Horseback Riders* (1944–46), and *Spring in Bagir* (1947). These works by Cherin'ko are on exhibit in the Museum of Fine Arts of the Turkmen SSR, in Ashkhabad. [29–220–3]

CHERKASOV, NIKOLAI KONSTANTINOVICH. Born July 14 (27), 1903, in St. Petersburg; died Sept. 14, 1966, in Leningrad. Soviet Russian actor. People's Artist of the USSR (1947). Member of the CPSU from 1940.

From 1923 to 1926, Cherkasov studied at the Leningrad Institute of Stage Arts. He appeared with the Leningrad Theater for Young Audiences and in 1933 joined the A. S. Pushkin Drama Theater in Leningrad. He also performed in the *estrada* (variety stage) trio Pat, Patashon, and Charley Chaplin. Cherkasov, an actor of extraordinary versatility, expressed great socialist optimism and profound devotion to the Communist Party in his roles. He masterfully portrayed a number of famous historical figures. He became famous for his performance of Professor Polezhaev in the film *Baltic Deputy* (1937), a turning point in the development of the Soviet cinema.

Cherkasov subsequently played a number of roles on the stage, including the title role in A. N. Tolstoy's *Peter the Great*, M. Gorky in Kapler and Zlatogorova's *Stormy Year*, Ivan the Terrible in Solov'ev's *His Supreme Majesty*, I. V. Michurin in Dovzhenko's *Life in Blossom*, and V. V. Mayakovsky in Katanian's *They Knew Mayakovsky*. Cherkasov earned a place in motion-picture history for his performances of Tsarevich Aleksei in *Peter the Great* (1937–39) and the title roles in *Alexander Nevsky* (1938) and *Ivan the Terrible* (parts I and II, 1945 and 1958).

Cherkasov was also an outstanding comedian, occasionally tending toward the grotesque. In 1929 he performed in the Moscow and Leningrad music halls and then in the Leningrad Komediia Theater. He gave distinct interpretations of the role of Don Quixote—in the play of that name (1957) and in a film version of Cervantes' novel. Cherkasov was very successful in his film role of Paganelle in *Captain Grant's Children* (1936). His rendering of the role of Dronov in Aleshin's *Everything Is Left to the People*, both on the stage and in the film of 1963, was one of his most outstanding dramatic successes. He was also highly successful as General Khludov in Bulgakov's play *Flight*.

Cherkasov was a member of the Soviet Committee for the Defense of Peace. He was the author of the books *In India* (1952), *Notes of a Soviet Actor* (1953), *The Fourth Don Quixote* (1958), and *In the Theater and The Cinema* (1961). He was a deputy to the first and second convocations of the Supreme Soviet of the RSFSR and the third and fourth convocations of the Supreme Soviet of the USSR. He was awarded the Lenin Prize (1964), the State Prize of the USSR (1941, 1946, 1950, and twice in 1951), two Orders of Lenin, three other orders, and various medals.

CHERKASSKII, ABRAM MARKOVICH. Born June 25 (July 7), 1886, in Belaia Tserkov'; died Nov. 30, 1967, in Alma-Ata. Soviet painter. People's Artist of the Kazakh SSR (1963).

Cherkasskii studied at the Kiev Art School under A. A. Murashko from 1901 to 1909 and at the St. Petersburg Academy of Arts under N. N. Dubovskii, V. E. Savinskii, and Ia. F. Tsionglinskii from 1909 to 1917. He was one of the first in the Ukraine to address the theme of Soviet peasant life (*At the Tractor*, 1928, Museum of Ukrainian Fine Arts of the Ukrainian SSR, Kiev). In 1941 he settled in Kazakhstan. He taught at the N. V. Gogol Art School in Alma-Ata from 1941 to 1958. As both a teacher and an artist, Cherkasskii played an important role in the training of professional Kazakh artists. His pupils included S. Mambeev and K. Tel'zhanov. Cherkasskii painted lyrical and epic landscapes, often executed in broad energetic strokes. His works also include thematic compositions, portraits (*People's Artist of the Kazakh SSR K. U. Badyrov*, 1958, T. G. Shevchenko Kazakh Art Gallery, Alma-Ata), and still lifes. Cherkasskii was awarded the Order of the Badge of Honor and a medal.

Rybakova, I. *A. M. Cherkasskii*. Moscow, 1966. [29–226–1]

CHERKASSKII, ALEKSEI MIKHAILOVICH. Born Sept. 28 (Oct. 8), 1680, in Moscow; died there Nov. 4 (15), 1742. Russian state figure; prince.

From 1719 to 1724, Cherkasskii was governor of Siberia. He became a senator and a privy councillor in 1726. Cherkasskii helped strengthen the autocracy of Anna Ivanovna by acting in opposition to the Supreme Privy Council. During the 1730's he was an advocate of close alliance with England. Cherkasskii was appointed grand chancellor, the de facto head of Russian foreign policy, in 1740. [29–226–2]

CHERKASSKII, IAKOV KUDENETOVICH (also Uruskan Cherkasskii). Date and place of birth unknown; died July 8 (18), 1666, in Moscow. State, political, and military figure in 17th-century Russia; boyar (1645); wealthy landowner.

A descendant of Kabardinian princes (*see* CHERKASSKII), Cherkasskii moved to Russia and was baptized in 1624. In 1648 he took part in a power struggle as the head of a boyar faction opposed to B. I. Morozov. After Morozov was exiled on June 12, 1648, Cherkasskii became the head of the government, but he was removed from all his posts upon Morozov's return to Moscow on Oct. 26, 1648. Cherkasskii took part in the Russo-Polish War of 1654–67 and the Russo-Swedish War of 1656–58. [29–227–1]

CHERKASSKII, VLADIMIR ALEKSANDROVICH. Born Feb. 2 (14), 1824, in Chern' District, Tula Province; died Feb. 19 (Mar. 3), 1878, in San Stefano, now Yeşilköy, Turkey. Russian public figure; prince.

Cherkasskii graduated from the law faculty of Moscow University in 1844. He was close to the Slavophiles and contributed to the journal *Russkaia beseda*. As a member of the Tula provincial committee and the Editing Commissions, Cherkasskii took part in the preparations for the abolition of serfdom; he advocated supplying the peasants with land in return for redemption payments. He served as the *mirovoi posrednik* (official assisting in the implementation of the Peasant Reform of 1861) of Tula Province from 1861 to 1863.

Until 1866, Cherkasskii was chief director of the government commission for the internal and spiritual affairs of the Kingdom of Poland. Together with N. A. Miliutin and Iu. F. Samarin, he drafted the law granting Polish peasants ownership of the land they used. In the early 1870's he served as *gorodskoi golova* (mayor) of the city of Moscow; he was the initiator of a liberal appeal to Alexander II. During the Russo-Turkish War of 1877–78, Cherkasskii was in charge of Red Cross work with the army in the field and headed the civil administration in Bulgaria.

P. A. ZAIONCHKOVSKII [29–226–3]

CHERKASSKII, a princely family that originated in Russia during the second half of the 16th century. The first Cherkasskiis were primarily rulers of Kabarda who were descendants of Idar Murza and who had gone into Russian service. The name "Cherkasskii" derives from the Russian word *cherkasy*, which means Circassians; the Northern Caucasian Adyg tribes were often referred to in medieval literature as Circassians.

In Russia the Cherkasskii family belonged to the upper stratum of the ruling class. A list of the most famous members of the family from the 16th through the 19th century follows.

Mikhail (Saltankul) Temriukovich Cherkasskii, a son of the Kabardinian prince Temriuk Idarovich, moved to Russia in 1558 and became an appanage service prince and a prominent *oprichnik* (*see* OPRICHNINA). He died, or was executed, in 1571. His sister Mariia (Kuchenei) Temriukovna Cherkasskaia was the second wife of Tsar Ivan IV.

Prince Dmitrii (Kanshov) Mamstriukovich Cherkasskii (died 1651) entered Russian service in the late 16th century and was close to the Second False Dmitrii from 1608 to 1610. He was a member of the *zemskii sobor* (national assembly) of 1613 and became a boyar in 1619. With his death the line of Temriuk came to an end.

Boris (Khoroshai) Kambulatovich Cherkasskii (died 1601) was a nephew of Temriuk's. He entered Russian service in 1557 and held high military posts during the 1580's and early 1590's. He became a boyar in 1591.

Boris' son Prince Ivan Borisovich Cherkasskii became a boyar in 1613. After the death of Filaret in 1633, he was the de facto head of the Russian government.

In the mid-17th century Iakov (Uruskan) Kudenetovich Cherkasskii was the most prominent member of Boris' branch of the family. With the death of Aleksei Mikhailovich Cherkasskii in 1742, this branch of the family came to an end.

Prince Grigorii (Sunchalei) Sunchaleevich Cherkasskii went to Moscow in 1642 and became a boyar in 1657. He served as *voevoda* (military governor) in Astrakhan from 1660 to 1663 and was murdered on his patrimonial estate in 1672.

Grigorii's grandson Mikhail Alegukovich Cherkasskii (died first quarter of the 18th century) became a boyar in 1677 and occupied a prominent position under Peter I.

Mikhail's grandson Petr Borisovich Cherkasskii (died 1768) was governor of Moscow during the reign of the empress Elizabeth.

Vladimir Aleksandrovich Cherkasskii (1824–78) was a descendant of Mikhail Alegukovich.

There were also branches of the Cherkasskii family that did not stem from descendants of Idar. Prince Vasilii (Kazyi) Kardanukovich Cherkasskii, who moved to Russia in the late 1570's and became an appanage service prince, was from a family of Abaza murzas. The Agamashukov-Cherkasskii family, which existed from the mid-16th to the mid-17th century, was descended from Beslenei princes. The Egupov-Cherkasskii family existed from the early 17th century to the mid-19th century. Other families included the Bekovich-Cherkasskii family, which was founded at the end of the 17th century by Aleksandr Bekovich-Cherkasskii.

V. D. NAZAROV [29–225–1]

CHERKASSKOE, an urban-type settlement in Vol'sk Raion, Saratov Oblast, RSFSR. Cherkasskoe is located 15 km from the Chernavka railroad station on the Saratov-Syzran' line. Enterprises include an industrial combine, a mechanized forestry farm, and a fruit-tree nursery. [29–227–2]

CHERKASSKOE, an urban-type settlement in Slaviansk Raion, Donetsk Oblast, Ukrainian SSR. Cherkasskoe is located near the Shidlovskaia railroad station on the Slaviansk-Lozovaia line. It has a chalk and lime plant and a cannery that is part of the Slaviansk Food-processing Combine. [29–227–3]

CHERKASSY, a city and the administrative center of Cherkassy Oblast, Ukrainian SSR. Railroad and highway junction; port on the right bank of the Kremenchug Reservoir. Population, 229,000 (1977; 52,000 in 1939, 85,000 in 1959, 158,000 in 1970). Cherkassy is divided into two raions.

Cherkassy was first mentioned in 1394 as part of the Kievan Principality, then ruled by Lithuania. After the Union of Lublin in 1569 it was seized by Poland. On several occasions the population took part in the peasant and cossack uprisings of the 16th and 17th centuries, and the city supported B. Khmel'nitskii. In 1648, Cherkassy became the headquarters of the Cherkassy Cossack Regiment. Under the Armistice of Andrusovo in 1667 it remained under Polish rule. Cherkassy became part of the Russian empire in 1793, a district capital in 1795, and part of Kiev Province in 1797.

Soviet power was established in Cherkassy on Jan. 16 (29), 1918. During the Civil War the city fell to the Germans and A. I. Denikin's forces; Soviet power was reestablished in December 1919. In 1932, Cherkassy became the administrative center of a raion in Kiev Oblast. The city was occupied by fascist German troops from Aug. 22, 1941, through Dec. 14, 1943. It became an oblast administrative center in 1954.

The economy of Cherkassy is dominated by machine building, the chemical industry, light industry, and the food-processing industry. Enterprises of the machine-building industry manufacture machinery for the food-processing industry. The chemical industry is represented by a chemical combine and plants for the production of chemical fibers and yarn and chemical reagents. The city's light industry is represented by a silk-fabric combine, a garment production association, and plants for the production of absorbent cotton and knitwear. Enterprises of the food-processing industry include a sugar refinery, a milk plant, a brewery, a cannery, and a meat-packing plant.

Enterprises built after the war include a prefabricated-housing combine and plants for the production of telegraph equipment, silica bricks, and construction machinery and equipment. Plants of light industry and the food-processing, chemical, metalworking, and building-materials industries were modernized.

Cherkassy has retained the regular street plan it was given in 1828 by the architect V. I. Geste. In the Soviet period multistory apartment buildings have been constructed, as well as such large public buildings as the House of Soviets (1959, architect V. I. Shtokman), the railroad station (1965, architects L. M. Chuprin and others), the T. G. Shevchenko Theater of Music and Drama (1964), the hotel Turist (1970, architects N. B. Chmutina and others, engineer A. V. Lozovskii), and an enclosed market (1971).

In addition to the Monument to Eternal Glory (1975, sculptors G. N. Kal'chenko, E. M. Kuntsevich, and B. P. Mikitenko, architects A. F. Ignashchenko and A. S. Ren'kas), the city has monuments to V. I. Lenin (1969, sculptor K. A. Kuznetsov) and T. G. Shevchenko (1964, sculptors M. K. Vronskii and A. P. Oleinik).

Cherkassy's educational institutions include a pedagogical institute, the department of general technology of the Kiev Construction Engineering Institute, and technicums of electrification and agricultural construction, finance, Soviet trade, and cooperation. The city has medical, music, and fire-fighting schools. Cultural institutions include a theater of music and drama, a puppet theater, a philharmonic society, a planetarium, and a museum of local lore.

[29–227–4]

CHERKASSY OBLAST, part of the Ukrainian SSR. Formed on Jan. 7, 1954. Area, 20,900 sq km. Population, 1,552,000 (Jan. 1, 1977). Cherkassy Oblast is divided into 20 raions and has 15 cities and 19 urban-type settlements. The administrative center is the city of Cherkassy. The oblast was awarded the Order of Lenin on Feb. 26, 1958.

Natural features. Cherkassy Oblast is situated along the middle course of the Dnieper River. Most of the oblast lies along the right bank of the river within the Dnieper Upland and has a maximum elevation of 270 m. Adjoining the Dnieper River valley are the Kanev Hills and the Moshnogorskii Ridge, which rises 160–180 m above the Dnieper. The smaller part of the oblast, along the left bank of the river, lies in the Dnieper Lowland, where elevations do not exceed 150 m.

The oblast has a moderate continental climate, with mild winters and warm summers. The average January temperature is −5.9°C, and the average July temperature is 19.5°C. Annual precipitation is 450–520 mm, and the growing season lasts approximately 210 days. The oblast's rivers are in the basins of the Dnieper and Iuzhnyi Bug. The principal river, the Dnieper, flows within the oblast for 150 km; its water level has been raised considerably by the Kremenchug and Kanev reservoirs. Right tributaries of the Dnieper in the oblast are the Ros', Ol'shanka, and Tiasmin; left tributaries include the Supoi and Sula. The basin of the Iuzhnyi Bug includes the Gornyi Tikich and the Gniloi Tikich rivers.

In the right-bank area of the oblast, the soil cover is primarily made up of podzolic and average-humus chernozems; the upland

areas have gray and light-gray podzols. Soddy-gley, thick meadow, and sod-podzol soils are widespread in the area along the left bank. Forests, predominantly oak forests, occupy approximately one-sixth of the oblast; near Cherkassy there is a large forest tract known as the Cherkassy Pine Forest. Steppe vegetation has remained along the edges of the forests and on the slopes of *balki* (small flat-bottomed valleys).

The forests are inhabited by elk, deer (including roe deer), wild boars, squirrels, wolves, foxes, hare, and marten. Along the river banks and the shores of lakes and ponds live beavers, otters, wild ducks, and birds of the suborder Limicolae. In the waters of the oblast swim European bream, Eurasian perch (*Perca fluviatilis*), pike, pike perch, and domesticated carp.

Population. According to the 1970 census, Ukrainians make up 92.8 percent of the oblast's population, Russians approximately 6 percent, and Jews approximately 0.7 percent. In 1977 the average population density was 74.3 persons per sq km, reaching 100 persons per sq km in the urban areas and near the Dnieper; 44 percent of the population was urban. The principal cities are Cherkassy, Uman', Smela, Zvenigorodka, Zolotonosha, Kanev, and Shpola.

Economy. The electric power industry is based on the Cherkassy District Heat and Power Plant; the Kanev Hydroelectric Power Plant went into operation in 1972. Brown coal is mined in Zvenigorodka Raion, and peat is extracted in Cherkassy Raion. The oblast is supplied with natural gas from Shebelinka, and is crossed by a natural-gas pipeline that extends from Orenburg to the western border of the USSR; the pipeline was laid in 1978 by member countries of the Council for Mutual Economic Assistance (COMECON).

The food-processing industry produces the greatest share of the oblast's gross output. In 1976 sugar factories, located mainly in the right-bank area, produced 524,000 tons of granulated sugar and 254,000 tons of refined sugar. Cherkassy's cannery, which is capable of turning out more than 100 million standard cans annually, and tobacco factory produce for the entire country. Also highly developed are meat packing (Cherkassy, Uman', and Vatutino), distilling, flour milling, brewing, and dairying.

The oblast has machine-building plants in Cherkassy, Smela, Uman', Kamenka, and Monastyrishche; a machine-tool plant in Korsun'-Shevchenkovskii; an electrical machinery and repair plant in Smela; and an instrument-making plant in Uman'.

During the ninth five-year plan (1971–75) the output of chemical products increased by a factor of 2.5. A large plant for the production of chemical fibers and yarn and a chemical combine have been built in Cherkassy, and a plant for the production of chemical reagents is being enlarged. Light industry is represented by a combine producing silk fabrics, a garment production association, and plants for the production of absorbent cotton, knitwear, fine cloth articles, and fulled felt fabric, all located in Cherkassy. There are hemp mills in Zolotonosha and Irkliev and a cotton factory in Steblev.

The wood-products industry is represented by such production associations as Cherkassymebel'. The construction industry has developed rapidly. The oblast has a prefabricated-housing combine, and there are plants for the production of silica bricks and construction machinery and equipment in Cherkassy. Brickyards are located in numerous raions, including Zolotonosha, Uman', Gorodishche, and Zhashkov raions, and there are granite quarries in Uman', Zvenigorodka, and Gorodishche raions. A plant for the production of fired refractory materials, which uses refractory clays from the Novoselitsa deposits, has been constructed; in 1978 construction was nearing completion on a combine for the production of bentonite clays in Lysianka Raion.

Agriculture is oriented toward the cultivation of sugar beets and grains, along with other vegetables and fruit. There is also livestock raising for meat and dairy products. In 1976 the oblast had 389 kolkhozes and 58 sovkhozes; 70 percent of the oblast was agricultural land, of which 91 percent was plowland and 7 percent was pastures and hayfields. The total sown area in that year was 1,320,700 hectares (ha): 609,000 ha were cultivated with such grains and legumes as winter wheat, spring barley, peas, maize, and millet; 201,700 ha with such industrial crops as sugar beets; 74,200 ha with potatoes; 21,800 ha with other vegetables; and 410,000 ha with feed crops. Tree-fruit and small-fruit plantings occupied 48,000 ha, and there were 34,000 ha suitable for dry farming.

In 1976 the livestock population included 887,000 head of cattle (including 320,800 cows), 936,400 swine, and 280,900 sheep and goats. There is poultry farming, and a fur farm for the production of mink pelts has been established near Moshny.

The oblast has 605 km of railroad lines, exclusive of spur lines. The most important trunk lines are Kiev-Dnepropetrovsk, Moscow-Odessa, and Donetsk-L'vov; the principal rail junctions are T. G. Shevchenko and Khristinovka. There are 6,500 km of roads, including 4,700 km of hard-surface roads. The main highways are Kiev-Dnepropetrovsk and Kiev-Odessa. There is navigation on the Dnieper. Air routes connect Cherkassy with Kiev, various oblast administrative centers, and many cities in the Ukrainian SSR.

Education, cultural affairs, and public health. In the 1976–77 academic year Cherkassy Oblast had 785 general-education schools of all types, with an enrollment of 241,700; 25 vocational-technical educational institutions, with an enrollment of 12,800; and 20 specialized secondary educational institutions, with an enrollment of 18,100. In that year 8,500 students attended the oblast's three higher educational institutions—a pedagogical institute in Cherkassy and pedagogical and agriculture institutes in Uman'—and the department of general technology of the Kiev Construction Engineering Institute, in Cherkassy. In 1976 approximately 71,700 children were enrolled in 821 preschool institutions.

In 1976 the oblast had 1,045 public libraries, with more than 13,600 copies of books and periodicals, and seven museums: museums of local lore in Cherkassy and Uman'; a literary-memorial museum in Kamenka dedicated to A. S. Pushkin and P. I. Tchaikovsky, both of whom visited the city; the Museum of the History of the Battle at Korsun'-Shevchenkovskii, in Korsun'-Shevchenkovskii; the T. V. Shevchenko memorial grave site, a museum-preserve, in Kanev; the T. G. Shevchenko Literary-Memorial Museum, in the village of Shevchenkovo; and the I. S. Nechui-Levitskii Literary-Memorial House-Museum, in the village of Steblev, the writer's birthplace. The oblast has two theaters, both located in Cherkassy: a theater of music and drama and a puppet theater. Other cultural and educational institutions and facilities include 948 clubs, 961 stationary motion-picture projection units, and 24 extracurricular institutions.

There are two oblast-level newspapers, both published in Ukrainian: *Cherkas'ka pravda* (Cherkassy Pravda), founded in 1918, and the Komsomol newspaper *Molod' Cherkashchyny* (Youth of Cherkassy), founded in 1960. The oblast receives two programs of All-Union Radio for a total of 44 hours daily, information broadcasts of republic radio for a total of 19 hours daily, combined national and republic broadcasts for 19 hours daily, and local broadcasts for 1.1 hours daily; programming is in Ukrainian and Russian. Programs of Central Television are transmitted for a total of 13 hours daily, and republic television programming in Russian and Ukrainian is broadcast for 11.2 hours daily.

As of Jan. 1, 1977, there were 162 hospitals, with 18,000 beds (11.6 beds per 1,000 inhabitants), and 3,800 physicians (1 physician per 409 inhabitants). The climatic health resort Sosnovka is located in the oblast, which also has sanatoriums and houses of rest.

Tourism is highly developed in Cherkassy Oblast, whose principal tourist itineraries are in the regions of the Kremenchug Reservoir, the Dnieper, and the cities of Cherkassy, Kanev, Korsun'-Shevchenkovskii, and Uman', where the Sofievka Arboretum is located. There are tourist centers in Cherkassy and Kanev and at the Kremenchug Reservoir.

F. N. Nepiivoda and V. K. Sobchenko [29–222–1]

CHERKESKA, the Russian name for a man's outer garment once common among many peoples of the Caucasus, including the Georgians, Circassians, Abkhazians, and Tsakhurs; it was also adopted by the Terek and Kuban' cossacks.

The *cherkeska* is a caftan with a single, unfastened opening down the front and no collar. It is usually black, brown, or gray and may be made from hand-woven or ready-made cloth. The *cherkeska* normally falls a little below the knee. It is gathered and pleated at the waist and is tied with a narrow belt. The sleeves are long and wide. From four to eight *gazyri* (leather pockets) are sewn on each side of the chest; they are designed to hold the wooden cylinders in which the Caucasians used to keep rifle cartridges.

The *cherkeska* is still worn on holidays and for special events, such as folk art performances. [29–229–2]

CHERKESS, the Adyg population of Karachai-Cherkess Autonomous Oblast, including the descendants of the Kabardins who settled in the Kuban' in the first third of the 19th century. According to the 1979 census the Cherkess number 46,500; they speak Kabarda-Cherkess, which belongs to the Abkhazo-Adyg group of the Caucasian languages.

As a general designation for Adygs, the term "Cherkess" appeared in written sources in the 13th century and was used in Russian texts until the first years of Soviet power. Inhabitants of mountainous regions of the Caucasus—including Adygs, Abkhazians, and Ossets—settled in Turkey in the 19th century. The descendants of these settlers also call themselves Cherkess, or Circassians; today they live in such Middle Eastern countries as Turkey and Syria and number approximately 150,000. In foreign sources the ethnonym "Circassians" is still used to refer to all Adygs.

CHERKESSK (from 1825 to 1931 the *stanitsa* [large cossack village] of Batalpashinskaia; from 1931 to 1939 the city of Batalpashinsk), a city and the administrative center of Karachai-Cherkess Autonomous Oblast, Stavropol' Krai, RSFSR. Situated on the right bank of the Kuban' River. Railroad station on the Nevinnomysskaia-Dzheguta line, a spur of the Armavir-Baku railroad line. Population, 85,000 (1977; 29,000 in 1939, 42,000 in 1959, 67,000 in 1970).

Cherkessk was founded in 1804 as a military fortress on the Kuban' fortifications line at the place where the Russian Army defeated the Turkish military leader Batal Pasha in 1790. It became a district capital of Kuban' Oblast in 1860 and the capital of an *otdel* (military department) of the oblast in 1886. Cherkessk is the starting point of the Sukhumi Military Road, which was built between 1828 and 1878. In 1922 it became the administrative center of Karachai-Cherkess Autonomous Oblast.

In addition to light industry, Cherkessk has sizable machine-building, chemical, electrical-engineering, building-materials, and food-processing industries. The city has plants for the manufacture of refrigeration equipment, chemical products, industrial rubber goods, low-voltage equipment, and cement. Educational institutions include a branch of the Stavropol' Polytechnic Institute, a road transportation technicum, and pedagogical, medical, and music schools. Cherkessk has scientific research institutes of economics, history, and language and literature, a museum of local lore, and a drama theater.

CHERLAK, an urban-type settlement and the administrative center of Cherlak Raion, Omsk Oblast, RSFSR. A landing on the right bank of the Irtysh River, Cherlak is located 41 km from the Cherlak railroad station and 140 km southeast of Omsk. A division of the Omsk Meat-packing Plant is located in the settlement. [29–230–1]

CHERMASAN, a river in the Bashkir ASSR, a left tributary of the Belaia River of the Volga basin. The Chermasan is 186 km long and drains an area of 3,970 sq km. It rises in the Bugul'ma-Belebei Elevation and is fed primarily by snow. The mean flow rate is 10 cu m per sec. The Chermasan freezes over in November, and the ice breaks up in April. [29–231–1]

CHERMOEV, ABDUL MEDZHID ORTSUEVICH. Born Mar. 3 (15), 1882; died 1936 in Paris. Chechen bourgeois nationalist figure (1917–19). Oil industrialist.

Chermoev graduated from the Nicholas Cavalry School in 1901. His cavalry service included membership in the personal escort of Nicholas II. He retired from the cavalry in 1908. During World War I, Chermoev was an officer in the Caucasian Native Horse Cavalry Division, nicknamed the Wild Division. After the February Revolution of 1917 he was one of the organizers of the counterrevolutionary Union of United Mountaineers and a leader of the bourgeois Terek-Dagestan Government. He supported the intervention of Turkish troops in Dagestan. After Soviet power was established in Dagestan at the end of 1919, Chermoev emigrated and continued his anti-Soviet activities abroad.

Abazatov, M. A. *Borba trudiashchikhsia Checheno-Ingushetii za Sovetskuiu vlast' (1917–1920)*, 2nd ed. Groznyi, 1969. [29–231–2]

CHERMOZ, a city in Il'inskii Raion, Perm' Oblast, RSFSR. Chermoz, a port on the Kama Reservoir, is situated 60 km from the Dobrianka railroad station and 212 km north of the city of Perm'. It has a log pond. Enterprises include a plant for the production of electrical equipment, and the Chermozskii Sovkhoz, which produces meat, milk, and grain. [29–231–3]

CHERNAIA, a river in the Crimea where a battle between Russian and allied (French, English, Sardinian, and Turkish) forces took place 8–12 km southeast of Sevastopol' on Aug. 4 (16), 1855, during the Crimean War.

In late June 1855, Emperor Alexander II demanded that the commander in chief of the Russian forces in the Crimea, General M. D. Gorchakov, mount a determined offensive to render aid to Sevastopol'. On June 28 (July 10) it was decided at a military council to attack the enemy at the Chernaia River. Preparations for the offensive proceeded slowly and with little attempt at concealment. About 58,000 troops, including 10,000 cavalry and 272 artillery pieces, were massed for the offensive. The enemy forces numbered about 60,000.

Two columns, the left led by General P. P. Liprandi and the right by General N. A. Reada, began the attack at dawn on August 4 (16) but were unable to advance because of insufficient troops, a lack of coordination in their operations, and unsatisfactory leadership by the Russian command. Reserves were brought into battle piecemeal and suffered heavy losses. The battle ended in sporadic skirmishes that were very bitter in some sectors. By 10 A.M. the Russian Army, having lost more than 8,000 men, had been driven from the Chernaia River. The allies' losses were about 2,000. The defeat at the Chernaia worsened the position of the Russian forces in the Sevastopol' area. [29–231–5]

CHERNAIA KHOLUNITSA, an urban-type settlement in Omutninsk Raion, Kirov Oblast, RSFSR. Chernaia Kholunitsa is located on the Chernaia Kholunitsa River, a tributary of the Viatka River, 47 km northwest of the Stal'naia railroad station on the Iar-Lesnaia line. Local industry includes reprocessing of wood. [29–240–3]

CHERNAIA MOGILA, a tenth-century Old Russian kurgan in Chernigov. Chernaia Mogila, which stands 11 m high and has a circumference of 125 m, was excavated by D. Ia. Samokvasov in 1872–73. It contained the cremated remains of two warrriors from the nobility and the slaves who were cremated with them; also in the mound were the remains of sacrificial animals, as well as various vessels, weapons, tools, and ornaments. After the cremation, a preliminary mound, measuring 7 m in height, was erected for the funeral celebration; the coats of mail and helmets were removed from the fire and placed on top of the mound, along with two sacrificial knives, two gold Byzantine coins, a bronze idol, two wisent horns, and a kettle with the bones of a

ram. The silver bands on the wisent horns are decorated with stamped plant designs. The larger horn also bears depictions of fantastical animals and of a man and a woman shooting at birds with bows. The mound was completed after the funerary feast, and a stela was installed at the summit.

Chernaia Mogila was the burial site of high-ranking members of the *druzhina* of a Kievan Rus' prince; it is similar to the large Gnezdovo burial mounds.

CHERNAIA RADA, a Ukrainian all-cossack *rada* (council) that met near the city of Nezhin on June 17–18 (27–28), 1663.

The Chernaia Rada was convoked in order to elect a hetman of the Left-bank Ukraine after the Polish henchman P. Teteria had been elected hetman of the Right-bank Ukraine. The name of the *rada* derives from the participation in it of not only cossacks but also the *chern'* (peasants and urban lower classes). The *starshina* (cossack officials) nominated V. N. Zolotarenko and Ia. S. Somko for the position of hetman, but the rank-and-file Zaporozh'e cossacks and the representatives of the peasants and urban poor elected I. M. Briukhovetskii. He was supported by the tsarist government and had made demagogic promises to lower taxes and to limit the seizure of land by the *starshina*.

The people's dissatisfaction with the *starshina* during the elections culminated in the destruction of houses owned by merchants and members of the *starshina* in Nezhin and Pereiaslav. The new *starshina* leadership headed by Briukhovetskii, however, continued to oppress the popular masses. Popular uprisings resulted in the Left-bank Ukraine in 1666 and 1668 against the *starshina* and tsarist *voevody* (military governors). [29–239–3]

CHERNAIA RUS', a historical region in the basin of the upper course of the Neman River. Chernaia Rus' included the cities of Grodno, Novgorodok, Slonim, Nesvizh, and Zditov.

Until the 13th century part of Chernaia Rus' was in the Polotsk Principality. Between 1240 and 1260, Chernaia Rus' came under the rule of the Lithuanian prince Mindaugas and the Galician-Volynian princes. Together with the Lithuanian lands, Chernaia Rus' formed the core of the Grand Duchy of Lithuania in the 14th century. [29–239–6]

CHERNELITSA, an urban-type settlement in Gorodenka Raion, Ivano-Frankovsk Oblast, Ukrainian SSR. Chernelitsa is located 27 km from the Gorodenka railroad station. The settlement has food-processing enterprises. [29–240–4]

CHERNENKO, KONSTANTIN USTINOVICH. Born Sept. 11 (24), 1911, in the village of Bol'shaia Tes', in what is now Novoselovo Raion, Krasnoiarsk Krai. Soviet party and state figure. Hero of Socialist Labor (1976). Member of the CPSU since 1931.

The son of a peasant, Chernenko graduated from the Higher School of Party Organizers of the Central Committee of the ACP(B) in 1945 and the Kishinev Pedagogical Institute in 1953. Beginning in 1929 he engaged in Komsomol, soviet, and party work. He served as secretary of the Krasnoiarsk Krai Committee of the party from 1941 to 1943 and as secretary of the Penza oblast committee from 1945 to 1948. In 1948 he became head of the Agitation and Propaganda Department of the Central Committee of the Communist Party of Moldavia.

Chernenko headed a section in the Agitation and Propaganda Department of the Central Committee of the CPSU from 1956 to 1960, the Secretariat of the Presidium of the Supreme Soviet of the USSR from 1960 to 1965, and the General Department of the Central Committee of the CPSU from 1965 to 1976. In 1976 he was made a secretary of the Central Committee of the CPSU. He became a candidate member of the Central Committee of the CPSU in 1966 and a member in 1971. Chernenko was named a candidate member of the Politburo of the Central Committee of the CPSU in 1977 and a member of the Politburo of the Central Committee in 1978. He was a deputy to the seventh through tenth convocations of the Supreme Soviet of the USSR. Chernenko has been awarded two Orders of Lenin, three other orders, and various medals. [29–240–6]

CHERNENKO, SEMEN FEDOROVICH. Born Sept. 1 (13), 1877, in the village of Gremiachki, in what is now Sumy Oblast; died Jan. 17, 1974, in Michurinsk, Tambov Oblast. Soviet scientist and fruit breeder. Hero of Socialist Labor (1966).

In 1933, Chernenko graduated from the Fruit and Vegetable Institute in Michurinsk. In 1926 he joined the staff of the I. V. Michurin Central Genetic Laboratory, and from 1933 to 1952 he also worked at the Fruit and Vegetable Institute in Michurinsk. Chernenko developed winter-hardy apple and pear varieties with various ripening times. The best of these, the Oranzhevoe, Chernenko Pepin, Antonovka Novaia, and Progress apples, have been regionalized in the Central Chernozem Zone of the European part of the USSR, as well as in the Ukraine and the Lithuanian SSR. Chernenko was awarded the State Prize of the USSR in 1947. He received three Orders of Lenin, two other orders, and various medals.

CHERNETSOV BROTHERS, Russian artists of the first half of the 19th century.

Grigorii Grigor'evich Chernetsov (born Nov. 12 [24], 1802, in Lukh, in present-day Ivanovo Oblast; died June 8 [20], 1865, in St. Petersburg) was a painter and draftsman. He studied with M. N. Vorob'ev at the St. Petersburg Academy of Arts from 1819 to 1827. Nikanor Grigor'evich Chernetsov (born July 21 [Aug. 2], 1805, in Lukh; died Jan. 11 [23], 1879, in St. Petersburg) was a painter and lithographer. He studied at the academy with Vorob'ev from 1823 to 1827. Nikanor traveled in the Caucasus (1829–31) and the Crimea (1833–36). Beginning in 1837 the two brothers worked together; they journeyed on the Volga (1838) and throughout various countries in Europe and the Middle East (1840–43).

Grigorii produced interiors, landscapes, and many-figured compositions. His painting *Review on the Tsarina's Meadow: October 6, 1831* (completed 1837, A. S. Pushkin All-Union Museum, Pushkin) is a collective portrait of all the outstanding figures in the development of Russian culture during the first three decades of the 19th century. Nikanor was primarily a landscapist; an example of his work is *View of Tiflis* (1831, Russian Museum, Leningrad).

The Chernetsov brothers' most important works—drawings, watercolors, and studies—were executed *en plein air* during the journey on the Volga. Also produced during the journey was a 1,981-page folio, in pencil and pen, depicting the shores of the Volga (completed 1851, M. E. Saltykov-Shchedrin Public Library, Leningrad). These works combine classical panoramic elements with documentary detail and accuracy of observation. Enlightened in character and imbued with a concern for the native environment, they represent a major stage in the development of the national landscape in Russian painting.

CHERNIAEV, IL'IA IL'ICH. Born Jan. 8 (20), 1893, in the village of Spasskoe, Vologda Province; died Sept. 30, 1966, in Moscow. Soviet inorganic chemist. Academician of the Academy of Sciences of the USSR (1943; corresponding member, 1933).

A student of L. A. Chugaev's, Cherniaev graduated from the

University of Petrograd in 1915. He began teaching there the same year, and in 1932 he became a professor. In 1918, while continuing to teach at the university, he joined the staff of the Institute for the Study of Platinum of the Russian Academy of Sciences. In 1934 he became a staff member of the Institute of General and Inorganic Chemistry of the Academy of Sciences of the USSR; he was made the institute's director in 1941. From 1935 to 1941, Cherniaev was a professor at the Moscow Petroleum Institute, and in 1945 he became a professor at Moscow State University.

Cherniaev's principal works dealt with the chemistry of platinum complexes and complexes of the platinum group metals. While studying nitro derivatives of platinum(II), he discovered the trans effect of ligands—that is, he discovered that the reactivity of any ligand in the inner sphere of a complex depends on the nature of the ligand trans to it. The discovery of this effect, which was named for Cherniaev, enabled Cherniaev and his students to synthesize many new complexes. He also discovered that the sign of rotation of optically active amino compounds of platinum(IV) changes upon their conversion to amido or imido derivatives. Cherniaev devoted considerable effort to the refining of platinum group metals.

Cherniaev received four State Prizes between 1946 and 1952. He was also awarded four Orders of Lenin, two other orders, and various medals.

CHERNIAEV, MIKHAIL GRIGOR'EVICH. Born Oct. 22 (Nov. 3), 1828; died Aug. 4 (16), 1898, in the village of Tubyshki, in what is now Mogilev Oblast, Byelorussian SSR. Russian military and public figure; lieutenant general (1882).

The son of a nobleman, Cherniaev graduated from the Military Academy in 1853 and fought in the Crimean and Caucasian wars. In 1864 and 1865, as commander of a special Western Siberian detachment, Cherniaev occupied Aulie-Ata, Chimkent, and Tashkent in the Kokand Khanate and was appointed military governor of the newly formed Turkestan Oblast. He was forced to retire in 1866 for overstepping his authority.

From 1873 to 1878, Cherniaev and R. A. Fadeev, a military affairs writer, published the conservative, nationalist newspaper *Russkii mir* in St. Petersburg. Against the wishes of the Russian government, Cherniaev traveled secretly to Belgrade in 1876, after the Bosnia-Hercegovina Uprising of 1875–78 had begun. He was appointed commander of the Serbian Army, which was defeated during Serbia and Montenegro's war with Turkey in 1876. When the Russo-Turkish War of 1877–78 began, Cherniaev enlisted for military service but was not taken into the active army. After serving as governor-general of Turkestan from 1882 to 1884, Cherniaev retired in 1886. [29–321–1]

CHERNIAKHOV, an urban-type settlement and administrative center of Cherniakhov Raion, Zhitomir Oblast, Ukrainian SSR. The settlement is located 24 km north of Zhitomir, on the Zhitomir-Mozyr' highway. It has a railroad station (Gorbashi) on the Zhitomir-Korosten' line. Cherniakhov has a brickyard, an asphalt plant, and a food-processing combine. A branch of the Polisianka Zhitomir Clothing Association is located in the settlement, and granite is worked there. [29–321–3]

CHERNIAKHOV CULTURE, an archaeological culture that flourished from the turn of the third century to the turn of the fifth century in the forest steppe and steppe, from the lower Danube in the west to the left bank of the Dnieper in the east. It is named after a burial ground near the village of Cherniakhov in Kagarlyk Raion, Kiev Oblast. In Rumania, the Cherniakhov culture is called Syntana-de-Mureş.

The settled agricultural and stock-raising tribes of the Cherniakhov culture lived in large unfortified settlements; dwellings, both ground-level and subterranean, were arranged in rows. The area of some ground-level houses, probably belonging to large patriarchal families, exceeded 100 sq m. Land cultivation was characterized by improvements of the plow and *ralo* with iron tips (*see* RALO), the probable use of oxen and horses as draft animals, and an increase in the number of cereals cultivated; increasingly more land was placed under cultivation. Ironworking, blacksmithing, bronze casting, stonecutting, and bone carving were well developed, with artisans working mainly to order rather than for the open market. Pottery (bowls, pitchers) was generally made on a potter's wheel. Trade with nearby Roman centers flourished. Imported items, such as amphorae in which wine and olive oil were transported, glass goblets, and, more rarely, red-laquered vessels, both intact and in fragments, were found at all sites of the Cherniakhov culture. Roman coins were used in internal and external trade. Certain features of the Cherniakhov culture were formed under the influence of late classical culture.

In the funerary rites of the Cherniakhov culture, both cremation (fields of burial urns) and inhumation were practiced, with the latter predominating. The majority of researchers believe that the Cherniakhov culture was formed by tribes of differing ethnic origin (Dacians, Sarmatians, Germans, late Scythians and Venedy-Slavs), mentioned by ancient authors as living in the area that the culture occupied. The theory of the polyethnic background of the Cherniakhov culture is corroborated in particular by the presence of local differences in house construction, pottery, and burial rites. The theory that the Cherniakhov culture was destroyed by the incursion of the Huns in the late fourth century is the most probable, although there is also a hypothesis that it eventually evolved into the ancient Slavic culture and even the ancient Russian culture.

CHERNIAKHOVSK (until 1946, Insterburg), a city under oblast jurisdiction and administrative center of Cherniakhovsk Raion, Kaliningrad Oblast, RSFSR. Situated at the confluence of the Instruch and Angrapa rivers, which form the Pregolia River. Population, 34,000 (1974).

Cherniakhovsk is a railroad junction with lines to Kaliningrad, Sovetsk, Kaunas, and Zheleznodorozhnyi and is also a highway junction. Among the industrial enterprises in Cherniakhovsk are the Tekhmash Plant, a leather plant, a ceramic plant, a motor-vehicle repair shop, a wood-products combine, and a logging and timber distribution establishment. The city's food industry includes a meat-packing plant, a milk plant, and a confectionery factory. The city has a pedagogical school. Cherniakhovsk was named in honor of General of the Army I. D. Cherniakhovskii. [29–321–4]

CHERNIAKHOVSKII, IVAN DANILOVICH. Born June 16 (29), 1906, in the city of Uman', in what is now Cherkassy Oblast; died Feb. 18, 1945; buried in Vil'nius. Soviet military commander; general of the army (1944). Twice Hero of the Soviet Union (Oct. 17, 1943, and July 29, 1944). Member of the CPSU from 1928.

The son of a Ukrainian railroad worker, Cherniakhovskii joined the Red Army in 1924. He graduated from the Kiev Artillery School in 1928 and from the Red Army Mechanization and Motorization Academy in 1936. At the beginning of the Great Patriotic War of 1941–45, he commanded the 28th Tank Division and later the 241st Rifle Division on the Northwestern Front; he took command of the XVIII Tank Corps on the Voronezh Front in June 1942 and in July was appointed commander of the Sixtieth Army, which fought on the Voronezh, Central, and First Ukrainian fronts. He was appointed troop commander on the Western Front on Apr. 15, 1944, and troop commander on the Third Byelorussian Front on Apr. 24, 1944. He saw action during the liberation of Byelorussia, and, in the battle to crush the enemy's forces in East Prussia, he was mortally wounded near the

city of Mehlsack (now Pieniężno in the Polish People's Republic).

Cherniakhovskii was awarded the Order of Lenin, four Orders of the Red Banner, two Orders of Suvorov First Class, the Order of Kutuzov First Class, the Order of Bogdan Khmel'nitskii First Class, and various medals. [29–322–1]

CHERNIANKA, an urban-type settlement and administrative center of Chernianka Raion, Belgorod Oblast, RSFSR. The settlement is situated on the left bank of the Oskol River, in the Don River basin. It is a railroad station on the Elets-Valuiki line. Chernianka has a sugar refinery, a vegetable-oil mill, a plant that produces butter and dry milk, a meat- and poultry-packing plant, a food-processing combine, an industrial combine, a brickyard, and a grain elevator. [29–321–2]

CHERNIGOV, a city and administrative center of Chernigov Oblast, Ukrainian SSR. Port on the right bank of the Desna River. Railroad junction of lines to Gomel', Ovruch, and Nezhin; highway junction. Population, 233,000 (1977; 69,000 in 1939, 90,000 in 1959, and 159,000 in 1970). Chernigov is divided into two city raions.

Chernigov, one of the oldest cities in Russia, was the center of the East Slavic Severiane tribes in the ninth century. At the end of the ninth century, it became part of Kievan Rus'. It is first mentioned in the chronicle for the year 907. From the tenth through 12th centuries it was a major artisan and trade center. From the 11th to 13th centuries it was the capital of the Chernigov Principality. In 1239 it was destroyed by the Mongol Tatars.

In the second half of the 14th century, Chernigov came under the rule of the Grand Duchy of Lithuania. In 1503 it became part of the Muscovite state. In 1611 it was captured by Poland. The population of Chernigov fought in the Liberation War of the Ukrainian People (1648–54), and in 1654 it became part of the Russian state. In 1782 it became the administrative center of the Chernigov Namestnichestvo (Vicegerency), in 1797, of the Little Russian (Malorossiiskaia) Province, and in 1802, of Chernigov Province. It quickly developed as a local trade center. At the end of the 19th century, it was linked by rail with Kiev by way of Bakhmach.

Soviet power was established on Jan. 19 (Feb. 1), 1918. During the Civil War, Chernigov was captured by Austro-German troops, the Ukrainian Directory, and the Denikin forces. Soviet power was restored on Nov. 7, 1919. In 1932, Chernigov became the administrative center of the oblast. From Sept. 9, 1941, to Sept. 21, 1943, it was occupied by fascist German troops, who inflicted enormous damage. The city was rebuilt after the war.

Among the industries developed in Chernigov are the chemical industry (the Khimvolokno chemical-fiber production association), light industry (worsted-wool combine, factory for the primary processing of wool, and garment and shoe factories), and the food-processing industry (meat-packing combine, milk plant, brewery, and plants for the production of confectionery and macaroni products). Chernigov also has a plant for the production of spare parts for motor vehicles, an instrument-making plant, a large-panel home-building combine, and factories for the production of pianos, cardboard, and other goods.

Numerous examples of Kievan Rus' architecture have been preserved in Chernigov, including the Spaso-Preobrazhenskii Cathedral (11th century), the Cathedral of St. Boris and St. Gleb (12th century), the Uspenskii Cathedral (12th century), the St. Elias Church (late 11th or early 12th century) and Paraskeva Piatnitsa Church (late 12th or early 13th century). Architectural landmarks of the 17th and 18th centuries (Ukrainian baroque) include Lizogub's house (1690's), the collegium (1702), the cathedral (1679–89) and refectory (1677–79) of the Troitskii Monastery, and St. Catherine's Church (1715). At the beginning of the 19th century, Chernigov was built up according to a grid plan, with buildings in the classical style, such as the governor-general's residence (1804; archiect A. D. Zakharov; since 1975 the Historical Museum).

Heavily damaged during the Great Patriotic War, Chernigov was rebuilt in accordance with a number of general plans (1945, 1958, and 1966); the central section was built up (1950–55; architects P. F. Buklevskii and I. D. Iagodovskii), and theater buildings were erected (1958; architects D. S. Fridlin, S. P. Tutuchenko, and others), as were the oblast committee building of the Communist Party of the Ukraine and the House of Political Education (1974). The city has a monument to V. I. Lenin (bronze and granite, 1967; sculptors A. E. Belostotskii and O. A. Suprun, architect V. M. Ustinov) and a memorial to the victims of fascism (granite, 1974; architect A. A. Karnabed, sculptor G. P. Gutman).

Educational institutions include the T. G. Shevchenko Pedagogical Institute, a branch of the Kiev Polytechnic Institute, an evening mechanical and technical technicum, a cooperative technicum, a technicum of Soviet trade, a law technicum, a medical school, and a music school. There are two museums—the historical museum and the M. M. Kotsiubinskii literary memorial museum—in the city and a branch of the Sofia Museum Preserve. Chernigov also has an oblast theater of music and drama, an oblast puppet theater, and a philharmonic society.

CHERNIGOVKA, an urban-type settlement and administrative center of Chernigovka Raion, Zaporozh'e Oblast, Ukrainian SSR. The settlement is situated on the Tokmak River (in the basin of the Sea of Azov), 7 km from the Verkhnetokmak I railroad station on the Berdiansk-Pologi line. Industry is represented by a plant that produces foodstuffs, a mixed-feed plant, and a butter-making section of the Molochansk Dairy Combine. Chernigovka has a forest-improvement station and a poultry hatchery. [29–244–1]

CHERNIGOV OBLAST, part of the Ukrainian SSR. Formed on Oct. 15, 1932. Area, 31,900 sq km. Population, 1.508 million (as of Jan. 1, 1977). Chernigov Oblast is divided into 22 raions and has 15 cities and 30 urban-type settlements. The administrative center is the city of Chernigov. On June 13, 1967, Chernigov Oblast was awarded the Order of Lenin.

Natural features. Chernigov Oblast is situated on the left bank of the middle Dnieper, in the Desna River basin. It occupies a lowland and a hilly plain, rising from elevations of 120–150 m in the southwest to 200–220 m in the northeast. The climate is temperate continental. The average January temperature varies in the range −6° to −8°C, and the average July temperature, in the range 18.4° to 19.7°C. Annual precipitation amounts to 500–600 mm. The growing season lasts 190–200 days.

The principal river is the Desna, which cuts across the oblast from northeast to southwest. Its left tributaries are the Seim and the Oster, and its right tributaries, the Ubed', the Snov, and the Belous. The Dnieper and its left tributary the Sozh flow along the northwestern border.

The northern part of the oblast—Poles'e—is characterized by soddy-podzolic, sandy, and sandy loam soils. The southern, forest-steppe part is dominated by chernozems, both podzolized and meadow-type.

The north (68 percent of the oblast's territory) is occupied by mixed forests, with predominantly pine, oak, birch, and hornbeam and some linden, maple, ash, and elm. The Trostianets Arboretum of the Academy of Sciences of the Ukrainian SSR is located in the southeastern part of the oblast; the variety of coniferous and ornamental plants in the arboretum is the most diverse in the Ukraine.

Animal life is represented by the European hare, fox, otter, raccoon dog, wolf, pine marten, badger, elk, roe deer, and wild boar. The rivers and lakes abound in roach, crucian carp, tench, pike, perch, pike perch, European bream, ide, and sheatfish.

Population. Ukrainians constitute (1970) 93.8 percent of the population, and Russians, 4.7 percent. The average population

density is 47.3 persons per sq km (1977). The forest-steppe regions are the most densely populated areas, with more than 50 persons per sq km. The urban population accounts (1977) for 43 percent of the total.

The most important cities are Chernigov, Priluki, and Nezhin.

Economy. During the years of Soviet power, Chernigov Oblast has been transformed from a backward agrarian region into a highly developed industrial-agrarian area. It abounds in peat and deposits of phosphorites and marl. The discovery, beginning in the late 1950's, of a number of petroleum deposits (Gnedintsi, Priluki, Leliaki, Monastyrishche, Malaia Devitsa) and petroleum-gas deposits (Bogdanovka, Mil'ki), has given rise to new branches of industry, the petroleum and natural-gas industries.

The most developed branches of light industry are the production of textiles (Chernigov), knitwear (Priluki), and garments (Chernigov and Nezhin) and the processing of flax and hemp. Machine building and metalworking are represented by plants for the construction of farm machinery (Nezhin and Priluki) and firefighting equipment (Ladan) and by plants for the production of motor-vehicle spare parts (a branch of the Gorky Automotive Plant), experimental hardware, and instruments and a repair plant (Chernigov). The chemical and petrochemical industries have been established, represented by the Khimvolokno chemical-fiber production association in Chernigov and by the production of synthetic resins and plastics in Priluki and varnishes and paints in Nezhin. The lumber, woodworking, and paper industries are represented by enterprises for the production of furniture and pianos in Chernigov and a mill for the production of industrial-grade paper in Koriukovka. Building-materials enterprises manufacture precast reinforced-concrete structural components and roofing materials (Chernigov), as well as bricks. The food-processing industry is dominated by meat-processing enterprises (Chernigov, Nezhin, Bakhmach, Priluki, Novgorod-Severskii) and enterprises for the production of butter, cheese, and milk (Ichnia, Bakhmach, and elsewhere). There are also sugar refineries, distilleries, breweries, and plants for the production of starch syrup. Vegetable processing is well developed (Nezhin).

Agriculture specializes in stock raising for meat and dairy purposes and the production of potatoes, grains, sugar beets, and flax. The oblast has (1976) 503 kolkhozes and 57 sovkhozes. Sixty-eight percent of the oblast's total land area is occupied by agricultural lands, of which lands under cultivation account for 72 percent, and pastures and hayfields, for 26 percent. In 1976, 1,587,100 hectares (ha) were under cultivation, of which 711,800 ha were under grains (winter wheat, rye, legumes, barley, oats, buckwheat, millet, and corn), 100,500 ha under industrial crops (sugar beets and long-staple flax), 193,300 ha under potatoes, 19,400 ha under melons, gourds, and vegetables, and 562,100 ha under fodder crops. Hemp and mint are also grown. Reclaimed lands total 196,000 ha, and irrigated lands, 10,000 ha.

In 1976 the oblast had 1,305,500 head of cattle (including 505,100 cows), 847,600 hogs, and 245,500 sheep and goats. Poultry farming, rabbit breeding, and beekeeping are also developing.

The operational length of railroads is 892 km (1976). The main lines are Moscow-Bakhmach-Nezhin-Chop, Kiev-Chernigov-Leningrad, Nezhin-Chernigov-Gomel', Simferopol'-Chernigov-Riga, Minsk-Bakhmach-Khar'kov, and Chernigov-Nezhin-Priluki. Railroad junctions include Nezhin, Bakhmach, Chernigov, and Priluki. Motor-vehicle roads total 7,500 km, of which 3,600 km are hard-surfaced. The Odessa-Kiev-Leningrad and Kiev-Moscow highways pass through the oblast. The Dnieper and Desna rivers are navigable. Chernigov is linked by air with Moscow, a number of oblast administrative centers of the Ukrainian SSR, and oblast raions.

The Dashava-Kiev-Moscow natural gas pipeline and the Priluki-Kremenchug petroleum pipeline pass through Chernigov Oblast.

Education, cultural affairs, and public health. During the 1914–15 academic year, the area that is now Chernigov Oblast had 1,374 general-education schools, with 111,000 pupils and students, two specialized secondary educational institutions, with 137 students, and one higher educational institution, with 134 students. During the 1976–77 academic year, the oblast had 1,113 general-education schools of all types, with 235,700 pupils and students, 17 vocational-technical schools, with 9,000 students, and 19 specialized secondary educational institutions, with 15,300 students. The Chernigov Pedagogical Institute, the Nezhin Pedagogical Institute, and the Chernigov branch of the Kiev Polytechnic Institute were attended by 8,300 students. In 1977, there were 404 preschool institutions in the oblast, caring for 42,900 children.

Chernigov Oblast has a number of scientific research institutes. It also has (as of Jan. 1, 1977) 1,105 public libraries, with about 11.8 million books and journals, and eight museums—a historical museum in Chernigov, museums of local lore in Nezhin, Oster, Priluki, and the settlement of Sosnitsa, the A. Dovzhenko literary memorial museum in the settlement of Sosnitsa, the M. M. Kotsiubinskii literary memorial museum in Chernigov, and the N. A. Shchors memorial museum in the city of Shchors. In addition, it has three theaters (an oblast theater of music and drama and the oblast puppet theater in Chernigov and a dramatic theater in Nezhin), 1,174 clubs, 1,204 motion-picture projection units, and 46 extracurricular institutions.

The following oblast newspapers are published in Ukrainian: *Desnians'ka pravda* (Desna Pravda; since 1917) and the Komsomol newspaper *Komsomol'skyi hart* (Komsomol Hardening; since 1933). Two programs of the All-Union Radio, totaling 44 hours a day and an informational republic-level program, totaling 19 hours, are broadcast in the oblast, as well as a joint Union-republic program, totaling 19 hours a day, and a local program, in both Russian and Ukrainian, totaling 1.1 hours. Two programs from the Central Television Studio, totaling 10.7 hours a day, are relayed, as well as republic-level and local programs in Russian and Ukrainian, totaling 13.5 hours a day.

By Jan. 1, 1977, the oblast had 194 hospitals, with 17,800 beds (11.8 beds per 1,000 inhabitants), and 3,400 physicians (one physician per 450 inhabitants). The Kachanovka climatological health resort is located in the oblast; there are also eight sanatoriums and four houses of rest.

The principal tourist sites are the areas around the Kiev Reservoir and the Desna and Oster Rivers, as well as the cities of Chernigov, Novgorod-Severskii, Nezhin, and the Trostianets Arboretum of the Academy of Sciences of the Ukrainian SSR (Ichnia Raion). There are tourist centers in Novgorod-Severskii and on the Oster River.

CHERNIGOV PRINCIPALITY, an ancient Russian principality that flourished from the 11th through 13th centuries. Chernigov Principality occupied the lands inhabited by the Severiane and some of the lands of the Poliane, Radimichi, Viatichi, and other tribes. It stretched along both banks of the Dnieper and along the Desna, Seim, and Sozh Rivers, extending into the basin of the Upper Oka. The principal cities were Chernigov (the capital), Snovsk, Liubech, Novgorod-Severskii, and Starodub.

From 1024 to 1036 the principality was an independent possession of Mstislav Vladimirovich (*see* MSTISLAV VLADIMIROVICH), from 1054 to 1073, of Sviatoslav Iaroslavich (*see* SVIATOSLAV IAROSLAVICH), and from the end of the 11th to beginning of the 13th centuries, of the Sviatoslavich princes, descendants of Sviatoslav Iaroslavich. In 1097 the Severskii Principality separated from Chernigov Principality (*see* SEVERSKII PRINCIPALITY). In the 12th century, Chernigov Principality rapidly underwent disintegration. The last Chernigov prince was Mikhail Vsevolodovich, who died in 1246 (*see* MIKHAIL VSEVOLODOVICH). In 1239, the city of Chernigov was captured and burned by the Mongol Tatars, and the principality soon ceased to exist as a state entity.

The cities of Chernigov Principality were centers of ancient Russian culture. Churches in Chernigov include the Spaso-Preobrazhenskii (Transfiguration of the Savior) Cathedral (1036), the Uspenskii (Assumption) Cathedral of the Elets Monastery (12th century), and the Paraskeva Piatnitsa Church (12th and 13th cen-

turies). The *Khozhdenie* (Pilgrimage) of Daniil (early 12th century), a work by the abbot of one of the Chernigov monasteries, was well known in ancient Rus'.

CHERNIGOV REGIMENT UPRISING, an armed insurrection of Decembrists in the Ukraine that lasted from Dec. 29, 1825, to Jan. 3, 1826.

Originally part of a larger plan to overthrow the government, the uprising was the final act of the Southern Society of Decembrists. Its purpose was to continue the Decembrist movement after the defeat of the uprising of Dec. 14, 1825, on Senate Square in St. Petersburg. It also aimed at creating a camp of revolutionary military units near Kiev to fight against the autocracy.

The uprising began on December 29, when the Chernigov Regiment officers A. D. Kuz'min, V. N. Solov'ev, I. I. Sukhinov, and M. A. Shchepilla freed Lieutenant Colonel S. I. Murav'ev-Apostol, a leader of the Southern Society who had been arrested in the village of Trilesy. On December 30, Murav'ev-Apostol led the 2nd Grenadier and 5th Musketeer companies of the regiment into Vasil'kov and seized weapons, ammunition, provisions, and the regimental treasury. Three more companies from the regiment joined the uprising.

On the morning of December 31, the "Orthodox Catechism," a revolutionary proclamation written by Murav'ev-Apostol and M. P. Bestuzhev-Riumin, was read to the insurgents as they stood in ranks. The proclamation called for an armed rebellion against the autocracy, serfdom, and compulsory service recruitment. Although the insurgents were joined in Brusilov by roughly two companies from the regiment, they were unable to link up with other units in which Decembrists were serving.

By January 1, the insurgents numbered some 1,000 soldiers and 17 officers. They started toward Zhitomir in an effort to link up with military units in which members of the Society of the United Slavs were active. Government troops cut them off and forced them to turn toward Belaia Tserkov'.

On Jan. 3, 1826, at the village of Ustimovka, the Chernigov Regiment was met by government troops as it attempted to break through to Zhitomir to join regiments of the 8th Infantry Division. After meeting volleys of canister fired point-blank, the insurgents wavered and were subsequently defeated by the cavalry. Shchepilla was killed, S. I. Murav'ev-Apostol was seriously wounded, and I. I. Murav'ev-Apostol and Kuz'min shot themselves. Six officers and 895 soldiers were taken prisoner.

In accordance with the sentence handed down by the Supreme Court, the leaders of the uprising, S. I. Murav'ev-Apostol and M. P. Bestuzhev-Riumin, were hanged. The officers Solov'ev, Sukhinov, A. A. Bystritskii, and A. E. Mozalevskii were given life terms of hard labor. More than 100 noncommissioned officers and soldiers received corporal punishment, and 805 men were transferred to the Caucasus. The regiment was later re-formed.

CHERNIGOVSKII, VLADIMIR NIKOLAEVICH. Born Feb. 16 (Mar. 1), 1907, in Ekaterinburg, now Sverdlovsk. Soviet physiologist. Academician of the Academy of Sciences of the USSR (1960; corresponding member 1953) and the Academy of Medical Sciences of the USSR (1950).

In 1930, Chernigovskii graduated from the medical school of the University of Perm', where he studied under V. V. Parin and K. M. Bykov. He worked at the Medical Institute in Sverdlovsk (1932–37), the All-Union Institute of Experimental Medicine in Leningrad (from 1937; laboratory head, from 1946), and the Naval Medical Academy in Leningrad (1941–52; professor, from 1944). Chernigovskii was director of the Institute of Normal and Pathological Physiology of the Academy of Medical Sciences of the USSR from 1952 to 1959 and the I. P. Pavlov Institute of Physiology of the Academy of Sciences of the USSR from 1959 to 1977. He was academician-secretary of the physiology division of the Academy of Sciences of the USSR from 1963 to 1967.

Chernigovskii's main research has been on the functional interrelationships between the cerebral cortex and the internal organs, interoception, and space physiology and medicine. He discovered and studied several interoceptors and their sites and mechanism of excitation. He elucidated the role of signaling from the visceral receptors in several forms of behavior of higher animals. Chernigovskii also studied reflex regulation of the circulatory system, identified the cortical projection zones of several internal organs, and, with his colleagues, created a model of hypertension.

Chernigovskii was a deputy to the sixth convocation of the Supreme Soviet of the USSR. He has been awarded four orders, several medals, the I. P. Pavlov Prize of the Academy of Sciences of the USSR (1944), the I. M. Sechenov Prize of the Academy of Sciences of the USSR (1974, jointly with S. S. Musiashchikova), and the I. P. Pavlov Gold Medal of the Academy of Sciences of the USSR (1964). Chernigovskii is a foreign corresponding member of the Academy of Sciences of the Socialist Republic of Rumania (1965) and a member of the International Astronautics Federation (1965).

CHERNISHNIA, a right tributary of the Nara River. During the Patriotic War of 1812, a battle was fought at the Chernishnia on October 6 between Russian troops and Napoleon's forces.

Aiming to weaken the enemy, the commander in chief of the Russian Army, Field Marshal M. I. Kutuzov, planned to crush the isolated vanguard of Marshal J. Murat—a force of more than 20,000 men located 6 km north of tbe Russian camp at Tarutino. Kutuzov divided his attack force into two arms. The left arm, which consisted of a cavalry unit commanded by General M. A. Miloradovich, was to make the main thrust. The right arm, commanded by General L. L. Bennigsen, comprised three columns. The first consisted of ten cossack regiments and a chasseur regiment, under General V. V. Orlov-Denisov; the second was formed by the II Infantry Corps, under General K. F. Baggovut; and the third was made up of the IV Infantry Corps and a cuirassier division, under General A. I. Osterman-Tolstoi. The III Infantry Corps and the I Cavalry Corps were held in reserve.

Army partisan detachments led by I. S. Dorokhov and A. S. Figner were assigned to move in the direction of the village of Voronovo to block the enemy's path of retreat. Orlov-Denisov's column skirted the enemy's flank and, in a surprise attack, overran the French cuirassier division. Owing to Bennigsen's poor leadership, however, and to a lack of coordination, the infantry columns were slow in reaching their assault positions. The attack in the center was repelled by the enemy, and Baggovut was killed. Despite successful operations by Miloradovich and Osterman-Tolstoi, Bennigsen halted the attacks. As a result, Murat,

who had suffered substantial losses (2,500 killed, 2,000 captured, and 38 artillery pieces disabled), was able to pull back to Voronovo.

The Russians pursued the vanguard as far as Spas-Kuplia, where Kutuzov, having received word of Napoleon's impending withdrawal from Moscow, halted the pursuit without bringing in his principal forces. Although the victory was incomplete, it played an important role in raising the combat morale of the Russian troops. [29–251–4]

CHERNITSYN, NIKOLAI NIKOLAEVICH. Born Nov. 20 (Dec. 2), 1883, in the village of Toikino, in what is now Perm' Oblast; died Mar. 31 (Apr. 13), 1917, in the city of Gorlovka. Russian mining engineer.

After graduating from the St. Petersburg Institute of Mines in 1910, Chernitsyn worked at the Makeevka Mine-rescue Station, where he organized and conducted the first studies in Russia on firedamp and coal dust and the reasons for their flammability. He was the first to use a vacuum process to degas hard coals, and he demonstrated that oxygen and nitrogen are absorbed from the air by methane-bearing coal seams.

Chernitsyn was killed during rescue operations in a mine.

CHERNOBAI, an urban-type settlement and the administrative center of Chernobai Raion, Cherkassy Oblast, Ukrainian SSR. Chernobai is situated 22 km from the Zolotonosha railroad junction, from which lines run to Cherkassy, Grebenka, and Liapliava. The settlement has a wine-making combine and an industrial combine. Chernobai is also the location of a museum of local lore. [29–252–1]

CHERNOBYL', a city (since 1841) and administrative center of Chernobyl' Raion, Kiev Oblast, Ukrainian SSR. Situated on the Pripiat' River, 18 km from the Ianov railroad station on the Chernigov-Ovruch line. Chernobyl', a river landing, has an iron foundry, a cheese plant, a ship-repair dock, and a workshop of an artistic production association. The city has a medical school. [29–252–3]

CHERNOGOLOVKA, an urban-type settlement in Noginsk Raion, Moscow Oblast, RSFSR. The settlement is situated on the Chernogolovka River, a tributary of the Kliaz'ma. The Noginsk Scientific Center, a complex of scientific institutions of the Academy of Sciences of the USSR, is located in Chernogolovka. The center comprises a division of the Institute of Chemical Physics, as well as the Institute of New Problems in Chemistry, the Institute of Solid-state Physics, the Institute of Theoretical Physics, and the Institute of Experimental Mineralogy. [29–263–1]

CHERNOGORA, the highest mountain massif in the southeastern part of the Lesistye Carpathians; situated in Transcarpathian and Ivano-Frankovsk oblasts, Ukrainian SSR. Chernogora has an elevation of 1,800–2,000 m, rising to 2,061 m at Mount Goverla. It is composed of clayey shales, sandstones, and marls. On the slopes grow beech forests at 900–1,200 m and spruce forests at 1,200–1,500 m. The alpine meadows in the massif are used for pastures. [29–263–3]

CHERNOGORSK, a city under oblast jurisdiction in the Khakass Autonomous Oblast, Krasnoiarsk Krai, RSFSR. Terminus (Chernogorskie Kopi) of a branch of the Achinsk-Abakan railroad line. Population, 70,000 (1977). Chernogorsk is the center of the Minusinsk Coal Basin. Industry is represented by a motor-vehicle repair plant, a brickyard, an experimental plant for the production of lightweight structural members, a casting and metalworking plant, a plant that produces reinforced-concrete structural members, a prefabricated housing combine, a building-materials combine, a worsted-goods combine, a synthetic-leather combine, a factory for primary wool processing, a garment factory, and a furniture factory. The city has mining and textile technicums. [29–275–1]

CHERNOISTOCHINSK, an urban-type settlement in Prigorodnyi Raion, Sverdlovsk Oblast, RSFSR. Chernoistochinsk is situated on Chernoistochinsk Pond, 20 km south of the Nizhnyi Tagil railroad station. Enterprises include a branch of the Nizhnyi Tagil Knitwear Association and a division of the Visimskii Feed Sovkhoz. The settlement has a people's amateur theater. [29–287–2]

CHERNOMORKA (formerly Liustdorf), a seaside climatic health resort in the Ukrainian SSR; part of the Odessa health resort region. In addition to sanatoriums, mainly for children with various types of tuberculosis, Chernomorka has houses of rest and Pioneer camps. There is a broad beach made of fine sand. [29–291–2]

CHERNOMORSKII, an urban-type settlement in Severskaia Raion, Krasnodar Krai, RSFSR. Chernomorskii is located on the Krasnodar-Novorossiisk highway, 3 km from the Khabl' railroad station. The settlement has a plant that produces reinforced-concrete components. Petroleum is extracted nearby. [29–294–1]

CHERNOMORSKOE (formerly Ak-Mechet'), an urban-type settlement and administrative center of Chernomorskoe Raion, Crimean Oblast, Ukrainian SSR. Chernomorskoe is located 64 km from the Evpatoriia railroad station, which is the terminus of a branch of the Dzhankoi-Sevastopol' line. The settlement has a plant that produces commercial equipment, a mixed-feed plant, and an industrial combine. [29–299–1]

CHERNOSOSHNYE KREST'IANE, a category of the rural population of Russia from the 14th to 17th centuries directly dependent on the feudal government rather than on private owners.

By the mid-16th century the *chernososhnye krest'iane* had disappeared in central Russia but remained in the northern areas of European Russia and in Siberia, where they were known as *pashennye liudi* (plowmen). At the end of the 17th century they numbered more than 50,000 households. In the 16th and 17th centuries agricultural land, including plowland, was divided up and privately held by the families of the *chernososhnye krest'iane*; the bulk of the pastureland and the forests and rivers were communally owned and used. Generally speaking, the *chernososhnye krest'iane* were exploited to a lesser extent than privately owned peasants.

Among the *chernososhnye krest'iane* handicrafts and trade were highly developed, as were such activities as the extracting of salt, fur trapping, and fishing. In the mid-16th century property and social distinctions emerged. Great merchants and entrepreneurs, such as the Amosovs, Bosyis, Gusel'nikovs, and Stroganovs, came from the ranks of the *chernososhnye krest'iane*. The reform of the land of Ivan IV expanded the administrative, judicial, and financial responsibilities of elected bodies in the *volosts* (small rural districts) inhabited by the *chernososhnye krest'iane*; the bodies were headed by the richest peasants.

From the end of the 16th century, the government increased the taxes paid by the *chernososhnye krest'iane*, restricted their rights to dispose of land, and imposed limitations on local self-administration. Under the reforms of Peter I the Great, the *chernososhnye krest'iane* became part of the state peasants.

CHERNOV, ALEKSANDR ALEKSANDROVICH. Born July 11 (23), 1877, in Solikamsk; died Jan. 23, 1963, in Syktyvkar. Soviet

geologist and paleontologist. Hero of Socialist Labor (1957). Honored Scientist of the RSFSR (1946).

Chernov graduated from Moscow University in 1903. From 1907 to 1909 he was a member of P. K. Kozlov's expedition to Mongolia and Szechwan. From 1909 to 1934 he taught at higher educational institutions in Moscow; he became a professor in 1917. Beginning in 1935, he worked in various institutions of the Academy of Sciences of the USSR.

Chernov's main works dealt with the geology and minerals of the Central and Northern Urals, the Pai-khoi mountains, and the Pechora region. Chernov provided theoretical substantiation for the existence of the Pechora Coal Basin and studied the structure of the Ukhta Oil-bearing Region. He collected extensive paleontological material, which helped establish the stratigraphy of the Paleozoic of the western slopes of the Northern Urals and of the Pai-khoi.

Chernov was awarded the A. P. Karpinskii Gold Medal (1952). He received two Orders of Lenin and two other orders, as well as various medals. A mountain ridge in the Komi ASSR has been named in honor of Chernov.

CHERNOV, DMITRII KONSTANTINOVICH. Born Oct. 20 (Nov. 1), 1839, in St. Petersburg; died Jan. 2, 1921, in Yalta. Russian scientist; specialist in metallurgy, metal science, and the heat treatment of metals.

The son of a feldsher, Chernov graduated from the St. Petersburg Institute of Practical Technology in 1858 and worked in the mechanical department of the St. Petersburg Mint. From 1859 to 1866 he was an instructor, an assistant librarian, and a curator in the museum of the St. Petersburg Institute of Practical Technology. In 1866 he became an engineer in the forging shop of the Obukhov Steel Mill in St. Petersburg, and from 1880 to 1884 he was engaged in prospecting deposits of rock salt in the Bakhmut region of the Donets Coal Basin; the beds he discovered proved to be of industrial importance. Upon returning to St. Petersburg in 1884, Chernov worked on the Naval Engineering Committee. Beginning in 1886 he simultaneously served as chief inspector of the Ministry of Railroad Transport in charge of overseeing the filling of orders at metallurgical works. He became a professor of metallurgy at the Mikhail Artillery Academy in 1889.

Chernov engaged in a practical investigation into the causes of defective products in the manufacture of gun forgings and an intensive analysis of the works of his predecessors P. P. Anosov, P. M. Obukhov, A. S. Lavrov, and N. V. Kalakutskii on the problems of smelting, casting, and forging steel ingots. As a result, between 1866 and 1868, Chernov demonstrated the dependence of the structure and properties of steel on the hot working techniques and heat treatments used. He discovered the critical temperatures for steel at which, as a result of heating or cooling in the solid state, phase transformations occur that significantly alter the structure and properties of the metal. These transformation temperatures, which were determined from the temperature colors of the steel, have been called Chernov's points. Chernov also demonstrated graphically the effect of carbon on the transformation temperatures when he drew the first sketch of the configuration for the most important lines in the iron-carbon phase diagram (*see* IRON-CARBON ALLOYS). The results of his study, which marked the beginning of modern metallography, were published by Chernov in *Zapiski Russkogo tekhnicheskogo obshchestva* (Proceedings of the Russian Technical Society, 1868, no. 7) under the title "A Critical Review of the Aritcles of Messrs. Lavrov and Kalakutskii on Steel and Steel Guns and D. K. Chernov's Own Studies on the Same Subject."

In another major scientific article, "Investigations Concerning the Structure of Cast Steel Ingots" (1879), Chernov presented an elegant theory of the crystallization of a steel ingot. He made a detailed study of the formation and growth processes of crystals (in particular, the dendritic steel crystals sometimes called Chernov crystals), devised a diagram of the structural zones in an ingot, developed a theory of successive crystallization, made a thorough investigation of flaws in cast steel, and demonstrated effective measures to prevent such flaws. Chernov's studies greatly aided the transformation of metallurgy from a craft to a scientific discipline with a theoretical foundation.

Chernov's works on the intensification of metallurgical processes and on the improvement of production techniques were of major importance to the progress of steel metallurgy. He proved the value of completely deoxidizing steel during smelting and the expediency of using multiple deoxidizers; he also recommended a system of practices that resulted in a dense, bubble-free metal. He suggested agitating the metal during crystallization and proposed a rotating ingot mold for this purpose.

Chernov did much to improve the converter method of producing cast steel. In 1872 he proposed using a cupola furnace to heat low-silicon liquid pig iron, which was considered to be unsuitable for the Bessemer process, before processing in a Bessemer converter; the technique subsequently became common practice in Russian and foreign foundries. Chernov used a spectroscopic instrument to determine the completion of the Bessemer process, and he was one of the first to demonstrate the advantage of using air enriched with oxygen for blowing through liquid cast iron in a converter (1876). He also worked on the direct reduction of iron ore to produce steel without the blast furance process. He was responsible for a number of important studies relating to artillery, including the production of high-quality steel gun barrels and steel armor-piercing shells and an investigation of combustion in the bores of guns during firing that results from the action of the propellant gases and other factors. Chernov was also well known for a series of articles on mathematics, mechanics, and aviation.

Chernov was the founder of modern metal science and of a major scientific school of Russian metallurgists and metal scientists. His discoveries have been recognized throughout the world. Chernov was elected honorary chairman of the Russian Metallurgical Society and honorary vice-president of the Iron and Steel Institute in Great Britain. He was an honorary member of the American Institute of Mining Engineers and of several other Russian and foreign scientific institutions.

A. S. FEDOROV [29–254–1]

CHERNOV, SERGEI NIKOLAEVICH. Born 1887 in Saratov; died Jan. 5, 1942, in Pushkin, Leningrad Oblast. Soviet historian. Doctor of historical sciences (1937).

Chernov graduated from the faculty of history and philology at the University of St. Petersburg in 1912. Between 1917 and 1927 he was on the staff of the University of Saratov and held positions in Leningrad and Middle Asia. In 1937 he became a professor in the subdepartment of the history of the USSR at the Gorky Pedagogical Institute.

Chernov's most important works are devoted to the feudal period in the territories that now make up the USSR, to various questions pertaining to the Decembrist movement, to Narodnichestvo (Populism), and to N. G. Chernyshevskii.

CHERNOV, VIKTOR MIKHAILOVICH (pseudonyms included Iu. Gardenin). Born Nov. 19 (Dec. 1), 1873, in Kamyshin, in

what is now Volgograd Oblast; died Apr. 15, 1952, in New York City, USA. Russian political figure. A founder of the Socialist Revolutionary Party (SR's) and a member of its Central Committee.

Chernov joined the revolutionary movement in the late 1880's. He studied at Moscow University from 1892 to 1894, when he was arrested in a crackdown on the People's Right Party and exiled to Tambov Province. He emigrated in 1899 and, with M. R. Gots, headed the foreign organization of the SR's and the newspaper *Revoliutsionnaia Rossiia*. Chernov was the party's chief theoretician and developed its program; his philosophic views were an indiscriminate blend of Narodnik (Populist) socialism and empiriocriticism (Machism).

During World War I, Chernov took part in the Zimmerwald Conference of 1915 and the Kienthal Conference of 1916. After the February Revolution of 1917 he returned to Russia, where from May to August 1917 he served as minister of agriculture in the Provisional Government. After the October Revolution of 1917 he actively opposed Soviet power. Chernov was elected chairman of the Constituent Assembly, which met on Jan. 5 (18), 1918, and during the summer and autumn of that year served on the Committee of Members of the Constituent Assembly.

Chernov emigrated in 1920. He worked with the French Resistance during World War II and eventually took up residence in the USA. While abroad, Chernov published his memoirs, *Notes of a Socialist Revolutionary* (vol. 1, 1922) and *Before the Storms* (1953). [29–253–2]

CHERNOV-LÜDERS LINES (Lüders' lines), thin, dark lines that appear on the polished surface of a steel specimen when the yield point is reached during cold plastic deformation. During extension or compression they are oriented at an angle of approximately 45° to the axis of the specimen; that is, they coincide with the direction of the planes of the principal shearing stresses. The lines were first described by L. Lüders of Germany in 1859 and independently by D. K. Chernov in 1884. They are also known as stretcher strains, deformation bands, Hartmann lines, and Piobert lines. [29–256–1]

CHERNOVTSY (until 1944, Chernovitsy), a city and administrative center of Chernovtsy Oblast, Ukrainian SSR. Population, 214,000 (1977; 106,000 in 1939, 152,000 in 1959, 187,000 in 1970). Situated in the foothills of the Carpathians on the Prut River, Chernovtsy is a railroad and highway junction and also has an airport. It is divided into three city raions.

According to archaeological data, Chernovtsy originated in the 12th century. It first appears in written sources dating from 1408. From the mid-14th century to 1774 it was part of the Principality of Moldavia. In 1775 it came under the rule of Austria (from 1867, Austria-Hungary). During the offensive of the Southwestern Front of 1916, Chernovtsy was captured by Russian troops. In November 1918 it was occupied by Rumania. In June 1940, Chernovtsy, together with northern Bucovina, became part of the USSR and the administrative center of an oblast of the Ukrainian SSR. From July 6, 1941, to Mar. 29, 1944, it was occupied by fascist German troops.

The leading branches of industry in Chernovtsy are light industry, food processing, and machine building. Light industry is represented by the Voskhod cotton production association, the Trembita garment production association, a glove and knitwear production association, a hosiery production association, and factories for the production of shoes, textiles, notions and clothing accessories, and decorative textile goods. The food-processing industry is represented by a meat-packing combine and combines for the production of oils and fats, sugar, and other foodstuffs. The machine-building industry is represented by a machine-building plant, the Elektronmash and Chernovtsylegmash production associations, and a machinery repair plant. Other industries include the wood-products industry, represented by furniture and woodworking combines and a furniture factory, and the chemical industry, represented by rubber-footwear and chemical plants and a plant for the production of household chemicals. The building-materials industry is also important.

Noteworthy architectural works include the wooden churches dating from the 17th and 18th centuries—the Church of St. Nicholas (1607), the Piatnitskaia Church (1768), the Trinity Church on the Klokuchka (1774), and the Uspenie Church on the Kalichanka (1783)—and the buildings in the classical style, such as the town hall (now the city soviet; 1843; architect A. Mikulich) and the former residence of the metropolitan (now the university; 1864–82; architect I. Glavka). During the Soviet period, work has been conducted on improving the planning and construction of apartment-house blocks. Monuments include the Victory Monument (1946; sculptor G. L. Petrashevich, architect V. I. Grigor).

Chernovtsy has a university, a medical institute, a branch of the Kiev Institute of Commerce and Economics, and 12 specialized secondary educational institutions, including industrial, textile, construction, railroad transportation, and other technicums, as well as pedagogical, medical, cultural-educational, and music schools. There is a musical and dramatic theater and a philharmonic society in the city. Museums include a museum of local lore and the O. Iu. Kobylianskaia and the O. Fed'kovich literary memorial museums. Chernovtsy also has a television center.

CHERNOVTSY, UNIVERSITY OF, a university in the city of Chernovtsy, Ukrainian SSR. Founded in 1875 on the basis of a seminary, it initially comprised the faculties of theology, law, and philosophy. During the years of Austrian rule in Bucovina (until 1918), German was the language of instruction. After the capture of Bucovina by boyar Rumania in 1918, the University of Chernovtsy was transformed into a Rumanian university (in 1920). During the 1938–39 academic year, 3.7 percent of the students were Ukrainians (in 1939–40 only four Ukrainians, that is, 0.8 percent, graduated). During the 1930's, a Marxist club and an underground Communist organization were active at the university.

In 1940, after Northern Bucovina once again became part of the Ukraine, the University of Chernovtsy was made a Soviet state university, with seven departments, and Ukrainian became the language of instruction. During the years of Soviet power, the university has become a major scientific and cultural center. It has (1977) departments of history, philology, foreign languages, mathematics, physics, chemistry, biology, geography, and general technology. It has a general correspondence school, a correspondence school in economics, an evening division, a division for preparing students for enrollment in the university, a department for improving professional qualifications, and a graduate school. It also has 51 subdepartments, a botanical garden (founded 1877), a biological station, an experimental fish plant, seismic and meteorological stations, and two special problem laboratories, one in the physics of semiconductors and one in the thermodynamics of nonreversible processes in chemistry. In addition, it has museums of zoology, botany, geology, and the history of the university. Its research library has more than 1.7 million books.

During the 1976–77 academic year, the University of Chernovtsy had an enrollment of about 10,000 students and a teaching staff of more than 500, including 26 professors and doctors of sciences and more than 290 docents and candidates of sciences. During the period of Soviet power, the university has trained more than 22,000 specialists. It has been awarded the Order of the Red Banner of Labor (1975). K. A. CHERVINSKII [29–260–2]

CHERNOVTSY OBLAST, part of the Ukrainian SSR. Formed on Aug. 7, 1940. Located in the southwestern part of the Ukrainian SSR. Area, 8,100 sq km. Population, 887,000 (as of Jan. 1, 1977). Divided into ten raions, Chernovtsy Oblast has ten cities and nine urban-type settlements. The administrative center is the city of Chernovtsy. On Feb. 26, 1958, Chernovtsy Oblast was awarded the Order of Lenin.

Natural features. The southwestern part of Chernovtsy Oblast is situated within the Ukrainian Carpathians, with elevations rising to 1,565 m. The central part occupies the Carpathian foothills, with elevations to 537 m, and the northern part, between the Prut and Dnestr rivers, occupies an upland plain, with elevations to 515 m. The climate is temperate continental. The average January temperature on the plain is −4° to −5°C, in the foothills, −5° to −6°C, and in the mountains, −6° to −10°C. In July the corresponding temperatures are 20°–18°C, 19°–17°C, and 18°–10°C. Annual precipitation amounts to 450–700 mm on the plain, 600–800 mm in the foothills, and 800–1,400 mm in the mountains. The growing season lasts 211–216 days on the plain, 206–212 days in the foothills, and 136–180 days in the mountains.

The most important rivers are the Dnestr, the Prut (with its tributary the Cheremosh), and the Siret (a tributary of the Danube).

The soil cover of the plains is dominated by gray forest soils and podzolized chernozems. The foothills have soddy-podzolic soils, and the mountain areas, mountain-type brown forest and soddy-brown soils. Forests and shrubs, which grow primarily in the mountains, occupy 29 percent of the oblast; the principal trees are spruce, fir, beech, oak, and hornbeam.

The forests are inhabited by the reindeer, roe deer, wild boar, bear, lynx, fox, marten, squirrel, muskrat, and European hare. The bison, elk, fallow deer, mink, and, among the birds, pheasant have all become acclimatized in the oblast. The rivers abound in sterlet, Danubian salmon, trout, sheatfish, European bream, and chub.

Population. Ukrainians constitute (1970) 68.8 percent of the population, Rumanians 10 percent, Moldavians 9.3 percent, Russians 6.3 percent, Jews 4.4 percent, and Poles 0.6 percent. The average population density is 109.5 persons per sq km (as of Jan. 1, 1977). The plain is the most densely populated area. In 1977 the urban population accounted for 37 percent of the total.

The most important cities are Chernovtsy, Khotin, and Storozhinets.

Economy. During the years of socialist construction, Chernovtsy Oblast has been transformed from a backward agrarian region into one of the most developed industrial-agrarian oblasts of the Ukraine. The food-processing industry is represented by a meat-packing combine, a combine for the production of oils and fats, and a milk combine (Chernovtsy, Novoselitsa), sugar refineries (Chernovtsy, Kel'mentsy, Zarozhany), vegetable-drying plants, and canneries. Machine building is dominated by the production of equipment for the petroleum-refining industry and by electric power production. It is represented by a machine-building plant, a mechanical repair plant, and the Elektronmash and Chernovtsylegmash production associations. The largest light industrial enterprises are located in Chernovtsy, including the Voskhod cotton production association, a glove and knitwear production association, a hosiery production association, and the Trembita garment production association. The lumber and wood-products industries are quite developed and are represented by logging and the production of furniture, plywood, and splint-slab panels in Chernovtsy, Vizhnitsa, Beregomet, Storozhinets, Khotin, and Putila. There are also plants for the production of chemicals and rubber footwear. The construction industry is represented by the production of brick and tile products and reinforced-concrete structural components and parts (Chernovtsy, Kostrizhevka, Storozhinets, Mamalyga, and Kel'mentsy). Various folk arts are also developed, including embroidery, rug weaving, and wood carving (Chernovtsy, Khotin, Vizhnitsa).

Agriculture specializes in the production of grain and industrial crops and in raising livestock for dairy and meat purposes. The oblast has (1976) 151 kolkhozes and 33 sovkhozes. Fifty-nine percent of the oblast's total land area is occupied (1976) by agricultural lands, of which lands under cultivation account for 73 percent, hayfields for 7 percent, and pastures for 14 percent. The sown area totals 351,900 hectares (ha), of which 147,300 ha are under grains (winter wheat, 45,800 ha; spring barley, 29,700 ha; seed corn; 47,700 ha; legumes, 14,300 ha), 35,800 ha under sugar beets, 5,000 ha under long-staple flax, 24,000 ha under potatoes, 8,000 ha under vegetable crops, and 126,300 ha under fodder crops. Fruit growing is also developed (apples, plums, pears, cherries, walnuts). The Bukovina and Dnestr production-agrarian orchard sovkhoz associations have been created in the Sokiriany and Khotin Raions. Fruit, berry, and grape plantings occupy 33,100 ha. Reclaimed land suitable for farming totals 57,000 ha.

Livestock raising accounts for more than 50 percent of the gross agricultural output. In 1976 the oblast had 448,700 head of cattle (including 154,000 cows), 266,200 hogs, and 169,800 sheep and goats. New forms of interbranch and intrafarm cooperation in stock raising have been widely introduced; at present, nine interfarm livestock-raising enterprises for fattening cattle, pigs, and poultry are in operation. Pond fisheries are widespread. Beekeeping is also developed.

Chernovtsy Oblast has 466 km of railroad. The following railroad lines pass through Chernovtsy Oblast: Mostiska–L'vov–Ivano-Frankovsk–Chernovtsy–Vadul-Siret, Ivano-Frankovsk–Chernovtsy–Ungeny–Kishinev–Odessa, and Chernovtsy–Oknitsa–Zhmerinka–Kiev. Motor-vehicle roads total 3,000 km, of which 2,800 km are hard-surfaced (1976). The principal highways are Chernovtsy–L'vov, Chernovtsy–Kiev (by way of Ternopol' and by way of Vinnitsa), and Chernovtsy–Kishinev–Odessa.

Education, cultural affairs, and public health. In 1914 there were 379 schools, with more than 71,000 pupils and students, in what is now Chernovtsy Oblast, as well as ten specialized secondary educational institutions, with 1,288 students, and the University of Chernovtsy, with an enrollment of 799. During the 1976–77 academic year, there were 478 general-education schools of all types, with 153,800 pupils and students, in the oblast, and 14 vocational-technical educational institutions, with 8,200 students, and 18 specialized secondary educational institutions with 15,000 students. More than 14,000 students were enrolled at the university, the medical institute, and a branch of the Kiev Institute of Commerce and Economics. There were 260 preschool institutions, providing care for 27,300 children.

The oblast has (as of Jan. 1, 1977) 579 public libraries, with 6.332 million books and journals, and three museums, all in Chernovtsy: a museum of local lore, the O. Iu. Kobylianskaia literary memorial museum, located in the house where the writer lived from 1928 to 1942, and the O. Fed'kovich literary memorial museum. The O. Iu. Kobylianskaia Musical and Dramatic Theater is located in Chernovtsy. There are also 490 clubs in the oblast, 479 motion-picture projection units, and 25 extracurricular institutions.

The following are published in the oblast: the oblast newspapers *Radians'ka Bukovina* (Soviet Bucovina; since 1940, in Ukrainian) and *Zorile Bukovinei* (Dawn of Bucovina; since 1941, in Moldavian) and the Komsomol newspaper *Molodyi bukovynets'* (Young Bucovinian; since 1940, in Ukrainian).

Programs of the All-Union and republic radio, totaling 28.1 hours per day, are broadcast in the oblast, as well as programs of the oblast radio in Russian, Ukrainian, and Moldavian, totaling two hours. Programs of the Central and republic television, totaling 23 hours per day, are relayed; there are also local television programs in Russian, Ukrainian, and Moldavian, totaling 2.7 hours.

By Jan. 1, 1977, there were 75 hospitals in the oblast, with 9,600 beds (10.9 beds per 1,000 inhabitants) and 2,700 physicians (one physician per 324 inhabitants). The oblast has six sanatoriums. The principal tourist sites are the Carpathians and areas along the Cheremosh River. There are tourist centers in Chernovtsy and Vizhnitsa.

CHERNOVTSY UKRAINIAN MUSICAL AND DRAMATIC THEATER (full name, O. Iu. Kobylianskaia Chernovtsy Ukrainian Musical and Dramatic Theater). The Chernovtsy Ukrainian Musical and Dramatic Theater was founded in 1931 in Kharkov as the Theater of the Revolution; its troupe included actors of the Kiev and Odessa theaters and, beginning in 1937, actors of the Kharkov Theater of Young Workers as well. Until 1940 it was called the Lenin Komsomol Theater. In 1940, after Northern Bu-

covina once again became part of the Ukraine, the theater was moved to Chernovtsy; during the Great Patriotic War, it performed in Dagestan, Tataria, the Mari ASSR, and elsewhere. In 1944 it returned to Chernovtsy. Since 1954 it has borne the name of O. Iu. Kobylianskaia.

The most important place in the theater's repertoire is occupied by productions devoted to the past and present life of Bucovina. Known as the Bucovina Chronicle, these productions include *Land* (1947), *On Sunday Morning She Gathered Herbs* (1955), and *The She-wolf* (1963), all based on Kobylianskaia's works, as well as Prokopenko's *Spring Flood* (1949), Balkovenko and Miziun's *Luk'ian Kobylitsa* (1955), *The Steep Banks of the Dnestr*, based on a work by Fed'kovich (1959), and Andrievich's *Lesia* (1959).

The theater also stages classical works of Soviet and foreign drama. Among the productions of the 1960's and 1970's were Snigur's *The Passionate Hearts* (1968), Kocherga's *The Diamond Millstone* (1970), Stel'makh's *The Enchanted Windmill* (1970) and *A Song About Love* (1972), Ostrovskii and Solov'ev's *Belugin's Marriage* (1973), Volodarskii's *Our Debts* (1974), Krym's *Catch Your Train* (1976), and Gel'man's *The Minutes of One Meeting* (1976).

Among those who have been instrumental in the development of the theater are the directors M. S. Tereshchenko, V. S. Vasil'ko, and B. A. Borin, the actors Iu. A. Velichko and V. K. Sokirko, and the composer B. V. Krizhanovskii. As of 1977, the theater troupe included People's Artists of the Ukrainian SSR Iu. S. Kozakovskii, P. G. Mikhnevich, and A. Ia. Ianushevich and Honored Artists of the Ukrainian SSR A. N. Anan'ev, V. A. Zhikharskii, E. B. Zolotova, A. G. Litvinchuk, P. I. Nikitin, A. P. Ponomarenko, O. F. Rudnitskaia, N. G. Fialko, and A. V. Sheremet. The principal director is V. D. Opanasenko (since 1975), and the principal artist (stage designer), Honored Artist of the Ukrainian SSR V. V. Lassan (since 1966).

M. A. ANDRIEVICH [29–260–1]

CHERNOZEM, a type of soil that forms beneath steppe and forest-steppe vegetation in the sub-boreal belt. Chernozems form chiefly from carbonate-bearing parent rock—loesses, loess-like clays, and loams—and sometimes from more ancient limestones, sandstones, and marly clays in undrained or periodically drained circumstances. Chernozems are characterized by the accumulation of organic matter in the humus-accumulative horizon, by a high humus content, by a well-expressed cloddy-granular texture, and high potential fertility.

The first scientific observations about the origin of chernozems were made by M. V. Lomonosov (mid-18th century). Lomonosov believed that chernozems formed as a result of the decomposition of plant and animal matter. At the turn of the 19th century, P. Pallas and others proposed the hypothesis of a marine origin of chernozems, considering them to be marine oozes remaining after the retreat of the Caspian and Black seas; this hypothesis is only of historical importance, reflecting the idea prevalent at that time of soil as a geological formation. The hypothesis of the bog origin of chernozems also proved unfounded. Supporters of this theory, such as E. I. Eikhval'd and others in the mid-19th century, believed that the zone of chernozems had in the past been highly marshy tundra areas and that the decomposition of marsh vegetation caused by the onset of a warm climate led to the formation of chernozems. The theory of the terrestrial-plant origin of chernozems (F. I. Ruprekht, V. V. Dokuchaev, and others) links their formation to the establishment and development of meadow-steppe and steppe-grass vegetation. This theory was expounded in great detail by V. V. Dokuchaev in *Russian Chernozem* (1883), in which Dokuchaev proved that chernozems formed as a result of the close interaction of grassy vegetation, climate, topography, parent rock, and other soil-forming factors. The accumulation of humus is a consequence of this process.

Each year, grassy vegetation leaves extensive dead matter in the soil. This matter is plant remains, 70–80 percent of which are roots. The hydrothermal conditions of the steppe and forest-steppe zones are conducive to humification, as a result of which complex humus compounds are formed (primarily humic acids) and impart to the soil profile its dark coloring. The best conditions for humification occur in the spring and early summer, when the soil is supplied with adequate moisture as a result of autumn and winter precipitation and the snowmelt and when temperature conditions are favorable. During the period of summer drying out, the microbiological processes markedly weaken, which prevents humic matter from becoming rapidly mineralized. When plant remains, rich in ash elements and nitrogen, decompose, bases form (calcium is especially plentiful), which saturate the humic matter. This helps to fix the decomposed remains in the soil in the form of humates and to preserve a neutral or close-to-neutral reaction in the top horizons of the chernozems. In addition to the humus, the plant nutritional elements, such as nitrogen, phosphorus, sulfur, and iron, are fixed in the soil in the form of complex organomineral compounds, which form as a result of the interaction of humic acids with the ash elements of plant remains and the mineral part of the soil.

Chernozem soil formation is most intensive in the forest-steppe zone, where better moisture conditions promote more intensive development of grassy vegetation and active humification of its residue. In the steppe zone, inadequate moisture causes shallower root penetration, a decrease in the amount of dead matter entering the soil, and fuller decomposition of the matter.

The natural process of soil formation alters significantly when chernozems are brought into agricultural use. The cultivation of crops changes significantly the character of the biological cycle of matter and conditions of formation of the water and heat regimes. A large part of the biomass formed and consequently a significant quantity of nutrients are removed each year, and the period of vigorous interaction between the plant root systems and the soil is reduced. In addition, the soil remains for a long time without a plant cover, which reduces its absorption of winter precipitation. When virgin chernozems are first plowed, the structure of the soil is partially broken down and the content of humus and nitrogen in the plowed horizon drops, especially in the first years of cultivation. This process slows down in later years. At the same time, the activation of microbiological processes when chernozems are cultivated promotes the mobilization of nitrogen and phosphorus. Therefore, cultivated chernozems have a high content of nutrients that are available to plants. To maintain the high fertility of chernozems that have been brought into intensive cultivation, it is essential to introduce crop rotation, apply organic and mineral fertilizers, and use the proper soil tillage system.

The following genetic horizons are identified in the chernozem profile: A (humus-accumulative)—the most intensively colored, top part of the humus layer; B_1 (humus-transitional)—the lower, less colored part of the humus layer; B_2 (the horizon of humus streaks)—not observed in all types of chernozems; B_c (illuvial-carbonate horizon)—often combined with horizon B_2; and C—parent rock. Horizons A and B_1 both measure 40–120 cm in thickness and have a humus content of 4–12 percent.

Chernozems are broken down into the following subtypes: podzolized, leached, typical, ordinary, and southern. Each subtype has its own characteristic features; each differs in the thickness of the humus horizons, the humus content, the depth of carbonate occurrence, and other features determined by the conditions of development (see Table 1).

Table 1. Characteristics of chernozem subtypes

Subtype	Thickness of horizons A and B_1 (cm)	Depth of occurrence of carbonates (cm)	Humus content (percent)	Humus reserves in 1-m layer (ton/ha)
Podzolized	50–80	140–150	5–8	450–500
Leached	50–80	100–140	6–10	500–600
Typical	85–120	85–120	8–12	500–800
Ordinary	65–80	50–60	6–10	350–600
Southern	40–50	0–30	4–6	250–400

A clear pattern can be observed in the geographic distribution of chernozem subtypes. The zone of chernozems is subdivided from north to south into the subzones of podzolized, leached,

typical, common, and southern chernozems. These subzones are most clearly expressed in the European USSR.

Also identified are micellar-carbonate chernozems (Azov and Ciscaucasian), which form in regions with warm winters, where the soil does not freeze, and chernozems that develop under conditions of winter freezing. Chernozems are classified as ordinary, carbonate, solonets, solonets-solonchak, and the like according to the degree of salinity. According to the thickness of the humus layer (A and B_1), they are classified as thin (less than 40 cm), medium thick (40–80 cm), thick (80–120 cm), and super thick (more than 120 cm). They are grouped according to humus content into low-humus (less than 6 percent), medium-humus (6–9 percent), and high-humus, or fertile (more than 9 percent). The clay and loam varieties of chernozems predominate. They possess favorable physical and physicochemical properties, such as good water capacity and high capacity for absorption of cations (30–70 mg per 100 g of soil).

There are about 240 million hectares of chernozems in the world, confined to Eurasia and North and South America. In Eurasia the chernozem zone, the largest in the world, encompasses Western and Southeastern Europe (Hungary, Bulgaria, Austria, Czechoslovakia, Yugoslavia, and Rumania), stretches in a broad band across the USSR, and continues on into Mongolia and China. In North America chernozems cover several western states of the USA and the southern provinces of Canada. In South America they are located in southern Argentina and the southern foothill regions of Chile.

In the USSR, chernozems are found in Moldavia, the Ukraine, the central part of the RSFSR, the Northern Caucasus, the Volga Region, and Western Siberia. They are very fertile and nearly all of them are farmed. The chernozem zone is the most important agricultural region of the country, containing more than 50 percent (130 million hectares) of the country's plowed land. Winter and spring wheat, sugar beets, sunflowers, hemp, flax, buckwheat, and beans are grown on chernozems; animal husbandry, fruit and vegetable growing, and viticulture are highly developed in the chernozem zone.

The accumulation of moisture and its rational use are of paramount importance for increasing the fertility of chernozems, especially in the steppe regions of the zone, where a greater deficit of atmospheric moisture is observed. To improve the water regime of chernozems, irrigation is practiced and forest windbreaks are planted. Measures to prevent soil erosion, contamination by pesticides, and the salinization that can occur during irrigation play a special role.

CHERNUKHI, an urban-type settlement and the administrative center of Chernukhi Raion, Poltava Oblast, Ukrainian SSR. Chernukhi is situated 35 km from the Piriatin railroad station on the Grebenka-Priluki line. The settlement has a milk plant, a mixed-feed plant, and a factory that produces household goods. Chernukhi has a museum of history and local lore with a memorial *usad'ba* (ensemble of buildings) devoted to G. S. Skovoroda. [29–303–5]

CHERNUKHINO, an urban-type settlement in Pereval'sk Raion, Voroshilovgrad Oblast, Ukrainian SSR. Chernukhino is a railroad junction with lines to Debal'tsevo, Sterovka, and Ilovaisk. Coal is mined near the settlement, which has a poultry-raising sovkhoz and a poultry farm. A museum of local history is in Chernukhino. [29–304–1]

CHERNUSHKA, a city and administrative center of Chernushka Raion, Perm' Oblast, RSFSR. Chernushka is a railroad station on the Kazan-Sverdlovsk line. Petroleum is extracted nearby. Industry is represented by a metalworks, a meat-packing plant, and a creamery. The city has a people's amateur theater and a museum of local lore. [29–304–4]

CHERNYE BRAT'IA, a group of three small islands in the central part of the Greater Kuril Chain, between the Boussole and Urup straits. The islands of Chirpoi and Brat Chirpoev are separated by the Bystryi Strait, which is 2.7 km wide.

Chirpoi Island (area, 21 sq km) consists of four volcanic cones rising to a maximum elevation of 691 m. Two of the volcanoes are active: Chernyi has erupted in 1712 and 1713, 1854, and 1857; Snou, in 1879, 1960, and other years. The island is composed of andesitic basalts.

Brat Chirpoev Island (area, 20 sq km) is a chain of volcanic cones showing traces of recent activity and rising to a maximum elevation of 749 m. It is composed of basalts.

Morskaia Vydra Island, a rocky crag rising to an elevation of 150 m, is a volcanic dome. [29–304–5]

CHERNYE LIUDI, a category of rural and urban dwellers in Russia from the 12th to 17th century. The rural dwellers of this category were the *chernososhnye krest'iane*, who lived on what were called the *chernye zemli*.

In the *posady* (merchants' and artisans' quarters of towns), the *chernye liudi* paid state taxes; by contrast, such taxes were not paid by the *belomesttsy* (urban dwellers not subject to the *tiaglo*, a system of state duties). The *chernye liudi* were divided, according to socioeconomic position, into "better," "middle," and "lesser." Under the reform of the land of Ivan IV, the urban and rural *obshchiny* (communes) of the *chernye liudi* were given greater latitude in electing their own officials and carrying out the tasks of self-administration, including administrative, financial, and judicial responsibilities; this new system later became established primarily in the north. The importance of the self-governing bodies declined in the 17th century as government by *voevoda* (military governor) developed. The term *chernye liudi* went out of use in the early 18th century. [29–305–2]

CHERNYE MOUNTAINS ("Black Mountains," from the dark color of the wooded ridges), the name of the frontal ranges of the Greater Caucasus, situated north of the Skalistyi Range, between the Belaia River in the west and the Argun River in the east. The Chernye Mountains rise to elevations of 1,500 m and for the most part resemble cuestas, with gentle northern slopes and steep southern slopes. The slopes have forests of oak, beech, and other trees. [29–304–6]

CHERNYE ZEMLI (literally, "Black Lands"), a flat, semidesert region in the western part of the Caspian Lowland, mainly in the Kalmyk ASSR. Chernye Zemli is bounded by the Ergeni Upland on the west and the Volga delta on the east. It is an area of transhumant stock raising with pastures primarily for winter use. The name of the region derives from its not being completely covered by snow in winter. [29–304–7]

CHERNYE ZEMLI (literally, "black lands"), in 14th- to 17th-century Russia, the landholdings of *chernososhnye krest'iane* (a category of peasants under the direct control of the state) and of the part of the urban population subject to the *tiaglo* system of taxation (*see* TIAGLO). In the early 18th century *chernye zemli* came to be called state (*kazennye*) lands. [29–304–8]

CHERNYI, GORIMIR GORIMIROVICH. Born Jan. 22, 1923, in Kamenets-Podol'skii. Soviet scientist in mechanics. Corresponding member of the Academy of Sciences of the USSR (1962). Member of the CPSU since 1954.

Chernyi served in the Soviet Army from 1941 to 1945. He graduated from Moscow State University in 1949. From 1949 to 1958, he was on the staff of the Central Institute of Aircraft Engine Construction. He became a professor at Moscow State University in 1958 and was made the director of the university's Research Institute of Mechanics in 1960.

Chernyi's main works deal with aerodynamics. Chernyi proposed a new method of studying and analyzing gas flows behind strong shock waves, particularly in the case of hypersonic flows past bodies. He has written works on the theory of detonation and combustion, boundary-layer theory, and the theory of gas-fired machines.

Chernyi has received the State Prize of the USSR and has been awarded five orders and various medals.

CHERNYI, SASHA (real name, Aleksandr Mikhailovich Glikberg). Born Oct. 1 (13), 1880, in Odessa; died Aug. 5, 1932, in Le Lavandou, France. Russian poet.

The son of a pharmacist, Chernyi was first published in 1904. Over a period beginning in 1905, he contributed to satirical journals in St. Petersburg, including, from 1908 to 1911, *Satirikon*. Chernyi's satirical verse was caustic and to the point. In the poems of his collection *Satiry* (1910), he unmasked political reaction, ridiculed liberal intellectuals who had betrayed their high ideals, and mocked philistinism and triviality in politics, literature, and everyday life. His sarcasm and pessimism subsequently intensified in his lyric poetry.

Chernyi emigrated in 1920. His book *Thirst* (1923) is colored with nostalgia for his lost homeland. In the last years of his life, in addition to conventional short stories, Chernyi wrote stories of a new type that were collected in *Soldier's Tales* (published 1933). In this collection Chernyi, who had fought in World War I, depicted the Russian soldier of that period. Chernyi was also a master of verse and prose for children.

CHERNYI LES CULTURE, an archaeological culture of pre-Scythian farming tribes of the middle Dnieper region, which migrated in the tenth to eighth centuries B.C. from the forest-steppe region between the Dnestr and Dnieper rivers to the basin of the Vorskla River. It is named after an ancient site in the Chernyi Les on the upper Ingulets River.

The Chernyi Les culture originated from the Belogrudovo culture of the Bronze Age (*see* BELOGRUDOVO CULTURE). During the period of the Chernyi Les culture, bronze and stone tools were replaced by iron tools, although implements made from bone were still widespread. The culture is characterized by bronze celts and daggers, swords with iron blades and bronze hilts, bronze and bone arrowheads, wide bronze bracelets, and wire temporal rings. The pottery includes tulip-shaped jugs and glazed goblets, bowls, and buckets, ornamented with hatched triangles. A group of ancient towns of the Chernyi Les culture, including Subbotovskoe, an important center of bronze casting, were concentrated in the basin of the Tiasmin River. The dead were cremated, and burial mounds were sometimes erected; the graves of warriors are distinctive. In the seventh century B.C., the Chernyi Les culture merged with the Scythian cultures.

CHERNYI OSTROV, an urban-type settlement in Khmel'nitskii Raion, Khmel'nitskii Oblast, Ukrainian SSR. Chernyi Ostrov is situated on the Iuzhnyi Bug River near the Chernyi Ostrov railroad station, 20 km northwest of the city of Khmel'nitskii. The settlement produces knitwear and footstuffs. There is a museum devoted to the Ukrainian poet L. I. Glebov in Chernyi Ostrov. [29–307–3]

CHERNYI PEREDEL (Black Repartition), the official journal of the Black Repartition, a revolutionary Populist organization. In 1880–81 five issues appeared. The first two were edited by G. V. Plekhanov, P. B. Aksel'rod, Ia. V. Stefanovich, L. G. Deich, and O. V. Aptekman. Because the organization's St. Petersburg printing house was seized by the government, the first two issues were printed in Geneva. The third through fifth issues were edited by A. P. Bulanov, K. Ia. Zagorskii, and M. I. Sheftel' and printed at the organization's Minsk printing house. Circulation, 1,000.

PUBLICATION

CHERNYI POROG, an urban-type settlement in Segezha Raion, Karelian ASSR. Chernyi Porog is situated 45 km west of the Kochkoma railroad station on the Petrozavodsk-Belomorsk line. It has a logging station of the Nadvoitsy logging and timber distribution establishment. [29–308–2]

CHERNYI SHLIAKH (Black Road), a route used by the Crimean Tatars in the 16th and 17th centuries for raids on Galicia, Poland, and the Right-bank Ukraine. It led from the Perekop Isthmus north through Zaporozh'e. Between the upper courses of the Ingulets, Ingul, and Tiasmin rivers, it turned west and divided into the Kuchman Road and two other routes, of which the northern route passed near what are now Korsun', Boguslav, Lisianka, Zhashkov, and Tetiev, and the southern route passed not far from present-day Shpola, Tal'noe, Uman', and Dashev. The two routes joined near Lipovets. The *Chernyi shliakh* then proceeded west toward Khmel'nik, Ternopol', and L'vov. [29–308–5]

CHERNYSHEV, ALEKSANDR ALEKSEEVICH. Born Aug. 9 (21), 1882, in the village of Loven', in present-day Chernigov Oblast; died Apr. 18, 1940, in Moscow. Soviet scientist; specialist in electrical engineering. Academician of the Academy of Sciences of the USSR (1932; corresponding member, 1929).

Chernyshev graduated in 1907 from the St. Petersburg Polytechnic Institute, where he became a professor in 1919 and remained a faculty member until he moved to Moscow in 1936. He also worked at the Physicotechnical Institute in Petrograd (beginning in 1918) and later at several institutes of the Academy of Sciences of the USSR, including the Institute of Power Engineering and the Commission on Automation and Telemechanics. Chernyshev's principal works were devoted to high-voltage and radio engineering. Chernyshev also worked on electrical measurements, television, long-distance radiotelephone communications, railroad electrification, the planning and organization of scientific work, and the history of electrical engineering. He was also instrumental in developing the GOERLO plan. Chernyshev was awarded the V. I. Lenin Award in 1930.

CHERNYSHEV, ALEKSANDSR IVANOVICH. Born Dec. 30, 1785 (Jan. 10, 1786), in Moscow; died June 8 (20), 1857, in Castellammare di Stabia, Italy. Russian military and state figure. Adjutant general (1812); general of the cavalry (1826); count (1826); grand duke (1849).

Chernyshev entered the guards cavalry in 1802 and fought in the war with France between 1805 and 1807. From 1808 to 1812 he performed important diplomatic assignments in France and Sweden and served as a military and diplomatic agent in Paris. Chernyshev was with Emperor Alexander I in the army field forces at the beginning of the Patriotic War of 1812, commanding a cavalry detachment. He took part in the foreign campaigns of the Russian army of 1813–14, became a member of the tsar's retinue in 1815, and assumed command of a cavalry division in 1821. In 1826, Chernyshev was a member of the commission investigating the Decembrists.

Chernyshev became a senator in 1827 and was appointed deputy chief of the Main Headquarters and head of the war ministry in 1828. Between 1832 and 1852, as minister of war he strengthened the recruiting system with the statute of 1831 and increased the centralization of the war department. He became chairman of the Council of State in 1848. An advocate of harsh discipline and obsolete linear tactics, Chernyshev was one of those primarily responsible for the defeat of the Russian Army in the Crimean War of 1853–56.

CHERNYSHEV, ANDREI BORISOVICH. Born Apr. 9 (22), 1904, in St. Petersburg; died Nov. 22, 1953, in Moscow. Soviet scientist; specialist in the gasification of solid fuels. Corresponding member of the Academy of Sciences of the USSR (1939). Academician of the Academy of Sciences of the Estonian SSR (1951). Member of the CPSU from 1943.

Chernyshev graduated from the Leningrad Institute of Technology in 1929 and held a professorship at the Moscow Institute of Chemical Engineering. In 1948 he became the director of the Institute of Fuel Resources of the Academy of Sciences of the USSR.

Chernyshev's major work was devoted to problems of gasification, including underground gasification and the thermal conversion of solid fuels. He directed various research efforts, including a study of coal gasification at a pressure of 100 technical atmospheres, development of a method for the production of town's gas by the catalytic methanization of water gas, and work on the integrated electrochemical use of fuels. Chernyshev was awarded the State Prize of the USSR (1946), three other orders, and various medals.

CHERNYSHEV, ARKADII IVANOVICH. Born Mar. 3 (16), 1914, in Nizhnii Novgorod (present-day Gorky). Soviet athlete; one of the founders of the Soviet school of ice hockey. Honored Master of Sport (1948); Honored Coach of the USSR (1956). Colonel.

Chernyshev graduated from the Higher Coaches' School in 1940. He was a champion of the USSR in soccer (1937, 1940) and ice hockey (1947). From 1937 to 1940 he played on the Moscow Dynamo bandy team, helping win the USSR Cup four times. From 1948 to 1972, he and A. V. Tarasov coached the national ice-hockey team of the USSR. Chernyshev's pupils included more than 30 Olympic, world, and European champions.

Chernyshev has been awarded four orders, as well as medals.

CHERNYSHEV, FEODOSII NIKOLAEVICH. Born Sept. 12 (24), 1856, in Kiev; died Jan. 2 (15), 1914, in St. Petersburg. Russian geologist and paleontologist. Academician of the St. Petersburg Academy of Sciences (1909).

Chernyshev studied at the Marine School, and in 1880 he graduated from the Mining Institute in St. Petersburg. In 1882 he began working on the Geological Committee, becoming its director in 1903. Beginning in 1900, he was also director of the Geological Museum of the Academy of Sciences in St. Petersburg.

Chernyshev worked out the stratigraphy of the Paleozoic deposits of the Urals, which served as the basis for subdividing synchronous formations in the arctic, the Altai, Middle Asia, and elsewhere. As a result of his studies of the circumpolar region (Timan, Novaia Zemlia, and Spitzbergen), Chernyshev compiled a series of paleontological surveys of Devonian and Upper Carboniferous fauna (1889–1901). He completed a petrographic study of the eastern slopes of the Urals, as a result of which he concluded that the schists of the region were metamorphosed Silurian and Devonian sedimentary rocks. Chernyshev believed that the structure of the Urals formed under the influence of tangential forces that caused dislocations in the latitudinal and northeasterly directions, characteristic of all of Northern Europe. A geological survey of the Donets Coal Basin was begun under Chernyshev's direction in 1892.

A ridge in the Polar Urals and a mountain range in Transbaikalia have been named after Chernyshev, as well as a glacier and a mountain on Novaia Zemlia and a bay on the Taimyr Peninsula.

CHERNYSHEV, GRIGORII PETROVICH. Born Jan. 21 (31), 1672; died July 30 (Aug. 10), 1745. Russian military leader and statesman. Count (1742). An associate of Peter I the Great.

Chernyshev participated in the Azov campaign in 1695 and fought in a number of significant battles during the Northern War of 1700–21. He distinguished himself in 1709 at the battle of Poltava, and in 1710 he commanded a large detachment during the capture of Vyborg. From 1713 to 1714 he headed the campaign into Finland. In 1718, Chernyshev became a member of the Admiralty College and a senator. When the Northern War ended, he occupied a series of important administrative positions and served as governor of Azov, Livland, and Moscow provinces. In 1730 he fought on the side of Empress Anna Ivanovna against the members of the Supreme Privy Council. Chernyshev left notes that contain valuable information about events in his time.

WORKS
"*Zapiski 1672–1745.*" *Russkaia starina*, June 1872. [29–311–2]

CHERNYSHEV, PAVEL FEOKTISTOVICH. Born circa 1854 in Samara Province; died the night of Mar. 26–27 (Apr. 8–9), 1876, in St. Petersburg. Russian Narodnik (Populist) revolutionary.

Chernyshev, who was of noble birth, attended the Medical and Surgical Academy. He was an organizer and the treasurer of the St. Petersburg student circle known as the Samartsy, and he took part in the "going to the people" movement. Arrested in Samara on Aug. 30, 1874, Chernyshev was sent to prison, where he contracted tuberculosis. He was released on bail on Mar. 11, 1876, and died in a hospital. He is buried in Volkovo Cemetery.

Chernyshev's funeral on Mar. 30, 1876, turned into a large antigovernment demonstration. G. A. Machtet dedicated the poem "Succumbed to the ordeal of imprisonment" ("The Last Farewell") to Chernyshev's memory. The poem became a song popular among young Russian revolutionaries. [29–312–1]

CHERNYSHEV, SERGEI EGOROVICH. Born Oct. 4 (16), 1881, in the village of Aleksandrovka, in what is now Moscow Oblast; died April 26, 1963, in Moscow. Soviet architect.

Chernyshev graduated from the Moscow School of Painting, Sculpture, and Architecture in 1901 and from the St. Petersburg Academy of Arts in 1907. At the latter institution he studied under L. N. Benois. Chernyshev was chief architect of Moscow from 1934 to 1941. He was chairman of the board of architecture

of the Moscow city executive committee from 1944 to 1948 and first secretary of the Architects' Union of the USSR from 1950 to 1955. Chernyshev taught at the Moscow Vkhutemas-Vkhutein (State Higher Arts and Technical Studios–Higher Art and Technical Institute) from 1918 to 1930 and at the Moscow Architectural Institute from 1931 to 1950.

Among Chernyshev's works were a general plan for the reconstruction of Moscow (with architect V. N. Semenov and others, 1931–35) and the Moscow University complex on the Lenin Hills (with architects P. V. Abrosimov, L. V. Rudnev, A. F. Khriakov, and others, 1949–53; State Prize of the USSR, 1949). Chernyshev was awarded the Order of Lenin, two other orders, and various medals. [29–312–2]

CHERNYSHEV, VASILII EFIMOVICH. Born Aug. 13 (26), 1908, in the village of Krasnoe, in what is now Livny Raion, Orel Oblast; died Nov. 12, 1969, in Moscow. Soviet party and government figure. A leader of the partisan movement in Byelorussia during the Great Patriotic War of 1941–45. Major general (1943). Hero of the Soviet Union (Jan. 1, 1944). Member of the CPSU from 1928.

The son of a worker, Chernyshev graduated from the Orel Infantry School in 1927 and Briansk Communist University in 1930. He took up party work, and in 1941 he became secretary of the Baranovichi oblast committee of the Communist Party of Byelorussia (Bolshevik). In 1942 he became the agent of the party's Central Committee in charge of organizing the partisan movement in Baranovichi Oblast, and in 1943 he became secretary of the underground oblast party committee and commander of a partisan formation. Chernyshev became first secretary of the Brest and Minsk oblast committees in 1944, and in 1950 he became secretary of the Central Committee of the Communist Party of Byelorussia (Bolshevik). From 1951 to 1959 he was first secretary of the Kaliningrad oblast party committee, and from 1959 to 1969 he was first secretary of the Primor'e Krai Committee.

Chernyshev became deputy chairman of the Party Control Committee of the Central Committee of the CPSU in 1969. He became a member of the Central Committee of the CPSU in 1952, and he was a deputy to the third through seventh convocations of the Supreme Soviet of the USSR. Chernyshev was awarded six orders of Lenin and three other orders, as well as various medals. [29–310–3]

CHERNYSHEV, VASILII IL'ICH. Born Dec. 29, 1866 (Jan. 10, 1867), in the village of Aleksino, in what is now Vladimir Oblast; died May 21, 1949, in Leningrad. Soviet Russian linguist. Corresponding member of the Academy of Sciences of the USSR (1931).

Chernyshev graduated from the Kirzhach Teachers' Seminary in 1886 and taught in village, district, and city schools from 1886 to 1912. He was recruited by A. A. Shakhmatov for lexicological work at the St. Petersburg Academy of Sciences. His main works dealt with lexicology, dialectology, orthography and orthoepy, stylistics, and the methodology of teaching Russian. In 1900 he drew up the most extensive plan to date for a complete dialect survey.

Chernyshev saw in the literary language the complex interrelations between the formal language and various dialect systems (*Regularity and Purity of the Russian Spoken Language*, 1911). He studied the language and style of E. A. Baratynskii, A. V. Kol'tsov, V. I. Maikov, N. A. Nekrasov, I. S. Turgenev, G. I. Uspenskii, and A. S. Pushkin. He also was the author of a number of textbooks. One of the initiators of the *Dictionary of the Modern Russian Literary Language*, he was the editor in chief of the first two volumes, which appeared in 1948 and 1950. Chernyshev was posthumously awarded the Lenin Prize in 1970.

CHERNYSHEV, ZAKHAR GRIGOR'EVICH. Born Dec. 14 (25), 1796; died May 1862 in Rome. Decembrist; count.

Chernyshev joined the Kavalergardy in 1817 and held the rank of *rotmistr*. In the spring of 1825 he was accepted into the Southern Society's St. Petersburg council, established in 1823–24 by P. I. Pestel'. In the autumn of 1825 he helped plan an armed uprising and the assassination of the tsar (*see* DECEMBRISTS), but he did not take part in the uprising of Dec. 14, 1825, since he was on furlough in Orel Province. Arrested there, Chernyshev endured interrogation courageously. He was sentenced to four years at hard labor (commuted to one year) and to exile. In 1829 he was transferred to the Caucasus as a private. He was promoted to officer's rank in 1833 and retired in 1837. After his rights were restored by amnesty in 1856, Chernyshev moved to Italy.

[29–311–3]

CHERNYSHEV, a mountain range at the junction of the Transbaikalia and Amur mountain systems; western link of the Tukuringra-Dzhagdy mountain chain in Amur Oblast, RSFSR. The Chernyshev Range separates the valley of the Niukzha River of the Olekma basin from the valleys of the Ol'doi and Tynda rivers of the Amur basin. The range is 120 km long and reaches an elevation of 1,572 m at Mount Lukinda. It is composed of granites and schists and has flattened, swell-like crests. Mountain taiga predominates, and thickets of dwarf stone pine are found at higher elevations. The range was named in honor of F. N. Chernyshev. [29–313–3]

CHERNYSHEVA, LIDIIA DEM'IANOVNA. Born May 10 (23), 1912, in Berdiansk; died Sept. 23, 1975, in Simferopol'. Soviet ballerina and choreographer. People's Artist of the USSR (1967). Member of the CPSU from 1964.

In 1929, after graduating from the Leningrad Choreographic School, Chernysheva first performed with the musical-comedy theater in Kharkov and then with the traveling M. Kotsiubinskii Theater in Artemovsk and other theaters. From 1939 to 1941 she was director of the song and dance ensemble that she organized for the Donetsk Philharmonic Society. During the Great Patriotic War (1941–45), she headed a song and dance ensemble that performed on the Southern, Transcaucasian, and First Ukrainian fronts. From 1955 to 1970 she was director of the Song and Dance Ensemble of the Kazakh SSR. From 1971 she was director of Tavriia, a women's vocal and dance ensemble in the Ukraine. Chernysheva's choreography organically blended music, dancing, lyrics, and singing, and it was distinguished by ethnic distinctiveness and high professionalism.

Chernysheva was awarded the Order of Lenin and six other orders, as well as various medals. [29–313–1]

CHERNYSHEVICH, ARKADII DMITRIEVICH. Born July 26 (Aug. 8), 1912, in the village of Kulaki, in what is now Soligorsk Raion, Minsk Oblast; died Jan. 18, 1967, in Minsk. Soviet Byelorussian writer.

The son of a peasant, Chernyshevich lived in the Northern Urals from 1930 to 1950 and worked as a logger, builder, and primary school teacher. He was first published in 1940. His works include the cycle of children's stories *Summer* (1940), the novellas *In One Family* (1951) and *On the Ponds* (1954; Russian translation, 1958), and short stories, such as those in the collection *Through Winters and Springs* (1960). In the novel *Dawn* (1957) Chernyshevich described the life of a Byelorussian village in the early 1920's. In *The Malinovka Torture Chamber* (1964–65; Russian translation under the title *Turn of the Century*, 1966), a novel dealing with revolutionary history, he depicted the life of the people on the eve of the Revolution of 1905–07 and a young peasant's difficult path to revolution. Works by Chernyshevich have been translated into various languages of the USSR.

CHERNYSHEV RIDGE, an upland in the Komi ASSR and Arkhangel'sk Oblast, RSFSR. The Chernyshev Ridge extends southward to the Polar Urals. It is about 300 km long and reaches an elevation of 205 m. It has a plateau-like surface and is composed of sandstones and limestones. The southern part is covered by taiga forest consisting primarily of spruce, with some larch and birch. Tundra is encountered in the northern part. The ridge was named in honor of F. N. Chernyshev. [29–313–2]

CHERNYSHEVSK, an urban-type settlement and the administrative center of Chernyshevsk Raion, Chita Oblast, RSFSR. Chernyshevsk is situated on the Kuenga River, a tributary of the Shilka. The settlement is a railroad junction (Chernyshevsk-Zabaikal'skii) of lines to Bukachacha and Mogocha. Chernyshevsk has enterprises serving railroad transportation. [29–314–1]

CHERNYSHEVSKII, NIKOLAI GAVRILOVICH. Born July 12 (24), 1828, in Saratov; died there Oct. 17 (29), 1889. Russian revolutionary, writer, economist, and philosopher.

Chernyshevskii was the son of a priest. From 1842 to 1845 he attended the theological seminary at Saratov, and in 1850 he graduated from the department of history and philology of the University of St. Petersburg. His world outlook, basically formed during his student years, was shaped by the reality of serfdom in Russia and the revolutionary events of 1848–49 in Europe. Chernyshevskii's views were influenced by the classics of German philosophy, English political economy, and French utopian socialism—including G. Hegel, L. Feuerbach, D. Ricardo, and C. Fourier—and especially by the works of V. G. Belinskii and A. I. Herzen. By the time he graduated from the university, Chernyshevskii was a confirmed democrat, revolutionary, socialist, and materialist. From 1851 to 1853 he taught Russian language and literature at the Saratov Gymnasium; he openly expressed his convictions to his students, many of whom later became revolutionaries. In 1853, Chernyshevskii moved to St. Petersburg. He began to write for *Otechestvennye zapiski* and then for *Sovremennik*, where he assumed a leading position shortly thereafter.

The underlying principle of Chernyshevskii's world outlook was anthropological. Starting from general ideas about human nature and man's tendency to act in his own interest, Chernyshevskii drew revolutionary conclusions on the need to change social relations and forms of ownership. According to Chernyshevskii, the anthropological principle consistently applied coincides with the principles of socialism.

In adopting the positions of anthropological materialism, Chernyshevskii considered himself a follower of Feuerbach, whom he called the father of modern philosophy. In Chernyshevskii's view, Feuerbach's teaching represented "the culmination of German philosophy, which—having now for the first time achieved positive solutions—has abandoned its former scholastic type of metaphysical transcendentalism and, admitting that its own results are identical to the teachings of the natural sciences, has merged with the general theory of natural science and anthropology" (*Poln. sobr. soch.*, vol. 3, 1947, p. 179). In Chernyshevskii's elaboration of Feuerbach's ideas, what was regarded as the criterion of truth was practice—"that immutable touchstone of all theory" (*ibid.*, vol. 2, 1949, p. 102). Chernyshevskii counterposed the dialectical method to abstract metaphysical thought, recognizing the class and party nature of political theories and philosophical teachings.

In 1855, Chernyshevskii defended his master's dissertation, *The Aesthetic Relation of Art to Reality*, which laid the basis for the development of a materialist aesthetics in Russia. Criticizing Hegel's aesthetics, he affirmed the social basis of the aesthetic ideal and formulated the thesis that "beauty is life" (*ibid.*, vol. 2, p. 10). According to Chernyshevskii, the sphere of art is not limited to the beautiful: "what is of general interest in life—*that* is the content of art" (*ibid.*, vol. 2, p. 82). The goal of art is to reconstruct life, to explain it, and "to pass judgment on its manifestations." Art should be a "textbook of life" (*ibid.*, pp. 90, 85, and 87). Chernyshevskii's aesthetic precepts struck a hard blow against the apolitical theory of "art for art's sake." At the same time, Chernyshevskii considered such aesthetic questions to be merely a "field of battle." His dissertation proclaimed the principles of a new revolutionary trend.

Chernyshevskii's journalistic activities were devoted to the struggle against tsarism and serfdom. In Lenin's words, "he approached all the political events of his times in a revolutionary spirit and was able to exercise a revolutionary influence by advocating, in spite of all the barriers and obstacles places in his way by the censorship, the idea of a peasant revolution, the idea of the struggle of the masses for the overthrow of all the old authorities" (*Poln. sobr. soch.*, 5th ed., vol. 20, p. 175).

From 1855 to 1857, Chernyshevskii's published articles were mainly on literary history and criticism; defending the realist trend in literature, he propagandized the idea that literature should serve the interests of the people. His study of Russian journalism and public opinion from the late 1820's to the 1840's (*Essays on the Gogol Period of Russian Literature*, 1855–56) carried on the tradition of Belinskii's democratic criticism. In his analysis of the period of the Enlightenment in Germany "as adapted to our domestic circumstances" (*Lessing: His Time, Life, and Work*, 1857), Chernyshevskii examined the historical circumstances in which literature could become "the principal motive force of historical development" (*Poln. sobr. soch.*, vol. 4, 1948, p. 7). Chernyshevskii had a high regard for A. S. Pushkin and especially for N. V. Gogol; he considered N. A. Nekrasov the best contemporary poet.

In late 1857, Chernyshevskii turned over the department of criticism to N. A. Dobroliubov and devoted himself entirely to economic and political problems. He joined the campaign waged in the magazines for discussion of the impending peasant reform; in a series of articles, such as "On the New Conditions of Rural Life" (1858), "On Methods of Buying the Peasants Out From Serfdom (1858), "How Difficult Is the Redemption of Land?" (1859), and "The Way of Life of the *Pomeshchich'i Krest'iane*" (1859), Chernyshevskii criticized the reform plans of the liberal nobility and proposed instead a revolutionary-democratic solution of the peasant question. He advocated the abolition of the system of landownership without redemption payment to the landowners. In December 1858, finally convinced that the government was incapable of satisfactorily resolving the peasant question, Chernyshevskii warned against the unparalleled impoverishment of the peasant masses and called for a revolutionary end to the reform.

Going beyond anthropologism, Chernyshevskii came close to a materialist interpretation of history. He repeatedly pointed out that "intellectual development, like development in any other area, including the political, depends on economic circumstances" (*Poln. sobr. soch.*, vol. 10, 1951, p. 441).

In order to substantiate his political program, Chernyshevskii studied economic theory and, in the words of K. Marx, "has thrown the light of a master mind on an event which is a declaration of the bankruptcy by bourgeois economy" (K. Marx and F. Engels, *Soch.*, 2nd ed., vol. 23, p. 17). Chernyshevskii's studies included "Economic Activity and Legislation" (1859), "Capital and Labor" (1860), "Comments on the 'Principles of Political Economy' of J. S. Mill" (1860), and "Essays on Political Economy (According to Mill)" (1861); here the author exposed the class nature of bourgeois political economy and contrasted to it his own economic "theory of the working people," which demonstrates "the need to replace the present economic system with a communist one" (*Poln. sobr. soch.*, vol. 9, 1949, p. 262).

Chernyshevskii's economic theory represented the high point of pre-Marxian economic thought. Chernyshevskii rejected the inevitability of exploitation and maintained that economic forms such as slavery, feudalism, and capitalism were transitory. In his judgment, the criterion for the preeminence of one form over another was the ability to ensure growth in the productivity of social labor. It was on such grounds that he was able to make his exceptionally profound criticism of serfdom.

Recognizing the relative progressiveness of capitalism, Chernyshevskii criticized it for the anarchy of its production, for its competition and crises, for its exploitation of the workers, and for its inability to maximize the productivity of social labor. He considered the transition to socialism to be a historical necessity, determined by mankind's entire development. Under socialism "the separate classes of hired worker and employer will disappear, being replaced by a single class of people who will be workers and managers at the same time" (*ibid.*, p. 487).

Chernyshevskii saw that Russia's economy was already coming under the influence of the laws of capitalism, but he wrongly believed that Russia could avoid "the plague of proletarianism," since the question of the "nature of changes in Russian economic life" had not yet been resolved. In such articles as "On Land Ownership" (1857), "Critique of Philosophical Prejudices Against Communal Ownership" (1858), and "Superstition and the Rules of Logic" (1859), Chernyshevskii proposed and justified the idea that Russia might skip the capitalist stage of development and pass to socialism through the peasant commune. In Chernyshevskii's opinion, this possibility would open up as the result of a peasant revolution. In contrast to Herzen, who believed that a socialist system would evolve independently in Russia out of the patriarchal peasant commune, Chernyshevskii considered the assistance of industrially developed countries a necessary guarantee of such development. This idea, which became a reality for the backward countries with the victory of the October Socialist Revolution in Russia, was utopian in the historical conditions of that earlier time. Together with Herzen, Chernyshevskii was one of the founders of *narodnichestvo*, or Populism.

By early 1859, Chernyshevskii was generally recognized as the leader of revolutionary democracy, and his journal *Sovremennik* as its militant organ. Convinced of the inevitability of an imminent popular uprising, Chernyshevskii inclined toward a peasant revolution and developed a political program for revolutionary democracy. In a series of articles on the history of France in which he analyzed revolutionary events, he sought to bring to light the leading role of the masses and their interest in fundamental economic changes. In his article "A Russian at an Assignation" (1858), which he wrote in reference to I. S. Turgenev's novella *Asya*, Chernyshevskii showed the practical impotence of Russian liberalism. His monthly surveys of international events (*Politika*, 1859–62) relied on the historical experience of Western Europe to throw light on pressing questions in Russia and to indicate possible solutions.

Chernyshevskii's article "The Anthropological Principle in Philosophy" (1860) was a systematic presentation of his philosophical views and set forth his ethical theory of "rational egoism." Chernyshevskii's ethics does not separate the interest of the individual from that of society; "rational egoism" is the free subordination of personal advantage to the general cause—whose success, in the final analysis, contributes to the individual's personal advantage as well.

In his "Introduction to Current Austrian Affairs" (February 1861), Chernyshevskii responded directly to the peasant reform with the argument that absolutism could not allow the destruction of feudal institutions and the establishment of political freedom. At the same time he organized a small group of like-minded associates who decided to appeal to various sections of the population. In his proclamation "Greetings to the Landlords' Peasantry From Their Well-wishers," which was confiscated during the seizure of the illegal printing house, Chernyshevskii exposed the predatory quality of the peasant reform; he warned the *pomeshchich'i krest'iane* (peasants owned by noble landlords) against uncoordinated spontaneous action and called on them to prepare for a general uprising upon a signal from the revolutionaries. From the summer of 1861 to the spring of 1862, Chernyshevskii was the source of ideological inspiration and advice for the revolutionary organization Land and Liberty. In his "Letters With No Address" (February 1862, published abroad 1874) he laid before the tsar two alternatives—renunciation of autocracy or revolution.

Fearing Chernyshevskii's growing influence, the tsarist government put a forcible stop to his activity. The *Sovremennik* was banned for eight months; Chernyshevskii, who had been under secret police surveillance since September 1861, was arrested on July 7, 1862, and imprisoned in the Aleksei Ravelin of the Peter and Paul Fortress. The arrest was made on the grounds of a letter, written by Herzen to N. A. Serno-Solov'evich and intercepted by the police, in which Chernyshevskii was named in connection with the proposed publication of the banned *Sovremennik* in London. In solitary confinement and unable to engage in journalistic activities, Chernyshevskii turned to literature.

In his novel *What Is to Be Done?* (1862–63), Chernyshevskii described the lives of new types of persons—the "rational egoists," who live by their own labor, lead a new kind of family life, and disseminate the ideas of socialism in practice. Among Chernyshevskii's characters are Rakhmetov, the first professional revolutionary in Russian literature, and Vera Pavlovna, a progressive Russian woman who devotes her life to socially useful work. The novel popularized the ideas of women's equality and artel production; foretelling the victory of the people's revolution and depicting the coming society, the book was a synthesis of Chernyshevskii's sociopolitical, philosophical, and ethical views and provided a practical plan of action for progressive youth. Published in the *Sovremennik* in 1863 because of careless censorship, the novel had a great effect on Russian society and contributed to the education of many revolutionaries.

While in the Peter and Paul Fortress, Chernyshevskii also wrote the novella *Alfer'ev* (1863), *Tales Within a Tale* (1863–64), and *Brief Stories* (1864). Despite the lack of evidence and his brilliant self-defense, Chernyshevskii in 1864 was found guilty, through false testimony and provocation, of "taking steps to overthrow the existing system of government." He was sentenced to seven years' penal servitude and lifetime residence in Siberia. After the ceremony of "civil execution" in Mytninskaia Square on May 19, 1864, Chernyshevskii was sent to the Nerchinsk hard labor camps (Kadaia mine; transferred to the Aleksandrovskii plant in 1866). In 1871, having completed his term of hard labor, he was sent to jail in Viliuisk.

While serving his sentence, Chernyshevskii wrote the partly autobiographical novel *Prologue* (1867–69; part 1 published abroad 1877), which portrayed the social struggle on the eve of the peasant reform. Of the works he wrote in Siberia, some others that have been preserved are a portion of the novel *Reflected Radiance*, the novella *Story of a Girl*, and the play *Madam Master-Troublemaker*. In these works Chernyshevskii sought to present his revolutionary views in the guise of conversations "on seemingly extraneous matters."

The Russian revolutionaries made some bold attempts to free Chernyshevskii from his Siberian isolation; such an attempt was made by G. A. Lopatin in 1871 and by I. N. Myshkin in 1875. In 1881 the Executive Committee of the People's Will, in its negotiations with the Sviashchennaia Druzhina (Holy Host), made the freeing of Chernyshevskii the first condition for the cessation of terror. It was only in 1883 that Chernyshevskii was transferred to Astrakhan under police supervision, and in June 1889 he was allowed to return to his birthplace.

While in Astrakhan and Saratov, Chernyshevskii wrote the philosophical work *The Nature of Human Knowledge* as well as various reminiscences—for example, about Dobroliubov and Nekrasov; he also prepared his *Materials for a Biography of N. A. Dobroliubov* (published 1890) and translated 11½ volumes of G. Weber's *Universal History*, supplemented by his own articles and commentaries. Chernyshevskii's works remained banned in Russia until the Revolution of 1905–07.

K. Marx and F. Engels studied the works of Chernyshevskii and called him a "great Russian scholar and critic" and a "socialist Lessing" (*Soch.*, 2nd ed., vol. 23, p. 18; vol. 18, p. 522). V. I. Lenin believed that Chernyshevskii had "made a great stride forward as compared with Herzen. Chernyshevskii was a far more consistent and militant democrat, his writings breathing the spirit of the class struggle" (*Poln. sobr. soch.*, 5th ed., vol. 25, p. 94). Compared to the other pre-Marxist thinkers, Chernyshevskii came closer to scientific socialism. Because of the backwardness of Russian life, he was not able to attain the dialectical materialism of Marx and Engels, but according to Lenin he was "the only really great Russian writer who, from the fifties until 1888, was able to keep on the level of an integral philosophical materialism" (*ibid.*, vol. 18, p. 384).

Chernyshevskii's works as well as the image he presented of himself as revolutionary—steady in his convictions and actions—served to educate many generations of Russian progressives. He exerted a great influence on culture and social thought in Russia and among the other peoples of the USSR.

IU. N. KOROTKOV [29–314–2]

CHERNYSHEVSKII, an urban-type settlement in Mirnyi Raion, Yakut ASSR. The settlement is situated on the Viliui River, a tributary of the Lena. It is linked to the city of Mirnyi by a highway. The Viliui Hydroelectric Power Plant is located in Chernyshevskii, which has a fish nursery. [29–319–1]

CHERNYSHKOVSKII, an urban-type settlement and administrative center of Chernyshkovskii Raion, Volgograd Oblast, RSFSR. The settlement has a railroad station (Chernyshkov) on the Volgograd-Likhaia line, 200 km west of Volgograd. A milk plant and a grain elevator are located in Chernyshkovskii. [29–319–2]

CHEROKEE, an Iroquois-speaking North American Indian tribe.

When the Europeans came to the New World, the Cherokee inhabited southeastern North America. They practiced hoe farming, and social classes were emerging among them. In the 18th century the Cherokee adopted the economic practices of the European settlers: they planted new crops, grew fruit, and raised livestock; they dealt in deerskins and introduced self-government along European lines. In the early 19th century Sequoyah, a mixed-blood, invented a Cherokee alphabet, in which the people received their instruction, a newspaper was published, and Cherokee folklore was recorded.

In 1838 and 1839 the lands of the Cherokee were seized and the tribe forcibly resettled in the west, in Oklahoma. Some hid in the Allegheny Mountains, where in 1842 a reservation was created for them in North Carolina; as a result, there emerged the two groups of Cherokee that exist today: the Eastern and Western Cherokee. The latter are more assimilated, have a more clearly delineated class system, and take an active part in the American Indian movement. According to the 1970 census the Cherokee number more than 66,000, of whom approximately 3,500 live in North Carolina. IU. P. AVERKIEVA [29–617–2]

CHEROKOV, VIKTOR SERGEEVICH. Born Nov. 10 (23), 1907, in the city of Ordubad, in what is now the Nakhichevan ASSR. Soviet military leader; vice admiral (1951). Member of the CPSU since 1938.

Cherokov joined the Soviet Navy in 1926. He graduated from the M. V. Frunze Naval School in 1930, the Naval Academy in 1939, and the K. E. Voroshilov Military Academy of the General Staff in 1950. Serving in the Baltic Fleet, he commanded a brigade of torpedo boats from 1939 to 1941 and fought in the Soviet-Finnish War of 1939–40. During the Great Patriotic War of 1941–45, he took command of the Ladoga Naval Flotilla in October 1941 and was named commander of the Riga Naval District in November 1944. He directed the freighting of supplies across Lake Ladoga during the blockade of Leningrad, the defense of Sukho Island, the Tuloksa Operation of 1944, and the blockading of the enemy's Courland group of forces.

In 1948, Cherokov was named commander of the White Sea Flotilla. He was senior adviser to the Polish Navy from 1950 to 1953 and chief of staff and first deputy commander of the Baltic Fleet from 1953 to 1956. He was named head of a subdepartment at the K. E. Voroshilov Military Academy of the General Staff in 1957 and a department head in 1960. Cherokov has been awarded two Orders of Lenin, three Orders of the Red Banner, the Order of the Red Banner of Labor, the Order of Ushakov Second Class, the Order of the Red Star, and various medals. He has also received orders and medals of the Polish People's Republic. [29–323–1]

CHERSKII, NIKOLAI VASIL'EVICH. Born Jan. 20 (Feb. 2), 1905, in the settlement of Ol'ga, in what is now Primor'e Krai. Soviet scientist; specialist in mechanics and the development of petroleum and gas deposits. Corresponding member of the Academy of Sciences of the USSR (1968); Hero of Socialist Labor (1975). Member of the CPSU since 1942.

Cherskii graduated from the Institute of Water Transport Engineers in Vladivostok in 1931 and from the Academy of the Petroleum Industry in 1951. He became chairman of the Presidium of the Yakutsk Branch of the Academy of Sciences of the USSR in 1964 and has also served as the director of the Institute of Physical and Technical Problems of the North since 1973. Cherskii's chief works deal with the designs of gas wells, the development of methods for calculating the reserves of natural gas deposits and for exploiting gas hydrate deposits, and container-pipeline transportation. He was the codiscoverer of the property of natural gas of forming deposits in the crust in the form of a solid gas hydrate. Cherskii was a deputy to the seventh through ninth convocations of the Supreme Soviet of the USSR. He has been awarded two Orders of Lenin, five other orders, and various medals. [29–323–3]

CHERSKII, an urban-type settlement and administrative center of Nizhnekolymsk Raion, Yakut ASSR. Cherskii is a port on the Kolyma River. The settlement has a fish-processing plant, a meat-dairy combine, and a reindeer-breeding and fur-farming sovkhoz. The floating gas-turbine electric power plant Severnoe Siianie-01 is in Cherskii. The settlement was named in honor of J. Czerski (I. D. Cherskii). [29–324–1]

CHERSKII RANGE, a mountain system in the northeastern part of the USSR, in the Yakut ASSR and Magadan Oblast of the RSFSR. The range was discovered by S. V. Obruchev in 1926 and named in honor of J. Czerski (I. D. Cherskii). It extends from northwest to east-southeast between the Iana-Oimiakon Highland in the southwest and the Moma-Selenniakh intermontane depression in the northeast for a distance of more than 1,500 km.

Numerous ranges stretch in the western part of the Cherskii system, between the Iana and Indigirka rivers, including the Khadaran'ia (to 2,185 m), Tas-Khaiakhtakh (2,356 m), Chemalgin (2,547 m), Kurundia (1,919 m), Dogdo (2,272 m), Chibagalakh (2,449 m), Borong (2,681 m), and Siliap (2,703 m) ranges. In the east, in the vicinity of the upper Kolyma, rise the Ulakhan-Chistai (highest point Mount Pobeda, 3,147 m), Cherge (2,332 m), and other ranges. The Moma-Selenniakh intermontane depression and the Selenniakh, Moma, and Garmychan ranges that rise above it to the north are often included in the Cherskii mountain system, although they actually lie north of the system.

The mountains of the Cherskii Range lie within a zone of Mesozoic folding. They are composed of strongly dislocated and metamorphosed Paleozoic carbonate rocks, with Permian, Triassic, and Jurassic marine and continental strata (shales, sandstones, and siltstones) along the margin. In some places, the carbonate rocks contain intrusions of granitoids, with which are associated deposits of gold, tin, and other minerals.

The principal features of the modern relief have been formed by recent tectonic movements. Typical of the relief is the alternation of horsts, separated by intermontane grabens. Medium-elevation mountains predominate, although some sections rise to 2,000–2,500 m and are characterized by an alpine relief with modern glaciers (the Ulakhan-Chistai, Chibagalakh, and other ranges). More than 350 valley, cirque, and hanging glaciers, with a total area of 156.2 sq km, are known.

The climate is severe and sharply continental. The average January temperatures vary from −34° to −40°C, reaching −60°C in depressions. Summers are short and cool, with frequent frost and snowfalls. The mean July temperature varies from 3°C in the high mountains to 12°–13°C in a number of valleys. Annual precipitation varies between 300 and 600–700 mm a year; as much as 70–75 percent occurs in the summer. Permafrost covers the entire region.

Many rivers, among them the Indigirka and its tributaries, cut across the ranges in narrow, frequently antecedent, valleys. The Moma and Selenniakh rivers flow in intermontane basins through broad, sometimes marshy valleys. The rivers are fed by melting snow and summer rains. More than 60 percent of the annual runoff occurs in the summer. The runoff of the large rivers in the winter is not more than 5 percent of the annual total. Many of the smaller rivers freeze down to the bottom. *Aufeis* is widespread.

The soil and vegetation cover is comparatively uniform. Tall floodplain forests of poplar and *Chosenia* grow on the bottom of the river valleys. Sparse larch forests, usually marshy, grow on the lower part of the slopes to elevations of 250–300 m in the north and to 700–1,100 m in the south. As much as 80 percent of the Cherskii system is covered by vegetation of the high-mountain zone—thickets of dwarf stone pine and alder, and rock, lichen, and shrub tundra. Cold stony deserts are found on the summits of the highest range.

CHERSKII RANGE, a mountain range in Transbaikalia, in Chita Oblast, RSFSR. The Cherskii Range extends for a length of 400 km, from the upper Olengui River to the Olekma River, near the mouth of the Ul'durga River. The Ingoda River cuts across the range near the city of Chita. The mountains rise to elevations of 1,400–1,500 m. They are composed of granites, with effusive and sedimentary rocks in some places. The slopes and summits are covered with pine and larch forests. Spruce-fir-cedar taiga is encountered in deep valleys on the northern slopes. The range is named after J. Czerski (I. D. Cherskii). [29–326–1]

CHERTKOV, VLADIMIR GRIGOR'EVICH. Born Oct. 22 (Nov. 3), 1854, in St. Petersburg; died Nov. 9, 1936, in Moscow. Russian public figure, journalist, and publisher. Close friend of L. N. Tolstoy.

The son of an aristocrat, Chertkov joined the Cavalry Guards Regiment in 1873. He resigned from the regiment in 1881 after undergoing a philosophical crisis; he subsequently conducted educational work among the peasants of Voronezh Province. Chertkov met Tolstoy in October 1883, adopted his teaching, and became a propagandist for Tolstoyism. In 1884 he founded the Posrednik Publishing House with Tolstoy's help.

Chertkov was exiled from Russia in 1897 because of his statements in defense of the Dukhobors. While living in Great Britain, he helped organize the emigration of the Dukhobors to Canada. In addition to works by Tolstoy that the censors had banned, Chertkov published in this period the newspaper *Svobodnoe Slovo* (1901–05) and the anthology *Pages From "Svobodnoe Slovo"* (1898–1902), which contained denunciations of the autocracy. During the Revolution of 1905–07, he advocated the adoption of Christian humility rather than revolutionary methods of struggle. He returned to Russia in 1907.

With money received from the publication of Tolstoy's *Posthumous Literary Works* (vols. 1–3, 1911–12), Chertkov purchased land from Tolstoy's heirs and turned it over to the peasants of Iasnaia Poliana and the village of Grumant. From 1917 to 1920, Chertkov was editor of the journal *Golos Tolstogo i edinenie*. In 1920 he published "A Letter to the British," in which he protested against British interference in Russian affairs. Chertkov collected Tolstoy's diaries, letters, and rough drafts, and on the basis of these materials the publication of Tolstoy's *Complete Collected Works* was begun in 1928; 72 of the edition's 90 volumes were published under Chertkov's editorship.

CHERTKOVO, an urban-type settlement and administrative center of Chertkovo Raion, Rostov Oblast, RSFSR. Chertkovo is a railroad station on the Millerovo–Georgiu-Dezh line. The settlement has a butter factory, a meat-packing plant, a poultry-packing plant, a food-processing combine, a building-materials combine, and a grain elevator. [29–331–1]

CHERTOK, BORIS EVSEEVICH. Born Mar. 1, 1912, in Łódź, in what is now Poland. Soviet scientist in aircraft and spacecraft control systems. Corresponding member of the Academy of Sciences of the USSR (1968); Hero of Socialist Labor (1961). Member of the CPSU since 1932.

After graduating from the Moscow Power Engineering Institute in 1940, Chertok served on the staffs of a number of research institutes and design offices. He joined the faculty of the N. E. Bauman Moscow Higher Technical School in 1947, becoming a professor in 1966.

Chertok's main works deal with automation, aircraft and spacecraft control systems, and aggregations of complex systems.

Chertok received the Lenin Prize in 1957 and the State Prize of the USSR in 1976. He has been awarded two Orders of Lenin, the Order of the October Revolution, two other orders, and various medals. [29–331–5]

CHERTOMLYK, a Scythian royal barrow of the late fourth century B.C., located 22 km northwest of the city of Nikopol', Dnepropetrovsk Oblast, Ukrainian SSR. It was excavated by I. E. Zabelin in 1862–63. Parts of horse harnesses and other items were found in a mound that stood 19.5 m high and had a circum-

ference of 350 m. Within the mound were four chambers, in which were buried a queen and a king (the burial had been robbed), along with two soldiers and a guard at the entrance to one of the chambers. Among the finds were gold ornaments, pottery, and weapons, including several outstanding examples of applied art: a silver amphora, with depictions in relief of Scythians taming horses, a gold facing for a sword scabbard, with a scene depicting a battle between the Scythians and Amazons, and a gold plate from a gorytus (quiver), with scenes from the life of Achilles. Separate graves yielded the skeletons of 11 horses, with gold and silver harness ornaments, and the burials of two stablemen.

CHERUSTI, an urban-type settlement in Shatura Raion, Moscow Oblast, RSFSR. Cherusti is a railroad station on the Moscow-Murom line, 156 km east of Moscow. The settlement has railroad transportation enterprises and a machinery-repair plant. [29–332–4]

CHERVEN', a city and administrative center of Cherven' Raion, Minsk Oblast, Byelorussian SSR. Cherven' is located 62 km southeast of Minsk and 30 km from the Pukhovichi railroad station; it is on the Minsk-Mogilev motor highway. The city has a milk plant, a vegetable-dehydration plant, a winery, a bread-baking combine, and a wood-products enterprise. [29–179–1]

CHERVEN (also Cherven'; Polish, Czerwień), an ancient Russian city on the left bank of the Khuchva River, a tributary of the Zapadnyi Bug.

The earliest known reference to Cherven occurs in the Primary Chronicle in the entry for the year 981. The city was the center of the upper Zapadnyi Bug region and gave its name to the Cherven cities. As a result of archaeological excavations in the 1950's and 1960's, scholars have determined that Cherven was located in the vicinity of the present-day village of Czermno, Lublin Województwo, Poland. [29–178–2]

CHERVEN CITIES (Russian, *Chervenskie goroda*), a group of cities that included Cherven, Lutsk, Suteisk, and Brody. The Cherven cities were located on the upper course of the Zapadnyi Bug, on the Zapadnyi Bug's tributaries the Khuchva and Luga, and in the region of the upper course of the Styr'. The cities lay on the border between Rus' and Poland and were often the subject of disputes and armed conflicts.

In the 980's, the Cherven cities became part of the ancient Russian state as a result of campaigns by the prince of Kiev, Vladimir Sviatoslavich. In 1018 the cities were conquered by the prince of Poland, Bolesław I the Brave. The Cherven cities were incorporated into Kievan Rus' in the early 1030's and later became part of the Vladimir-Volyn Principality.

CHERVIAKOV, ALEKSANDR GRIGOR'EVICH. Born Feb. 25 (Mar. 8), 1892, in the village of Dukorki, in what is now Minsk Oblast; died June 16, 1937. Soviet state and party figure. Member of the Communist Party from May 1917.

The son of a peasant, Cherviakov graduated from an urban school and in 1909 passed the examination to become a rural school teacher. He taught in Vil'na Province. Cherviakov graduated from the Vil'na Teachers Institute in 1915 and was drafted into the army. After the February Revolution of 1917 he helped organize the Byelorussian Social Democratic Labor Party, from which the Byelorussian Section of the RCP(B) was later formed. Between 1918 and 1920 he helped establish the Byelorussian SSR and did political work in the Red Army on the Western Front. In the same period he served as commissar for Byelorussian affairs of the People's Commissariat of Nationalities of the RSFSR and people's commissar for education of the Byelorussian SSR.

In 1920, Cherviakov was chairman of the Minsk and Byelorussian revolutionary committees. He served as chairman of both the Central Executive Committee of the Byelorussian SSR and the Council of People's Commissars of the Byelorussian SSR from 1920 to 1924; beginning in 1924, he was chairman of the Central Executive Committee of the Byelorussian SSR. In 1922 he was made one of the chairmen of the Central Executive Committee of the USSR. Cherviakov was a delegate to the Eleventh through Seventeenth Congresses of the ACP(B) and a member of the Bureau of the Central Committee of the Communist Party (Bolshevik) of Byelorussia.

CHERVIAKOV, EVGENII VENIAMINOVICH. Born Dec. 27, 1899 (?) in the village of Abdulino; died Feb. 17, 1942. Soviet Russian actor, director, and screenwriter.

Cherviakov graduated from an Ufa drama studio in 1918 and from the State Technicum of Cinematography in Moscow in 1927. He acted and directed at the Ufa Theater. He appeared in films while still a student, playing in *Gold Supply* and *The Cross and the Mauser* (both 1925), and was assistant director at the Lenfil'm Studio. He played the role of A. S. Pushkin in the film *The Poet and the Tsar* (1927), on which he collaborated as screenwriter and director with V. R. Gardin.

Cherviakov's films are distinguished by their poetic lyricism, original montage, interest in contemporary topics, and profound character development. They include *The Girl From the Distant River* (1928), *My Son* (1928), *Cities and Years* (1930, based on the novel by K. Fedin), *The Prisoners* (1936), *Honor* (1938), and *Far-off Cossack Village* (1940). He also wrote and filmed the short story "The Old Nurse" (*Boevoi kinosbornik*, no. 2, 1941). In 1929 he made the historical film *The Golden Beak*, based on A. Karavaeva's novella. He wrote the scripts for a number of his films and played roles in films by other directors.

In 1941, Cherviakov volunteered for a partisan detachment and was mortally wounded on Feb. 16, 1942, in a battle near Leningrad.

CHERVONENKO, STEPAN VASIL'EVICH. Born Sept. 3 (16), 1915, in the village of Okop, in what is now Poltava Oblast. Soviet diplomat and party figure; candidate of philosophy (1949). Member of the CPSU since 1940.

The son of a peasant, Chervonenko graduated from the T. Shevchenko Kiev State University in 1936 and was director of a secondary school from 1937 to 1941. He served in the Soviet Army and fought in the Great Patriotic War from 1941 to 1944. From 1944 to 1948 he was associated with the teachers' institute of the Cherkassy Pedagogical Institute, serving at various times as instructor, head of the subdepartment of Marxism-Leninism, and director.

Chervonenko was on the staff of the Central Committee of the Communist Party of the Ukraine from 1949 to 1956 and was secretary of the Central Committee from 1956 to 1959. He was the USSR's ambassador to the Chinese People's Republic from 1959 to 1965 and to the Czechoslovak Socialist Republic from 1965 to 1973. In 1973 he became ambassador to France. He was made a member of the Central Committee of the CPSU in 1961 and was a deputy to the fifth convocation of the Supreme Soviet of the USSR. Chervonenko has been awarded three Orders of Lenin, the Order of the October Revolution, the Order of the Red Banner of Labor, and various medals. [29–181–1]

CHERVONETS. (1) The general name for gold coins in use in pre-Petrine Russia, for example, ducats and sequins.

(2) A Russian gold coin worth 3 rubles and containing 3.4 g of gold, first issued in 1701; double *chervontsy* were also coined.

(3) A bank note issued by the State Bank of the USSR from 1922 to 1947 in denominations of 1, 2, 3, 5, 10, 25, and 50 *chervontsy*. The value of the *chervonets* was defined as equivalent to 7.74234 g of pure gold, and one *chervonets* was equal to 10 rubles in treasury notes. The monetary reform of 1947 replaced the *chervontsy* with new bank notes in ruble denominations. [29–181–2]

CHERVONIUK, EVGENII IVANOVICH. Born Apr. 21, 1924, in Brusilov, in what is now Zhitomir Oblast. Soviet singer (bass). People's Artist of the USSR (1967). Member of the CPSU since 1960.

In 1950, Chervoniuk graduated from the Kiev Conservatory, where he studied under D. G. Evtushenko and I. S. Patorzhinskii. He was a soloist at the Ukrainian Theater of Opera and Ballet from 1950 to 1952 and has been a soloist at the Kharkov Theater of Opera and Ballet since 1952. His wide repertoire includes the title roles in Glinka's *Ivan Susanin* and Mussorgsky's *Boris Godunov*, Mephistopheles in Gounod's *Faust*, Basilio in Rossini's *The Barber of Seville*, and Taras and the Elected Official in Lysenko's *Taras Bulba* and *Natalka Poltavka*. Chervoniuk also gives concerts. Since 1960 he has taught at the Kharkov Institute of the Arts.

Chervoniuk was a deputy to the sixth through eighth convocations of the Supreme Soviet of the Ukrainian SSR. He has performed abroad. Chervoniuk has been awarded the Order of Lenin.

CHERVONOARMEISK (until 1940, Radziwiłłów), a city and administrative center of Chervonoarmeisk Raion, Rovno Oblast, Ukrainian SSR. Chervonoarmeisk is located on the L'vov-Rovno highway. It is a railroad station on the Krasne-Zdolbunov line. Industry is represented by a vegetable drier and cannery, a food-processing combine, a cereal-products combine, a mixed-feed plant, a plant that produces accessories, an asphalt plant, the Maiak factory, and a furniture factory. [29–181–5]

CHERVONOARMEISK, an urban-type settlement and administrative center of Chervonoarmeisk Raion, Zhitomir Oblast, Ukrainian SSR. Chervonoarmeisk is situated 45 km northwest of Zhitomir, 7 km from the Kiev-L'vov highway, and 15 km from the Kurnoe station on the Zhitomir–Novograd-Volynskii railroad line. It has a brickyard, a plant for the production of bone meal, a food-processing combine, and a poultry hatchery. The city also has a museum of history and local lore. [29–181–6]

CHERVONOE, an urban-type settlement in Glukhov Raion, Sumy Oblast, Ukrainian SSR. Chervonoe is situated 146 km northwest of the city of Sumy and 6 km from the Esman' railroad station on the Khutor-Mikhailovskii–Vorozhba line. The settlement has a brickyard. [29–182–5]

CHERVONOE, an urban-type settlement in Andrushevka Raion, Zhitomir Onlast, Ukrainian SSR. The settlement is located 18 km from the Andrushevka railroad station, which is the terminus of a branch of the Fastov-Kazatin line. Chervonoe has a sugar refinery and a distilling plant. [29–182–4]

CHERVONOE LAKE (also Chervonoe Poles'e, Kniaz'-ozero), a lake overgrown with vegetation in Gomel' Oblast, Byelorussian SSR. Chervonoe Lake has an area of 43.6 sq km and a maximum depth of 4 m. It is fed by mixed sources. The water level varies by 0.8 m and is highest in March and April. The lake freezes over in November and December, and the ice breaks up in the second half of March or in April. Drainage ditches and the Bobrik River drain the lake into the Priapat' River. European bream, pike, and Eurasian perch (*Perca fluviatilis*) are fished in Chervonoe Lake. [29–182–6]

CHERVONOGRAD (until 1953, Kristanopol'), a city (since 1951) under oblast jurisdiction in L'vov Oblast, Ukrainian SSR. Situated on the Bug River. Population, 53,000 (1977). Chervonograd is a railroad station on the L'vov-Kovel' line. Coal is mined nearby. The city has a plant that produces reinforced-concrete components, a milk plant, a wood-products combine, a garment factory, and a hosiery factory. A branch of the L'vov Polytechnic Institute and a mining technicum are located in Chervonograd. [29–182–2]

CHERVONOGRIGOROVKA, an urban-type settlement in Nikopol' Raion, Dnepropetrovsk Oblast, Ukrainian SSR. The settlement is situated on the shore of the Kakhovka Reservoir, 10 km from the Nikopol' railroad station on the Zaporozh'e-Apostolovo line. The Konservvinprom Production Association is located in Chervonogrigorovka. [29–182–3]

CHERVONOGVARDEISKOE, an urban-type settlement in Voroshilovgrad Oblast, Ukrainian SSR. Chervonogvardeiskoe is under the jurisdiction of the Kirov city soviet. The settlement is situated 10 km from the Sentianovka railroad station on the Rodakovo–Krasnyi Liman line. Coal is mined in the vicinity. A winery is located in Chervonogvardeiskoe. [29–182–1]

CHERVONOPARTIZANSK, a city (since 1960) in Voroshilovgrad Oblast, Ukrainian SSR, under the jurisdiction of the Sverdlovsk city soviet. Railroad station (Krasnaia Mogila) on the Debal'tsevo-Zverevo line. Population, 25,000 (1974). Coal is mined in the area, and the city has a coal-washing plant. A museum of local lore is located in the city. [29–182–8]

CHERVONOZAVODSKOE, a city (since 1977) in Lokhvitsa Raion, Poltava Oblast, Ukrainian SSR; situated on the Sula River, a tributary of the Dnieper. Chervonozavodskoe has a railroad station (Sula) on the Bakhmach-Kremenchug line. Enterprises include sugar-refining and alcohol-distilling combines and plants for the production of butter and dehydrated milk, mixed feeds, and nutrient yeast. The city has a technicum of the food-processing industry. [29–182–7]

CHERVONYI ARKHIV (Red Archive), a supplement to the journal *Arkhivna sprava. Chervonyi arkhiv* was published in Kharkov in 1927, in Ukrainian. Two volumes were issued. Archival materials dealing with the history of the peasant and national liberation movements, revolutionary Populism (*Narodnichestvo*), and the Civil War in the Ukraine were published in *Chervonyi arkhiv*.

PUBLICATION

Arkhivna sprava, 1927, nos. 2–3, 4. [29–183–2]

CHERVONYI DONETS, an urban-type settlement in Balakleia Raion, Kharkov Oblast, Ukrainian SSR. The settlement is situated on the Severskii Donets River, a tributary of the Don, 4 km from the Shebelinka railroad station on the Kharkov-Sviatogorskaia line. The Shebelinka gas deposit is nearby. [29–183–3]

CHESAPEAKE BAY, a bay of the Atlantic Ocean on the coast of the USA. Along with Delaware Bay, the Chesapeake Bay isolates the Delmarva Peninsula. The bay is 315 km long and 5–30 km wide. It reaches a depth of 27 m; the depth of the fairway is more than 11 m. The shoreline is low, swampy, and heavily indented by the mouths of numerous rivers, including the Susquehanna, Potomac, James, and others, which form natural harbors. The tides are semidiurnal, measuring up to 1 m. The chief port on the Chesapeake Bay is Baltimore. [29–338–1]

CHESHA BAY (Cheshskaia Guba), a bay in the eastern part of the Barents Sea, between the Kanin Nos Peninsula and the mainland. Chesha Bay is 110 km long and 55 km wide at its mouth; it reaches a maximum width of 130 km. The shores are low-lying except in the northwest, where they form steep cliffs. The bay is 55 m deep at its mouth. It is subject to semidiurnal tides of up to 4.3 m. Ice covers the bay from November until the end of June. The Vizhas, Oma, Pesha, and Chesha rivers empty into Chesha Bay. [29–524–3]

CHESHIRE, a county in Great Britain. Population, 902,300 (1974). The administrative center of Cheshire is Chester. Cheshire's main industries are chemicals, nonferrous metallurgy, and machine building. Dairy farming is the chief sector of the county's agriculture. Cheshire's industrial centers—Warrington, Widnes, and Runcorn—are situated along the Manchester Canal. Salt is mined in the region. [29–523–2]

CHESKII, IVAN VASIL'EVICH. Born 1777; died June 17 (29), 1848, in St. Petersburg. Russian engraver.

Beginning in 1791, Cheskii studied with I. Klauber at the St. Petersburg Academy of Arts; he enrolled in the academy's landscape class in 1799. He became an academician in 1807.

Cheskii's landscapes, portraits, and illustrations were executed in the technique of line engraving; most were derived from the drawings of other artists. The engravings are characterized by precision and clarity of line. Examples are *Landscape With Hunters* (1807, from the original by G. Dughet), *The Temple of Friendship in Pavlovsk* (from an original by S. F. Shchedrin), *Portrait of V. A. Zhukovskii* (published 1821–22), *Portrait of G. R. Derzhavin* (published 1825), and illustrations to Krylov's fable "The Horse and the Horseman" (1825, based on drawings by A. Sauerweid).

CHESNOKOV, IURII BORISOVICH. Born Jan. 22, 1933, in Moscow. Soviet athlete. Honored Master of Sport (1960); Honored Coach of the USSR (1976). Member of the CPSU since 1968.

Chesnokov is the son of the oldest figure in the Russian and Soviet physical-fitness and sports movement, B. M. Chesnokov (1891–1979). He graduated from the V. V. Kuibyshev Military Engineering Academy in 1958 and eventually became a colonel. From 1954 to 1964 he was one of the leading players on the USSR volleyball team, and from 1969 to 1977 he served as the team's senior coach. He was USSR champion nine times between 1954 and 1966 as a member of the Central Sports Club of the Army. He was world champion in 1960 and 1962 and Olympic champion in 1964.

Chesnokov has been awarded the Order of the Badge of Honor and several medals. [29–341–1]

CHESNOKOV, PAVEL GRIGOR'EVICH. Born Oct. 12, (24), 1877, near Voskresensk, in what is now Moscow Oblast; died Mar. 14, 1944, in Moscow. Soviet choral conductor, teacher, and composer.

In 1895, Chesnokov graduated from the Synod School as a choral conductor. In 1917 he graduated from the Moscow Conservatory, where he had studied composition under S. N. Vasilenko; he had previously taken lessons from S. I. Taneev and M. M. Ippolitov-Ivanov. He taught at the Synod School (Choral Academy) from 1895 to 1920. From 1920 to 1944, Chesnokov taught choral conducting at the Moscow Conservatory, becoming a professor in 1921. He developed courses in choral conducting and methods of working with choirs. He was the principal conductor of the Moscow State Chorus from 1917 to 1922, led the Moscow Academic Chorus from 1922 to 1928, and served as choral director of the Bolshoi Theater.

Chesnokov was one of the most important masters of Russian choral art, which he raised to a high level through his diverse musical activities. His book *The Chorus and Choral Conducting* (1940; 3rd ed., 1961), which deals with theoretical problems of choral art, was the first solid and detailed study of choir conducting in the Soviet and world literature. Chesnokov composed many musical works, including choral pieces and art songs.

I. M. IAMPOL'SKII [29–340–1]

CHESNOKOVKA, until 1962, the name of the city of Novoaltaisk, Altai Krai, RSFSR. [29–341–2]

CHESS, a game for two played with special men on a board with 64 squares. Chess simulates the actions of combatants contending in accordance with strict rules. Combining the features of an art, a science, and a sport, the game helps develop logic, concentration, and the ability to calculate possible sequences of moves quickly and accurately. It instills in the players a will to win and other moral qualities. Chess can reveal aspects of a person's character and skills with striking accuracy, and it is therefore used in various psychological tests, as well as in cybernetics, to study the potential of computers. Chess theory examines the strategic and tactical principles of the game, the deployment and interaction of the men, typical moves, and patterns of play in openings and endgames. A special art and sport based on chess is chess composition.

Each side in the game plays with 16 men, including eight pieces (one king, one queen, two rooks, two bishops, and two knights) and eight pawns.

Rules of play. Chess moves are made alternately. The capture of the opponent's men is obligatory only when there is no other way of defending a king in check.

The moves of the men on an open board are as follows. The king moves to any square adjacent to his own. The queen moves any distance along a file (vertical row of squares), rank (horizontal row of squares), or diagonal. A rook moves any distance along a rank or file, and a bishop moves any distance along a diagonal. The knight's move is L-shaped: one square along a rank or file and one along a diagonal; the knight is the only piece that can cross a square occupied by another piece or pawn. The pawns only move ahead one square at a time along their file, although they may make a two-square move from the initial position.

If an opponent's pawn or piece stands in the way of a move, it may be captured (removed from the board) and replaced on its square by the piece that captured it. A pawn captures by moving diagonally one square, after which it moves along its new file. A pawn advanced to the last rank may be replaced by any piece its player wishes except a king. If a pawn makes a two-square move over a square that is under attack by an opponent's pawn it may be captured *en passant*; the capturing pawn advances diagonally to the square the captured pawn has passed.

One time in a game each player may move his king and a rook simultaneously provided they have not been moved before, the squares between them are unoccupied, and the king is not in check. This is called castling. The king moves two squares toward the rook (either right or left), and the rook shifts to the adjacent square jumped over by the king.

The object of the game is to put the king in checkmate, an attack against which there is no defense. The game ends in a draw if the correlation of forces on the board is such that checkmate is impossible, if one side has no possible move but its king is not under attack (stalemate), or if one of the kings cannot escape check (perpetual check). The game is divided into three stages: the opening, the middle game, and the endgame.

Historical survey. India is considered the birthplace of chess. By the fifth century, an ancient form of the game called *chaturanga* had evolved there; the object of the game was the capture of the opponent's pieces. Later, presumably in the vicinity of the Kushana kingdom or the Ephthalite state, the object became mate. In Persia, chess was called *chatrang* or *shatrang*, and in the Arab countries of the East it was called *shatranj*. In *shatranj* the bishop (Russian *slon*, Arabic *al-fil*, "elephant") moved diagonally two squares but could jump over pieces as the knight in modern chess can. The queen (Russian *ferz'*, Arabic *firzan*, "counsellor") moved only one square diagonally. In the eighth and ninth centuries *shatranj* spread throughout the countries of the Arabian Caliphate. The first method of recording games was devised, and the first theoretical works were written. Players of *shatranj* were divided into four classes in the caliphate. The highest class consisted of the *al-Aliya*, or grandmasters, many of whom were also famous as the authors of chess treatises, for example, the Tadzhik Abul Fath in the 12th century.

By the seventh and eighth centuries the peoples of Middle Asia were acquainted with chess. The first references to the game in Georgia and Armenia date from the 12th century.

The first reference to chess in Western Europe dates from the early 11th century, although there is evidence that the game was introduced as early as the ninth or tenth century from the Arab countries, chiefly through Spain and possibly Italy. The Vikings

(Normans) introduced chess to Scandinavia and the British Isles. By the 13th and 14th centuries chess had become a popular amusement of the feudal nobility and was mentioned in a number of literary works, including *The Song of Roland* and *Tristan and Iseult*. It was also part of the education of a knight. In Western Europe the chessboard became two-colored, whereas in the East it was of a single color. Special writings on the game, edifying works called moralities, encouraged the playing of chess as a means of moral instruction.

In the mid-15th century, apparently on the Iberian Peninsula, chess was reformed. The queen and bishop acquired their present moves, and the game became quick and dynamic. In the late 15th century the first books on the theory of the new chess appeared in Spain, written by Vicentz (1495) and Lucena (1497). In Rome in 1512 the Portuguese Damiano published a book on chess that was frequently reprinted, contributing greatly to the popularity of chess in Western Europe.

Development of theory. R. López de Segura, the best chess player in 16th-century Spain, must be regarded as the first theorist of modern chess. His *Book of the Liberal Invention and Art of Playing Chess* was published in 1561. In the late 16th and early 17th centuries a new Italian school of chess advocated an immediate attack on the opponent's king, regardless of losses; the principal piece was the queen. The Italian school conceived original combinations and developed the aesthetics of chess. Its most famous players were G. Leonardo, P. Boi, G. Polerio, A. Salvio, P. Carrera, and especially G. Greco (1600–34), whose work was regarded for almost 100 years as the best guide to chess.

In the 18th century, France became the center of the chess world. Algebraic chess notation appeared in a book by P. Stamma (Paris, 1737) and was perfected in the late 19th century. A French school of chess evolved, headed by F. A. Philidor, author of *Analysis of the Game of Chess* (*Analyze du jeu des échecs*, 1749). The basis of Philidor's theory was the leading role of the pawns and pawn arrangement in seizing space, attacking, and defending. Philidor, the first to study the general appraisal of position, analyzed a number of endgame positions and developed their principles of play. In the early 19th century several of his ideas were developed by A. D. Petrov.

In 1836 the first chess journal, *Le Palamède*, was published in Paris. P. Morphy made an important contribution to the theory of open positions in chess. Integrating strategic constructions and tactical strikes, he based his combinations and attacks on a solid study of position. In the 1880's, W. Steinitz developed the general theory of positional play. The plan of a game, according to Steinitz, should stem from a general appraisal of position. The essence of positional play is the accumulation of small advantages; control of the center of the board, open lines, and points; and the attainment of a numerical advantage on the board. The player who has achieved these advantages is obliged to attack. M. I. Chigorin (Tchigorin) opposed certain dogmatic aspects of the theory, proving that general principles are no substitute for the analysis of specific alternatives.

Steinitz's theoretical principles were developed by S. Tarrasch (1862–1934), A. I. Nimzowitsch (1886–1935), A. A. Alekhine, R. Réti (1889–1929), and A. K. Rubinstein (1882–1961).

Competitions. Various medieval sources contain reports of individual encounters between chess players of different countries. The competition between the Spaniards R. López and A. Ceron and the Italians Leonardo and Boi in 1575 at the palace of King Philip II of Spain is sometimes called the first international tournament. In the late 18th and early 19th centuries matches were held in many European countries. Cafés and then clubs were the centers of chess life at that time. For example, beginning in the early 18th century, the Café de la Régence in Paris was France's major chess center.

Outstanding chess players included K. Légal (1702–92), Philidor, A. Deschapelles (1780–1847), L. La Bourdonnais (1795–1840), and P. Saint-Amant (1800–73) in France; A. McDonnell (1798–1835) and H. Staunton (1810–74) in Great Britain; T. Lasa (1818–99), A. Anderssen (1818–79), L. Paulsen (1836–90), and J. Zukertort in Germany; Morphy in the United States; and Steinitz in Austria-Hungary. Anderssen and then Morphy, who defeated him in 1858, were regarded as the strongest players of the mid-19th century. Steinitz was declared the first official world champion after defeating Zukertort in 1886. In 1894, E. Lasker became the champion by defeating Steinitz. In 1921, Lasker was defeated by J. R. Capablanca, who in 1927 lost to Alekhine. In 1935, M. Euwe became champion by defeating Alekhine; however, Alekhine regained the title in 1937 and died undefeated. V. Menchik won the first world chess championship for women, held in 1927.

The first international tournament took place in London in 1851, with Anderssen the winner. The German Chess League held international tournaments every two years from 1879 to 1914. Major chess competitions were also held in connection with the industrial expositions in London (1862), Paris (1867, 1900), Vienna (1873), and Prague (1908). In the 1870's and 1880's, newly formed chess societies and clubs in many cities also organized international tournaments; major contests were held in Vienna (1882, 1903), London (1883, 1899), New York (1889), Hastings, Great Britain (1895), and St. Petersburg (1896, 1909, 1914).

Since the early 20th century a number of competitions have been held at resorts, for example, Monte Carlo (1901–04), Cambridge Springs (1904), Oostende (1905–07), Karlovy Vary (1907, 1911, 1923, 1929), San Sebastián (1911, 1912), and San Remo (1911, 1930). Between 1920 and 1939 approximately 50 major international tournaments were held, including three in Moscow, in 1925, 1935, and 1936. Since 1919 annual tournaments have been a tradition in Hastings, the scene of eight international team tournaments, or Olympiads, between 1927 and 1939. The strongest players to emerge during this period were Euwe, E. Grünfeld, S. M. Flohr, M. M. Botvinnik, S. Reshevsky, R. Fine, P. P. Keres, G. Stahlberg, V. V. Ragozin, G. Ia. Levenfish, P. A. Romanovskii, R. Spielmann, and M. Vidmar. Since World War II, chess has become an integral part of the culture of the socialist countries, and the game is now becoming popular in the countries of Asia and Africa. Chess theory is advancing further, and national chess associations are being reorganized.

In 1948 the five men regarded as the strongest chess players in Europe and America competed in a tournament. The winner, Botvinnik, was declared world champion. World championship competitions have been held regularly every three years since then according to the following system: first zonal and interzonal tournaments are held, followed by a candidates' tournament, and finally a match with the reigning champion. In 1951 and 1954, Botvinnik retained the title in draw matches with D. I. Bronstein (born 1924) and V. V. Smyslov. He lost a second match to Smyslov in 1957 but won a return match in 1958. In 1960, Botvinnik lost to M. N. Tal', but in 1961 he regained the title in a return match. In 1963 he lost to T. V. Petrosian. In that year return matches were eliminated. In 1966, Petrosian defended the title by defeating B. V. Spassky; in 1969, at the next round in the battle for the world championship, Spassky won the title, but in 1972 he lost it to R. Fischer. In 1975, Fischer declined a match with A. E. Karpov of the USSR (born 1951), who became world champion by default.

Since 1950 regular world championships have also been held among women. Champions have included L. V. Rudenko (1950–53), E. I. Bykova (1953–56, 1958–62), and O. N. Rubtsova (1956–58). N. T. Gaprindashvili has been women's champion since 1962.

Major international tournaments include regular world team championships for men and women, world and European individual youth championships, and student team Olympiads (since 1954).

In addition to those in Hastings and in Beverwijk, The Netherlands, tournaments are held in memory of outstanding chess players of the past, including anniversary tournaments. Major tournaments include the 1946 Groningen tournament (first prize, Botvinnik); the Chigorin tournament in Moscow in 1947 (Botvinnik); the Alekhine tournaments in 1956 (Botvinnik and Smyslov), 1971 (Karpov and L. Shtein), and 1975 (E. Geller); the 1967 tournament (Shtein); the tournament in Bled in 1961 (Tal'); the tournaments in Los Angeles in 1963 (Keres and Petrosian) and 1966 (Spassky); the Tournament of the World in Rovinj and Zagreb, Yugoslavia, in 1970 (Fischer); and the tournament in San Antonio in 1972 (Karpov, Petrosian, L. Portisch). From the 1950's to the 1970's, major prizes have been won by B. Larsen of Denmark, Portisch and L. Szabó of Hungary, L. Ljubojević and

S. Gligorić of Yugoslavia, F. Olafsson of Iceland, R. Byrne and L. Kavalek of the USA, V. Hort and J. Smejkal of Czechoslovakia, R. Hübner of the Federal Republic of Germany, and H. Mecking of Brazil.

The International Chess Federation (FIDE), founded in 1924, promotes chess around the world and organizes international competitions. In 1978 it included the national chess federations of more than 100 countries.

In prerevolutionary Russia and the USSR. The Russian names of the chessmen and of the game itself (*shakhmaty*; from Persian *shah mat*, "the king is dead"), as well as archaeological discoveries, indicate that chess entered Russia from the East, probably via Khwarazm and Khazaria, no later than the ninth and tenth centuries. Chessmen have been unearthed in Novgorod, Kiev, Grodno, Minsk, Vyshgorod, and other cities. The game was already widespread in Russia in the 12th and 14th centuries and is mentioned in *byliny* (epic folk songs) about Russian *bogatyri* (warriors). Foreigners visiting Russia in the 16th and 17th centuries reported that chess was popular. The Eastern name for the rook, *rukhkh* ("chariot"), was changed to a word more familiar to Russians, *lad'ia* ("boat").

In the 18th and early 19th centuries chess was primarily a game of the nobility and the intelligentsia. Sources tell of chess being played at assemblies, with Peter I among the players. Well-known references to the game are found in the writings of A. S. Pushkin, N. G. Chernyshevskii, I. S. Turgenev, L. N. Tolstoy, and other outstanding figures of Russian culture. The first chess textbook was published in 1821 by I. Butrimov, and the first chess club was founded in St. Petersburg in 1853. The eminent chess players of the mid-19th century were Petrov, K. A. Ianish, I. S. Shumov, S. S. Urusov, and D. S. Urusov. Chigorin, the founder of the Russian school of chess, was the strongest Russian player of the 1870's, as well as a promoter of the game and organizer of the chess movement.

In the late 19th and early 20th centuries a number of national and international tournaments were held in Russia. Russian players who successfully competed were E. S. Shiffers, S. Z. Alapin, G. S. Sal've, F. I. Duz-Khotimirskii, Rubinstein, O. S. Bernstein, Alekhine, and Nimzowitsch. Chess is very popular in the USSR, where in 1976 there were more than 3 million qualified players.

In 1924, N. V. Krylenko became the first chairman of the newly created All-Union Chess Section, since 1959 the Chess Federation of the USSR. In 1956 the Central Chess Club of the USSR was founded in Moscow. In the 1930's a Soviet school of chess took shape, led in the 1940's and 1950's by M. M. Botvinnik. The characteristic features of the Soviet school of chess are a scientific approach to the game, a thorough development of theory, and a harmonious combination of general appraisals and specific analysis. For its successes from the 1950's to the 1970's the Soviet school of chess is indebted to a number of world champions and repeated winners of international competitions and USSR championships, notably A. A. Kotov, E. P. Geller, Iu. L. Averbakh, M. E. Taimanov, L. A. Polugaevskii, and I. E. Boleslavskii. In the USSR, chess players may receive official ratings (four levels) and the titles candidate for master (over 3,000 in 1976), master (559 men, 69 women), and grandmaster (37 men, 11 women).

National championships have been held for men since 1920, and for women since 1927. There are championships in the Union republics, autonomous republics, oblasts, krais, and cities. Other major competitions include all-Union team championships among republics (since 1948), athletic societies (since 1938), and Pioneer (since 1968), as well as nationwide individual youth championships (since 1934), nationwide rural championships (since 1939), and correspondence championships (since 1948). In 1959 chess was included among the games of the Spartakiad of Peoples of the USSR. As of January 1981, Soviet chess players held the official world championship titles in the men's and women's individual and men's, women's, and juniors' team categories and the European title in the men's team category.

The first Soviet chess periodical was *Listok shakhmatnogo kruzhka Petrogubkommuny* (Leaflet of the Chess Club of the Petrograd Provincial Commune), founded in 1921 and renamed *Shakhmatnyi listok* in 1922; in 1931 it was renamed *Shakhmaty v SSSR*. The journal *Shakhmaty i shashki v rabochem klube* (Chess and Checkers in the Workers' Club) was published from 1927 to 1935. A chess newspaper entitled *64* was issued from 1935 to 1941; from 1968 to 1979, *64* was published as a special supplement to the newspaper *Sovetskii Sport*. Other chess periodicals include *Shakhmatny biulleten'* (since 1955), *Shakhmatnoe obozrenie* (since 1980), the Latvian journal *Šahs*, the Armenian *Shakhmatain Aiastan*, and the Georgian *Chadraki*. Major chess competitions are given wide coverage in the national press and on All-Union Radio and Central Television. A weekly television program on chess, *The Chess School*, has been broadcast since 1968.

CHESS CLOCK, a clock for recording the time spent by each chess player in considering his next move during a game of prescribed duration.

A chess clock usually consists of two clock movements in a single case with two faces and two hands. The two movements are kinematically connected in such a way that at any given moment only one clock is running. Pushing the buttons located in the upper part of the case starts one clock and simultaneously stops the other. After making his move, the player pushes the button, stopping his own clock and starting his opponent's clock. Thus the total playing time is calculated separately for each player. Two to three minutes before the prescribed playing time elapses, the hand of the clock raises a flag. As soon as the hand reaches the numeral 12, the flag falls, signaling that the playing time has expired.

Chess clocks are sometimes equipped to indicate how many times a button has been pushed. Some clocks consist of a single continuously running movement and hands that are switched on and off by pushing a button. Another type of clock has a separate case for each movement. Chess clocks are usually accurate to 60 sec per 24 hr. Digital electronic chess clocks are now being developed (1978).

Mechanical chess clocks were introduced in Great Britain in the mid-19th century, until which time sandglasses were used. They were first used in an international tournament in 1883, in London.

B. M. CHERNIAGIN [29–894–2]

CHESS COMPOSITION, a specialized branch of chess that involves the composition of problems (hypothetical positions with a checkmate possible in a given number of moves) and studies (positions similar to those used in games, in which the player must find the way to victory or stalemate).

The study as an independent branch of chess composition evolved in the mid-19th century. The first collection of studies was compiled by B. Horwitz and J. Kling in 1851. The founder of the modern artistic study was A. A. Troitskii (1866–1942, Honored Art Worker of the RSFSR from 1928), who established the basic principles of study aesthetics between 1894 and 1900 and elaborated them in subsequent years. His immediate followers were I. Zevers, V. N. Platov, M. N. Platov, and L. I. Kubbel' of Russia and H. Rinck of France. Soviet chess composers have continued to play a leading role in the development of study composition.

The first chess problem was composed in the Middle Ages. The modern artistic study criteria (originality and economy) were defi-

ned in the mid-19th century. By the end of the century the principles of the chief schools were formulated by the problemists S. Lloyd (USA), A. Mackenzie (Jamaica), K. Bayer and J. Berger (Germany), J. Dobruský and J. Pospišil (Czechoslovakia), and C. Plank and B. Laws (Great Britain). The best-known Russian problemists of the 19th century were A. D. Petrov, I. S. Shumov, and A. V. Galitskii. Major problemists of the 20th century have included J. Kohtz and W. von Holzhausen (Germany), M. Havel and E. Palkoský (Czechoslovakia), A. White (United States), A. Ellerman (Argentina), and M. M. Barulin and L. A. Isaev (USSR).

International and national competitions in problems and studies are held. In the USSR, individual championships were first organized in 1929 and have been held regularly since 1947; team championships have been conducted since 1956. Sports ranks are awarded on the basis of results in these competitions. Based on the process of elimination in a competition sponsored by the *FIDE Album*, which publishes the official collection of studies and problems of the International Chess Federation, the title of international grandmaster was awarded to the following between 1930 and 1970: E. Wissermann (the Netherlands), C. Mansfield (Great Britain), G. Paros (Hungary), N. Petrović (Yugoslavia), J. Fritz and V. Pachman (Czechoslovakia), and V. A. Bron, G. M. Kasparian, V. A. Korol'kov, and L. I. Loshinskii (USSR).

E. I. UMNOV [29–893–3]

CHESTER, a city in Great Britain; seat of the county of Cheshire. Population, 117,300 (1974). Chester is a commercial center on the Dee River and a transportation junction. Local industry includes machine building and metalworking. [29–343–2]

CHESTER, a city in the eastern USA, in the state of Pennsylvania, on the Delaware River; a southwestern suburb of Philadelphia. Population, 52,000 (1975). Chester, which was founded in 1644, has an iron and steel industry and enterprises of the metalworking, machine-building, oil-refining, and chemical industries. Equipment for power engineering and heavy industry is produced. There are shipyards and automotive assembly plants in Chester. [29–343–3]

CHESTERFIELD, FOURTH EARL OF (Philip Dormer Stanhope). Born Sept. 22, 1694, in London; died there Mar. 24, 1773. English writer and statesman.

Chesterfield attended Cambridge University in 1714 and 1715. In 1715 he became a member of the House of Commons, and in 1726 he entered the House of Lords and headed the opposition to the Whig cabinet of R. Walpole. He was ambassador to Holland from 1728 to 1732, lord lieutenant of Ireland in 1745 and 1746, and secretary of state from 1746 to 1748.

In 1750, Chesterfield began writing essays of manners and satirical essays, which were influenced by the ideas of the Enlightenment. He entered the history of English literature as the author of *Letters to His Son* (published 1774, reprinted several times with additions), which contained an extensive code of admonitions and recommendations in the spirit of the pedagogical ideas of J. Locke. The narrow, practical orientation of the program of upbringing—preparation for high society and a government career—shocked many of Chesterfield's contemporaries, but Voltaire highly praised the work both as a model of 18th-century epistolary prose and as a sincere human document. Chesterfield was also the author of *Maxims* and *Characters* (both published 1777). A number of apocryphal works are attributed to him.

V. A. KHARITONOV [29–344–1]

CHESTERTON, GILBERT KEITH. Born May 29, 1874, in London; died June 14, 1936, in Beaconsfield. English writer and thinker. A major writer of detective literature.

In 1900, Chesterton began contributing regularly to liberal newspapers and magazines. During his life he published collections of poems, essays, and short stories. Chesterton wrote several short-story collections about the priest-detective Father Brown, including *The Innocence of Father Brown* (1911) and *The Incredulity of Father Brown* (1926). Chesterton wrote six novels, the best known of which were *The Napoleon of Notting Hill* (1904; Russian translation *The Napoleon From the Suburb*, 1925) and *The Man Who Was Thursday* (1908; Russian translation, 1914); several books of literary criticism; and books of a religious character.

An adherent of Catholic orthodoxy, Chesterton based his social and ethical program on the theology of Thomism. *Orthodoxy* (1908) was the title of his best known collection of religious and philosophical thought. Chesterton's utopia depended on the restoration of "merry old England" with its clearly defined hierarchy. The world he created in his books was unusual, romantically transformed. The entertaining plots, eccentricity, and paradoxical judgments in his works made Chesterton popular with broad circles of readers. He strongly influenced Catholic writers and thinkers, as well as authors writing in the detective genre.

CHESTNOKOV, VLADIMIR IVANOVICH. Born Mar. 30 (Apr. 12), 1904, in St. Petersburg; died May 15, 1968, in Leningrad. Soviet actor. People's Artist of the USSR (1960). Member of the CPSU from 1941.

Chestnokov graduated from the School of Russian Drama in 1924. He appeared with the Leningrad Pushkin Drama Theater from 1924 to 1936 and rejoined the company in 1954 after performing with the Theater of the Lenin Komsomol, the Theater of the Baltic Fleet, and the Bolshoi Drama Theater, all in Leningrad.

Chestnokov excelled in the title role in Rostand's *Cyrano de Bergerac*, as Aleksei Ivanovich in *The Gambler* (after Dostoevsky's novel), Saburov in *Days and Nights* (after the novella by Simonov), and in the title role in *Don César de Basan* by Dumanoir and Dennery, which was made into a film.

Chestnokov portrayed V. I. Lenin in Kapler's *Year of the Storm*, Mikhailov's *Grim Happiness*, Pogodin's *Living Flowers*, Shtein's *Between Downpours*, and in the film *In the October Days* (1958). He also appeared in the films *The Fourth Periscope* (1939), *Ivan Pavlov* (1949), and *The Green Carriage* (1967). From 1949 to 1953 he taught at the Leningrad Ostrovskii Theatrical Institute.

Chestnokov, a recipient of the State Prize of the USSR in 1950 and 1967, was awarded the Order of Lenin, two other orders, and various medals.

[29–344–3]

CHET', a river in Tomsk Oblast, and, in its upper course, in Krasnoiarsk Krai, RSFSR; a right tributary of the Kiia River of the Ob' River basin. The Chet' is 432 km long and drains an area of 14,300 sq km. It flows along the southeastern edge of the Western Siberian Plain. It is fed primarily by snow, and high water occurs in May. The mean flow rate is 66 cu m per sec. The river freezes over in late October or November, and the ice breaks up in late April or early May. The Chet' is used for timber flotation. [29–371–3]

CHETAEV, NIKOLAI GUR'EVICH. Born Nov. 23 (Dec. 6), 1902, in the village of Karaduli, in what is now Laishevo Raion, Tatar ASSR; died Oct. 17, 1959, in Moscow. Soviet scientist; specialist in mechanics. Corresponding member of the Academy of Sciences of the USSR (1943).

Chetaev graduated from the University of Kazan in 1924. In 1929, after completing his graduate study, he was sent to Göttingen for advanced study. From 1930 to 1940 he was a professor at the University of Kazan, where he established a school of specialists in theory of the stability of motion. From 1940 he worked at the Institute of Mechanics of the Academy of Sciences of the USSR and was a professor at Moscow State University.

In 1934, Chetaev established the general theorem of the instability of motion, and in 1938 he further developed Lagrange's theorem of dynamic equilibrium; in 1949 he proposed methods for solving problems of the stability of unsteady motion. He also found the sufficient conditions for the stability of rotary motion of artillery shells. A number of his works were devoted to analytical dynamics. He extended the principle of least constraint to the case of a nonholonomic constraint.

Chetaev received the Lenin Prize in 1960. He was awarded the Order of Lenin, the Order of the Red Banner of Labor, and several medals.

WORKS

Ustoichivost' dvizheniia, 3rd ed. Moscow, 1965. [29–346–1]

CHETI (also *chetverti, chetvertnye prikazy*), institutions of the central government in Russia in the second half of the 16th and in the 17th century that fulfilled financial, administrative, and judicial functions involving the part of the population subject to the *tiaglo* (system of state duties) in certain regions of the country.

First mentioned in 1561 and 1562, the *cheti* were created after the abolition of *kormlenie* (system of local administration). In the early 17th century *cheti* were organized for the collection of direct and indirect taxes from the population in designated areas; an exception was the Novaia Chetvert'. The Novgorod Chetvert' (Nizhegorodskaia Chetvert') had jurisdiction over Novgorod, Nizhny Novgorod, Pskov, Vologda, Arkhangel'sk, and their districts. The Vladimir Chetvert' dealt with Vladimir, Tver', Tula, Orel, and their districts. The Kostroma Chetvert' (Yaroslavl Chetvert') handled Kostroma, Yaroslavl, Murom, and their districts. The Galich Chetvert' had authority over Galich, Beloozero, Shuia, and their districts. The Ustiug Chetvert' dealt with Velikii Ustiug, Sol'vychegodsk, and their districts.

Part of the *chetvert'* revenues went to the *prikazy* (government offices); the rest was used to pay the salaries of the upper ranks of the *sluzhilye liudi* (civil service class), including the elite of the provincial nobility, known as the *chetvertchiki*. In the 1670's and 1680's the *cheti* declined in importance, as the Novgorod, Vladimir, Galich, and Ustiug *chetverti* were made subordinate to the Posol'skii Prikaz (Foreign Office), the Kostroma Chetvert' was subordinated to the Streletskii Prikaz (Musketeers' Prikaz), and virtually all tax-collecting responsibilities were transferred to other institutions.

In 1683 and 1684 the *cheti* were to some degree reactivated when they regained the prerogative of collecting most of their former taxes, except for customs duties and taxes on liquor; shortly thereafter the *cheti* and the *prikazy* to which they belonged were abolished when the government was reorganized at the beginning of the 18th century.

CHETLASSKII KAMEN', a plateaulike upland in the Timan Ridge, between the Mezen' and Pizhma rivers, in Arkhangel'sk Oblast and the Komi ASSR. The upland has elevations to 463 m. It is composed of shales. It has mixed and coniferous forests, as well as swamps. [29–356–2]

CHETNIKS (Russian, *chetniki*; Serbo-Croatian, *četnici*), in the Balkans:

(1) From the 15th to the 19th century, participants (mainly haiduks) in the armed struggle waged by partisan detachments for national liberation from the Ottoman yoke. Prominent members of the Chetnik movement in Bulgaria in the 1860's included G. S. Rakovski, P. Khitov, F. Tot'o, S. T. Karadzha, and Khadzhi Dimitur.

(2) Members of a reactionary organization, participants in the nationalistic Greater Serbia movement (headed by General D. Mihajlović) and other antinationalist groups in Yugoslavia that fought against the forces of people's liberation during World War II. [29–356–3]

CHETVERIK, in Russian and Ukrainian architecture, both wooden and stone, a quadrilateral structure or part of one. The *chetverik*, the basic architectural form of the Russian church before the 18th century, was frequently built with an octagonal superstructure, a *vos'merik*, creating the *vos'merik-na-chetverike* design. [29–346–4]

CHETVERIK, a Russian dry measure. The chetverik came into use in Novgorod the Great in the 15th century. In the Russian state in the early 17th century, the chetvert equalled two osminas, or eight chetveriks; by the end of the 17th century, the size of the chetvert had been changed from four *poods* to eight *poods*. From the 18th century to the early 20th century, the chetverik was the main unit of dry measure used in Russia. As such, the chetverik (one-eighth of a chetvert) equalled eight garnetzes, or 26.24 liters. The use of the chetverik was discontinued when the metric system was introduced in the USSR. [29–346–3]

CHETVERIKOV, SERGEI SERGEEVICH. Born Apr. 24 (May 6), 1880, in Moscow; died July 2, 1959, in Gorky. Soviet biologist.

Chetverikov graduated from Moscow University in 1906. He was a docent at the Women's Higher Educational Institution in Moscow from 1909 to 1917, at the Second Moscow University from 1917 to 1919, and at the First Moscow University from 1919 to 1929. He also headed the genetics department at the Institute of Experimental Biology in Moscow from 1921 to 1929 and the department of genetics at the University of Gorky from 1935 to 1948 (professor from 1938).

Chetverikov's main fields of study were genetics, the theory of evolution, and entomology. He was the first to introduce the concepts of the impregnation of species in nature with emerging mutations, the significance of such genetic processes as mutation, free interbreeding, and selection, and isolation in species formation and evolution. Chetverikov bridged the gap between Darwin's teachings and genetics by laying down the principles of evolutionary genetics. For his work in the development of evolutionary science, the Leopoldina German Academy of Naturalists (German Democratic Republic) awarded Chetverikov the Darwin Plankette in 1959. He was also awarded the Order of the Badge of Honor and several medals.

CHETVERT', in Rus' and Russia:

(1) A land measure equal to one-half of a *desiatina*. It was mentioned as early as the late 15th century and was in official use until 1766. Depending on the size of the *desiatina*, the *chetvert'* amounted to 1,200, 1,600, or 1,250 square *sazheni*.

(2) A dry measure, used principally for grain, groats, and flour. In certain Russian principalities and states in the 14th and 15th centuries, a *chetvert'* was equal to one-fourth of a *kad'* (or *okov*) with varying weights. The official *chetvert'* in the 16th and early 17th centuries was equal to 4 *poods* of rye grain (1 *pood* equals approximately 16.38 kg), then to 6 *poods*, and, beginning in the last quarter of the 17th century, to 8 *poods*. In several regions, local *chetverti* of various volumes were known in the 17th century. The unit went out of practical use in the mid-18th century.

(3) A liquid measure equal to one-fourth of a *vedro* (bucket). It was first used in the 16th or 17th century. In 1885 the volume of a *chetvert'* was defined as 3.0748 liters. It was used chiefly in the sale of wine and liquor and was equal to 5 vodka *butylki* (bottles) or 4 wine *butylki*.

(4) In the 17th century the *chetvert'* was sometimes used as a measure of weight for certain commodities; for example, 1 *chetvert'* of wax was equal to 12 *poods*.

(5) A measure of length used in the 16th and 17th centuries, equal to one-quarter of a *sazhen'* or, later, one-quarter of an *arshin*. The latter dimension (about 18 cm) was used in rural areas until the October Revolution of 1917.

CHETVERTAKOV, ERMOLAI VASIL'EVICH. Born 1781 in the village of Nefedovka, Chernigov Province; date and place of death unknown. Hero of the Patriotic War of 1812; soldier.

The son of a serf, Chetvertakov fought in the war against France between 1805 and 1807. In the initial stage of the Patriotic War of 1812, he served in the Kiev Dragoon Regiment of the rear guard commanded by General P. P. Konovnitsyn. After being taken prisoner near Tsarevo Zaimishche on August 19, he escaped, organized a partisan detachment of approximately 50 peasants from Gzhatsk District, Smolensk Province, and conducted raids against small enemy groups.

In the village of Basmany, which had become its base of operations, the detachment grew to 300 men. Chetvertakov taught the men marksmanship, organized patrols and guard duty, and led attacks against enemy troops. Near the village of Skugarevaia, at the head of 4,000 peasants, he defeated a French battalion that was supported by artillery. He subsequently liberated all of Gzhatsk District. After rejoining his regiment in November, he was awarded the Military Order badge and became a noncommissioned officer. Chetvertakov later fought in the foreign campaigns of 1813–14. [29–348–2]

CHETVERT' LANDHOLDING, a form of land tenure in Russia from the 17th to 19th centuries.

Chetvert' holdings, which were hereditary and apportioned by family, were grants made by the state to groups of *sluzhilye liudi* (civil service class) in the 17th century and *odnodvortsy* (a category of state peasants) in the 18th and 19th centuries. Certain families were given a fixed number of *chetverti*, whose size varied according to the total land granted to the group. Especially widespread in the regions of the Belgorod line, *chetvert'* holdings were the property of the state and could not be sold. In the mid-19th century more than 657,000 *odnodvortsy*, of a total of 1,190,000, held lands under *chetvert'* law. Under a reform of 1866 that dealt with state peasants, *chetvert'* holdings were recognized as the individual property of the peasants.

CHEVAGE, in medieval France, a small annual capitation paid by serfs as a token of their personal subordination. After the liberation of the peasantry in the 13th and 14th centuries, the chevage virtually disappeared. It survived only in a few eastern provinces that retained certain aspects of serfdom and were for the most part economically backward. In August 1789, during the French Revolution, the chevage was officially abolished without compensation. [29–1066–3]

CHEVAKINSKII, SAVVA IVANOVICH. Born in 1713 in the village of Veshki, near Torzhok, in present-day Kalinin Oblast; died sometime between 1774 and 1780 in St. Petersburg (?). Russian architect.

Chevakinskii, a representative of mid-18th-century Russian baroque, studied under I. K. Korobov from 1732 to 1738. He was the chief architect of the Admiralty College from 1741 to 1767. His students included V. I. Bazhenov and I. E. Starov. Chevakinskii blended elements of 17th-century Russian architecture with devices from classical architecture. His works are marked by balanced and precise spatial composition, by sensitivity to the silhouette, and by lavish and colorful ornament.

Chevakinskii participated in the design of the palace and park complex in Tsarskoe Selo (1745–60). His buildings in Leningrad include the palace of P. B. Sheremetev on the Fontanka (1750–55), the palace of I. I. Shuvalov (1753–55), and the Naval Cathedral of St. Nicholas (1753–62). Chevakinskii also redesigned the Kunstkamera (1754–58) and the New Holland Warehouses (1765–80) in Leningrad.

CHEVALIER, MAURICE. Born Sept. 12, 1888, in Paris; died there Jan. 1, 1972. French singer, film actor.

From 1912 to 1918, Chevalier worked in music hall comedy productions; he later performed on the stage as a *chanteur*. He became famous in the late 1920's and early 1930's. Chevalier began acting in motion pictures in 1911, appearing in such films as *The Love Parade* (1931), *The Merry Widow* (1934), *Le Silence est d'or* (1947; released in the USA under the title *Man About Town*), *Love in the Afternoon* (1956), *Can-Can* (1962), *Fanny* (1963), and *Captain Grant's Children* (1965, in the role of Paganelle).

Istoriia viiny kozakiv proty Pol'shi. Kiev, 1960. [29–1067–2]

CHEVAU-LÉGERS, horsemen in a type of light cavalry established in France in 1498. Similar units were also used in Austria and Bavaria from the 17th to the 19th century. The *chevau-légers* were armed with sabers, pistols, and carbines. [29–1069–1]

CHEVEREV, ALEKSANDR MIKHAILOVICH. Born 1887, in Orenburg; died Oct. 2, 1921. Hero of the Civil War of 1918–20. Member of the CPSU from 1908.

The son of a worker, and a worker himself, Cheverev was named a member of the Sim Plant soviet after the February Revolution of 1917. He later became a member of the Ufa provincial soviet and served as a delegate to the Seventh (April) Conference of the RSDLP(B). In 1918, Cheverev was a detachment commander in battles with the White Cossacks, White Czechs, and White Guards in the Southern Urals and the Volga Region. In the autumn of the same year, he assumed command of the 4th Combined Regiment of V. M. Azin's 2nd Combined Division, which stormed Sarapul and Izhevsk.

After studying at the Academy of the General Staff of the Workers' and Peasants' Red Army in late 1918 and early 1919, Cheverev commanded a brigade in the Second Army of the Eastern Front and was seriously wounded. In 1919 he headed a food appropriation detachment and commanded a detachment that helped suppress the kulak rebellions in Ufa Province. Over a period beginning in January 1920, Cheverev was commander of the 23rd and 27th brigades and the 67th Rifle Regiment of the interior service forces. He was sent to the Far East Republic in the fall of 1921 as a military representative of the RSFSR but died en route. Cheverev was awarded the Order of the Red Banner.

CHEVIOT, a breed of semifine-wooled short-haired sheep raised for meat and wool. The breed was developed in the 18th century in Great Britain in the mountainous region of the Cheviot Hills by crossing local sheep with probably the Leicester breed. The rams weigh about 80 kg, and the ewes 60 kg. The white wool is 10 cm long and of 48–56 quality. A clipping yields 1.8–2.3 kg. The wool is used for soft woven fabrics and high-quality knitwear. One hundred ewes produce from 120 to 150 lambs. Cheviots are used for commercial crossing with other breeds. The animals can be acclimatized easily. They are distributed in many European countries, as well as in Canada, the USA, and Australia. In the USSR they were used in the development of the Estonian Whitehead breed. [29–1068–5]

CHEVIOT, one of the common names for wool and part-wool worsted and fine-felted suiting produced by a serge interweaving resulting in small diagonal ribs on the surface. Cheviot is manufactured from simple and twisted woolen yarn; frequently cotton yarn is used as the warp or weft. Sometimes the fabric is made from blended wool and cotton yarn. Cheviot is produced in solid, usually dark, colors for making suits and various types of uniforms. [29–1068–6]

CHEVIOT HILLS, low mountains in Great Britain, situated between the Southern Uplands and the Pennines. The Cheviot, at 816 m tall, is the highest peak. The mountains are composed of granite, tuffs, limestones, and sandstones. There are heathlands, meadows, and peat bogs. Sheep are raised here. [29–122–2]

CHEVKINITE (named after K. V. Chevkin [1802–75], chief of staff of the Corps of Mining Engineers in St. Petersburg), also tscheffkinite, a mineral.

Chevkinite, a diorthosilicate with the chemical composition $Ce_4Ti_4O_8[Si_2O_7]_2$, contains admixtures of Nb, Th, Ca, Sr, and Zr. It crystallizes in the monoclinic system, forming lamellar and tabular crystals. With respect to chemical composition and structure, chevkinite resembles its polymorphic modifications: orthohombic orthochevkinite and monoclinic perrierite. It is often metamict, and the crystal structure is restored after roasting. Chevkinite is pitch black in color and has a hardness of 5.5 on Mohs' scale and a density of 4,400–4,930 kg/m^3. It occurs together with ilmenite, sphene, and zircon in alkali granites, syenites, and granitic and syenite pegmatites. [29–122–3]

CHEVREUL, MICHEL ÉUGÈNE. Born Aug. 31, 1786, in Angers; died Apr. 9, 1889, in Paris. French organic chemist. Member of the Paris Academy of Sciences (1826). Professor at the Lycée Charlemagne (from 1813) and the natural history museum in Paris (from 1830).

Chevreul's main works deal with the chemistry of fats (1810–23). Chevreul established the chemical composition of fats and, by saponification, isolated stearic, oleic, palmitic, and other acids. He gave the name "glycerin" to the "sweet principle of oils and fats" discovered by K. Scheele. Chevreul derived a number of dyes from plants, including hematoxylin (1811), quercitrin (1831), morin (1831), and luteolin (1833); he also derived creatine from meat extract (1835). Chevreul proposed an efficient system of color classification. His research has found applications in the manufacture of soap, stearin, and certain dyes.

Chevreul was a foreign corresponding member of the St. Petersburg Academy of Sciences (1853).

WORKS
Résumé d'une histoire de la matière depuis les philosophes grecs jusqu'à Lavoisier inclusivement. Paris, 1878.
Recherches chimiques sur les corps gras d'origine animale. Paris, 1889.

CHEVRON, a badge consisting primarily of angular stripes of galloon, braid, or cord and worn in many armies on various parts of the uniform—usually the sleeve—to indicate rank. Chevrons are also used to designate the number of years of extended service, the level of study of a cadet, and the receipt of a wound.

Gold gallooned chevrons to be worn on the left sleeve of the greatcoat and the pea jacket were introduced in the Soviet Navy in February 1941 to indicate extended service. Chevrons of silver or gold galloon, also indicating extended service, were introduced in the Soviet Army in November 1945. They were worn on the left sleeve of the greatcoat, dress jacket, and service shirt. After January 1958, chevrons were no longer used. [29–1069–5]

CHEYENNE, an Algonquian-speaking Indian tribe of North America (*see* ALGONQUIAN LANGUAGES). Until the late 17th century the Cheyenne lived in settlements along the Minnesota River, in what is now Minnesota, and engaged in land cultivation. They were subsequently pushed by Sioux tribes to the South Dakota prairie. By the late 18th century the Cheyenne had become nomadic hunters of bison; their society was a military democracy. In 1832 the tribe split up into the Northern and Southern Cheyenne. In 1851 settlers began seizing the lands of the Cheyenne; despite stubborn resistance the tribe was overcome and was resettled on reservations in Montana, Wyoming, and Oklahoma. Today the Cheyenne, who according to the 1970 census number approximately 6,900, mainly work as hired laborers. Their religion combines Christian dogma and rituals with tribal cults. [29–125–3]

CHEYENNE, a city in the western USA; capital of Wyoming. Population, 44,000 (1975). Cheyenne is a railroad and highway junction and the center of a large agricultural region. Industry in Cheyenne includes meat processing, oil refining, and the production of chemicals. Crude oil is produced and lignites and uranium ore are mined in the area. [29–809–3]

CHIANG MAI (also Chieng Mai), a medieval Laotian kingdom in what is now northern Thailand. Chiang Mai took its name from the city of Chiang Mai, which had been founded by Meng Rai, a Laotian ruler of the Chiang Rai principality, after he had conquered Haripunchaya.

Over a period beginning in the late 14th century, Chiang Mai waged frequent wars against the Siamese kingdom of Ayutthaya. For most of the 16th, 17th, and 18th centuries, Chiang Mai was controlled by either the Burmese or the Siamese. The kingdom was a vassal of Burma from 1556 until 1595, when it became a vassal of Ayutthaya. Burma conquered the territory in 1615 and held it until 1662, when the Siamese captured it. The Burmese reconquered the territory in 1664. Chiang Mai enjoyed independence from 1727 until 1764, when it was once again conquered by Burma. In 1775, Chiang Mai was conquered by Taksin and incorporated into Siam. [29–544–1]

CHIANG MAI (also Chieng Mai), a city in Thailand; situated on the Ping River, a tributary of the Chao Phraya. Population, 65,700 (1960). Chiang Mai is the capital of Chiang Mai Province. It is the terminus of a railroad from Bangkok. The city's industries include logging (mainly the procurement of teak), timber flotation, sawmilling, and the manufacture of food products, including tobacco products. From the 13th to the 18th century, Chiang Mai was the capital of a kingdom that was also called Chiang Mai. [29–544–2]

CH'IANGT'ANG (also Chang Tang), the northern part of the Tibetan Highlands in China. The Ch'iangt'ang is dominated by hilly plains, at an elevation of approximately 5,000 m, that are separated by ranges rising 500–1,500 m above the plains. There are stony deserts, salt bottoms, and lakes. [29–39–1]

CHIANTAR, a glacier in the Hindu Kush and the largest glacier in the mountains of Hindu Raj, lowering from 6,400 to 3,660 m. Chiantar is 32 km long and covers an area of 260 sq km. It is a compound valley glacier with numerous tributaries; its meltwater flows into the Kunar River of the Indus River basin. [29–544–4]

CHIANURI, a Georgian bowed instrument. The *chianuri* has a round, cup-shaped body over the top of which is stretched a membrane of animal bladder; among the Svans a gourd is often used for the body of the instrument. The quadrihedral neck often passes through the body, emerging at the bottom as a kind of supporting leg. The two or three twisted horsehair strings are stretched between pegs at the top of the instrument and a metal ring of the tailpiece, which is secured to the supporting leg. The strings are tuned to a second or third, and the bow resembles an arc. The *chianuri*, which is held vertically against the knee, is used as an accompanying instrument. Once popular among such peoples as the Khevsurs and Gurians, the *chianuri* is now rarely encountered.

CHIAPAS, a state in southeastern Mexico. Area, 73,900 sq km. Population, 1,933,000 (1976). The capital of Chiapas in Tuxtla Gutiérrez. In the Indian communities, maize and beans are cultivated by the slash-and-burn method. Coffee plantations are located in the foothills. In the 1970's, Chiapas began producing sizable quantities of petroleum. [29–782–4]

CHIATURA, a city (since 1921) under republic jurisdiction in the Georgian SSR. Population, 26,000 (1974). The city is situated in the gorge of the Kvirila River, a tributary of the Rioni, and on the adjacent plateau; all the outlying districts of the city are connected with its center by passenger aerial tramways. Chiatura is a railroad station on the Zestafoni-Sachkhere branch of the Samtredia-Khashuri line. Industry includes the extraction and concentration of manganese ore and quartzose sand and the quarrying of marble. The city contains a plant that makes silica bricks, a tea factory, and a garment factory. Chiatura has a museum of local lore and a drama theater. [29–545–1]

CHIAURELI, MIKHAIL EDISHEROVICH. Born Jan. 25 (Feb. 6), 1894, in Tiflis; died Oct. 31, 1974, in Tbilisi. Soviet motion-picture director. People's Artist of the USSR (1948). Member of the CPSU from 1940.

Chiaureli graduated from the Tbilisi School of Painting and Sculpture. He worked as an actor, designer, and director in the theater. In 1921 he organized the Theater of Revolutionary Satire in Georgia and portrayed the title role in the film *Arsen Dzhordzhiashvili*. Subsequently he worked mainly as a director. His first films were *First Cornet Streshnev* (1928, together with E. L. Dzigan), *Saba* (1929), and *Khabarda* (1931). His film *The Last Masquerade* (1934) was the first in a series of historical revolutionary films characteristic of Chiaureli's work. His films included *Arsen* (1937), *The Great Glow* (1938), *Georgii Saakadze* (1942, 1943), *The Vow* (1946), *The Fall of Berlin* (1950), *Otar's Widow* (1958), and *The General and the Daisies* (1964).

Chiaureli was awarded the State Prize of the USSR in 1941, 1943, 1946, 1947, and 1950. He was awarded three orders of Lenin, two other orders, and various medals.

CHIBAGALAKH, a mountain range in the Cherskii mountain system, in the Yakut ASSR. The Chibagalakh Range extends 250 km from the Tuostakh River valley in the Iana River basin. The range has a maximum elevation of 2,449 m. The mountains are composed primarily of metamorphic rocks and sandstones. Larch forests grow on the mountain slopes. At higher elevations, a belt of dwarf stone pine and tundra is encountered. [29–545–3]

CHIBCHAN LANGUAGES, a language family of the Chibcha Indian tribes. The Chibchan languages are spoken in northeastern South America and southern Central America—in Peru, Ecuador, Colombia, Venezuela, Panama, and Costa Rica. They comprise the following language groups: Western Chibchan (subgroups Talamanca, Barbacoa, Guatuso, and Cuna); Pacific Chibchan (Isthmian and Colombian Chibcha); Inter-Andean Chibchan (Paez, Coconuco, and Popayanense); and Eastern Chibchan (Cundinamarca, Arhuaco, Central-American Chibcha). Some scholars combine the Chibchan languages with the Misumalpan languages (Miskito, Sumo, Matagalpa) and other languages to form a Macro-Chibchan family.

CHIBISOV, KONSTANTIN VLADIMIROVICH. Born Feb. 17 (Mar. 1), 1897, in Moscow. Soviet physical chemist. Corresponding member of the Academy of Sciences of the USSR (1946).

Chibisov graduated from Moscow State University in 1922. He worked at the Air Force Scientific and Testing Institute from 1918 to 1930, the All-Union Scientific Research Institute of Motion Pictures and Photography from 1930 to 1966, and the State Scientific Research and Design Institute of the Chemico-photographic Industry from 1966 to 1977. He gained a professorship at Moscow State University in 1950 and became chairman of the Commission on the Chemistry of Photographic Processes of the Academy of Sciences of the USSR in 1948. He was made honorary president of the International Committee on Scientific Photography in 1974.

Chibisov's major work is devoted to the theory of the light sensitivity of photographic emulsions and the chemistry of the photographic process. He received the USSR State Prize in 1950. He has been awarded four Orders of Lenin, six other orders, and several medals.

CHIBISOV, NIKANDR EVLAMPIEVICH. Born Oct. 24 (Nov. 5), 1892, in the *stanitsa* (large Cossack village) of Romanovskaia, in what is now Tsimliansk Raion, Rostov Oblast; died Sept. 20, 1959, in Minsk. Soviet military leader; colonel general (1943). Hero of the Soviet Union (Oct. 20, 1943). Member of the CPSU from 1939.

Chibisov graduated from the Petergof School for Ensigns in 1915 and served as a company commander in World War I with the rank of staff captain. He joined the Red Army in 1918 and fought in the Civil War of 1918–20 as a battalion commander, regimental commander, and chief of staff of a rifle brigade. After graduating from the M. V. Frunze Military Academy in 1935, Chibisov fought in the Soviet-Finnish War of 1939–40 and became chief of staff of the Seventh Army in 1940. He was appointed deputy commander of troops for the Leningrad Military District in July 1940 and for the Odessa Military District in January 1941. During the Great Patriotic War of 1941–45, Chibisov was appointed deputy commander of troops for the Briansk Front in July 1942. He was commander of troops of the Thirty-eighth Shock Army from August 1942 to October 1943 and of the Third and First Shock armies from November 1943 to May 1944, serving on the Southern, Briansk, Voronezh, and Second Baltic fronts. He was director of the M. V. Frunze Military Academy from 1944 to January 1948. Chibisov later served as deputy chairman of the Central Committee of the Voluntary Society for Cooperation with the Army, Air Force, and Navy and assistant commander of troops of the Byelorussian Military District. In May 1954 he was transferred to the reserves.

Chibisov was awarded three Orders of Lenin, three Orders of the Red Banner, the Order of Suvorov First Class, and various medals. [29–546–2]

CHIBIZHEK, an urban-type settlement in Kuragino Raion, Krasnoiarsk Krai, RSFSR. Chibizhek is located 27 km northeast of the Koshurnikovo railroad station on the Abakan-Taishet line. Gold is mined nearby. [29–545–4]

CHIBONI, an Adzhar wind reed instrument. A type of bagpipe, the *chiboni* has two melody pipes with five and three finger holes, respectively. It can perform two-part melodies in sharp and loud shrills and is used at festivals as a solo instrument and to accompany dancing—particularly dancing involving large numbers of people—and singing. Sometimes rhythmic folk tunes are performed on the instrument as an accompaniment to work. The *chiboni* is played by men, called *mechibone*.

Vertkov, K., G. Blagodatov, and E. Iazovitskaia. *Atlas muzykal'nykh instrumentov narodov SSSR*, 2nd ed. Moscow, 1975. Pages 135–36. [29–546–3]

CHICAGO, a city in the USA, in the state of Illinois. Second among US cities in economic importance and population and the largest center of industry, commerce, transport, and finance west of the Appalachian Mountains. Situated on the southwestern end of Lake Michigan where the Chicago River meets the lake, at the beginning of the canalized waterway that extends from the Great Lakes to the Mississippi River. Area, 575 sq km. Population, 3.2 million (1975), 33 percent of whom are Negroes.

Chicago forms part of one of the largest conurbations in the USA. Called the Chicago-Northwestern Indiana Standard Consolidated Area, the metropolitan area includes Chicago and various cities in Illinois and Indiana, such as Gary, Hammond, and East Chicago. It covers an area of 9,000 sq km and has a population of 7.7 million (1975). In 1974 the economically active population totaled 3.3 million; 31 percent were employed in industry, 5 percent in construction, 7 percent in transport, 6 percent in finance, 39 percent in commerce and the service sector, and 12 percent in the civil service. Approximately two-thirds of those working in industry are employed in heavy industry, and more than one-tenth, in the food-processing industry.

Chicago's location on the principal east-west arteries of the USA and at the junction of land and water routes has made it an important transportation center of the USA (more than 30 railroad lines converge at the city) and a major center of domestic air traffic. The Port of Chicago, which includes piers on Lake Michigan, is the largest port on the inland waterways of the USA, and it handled more than 50 million tons of freight in 1974.

Chicago is the center of US ferrous metallurgy; its steel-melting furnaces have a capacity of approximately 30 million tons. Leading products of the city include communication facilities, electronic equipment, electrical machinery, transportation equipment, agricultural machinery, and various types of equipment for industry, construction, and road building. The printing, chemical, petroleum-refining, garment, and furniture industries are well developed, as is the food-processing industry, which is dominated by flour milling and the production of canned meat. Heavy machine building and the metallurgical, petroleum-refining, and chemical industries are located primarily along Lake Michigan in southeast Chicago (near the port) and in the adjacent suburbs of Indian Harbor, Gary, and East Chicago. Machine building is most highly developed in the western section of the industrial complex, in such areas as Cicero.

Chicago is the most important market in the USA for wheat, maize, soybeans, and livestock, and its stock exchange is second in importance only to the New York Stock Exchange. The Chicago financial group is one of the major groups of finance capital in the USA. Capitalist monopolies dominate the city's industry and commerce, with the firms International Harvester and Pullman playing a major role in machine building and the General Foods Corporation occupying a leading position in the food-processing industry. The country's largest grain exchange is located in Chicago.

For a long period the area that is now Chicago belonged to the Indians. The city developed on the site of Fort Dearborn, a military post established in the early 19th century. In 1833 the settlement that grew up around the fort was incorporated as a city. The city's rapid population growth, which was particularly marked after the completion of the Illinois-Michigan Canal in 1848 and a railroad line to the Atlantic Ocean in 1852, made Chicago the country's largest city after New York by the end of the 19th century; it had 550 inhabitants in 1830, 4,500 in 1840, 109,000 in 1860, and 1,100,000 in 1890. In the 1840's industry began to expand rapidly, and in 1893 an international fair, the World's Columbian Exposition, was held in the city.

Chicago was an important center of the working-class and democratic movements. In 1870, sections of the First International were formed in the city. Notable events involving the Chicago proletariat in the late 19th century included the Haymarket Square Riot of 1886 and the Pullman strike of 1894. The trade union organization Industrial Workers of the World was founded in Chicago in 1905, and the Communist Party of the USA was founded in 1919. In 1937 police, in an incident known as the Memorial Day Massacre, fired on workers demonstrating against Republic Steel. In the 1960's and 1970's Chicago became a center of the civil rights movement, and during the American aggression in Vietnam (Vietnam War) massive antiwar demonstrations were held in the city.

Chicago, a city of sharp social contradictions and contrasts, is noted for its elegant lakefront; for its business center of huge skyscrapers, called the Loop, which is located near the place where the Chicago River meets Lake Michigan; and for its area of private residential buildings north of the Loop, known as the Gold Coast. The city is also renowned for its parks, its wide boulevards, and its drive that runs along the lakeshore. Alongside these attractions, however, are neglected slum areas and the ethnic ghettos of Chinatown and the Negro districts; in the west and southeast lie the industrial areas.

After the fire of 1871, which virtually destroyed the city, Chicago was completely rebuilt, and skyscrapers with metal skeletons were erected. The Chicago school of architecture, a precursor of the rational architecture of the 20th century, produced such structures as the second Leiter Building (now Sears and Roebuck; 1889–91, architect W. Le Baron Jenney), the Reliance Building (1890–94, architects D. H. Burnham and J. W. Root, assisted by C. B. Atwood), and the Carson Pirie Scott department store (1899–1900, architect L. Sullivan).

In the 20th century, rebuilding has been restricted to the construction of skyscrapers in the Loop, such as the Tribune Tower

(1923–25, architects J. M. Howells and R. Hood); elegant complexes, such as the Civic Center (1963–65, architect J. Brownson); and expressways that are incongruous with the city's layout.

Chicago remains an important center of architectural design. Among its notable structures are F. L. Wright's Robie House (1909), now part of the University of Chicago, and numerous buildings by L. Mies van der Rohe—including the Illinois Institute of Technology (1942–58), high-rise apartment buildings on Lake Shore Drive (1950–51), and the Commonwealth Promenade Apartments (1957). B. Goldberg designed the Marina City high-rise apartment buildings (1964), and the architectural firm of Skidmore, Owings, and Merrill designed the 100-story Hancock Building (1971) and the 109-story Sears Tower (1970–74), which, with a height of 442 m, is the world's tallest building.

A major scientific and cultural center of the USA, Chicago is the location of such nationally important universities as the University of Chicago, Northwestern University, De Paul University, and the Illinois Institute of Technology. Museums include the Field Museum of Natural History and the Museum of Science and Industry. Other cultural and educational institutions include the Art Institute of Chicago, the John G. Shedd Aquarium, the Chicago Public Library, and the Shubert and Blackstone theaters.

CHICAGO, ART INSTITUTE OF, a major art museum of the USA. Founded in 1879, the museum houses collections of primitive art, Oriental art, traditional art of America, Africa, and Oceania, and Western European art of the 13th to 20th centuries. [29–561–3]

CHICAGO, UNIVERSITY OF, a major higher educational institution of the USA, located in the state of Illinois. Founded in 1857, the university suspended operations from 1886 to 1889 but reopened in 1890 with the financial support of J. D. Rockefeller; regular instruction began in 1892. In the late 19th century the University of Chicago became one of the first American universities to admit women. The university's medical school was founded in 1927.

The payment of tuition is required for study at the university, which comprises 12 subdivisions: graduate divisions of biological sciences, humanities, physical sciences, and social sciences; graduate professional schools of theology, business administration, library science, education, social service administration, medicine, and law; and an undergraduate college. The University of Chicago has 8,000 students and more than 1,000 faculty members. The Oriental Institute and a university press are attached to the university. The university library, founded in 1892, contains more than 3.3 million volumes. [29–561–2]

CHICAGO FINANCIAL GROUP, one of the largest groups in the US financial oligarchy. It is a coalition of industrial and finance monopolies and the richest families in Chicago and the state of Illinois. A united group of influential families and the Crown-Hilton group are the most prominent members.

The group represented by the Stuart, Blair, Block, Percy, McCormick, and Swift families holds the leading position in the Chicago financial group. The assets of the corporations and credit and finance institutions it controls amounted to more than $50 billion in the mid-1970's. As a result of changes in the industrial development in the US Midwest after World War II, the industrial base of the group expanded (previously it had been connected mainly with the development of the food-processing industry and of trade). The group seized control over the retail concern Montgomery Ward and several railroad companies and filled important positions in Standard Oil of Indiana, pushing out the Rockefellers. The group has a ramified network of credit and finance institutions with more than $20 billion in assets. The institutions are mainly banks that finance industry, transportation, and trade in Illinois and adjoining regions. In the mid-1970's the city of Chicago became the third financial center of the country, after New York City and Boston.

The assets controlled by the Crown-Hilton group amounted to more than $2 billion in the mid-1970's. Before World War II the nucleus of the group consisted of the Crown family and the First National Bank of Chicago. During the war the two merged their interests with the Hilton family, owners of hotels and other real estate. After the war the Crowns established control over the war-industry concern General Dynamics Corporation.

The Chicago financial group has vast financial and economic interests outside the USA, with numerous divisions and branches abroad.

CHICAGO SCHOOL, in bourgeois political economy, a school of economic theory founded on liberalism. The ideological and theoretical views of the Chicago school began to take shape in the 1930's and reached their final form as a fully elaborated doctrine in the 1960's and 1970's. The school's principal representatives are American scholars and economists associated, for the most part, with the University of Chicago and include F. Knight, H. Simons, L. Mints, M. Friedman, J. Viner, P. Cagan, D. Meiselman, R. Selden, and A. Schwartz. The theories and practical recommendations of the Chicago school are reflected most fully in the works of Knight and, especially, Friedman.

Adherents of the Chicago school, who belong to the neoclassical school of contemporary bourgeois political economy, take an anti-Keynesian position on such issues as the forms and methods of government regulation of the capitalist economy, monetary theory, demand, pricing, economic cycles, and employment. The school's methodology is based on the principles of marginalism, on the subjective and psychological marginal utility theory, and on the apologetic concept of the marginal productivity of factors of production (*see* PRODUCTIVITY, THEORIES OF).

Economists of the Chicago school, who reject the view of J. M. Keynes that a capitalist economy cannot ensure normal expanded reproduction without the intervention of the bourgeois state, argue that the state has a destabilizing influence on the development of a capitalist economy. Idealizing the natural mechanisms of the market, they maintain that effective management and economic efficiency can be achieved only under a system of private ownership and free enterprise.

The Chicago school uses its defense of the mechanisms of the marketplace and free competition to sharply attack the working class, whose demands for higher wages are regarded as a constraint on the free play of market forces. The school's theorists do not consider unemployment a major socioeconomic problem of modern capitalism, whose ills, they believe, must be ameliorated through the "automatic" mechanisms of the market and through free competition.

Economists of the Chicago school oppose restrictions on the economic expansion of monopolies and have spoken out against the progressive income tax, taxes on corporations and savings, and government price controls. The Chicago school, which expresses the ideology and interests of the most conservative circles of the monopolistic and middle bourgeoisie, is one of the most ardent defenders of private ownership as the basis of a capitalist society.

For the Chicago school, monetary theory constitutes the central problem in economics. In the 1950's, Friedman and his supporters began working on a modern variant of the quantity theory of money, a variant that has come to be known as monetarism. According to monetarist theory, money plays a key role in the economic development of capitalist society, and quantitative changes in the money supply generate changes in other economic areas. Like such bourgeois economists as K. Wicksell and I. Fisher, then, the adherents of the Chicago school take a monetary approach to the analysis of economic crises. They reject the notion that such crises are regularly recurring phenomena inherent in capitalism, maintaining that the cyclical development of a capitalist economy results from disruptions in the

money supply. According to Friedman, the destructive economic crises of 1929–33 could have been ended in the USA by 1931 if the Federal Reserve System had not resorted to a reduction in the money supply.

An important place in monetarist theory belongs to the notion of a regular income, which presupposes the existence of a constant component of consumer expenditure. A central element in monetarist doctrine is the money demand function, which underlies the conclusion that there is a proportional relation between growth in the money supply and a change in price level. The monetarists believe that inflation occurs when deficit financing based on Keynesian methods of regulating the economy results in an excessive money supply. The monetarists criticize such methods, believing that only the growth of the money supply requires regulation. Friedman asserts that a regular, steady increase in the money supply of 3–5 percent annually will ensure the smooth functioning of a capitalist economy. The implementation of the recommendations of the Chicago school cannot, however, eliminate the cyclical nature of the development of a capitalist economy. Economic cycles stem from the basic contradiction of capitalism—the contradiction between the social nature of production and the private, capitalist form of appropriation.

CHICAGO TRIBUNE, a daily newspaper in the USA. The Chicago *Tribune*, founded in 1847, is published in Chicago by the Tribune Company. It is closely connected with influential monopolistic groups of the Midwest. Circulation, more than 750,000; Sunday edition, 1.1 million (1977). [29–555–1]

CHICHAGOV, PAVEL VASIL'EVICH. Born June 27 (July 8), 1767, in St. Petersburg; died Aug. 20 (Sept. 1), 1849, in Paris. Russian military figure; admiral (1807). Son of V. Ia. Chichagov.

Chichagov joined the navy in 1782 and served as his father's adjutant; he commanded a ship of the line in the Russo-Swedish War of 1788–90. He studied in England in 1791 and 1792 and retired in 1797.

In 1799, Chichagov commanded a landing expedition to Holland. He joined Alexander I's retinue in 1801 and became a deputy minister of the navy in 1802. He served as minister of the navy from December 1802 to 1809 (although he officially held the post until 1811) and introduced a series of measures to improve the fleet. From 1805 to 1809 and again from 1811 to 1834 he was a member of the State Council. In April 1812, Chichagov was named commander in chief of the Army of the Danube, chief of the Black Sea Fleet, and governor general of Moldavia and Walachia.

During the Patriotic War of 1812, the Army of the Danube and the Third Army were united in September 1812 under the general command of Chichagov, who was ordered to attack the rear of Napoleon's forces. According to the plan put forward by M. I. Kutuzov, Chichagov's army, together with a corps under P. Kh. Vitgenshtein, was to cut off Napoleon's escape routes to the west across the Berezina River. However, because of a lack of cooperation on the part of several groups of forces and mistakes by Chichagov and Vitgenshtein, the plan was not carried out. Russian public opinion laid the entire blame for the failure on Chichagov. In late 1812 and early 1813, Chichagov, commanding the Third Army, directed the pursuit of the enemy. In February 1813 he was forced to retire. Insulted at being suspected of treason, Chichagov emigrated in 1814 to live in Italy and France. His memoirs were published in the historical journals *Russkii arkhiv* (Russian Archive; 1869–70) and *Russkaia starina* (Russian Antiquity; 1883, 1886–88, vols. 38, 50–52, 55, 58–60).

CHICHAGOV, VASILII IAKOVLEVICH. Born Feb. 28 (Mar. 11), 1726; died Apr. 4 (16), 1809, in St. Petersburg. Russian navigator; admiral (1782).

Chichagov studied at a school for navigation and continued his education in England. He joined the Russian Navy in 1742. In 1764 he was appointed leader of an expedition to find a sea route from Arkhangel'sk to North America via the Arctic Ocean; the expedition was then to proceed west across the Bering Strait to Kamchatka and join up with P. K. Krenitsyn's detachment. In 1765 the expedition reached 80°26′ N lat., northwest of Spitsbergen, but it was forced to return to Arkhangel'sk because of heavy ice. During a second attempt in 1766 the expedition managed to reach 80°30′ N lat. During the Russo-Turkish War of 1768–74, Chichagov commanded a detachment of the Don Military Flotilla from 1772 to 1774 and fought in the defense of the Kerch' Strait. He became a member of the Admiralty College in 1775. During the Russo-Swedish War of 1788–90 he commanded the Baltic Fleet, which fought in the battles of Oland Island, Revel' (now Talinn), and Vyborg. Chichagov retired in 1797.

Several geographical features have been named in honor of Chichagov, including islands in the Novaia Zemlia Archipelago, an island in the Alexander Archipelago off the coast of North America, a gulf and cape on the island of Nuku Hiva in southern Polynesia, a cape on the island of Kyushu, and a mountain on the island of Vestspitsbergen.

CHICHÉN ITZÁ, a political and cultural center of the Maya, located in the northern part of the Yucatán peninsula, in Mexico. Chichén Itzá was probably founded in the eighth century A.D. Captured by the Toltecs in the tenth century, it became the capital of the Toltec empire in the mid-11th century. In 1178 it was destroyed by the forces of three city-states—Mayapán, Uxmal, and Izamal. By the time of the Spanish conquest (mid-16th century), Chichén Itzá was in ruins.

Numerous excavations conducted at Chichén Itzá led to the discovery of large Maya-Toltec architectural monuments, including the Temple of Kukulcán, a pyramid with nine stages (24 m high) and a wide stairway on each of the four sides, the Temple of the Warriors, atop a low pyramid (four stages), and the Temple of the Jaguars; the last two were decorated with wall paintings. Also discovered were the Caracol observatory, seven ball courts, and the ruins of four colonnades forming a gigantic rectangle (the Thousand Columns). Stylized statues of deities, reliefs rich in floral and geometric ornamentation, small sculptures, and artistic hand-crafted works were unearthed.

CHICHERIN, BORIS NIKOLAEVICH. Born May 26 (June 7), 1828, in Tambov; died Feb. 3 (16), 1904, in the village of Karaul, Tambov Province. Russian philosopher, historian, publicist, and public figure.

Chicherin was of noble birth. He studied under T. N. Granovskii and graduated from the law faculty of the University of Moscow in 1849. In 1853 he successfully defended his master's thesis, *Regional Institutions of Russia in the 17th Century* (published 1856); he was retained at the university, where he was named professor of Russian law in 1861. In 1866 he defended his doctoral dissertation, *On Popular Representation*, which was published in book form (1866). In 1868, Chicherin was one of a group of professors who resigned in protest against violation of the university statute; he then lived in the village of Karaul, where he carried on his research work and participated in *zemstvo* activities. In 1882–83 he was mayor of Moscow; he was

forced to resign by order of the emperor Alexander III because of a speech at the coronation in which the tsar misinterpreted an allusion made by Chicherin to the demand for a constitution.

From the mid-1850's, Chicherin was a leader of the liberal Westernizers' wing of the Russian social movement. Chicherin and K. D. Kavelin's joint "Letter to the Editor" (published in *Voices From Russia*, vol. 1) was the first document to appear in print as a program of Russian liberalism. In September 1858, Chicherin traveled to London to talk with A. I. Herzen about changing the line of propaganda of the Free Russian Printing House. His attempt to persuade Herzen to make concessions to the liberals ended in complete rupture, thus initiating the separation of liberalism and democracy that marked Russian social thought in the second half of the 19th century.

Chicherin described the Peasant Reform of 1861 as "the greatest monument of Russian legislation," and he took an extremely negative view of the revolutionary democrats' activities; in the fall of 1861 he spoke out against the student movement, and he supported the government's reactionary policy on Poland and the Polish Uprising of 1863–64. The political principle formulated by Chicherin—"liberal measures and strong rule"—was supported in governmental circles. In his works he developed the idea of gradual transition, through reforms, from autocracy to constitutional monarchy, which he considered the ideal form of government for Russia.

Chicherin was the most prominent theoretician of the current known as the state school of Russian historiography; he was the originator of the theory of "enslavement and emancipation of the estates," which held that in the 16th and 17th centuries the government had created the estates and subordinated them to state interests; in the subsequent course of historical development, when the need for the "forcible lifelong service of the estates" had passed, the government supposedly began to emancipate them. This notion was the theoretical basis of the bourgeoisie's and nobility's liberalism, which was grounded in the idea of reforms "from the top."

As a philosopher, Chicherin was the most notable representative of right-wing Hegelianism in Russia. In his later years he wrote various works on the natural sciences (chemistry, zoology, and descriptive geometry). His *Memoirs* (parts 1–4, Moscow, 1929–34) are a valuable source of historical information on social life and social movement in the second half of the 19th century.

CHICHERIN, GEORGII VASIL'EVICH. Born Nov. 12 (24), 1872, in the village of Karaul, in Kirsanov District, Tambov Province; died July 7, 1936, in Moscow. Soviet state figure and diplomat. Joined the revolutionary movement in 1904. Member of the Communist Party from 1918. Nephew of B. N. Chicherin.

Of noble birth, G. V. Chicherin graduated from the faculty of history and philology at the University of St. Petersburg in 1896 and took up a position in the Ministry of Foreign Affairs in 1897. In 1904 he emigrated to Germany, where the following year he joined the RSDLP. After the Fourth Congress of the RSDLP in 1906 he joined the Mensheviks. In 1908 he began working with the French Socialist Party.

During World War I, Chicherin was an internationalist. In 1917 he was arrested in Great Britain as the secretary of a "delegate commission" dealing with the return of political exiles to Russia; the Soviet government obtained his release from prison. In 1918, on returning to Soviet Russia, he was appointed deputy people's commissar for foreign affairs.

On Mar. 3, 1918, as part of the Soviet delegation, Chicherin signed the Brest-Litovsk Treaty of 1918 with Germany. He became acting people's commissar for foreign affairs of the RSFSR on March 13, people's commissar for foreign affairs on May 30, and people's commissar for foreign affairs of the USSR in 1923, a post he held until 1930. In 1921 he signed Soviet-Iranian, Soviet-Afghan, and Soviet-Turkish treaties of friendship, the first treaties, signed on an equitable basis, between the countries of the East and Soviet Russia.

Chicherin led the Soviet delegation at the Genoa Conference of 1922 and the Lausanne Conference of 1922–23; he signed the Treaty of Rapallo with Germany in 1922 and treaties of neutrality with Turkey in 1925 and Iran in 1927. At the Fourteenth and Fifteenth Congresses of the ACP(B) he was elected a member of the Central Committee. Chicherin was a member of the All-Russian Central Executive Committee and the Central Executive Committee of the USSR. He became a personal pensioner in 1930.

Chicherin made an important contribution to the protection of Soviet interests, and his work was highly regarded by V. I. Lenin (see *Poln. sobr. soch.*, 5th ed., vol. 50, p. 111). Chicherin was the author of numerous works on a variety of subjects, including international relations, culture, and the history of the revolutionary movement.

CHICHEROV, VLADIMIR IVANOVICH. Born May 29 (June 11), 1907, in Viazniki, in what is now Vladimir Oblast; died May 11, 1957, in Moscow. Soviet folklorist.

Chicherov graduated from Moscow State University in 1928 and became a professor there in 1953. His doctoral dissertation, *The Winter Period of the Russian Agricultural Calendar in the 16th to 19th Centuries* (1948; published 1957), was devoted to poetry connected with calendar rituals.

Chicherov's book *Questions of the Theory and History of Folk Works* (1959) dealt with historical songs. He also wrote on the theory of folklore, Russian epic poetry, and the various schools of *skaziteli* (singers of epic folk songs or historical songs) of the Russian north. His ideas about folklore reflected a Marxist conception of the role of the people in history and culture. Chicherov wrote the textbook *Russian Folk Works* (1959; German translation, 1968).

CHICHIBABIN, ALEKSEI EVGEN'EVICH. Born Mar. 17 (29), 1871, in Kuzemin, in what is now Poltava Oblast; died Aug. 15, 1945, in Paris. Russian organic chemist. Academician of the Academy of Sciences of the USSR (1928; corresponding member, 1926).

Chichibabin graduated from Moscow University in 1892. In 1909 he became a professor at the Moscow Higher Technical School. From 1930 to the end of his life he worked in France.

Chichibabin's main works are devoted to the chemistry of nitrogen-containing heterocyclic compounds, primarily pyridine. He developed a method of obtaining pyridine derivatives by the condensation of aldehydes and ketones with ammonia. He was the first to produce α-aminopyridine, by the action of sodium amide on pyridine (Chichibabin reaction). He investigated its properties and studied the tautomerism of aminopyridine and hydroxypyridine. He also determined the structure of many alka-

loids and other plant substances, such as pilocarpine, santonine, and bergenin, and synthesized them. Chichibabin is also known for his work on free aromatic radicals and his method of synthesizing aldehydes by means of organomagnesium compounds.

Chichibabin contributed a great deal to the creation of the Soviet chemical-pharmaceutical industry. He was the author of the textbook *Basic Principles of Organic Chemistry* (1925; 7th ed., vol. 1, 1963). Chichibabin was awarded the V. I. Lenin Prize (1926).

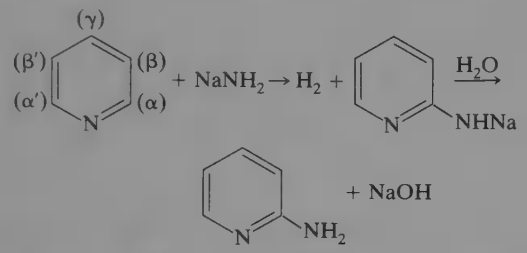
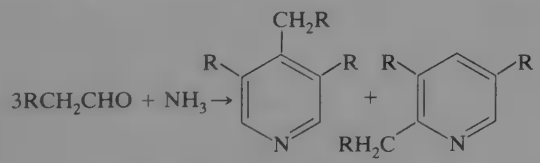
CHICHIBABIN REACTION, the interaction of nitrogen-containing heterocyclic compounds, mainly pyridine, quinoline, and isoquinoline, with sodium amide, $NaNH_2$, that leads to the formation of α-amino derivatives. For example, α-aminopyridine is obtained from pyridine:



The Chichibabin reaction (or Chichibabin amination reaction) is usually carried out at boiling temperatures in an aromatic hydrocarbon or in dialkyl aniline or at room temperature in liquid ammonia. If there is an excess of $NaNH_2$, the principal product is α,α′-diaminopyridine. If both α-positions are occupied in the ring, the amino group attacks the γ-position. The reaction, used in preparative organic chemistry, was discovered by A. E. Chichibabin in 1914.

Also known as the Chichibabin reaction is the condensation of aldehydes or ketones with ammonia, leading to the formation of substituted pyridines, for example,



This reaction (also called Chichibabin pyridine synthesis) is carried out in the gaseous phase at temperatures of 300°–350°C with various catalysts of the Al_2O_3 type or in an autoclave at temperatures of 200°–250°C in the presence of concentrated aqueous ammonia. The reaction was carefully investigated by A. E. Chichibabin beginning in 1905; isolated syntheses were carried out by A. Baeyer in 1870 and P. Waage in 1882. [29–666–3]

CHICHIKLEIA, a river in Odessa and Nikolaev oblasts, Ukrainian SSR; a right tributary of the Iuzhnyi Bug. The Chichikleia is 156 km long and drains an area of 2,120 sq km. It is fed by snow. High water occurs between late February and early April. The mean flow rate 46 km from the mouth is 1.9 cu m per sec, and the maximum flow rate is 318 cu m per sec. The Chichikleia dries up for seven or eight months a year. There is ice on the Chichikleia from November through February. [29–667–1]

CHICHINADZE, KONSTANTIN ARCHILOVICH. Born May 6 (18), 1891, in the village of Khimshi, in what is now Ambrolauri Raion, Georgian SSR; died June 21, 1960, in Tbilisi. Soviet Georgian poet and translator.

Chichinadze was educated at the University of Tiflis. His poetry was first published in 1908. He translated *The Tale of Igor's Campaign, David of Sasun, Das Nibelungenlied*, Dante's *The Divine Comedy*, and works by 19th-century Russian and Western European poets. Chichinadze's research on Rustaveli is well known; in 1934 he published a critical edition of Rustaveli's narrative poem *The Man in the Panther's Skin.*

CHICHKAIUL (also Chichke-Iul), a river in Tomsk Oblast, RSFSR; a right tributary of the Chulym River in the basin of the Ob'. The Chichkaiul is 450 km long and drains an area of 6,150 sq km. It flows across the Chulym Plain. It is fed by mixed sources, predominantly by snow. The mean flow rate is 28.2 cu m per sec. The river freezes over in late October or November, and the ice breaks up in April or early May. The Chichkaiul is navigable 192 km from the mouth. [29–667–3]

CHICLAYO, a city in northeastern Peru; the capital of Lambayeque Department. Located on the Pan-American Highway. Population, 189,700 (1972).

Chiclayo is connected by railroad with the ports of Pimentel and Puerto Eten. The city's food-processing industries manufacture dry and condensed milk, sugar, and processed rice. The city also has leather and textile industries and enterprises for the production of building materials. It is the center of an agricultural region that produces rice and sugarcane. A university is located in Chiclayo. [29–561–5]

CHICOPEE, a city in the USA, in Massachusetts; situated on the Connecticut River. Population, 63,000 (1975). Chicopee is a northern suburb of Springfield. Industry includes machine building and the manufacture of rubber products and chemicals. [29–565–1]

CHICOUTIMI AND JONQUIÈRE, two cities in eastern Canada, in Quebec. Combined population, 136,000 (1973, including suburbs). Chicoutimi is situated on the Saguenay River. The two cities constitute a major center of the chemical, pulp and paper, and metallurgical industries. Chicoutimi has a ferroalloy foundry. [29–1184–2]

CHIGANAK, an urban-type settlement in Moiynkumskii Raion, Dzhambul Oblast, Kazakh SSR. Chiganak is situated on the southwestern shore of Lake Balkhash. The settlement has a railroad station on the Mointy-Chu line. [29–547–3]

CHIGIRIN, a city and administrative center of Chigirin Raion, Cherkassy Oblast, Ukrainian SSR. Chigirin is situated on the Tiasmin River, a tributary of the Dnieper, 36 km from the railroad station of Fundukleevka on the Znamenka–Imeni Tarasa Shevchenko line, and 63 km southeast of Cherkass. It has enterprises for the production of leather clothing accessories, furs, furniture, accessories, bricks, and foodstuffs. The city has a museum of local lore.

Chigirin has been known since the first half of the 16th century, when it was a fortified cossack wintering site. From 1648 to 1657 it was the seat of the Ukrainian hetman B. Khmel'nitskii. Chigirin was destroyed by Turkish and Tatar invaders during the Chigirin Campaigns of 1677–78. In 1795 it became a district capital in Voznesensk Province, and in 1797, a district capital in Kiev Province. In 1876–77 Chigirin District was the scene of an attempted peasant uprising under the leadership of the Narodniki (Populists). [29–547–4]

CHIGIRIN CAMPAIGNS OF 1677–78, campaigns of the Russian Army and Ukrainian cossacks during the concluding period of the Russo-Turkish War of 1676–81, when Turkish troops undertook two sieges of the city of Chigirin, the most important political and strategic center of the southern Ukraine.

In the first Chigirin campaign, the Turkish Army, commanded by Ibrahim Paşa, advanced from the Danube in late June 1677 and on August 3 laid siege to Chigirin, where it was joined by more than 40,000 Crimean Tatars. The city garrison withstood a number of attacks and undertook several sorties. The joint Russian-Ukrainian forces, led by Prince G. G. Romodanovskii and the hetman I. Samoilovich, crossed to the right bank of the Dnieper on the night of August 26 and crushed the Turkish Army in a decisive battle.

In the second campaign, the Turkish Army, led by the vizier Kara Mustafa, approached Chigirin on July 9, 1678, and began constructing siege works. The Russian Army, having crossed the Dnieper, won a major battle on July 12. In bitter fighting from August 1 to August 3, the Russian Army repulsed the Turkish Army beyond the Tisman River. However, because Romodanovskii missed the opportunity of completely surrounding the Turkish troops, the Turks seized Nizhnii Gorod, and on the night of August 11, the Russian garrison abandoned the fortress. A new battle on August 19 ended in a Russian victory. On August 20, the Turkish troops began retreating. The reverses suffered by the Turks near Chigirin presaged the failure of the aggressive plans of the Ottoman Empire with respect to the Ukraine.

CHIGIRIN CONSPIRACY OF 1877 (also Chigirin affair), an unsuccessful attempt by a group of revolutionary Narodniki (Populists) to raise a peasant rebellion in Chigirin District of Kiev Province.

In 1875 disturbances broke out among the state peasants in Chigirin District; ten *volosts* (small rural districts), with a total population of more than 50,000, were affected. Members of the Southern Rebels circle sought to use the disturbances as the basis for a local rebellion that would spread to neighboring districts. The organizers of the Chigirin conspiracy were Ia. V. Stefanovich, L. G. Deutsch, I. V. Bokhanovskii, and S. F. Chubarov.

In the winter of 1876, Stefanovich made contact with the peasants of Chigirin District by posing as Dmitrii Naida, a messenger sent by peasants of Kherson Province to the tsar. At the end of that year Stefanovich presented the Chigirin peasants with what he claimed were a secret *gramota* (document) from the tsar, a charter for a peasant organization called the Secret Druzhina, and the text of a solemn oath. The peasants were told that all the documents had the tsar's approval; in actuality the documents had been written by Stefanovich and his comrades and printed by Bokhanovskii.

In the forged *gramota*, the tsar acknowledged his inability to help the peasants in their struggle against the *pomeshchiki* (landowners) and directed them to form secret organizations with the purpose of rebelling against the *dvoriane* (nobles) and government officials and seizing the land.

In February 1877 at secret meetings in the village of Shabel'niki, the solemn oath was taken by peasants joining the Secret Druzhina; they agreed to not pay taxes and to fight for the redistribution of land on a per capita basis. By mid-1877 approximately 2,000 peasants had joined the Secret Druzhina. E. A. Oleinik, a retired noncommissioned officer, served as the organization's ataman; he was subordinate to Naida (Stefanovich), who claimed to have been appointed "commissar" by the tsar. The uprising was planned for Oct. 1, 1877. The authorities learned of the conspiracy, however, before the rebellion could take place.

The ensuing investigation involved approximately 1,000 peasants. The Kiev Sudebnaia Palata (high court tribunal) tried 44 of the peasants in June 1879. In 1880 the Senate reviewed the case and lengthened the term of confinement for most of the convicted peasants. Stefanovich, Deutsch, and Bokhanovskii faced death sentences, but in May 1878, before their trial, they escaped from Kiev Prison with the help of M. F. Frolenko and V. A. Osinskii.

The Secret Druzhina was the only mass peasant organization to arise from the Populist movement, but the unscrupulous nature of the means employed to organize the Secret Druzhina greatly diminished its significance. The abuse of the peasantry's illusions about the tsar was condemned in revolutionary circles as alien to the Populist program. By having to invoke the tsar's authority to induce the peasants to rebel, the Southern Rebels proved the falsity of their theories about the revolutionary character of the peasantry.

CHIGORIN, MIKHAIL IVANOVICH (also spelled Tchigorin). Born Oct. 31 (Nov. 12), 1850, in Gatchina; died Jan. 12 (25), 1908, in Lublin, now in Poland. Russian chess player and organizer of the chess movement in Russia.

Chigorin, the son of a master worker at the Okhta Gunpowder Mill, studied at the Gatchina Orphans' Institute. In the 1880's and 1890's he was universally recognized as the chief contender for the chess championship of the world, but in 1889 and 1892 he was defeated by the world champion, W. Steinitz. From 1899 to 1903 he won the first three all-Russian chess tournaments. Victorious in international tournaments in New York (1889), Budapest (1896), and Vienna (1903), Chigorin ranked second in Hastings in 1895, ahead of the world champion E. Lasker. He won a number of two-game telegraph matches: St. Petersburg–London (1886–87) and one with Steinitz (1890–91). He also won a match with Lasker in 1903.

Chigorin pioneered the formation of chess organizations in many cities in Russia. He edited and published the St. Petersburg journals *Shakhmatnyi listok* (1876–81), *Shakhmatnyi vestnik* (1885–87), and *Shakhmaty* (1891–92) and wrote chess columns for the weekly *Vsemirnaia illiustratsiia* (1881–90) and the newspaper *Novoe vremia* (1890–1907). He was the author of many theoretical works on openings and endgames.

In 1909, an international tournament was held in memory of Chigorin in St. Petersburg, and tournaments were held in his memory in the USSR between 1947 and 1980.

CHIGRINOV, IVAN GAVRILOVICH. Born Dec. 21, 1934, in the village of Velikii Bor, Kostiukovichi Raion, Mogilev Oblast. Soviet Byelorussian writer. Member of the CPSU since 1973.

Chigrinov graduated from the philology department of Byelorussian University in 1957. He was first published in 1961. He is the author of the short story collections *The Birds Fly to Freedom* (1965), *The Happiest Man* (1967), and *A Man Went to War* (1973), which deal with the life and labor of Soviet people and with the heroism of the past war and its consequences. His pair of novels *The Quail's Cry* (1972) and *Blood Acquittal* (1977) depict the dramatic nature of events and the fates of individuals at the beginning of the Great Patriotic War of 1941–45. Chigrinov is a coauthor of a television screenplay about the Minsk party underground entitled *The Ruins Are Firing* (1973; State Prize of the Byelorussian SSR, 1974).

CHIHLI CLIQUE, a group of the Peiyang Militarists in China that was formed after the death of Yüan Shih-k'ai in 1916. The clique took its name from Chihli Province, the home of several of the group's leaders, including Wu P'ei-fu and Ts'ao K'un. Its main territorial base comprised Chihli, Honan, Hupei, and Hunan. The clique, which received financial support from British and American imperialists, controlled the government in Peking from 1920 to 1924; in 1920 and 1921 it shared control with the Fengtien clique. After the National Revolutionary Army defeated Wu P'ei-fu during the Northern Campaign of 1926–27, the Chihli clique vanished from the political scene. [29–536–1]

CHIHUAHUA, a state in northern Mexico. Area, 247,000 sq km. Population, 2 million (1976). The capital is the city of Chihuahua. The eastern part of the state is a semidesert upland plain with elevations of mainly 1,000–2,000 m. The Sierra Madre Occidental, which reach an elevation of 2,591 m, occupy the western part. Cattle raising is extensive, and irrigated land is cultivated, mainly for cotton. The mining of complex ores and nonferrous metallurgy are centered in and around Chihuahua, Hidalgo del Parral, and San Francisco del Oro. Timber is procured in the Sierra Madre Occidental. [29–660–4]

CHIHUAHUA, a city in northern Mexico; capital of Chihuahua State. A major industrial, transportation, and commercial center of northern Mexico. Population, 364,000 (1975). Chihuahua is a railroad and highway junction. The city's main industry is nonferrous metallurgy, that is, the smelting of lead and other nonferrous metals. Chihuahua also has light industry, as well as food processing, chemical production, and metalworking. [29–660–5]

CHIHUAHUA, a breed of pet dog developed in the state of Chihuahua, Mexico. The Chihuahua is a small dog, standing 17–22 cm high. It is a delicate breed, with a long body, a rounded head, a small pointed muzzle, slightly bulging eyes, and large erect or pendant ears. The breed has two varieties: the long-coated, which has a long wavy coat with fringed ears, a ruff, and feathering on the legs, and the smooth-coated, which has a short, thick, shiny coat. Coat colors include brown, white, cream, black, and various shades of red. The Chihuahua is common throughout the world. [29–662–1]

CHIILI, an urban-type settlement and administrative center of Chiili Raion, Kzyl-Orda Oblast, Kazakh SSR. Chiili is a railroad station on the Kzyl-Orda–Arys' line, 128 km southeast of Kzyl-Orda. The settlement has a butter factory and enterprises serving railroad transportation. An experimental forestry station of the Kazakh Scientific Research Institute of Forestry and Land and Forest Reclamation is located in Chiili. [29–553–1]

CHII-SAN, a mountain massif in Korea constituting the southern end of the Sobaek Range. Chii-san measures approximately 50 km in length and rises to a maximum elevation of 1,915 m at the mountain Chii-san, the highest peak on the Korean peninsula. The slopes have deciduous (oak, ash) and mixed forests to an elevation of 1,400 m and coniferous forests (spruce, pine) at higher elevations. [29–616–2]

CHIK, an urban-type settlement in Kochenev Raion, Novosibirsk Oblast, RSFSR. Chik is situated on the Chik River (Ob' basin). It has a railroad station on the Barabinsk-Novosibirsk line, 30 km west of Novosibirsk. [29–553–3]

CHIKA (real name Ivan Nikiforovich Zarubin). Born 1736; died Jan. 24 (Feb. 4), 1775, in Ufa. Iaik cossack; associate of E. I. Pugachev.

Chika took part in the Iaik cossack uprising of 1772. During the Peasant War of 1773–75 under the leadership of E. I. Pugachev, Chika led the insurgent movement in the Central Urals, Bashkiria, and the Ural Region. A detachment led by Chika and A. A. Ovchinnikov routed the forces of General V. A. Kar on Nov. 7–9, 1773, and besieged Ufa in late 1773. After stubborn fighting against punitive troops, Chika's main forces were defeated near Ufa on Mar. 24, 1774, by a detachment under the command of Lieutenant Colonel I. I. Mikhel'son. On March 26, Chika was captured in Tabynsk as a result of treachery; during his interrogation he manifested unusual courage and steadfastness. Chika was executed in Ufa.

CHIKHACHEV, PETR ALEKSANDROVICH. Born Aug. 16 (28), 1808, in Gatchina; died Oct. 1 (13), 1890, in Florence. Russian geographer and geologist. Honorary member of the Imperial St. Petersburg Academy of Sciences (1876) and of the Russian Geographical Society (1890).

Chikhachev spent most of his life outside Russia, mainly in Paris and Florence. As a result of his travels through Italy and southern France between 1839 and 1841, he compiled a geological map of the Italian Peninsula. In 1842 he journeyed through the Altai and Northwest China; in 1845 he used the information gathered during his travels to compile a geographic and geological description of the Altai, Northwest China, and the Kuznetsk Coal Basin. From 1847 to 1863, he undertook a number of expeditions through Asia Minor. In 1877 and 1878, he traveled through Spain, Algeria, and Tunisia.

Chikhachev's main works dealt with the geology and geography of Asia Minor, the Altai, Italy, southern France, Spain, Algeria, and Tunisia. Chikhachev wrote several works devoted to the political life and economy of the Ottoman Empire and to the policies of the European powers regarding the Eastern Question.

A range in the Altai is named after Chikhachev.

CHIKHACHEV BAY (until 1952, De-Kastri Gulf), an inlet of the Sea of Japan off the western coast of the Tatar Strait. Chikhachev Bay measures approximately 12.5 km in length and width at the entrance. It has depths to 9 m. The bay is covered with ice in winter; in summer the water temperature at the surface reaches 14°C. Tides are semidiurnal, with an approximate range of 1 m. The port of De-Kastri is situated on the bay. [29–661–4]

CHIKHACHEV RANGE, a mountain range in the southeastern Altai, in Altai Krai, Tuva ASSR, and also along the USSR-Mongolia border. The Chikhachev Range measures approximately 100 km in length and has elevations to 4,029 m. It is composed of sandstones, limestones, schists, and quartzites and has small glaciers. Grass and wormwood steppes and rocky tundras are found on the slopes. The range was named in honor of P. A. Chikhachev. [29–661–5]

CHIKOBAVA, ARNOL'D STEPANOVICH. Born Mar. 14 (26), 1898, in the village of Sachikobao, in what is now Tskhakaia

Raion. Soviet linguist. Academician of the Academy of Sciences of the Georgian SSR (1941).

Chikobava graduated in 1922 from the University of Tiflis, where he became a professor in 1933. His major works are devoted to general linguistics, the history and structure of the Caucasian languages, and ergative sentence construction. He compiled the *Chan-Mingrelian-Georgian Dictionary* (1938) and edited the *Defining Dictionary of the Georgian Language* (vols. 1–8, 1950–64) and numerous publications devoted to Caucasian studies. Chikobava has been awarded three Orders of Lenin and two other orders.

CHIKOI, an urban-type settlement in Kiakhta Raion, Buriat ASSR. Chikoi is a landing on the left bank of the Chikoi River, 80 km southeast of the Naushki railroad station. It has a tannery. [29–564–2]

CHIKOI, a river in Chita Oblast, RSFSR, in the Buriat ASSR, and partially along the border of the Mongolian People's Republic; a right tributary of the Selenga River. The Chikoi is 769 km long and drains an area of 46,200 sq km. It rises on the eastern slope of the Chikokonskii Range and flows westward along the southern slope of the Malkhanskii Range; it divides into branches in the lower course. It is fed primarily by rain; freshets occur in summer and fall. The mean flow rate is 265 cu m per sec. The Chikoi freezes over in late October or November, freezing through in the shallows in the upper course; the ice breaks up in April or early May. The largest tributary on the left is the Menza. The Chikoi is used for irrigation. The health resort of Iamarovka is located in the Chikoi valley. [29–564–1]

CHIKOIDZE, MIKHAIL NIKOLAEVICH. Born 1853, in the village of Patara-Medzhruskhe, Tiflis Province; died Nov. 24 (Dec. 6), 1897, in Kurgan. Narodnik (Populist) revolutionary.

The son of a nobleman, Chikoidze entered the Mikhail Artillery School in 1872, but he fell ill and was unable to complete the course of study. In 1874 he went abroad. In Switzerland he joined the Georgian student organization known as the Kavkaztsy, one of whose founders was I. S. Dzhabadari.

In December 1874, Chikoidze returned to Russia, where he helped draft the charter of the All-Russian Social Revolutionary Organization. Arrested in Moscow on Apr. 4, 1875, he was a defendant in the Trial of the 50. He was exiled to Kirensk, in Irkutsk Province. In May 1881, Chikoidze escaped from his place of exile and joined the People's Will. He was arrested again in 1882, however, and was sentenced in December 1883 to three years at hard labor for having escaped from Kirensk. He served the sentence in the Kara Penal Colony. From 1885, Chikoidze was required to live in a remote area of the country.

CHIKOLEV, VLADIMIR NIKOLAEVICH. Born July 23 (Aug. 4), 1845, in the village of Peski, Gzhatsk District, in what is now Smolensk Oblast; died Feb. 22 (Mar. 5), 1898, in St. Petersburg. Russian scientist, specialist in electrical engineering.

After graduating from Moscow University in 1867, Chikolev joined the staff of the Petrovskoe Farming and Forestry Academy (now called the K. A. Timiriazev Moscow Agricultural Academy). In 1870 he joined the faculty of the Moscow Technical School (now known as the Moscow Higher Technical School). He helped organize the Moscow Industrial Exhibition in 1872 and helped found the Polytechnical Museum. In 1876 he moved to St. Petersburg and joined the staff of the Main Artillery Directorate.

Chikolev was a founder of the electrical engineering section of the Russian Technical Society and became the first editor of the journal *Elektrichestvo* (Electricity). His main works dealt with illuminating engineering.

In 1869, Chikolev proposed for the first time that the principle of differential control be used in arc lamps. Subsequently, he developed a number of designs for differential regulators. The first industrial model of an arc lamp with a regulating mechanism powered by an electric motor appeared in 1877.

In 1876, Chikolev initiated a series of original studies in projector illumination. Between 1892 and 1895, the results of the studies were summarized in *The Illuminance of Electric Light Projectors*, which was written by Chikolev, V. A. Tiurin, and R. E. Klasson. Chikolev's original technique for plotting the luminous-intensity curve of a projector was first presented in the book. His technique was used to develop a theory of projector-beam analysis. Chikolev proposed a system for the "optical breakup of light" by means of tubular and plane mirrors.

In 1895 and 1896, Chikolev designed the lighting of the Liteinyi Bridge in St. Petersburg and, together with Klasson, modernized the lighting of the Okhta powder mill. Chikolev was one of the first to use electrical illumination for military purposes.

CHIKOVANI, GRIGOL SAMSONOVICH. Born Mar. 2 (15), 1910, in the village of Khobi, in what is now Khobi Raion, Georgian SSR. Soviet Georgian writer.

The son of a civil servant, Chikovani graduated from the department of law at the University of Tbilisi in 1936 and from the screenwriting department of the Moscow Institute of Cinematography in 1939. He was first published in 1932. During the Great Patriotic War of 1941–45, Chikovani wrote stories about the exploits of Soviet servicemen and workers. His most important postwar works are contained in the cycle *Odishi Stories*, in which critical social conflicts unfold against a background of the colorful Western Georgian landscape and sketches of peasant life. Chikovani proves himself a master of social satire in such works as the short story "Staircase." In his historical novel about revolution entitled *February Is Here* (1971; Russian translation, 1973), he describes the revolutionary struggle of Georgian workers under the leadership of the Bolsheviks. The novel is noteworthy for the profound historical knowledge it displays of the period. Chikovani has also written plays and screenplays.

CHIKOVANI, MIKHAIL IASONOVICH. Born Mar. 25 (Apr. 7), 1909, in the village of Lechkhumi. Soviet Georgian folklorist and literary scholar. Doctor of philology (1945); Honored Scientist (1961).

Chikovani graduated from the University of Tiflis in 1932. In 1947 he published *Amirani Bound*, a study of the Georgian heroic epic *Amiraniani*. He has dealt with theoretical problems of folk poetry. In 1971 he published *Problems in Greek and Georgian Mythology*. Chikovani has also written textbooks for higher educational institutions.

CHIKOVANI, SIMON IVANOVICH. Born Dec. 27, 1902 (Jan. 9, 1903), in the village of Naesakovo, in what is now Gegechkori Raion, Georgian SSR; died Apr. 24, 1966, in Tbilisi. Soviet Georgian poet. Member of the CPSU from 1941.

The descendant of a noble family, Chikovani was a student in the department of philology of the University of Tiflis. He was first published in 1924. After a period of experimentation, Chikovani turned to vivid and expressive forms of realistic writing in the 1930's. He became recognized as a master of gracefully constructed and picturesque images in such works as his cycles and verse collections *The Gates of Nature, Let Me Pass, Mountain*, and *Colchis Evenings* (1933.)

Chikovani's collection *Victory* (1942) comprises his poems from the war years. His lyrical epic poem *Song About David Guramishvili* (1942–46; State Prize of the USSR, 1947) is devoted to the age-old ties and historical sources of friendship and brotherhood between the Georgian, Russian, and Ukrainian peoples. In such works as the cycle *Giandzha Notebook*, which deals with the fate of N. Baratashvili, and the cycle *Autumn in Adzharia*, the poet expressed his philosophical and social optimism and his love of life in psychologically profound meditations and controlled yet passionately lyrical dramatic monologues. Chikovani also wrote critical works dealing with Georgian, Russian, Ukrainian, and Armenian literatures.

Chikovani was head of the Writers' Union of Georgia from 1944 to 1951, and he was a deputy to the third convocation of the Supreme Soviet of the USSR. Chikovani was awarded the Order of Lenin and three other orders as well as various medals.

CHILD, CHARLES MANNING. Born Feb. 2, 1869, in Ypsilanti, Mich., died Dec. 19, 1954, in Palo Alto, Calif. American biologist.

Child graduated from Wesleyan University (Connecticut) in 1890. He worked at the University of Chicago from 1895 to 1934, receiving a professorship there in 1916. He became a professor at Stanford University (California) in 1937.

Child's work was primarily in cytology and embryology. His physiological gradient theory attempted to explain the process of embryonic development in vertebrates and the phenomena of differentiation and integration in developing multicellular animals. The theory maintains that the different parts of an elongated body (for example, that of flatworms) vary in metabolic rate and sensitivity to injurious agents, for example, oxygen insufficiency and poisons. As a result, physiological properties

gradually weaken or intensify from one end of the body to another or from an end of the body to the center. Child's theory accounts for objective phenomena but does not explain the individual development of the organism as a whole.

CHILDE, VERE GORDON. Born Apr. 14, 1892, in Sydney, Australia; died Oct. 19, 1957. British archaeologist. Fellow of the British Academy (from 1940). Director of the Institute of Archaeology of the University of London (1946–56).

Childe conducted excavations in Scotland and Northern Ireland and on the Orkney Islands, at Skara Brae. His main works dealt with the prehistory of Europe and the East, in which, guided by the works of Soviet researchers, he proposed a materialistic basis for historical processes. He opposed the theory of migrationism, which explains changes in culture through migrations of peoples, advancing instead the theory of the independence of cultural development. Childe studied the origin and development of farming—the Neolithic revolution, the transition from the hunting and gathering economy of the Paleolithic to the producing economy of the Neolithic. Although he regarded the evolution of the economy as the primary factor in social progress, he reduced the problem of the rise of a state system to a question of the origin of cities (the urban revolution), not devoting proper attention to social relations.

Childe was accidentally killed in the mountains near Sydney.

General information

A state in the southwestern part of South America, Chile is bounded by Peru on the north, by Argentina and Bolivia on the east, and by the Pacific on the west. Its territory includes the coastal islands of the Chilean Archipelago (Chiloé, Wellington, Santa Inés), the western portion of the island of Tierra del Fuego, and the Pacific islands of San Ambrosio, San Félix, Juan Fernández, Sala-y-Gómez, and Easter Island. Area, 756,900 sq km (UN data). Population, 10.45 million (1976). The capital is Santiago. For administrative purposes, Chile is divided into 12 regions, which are subdivided into 40 provinces (see Table 1). Santiago and its suburbs constitute the 13th region.

Constitution and government

After the military coup of Sept. 11, 1973, a military fascist regime was established in the country that upheld the openly terroristic dictatorship of the big Chilean capitalists and the foreign monopolies allied with them. All democratic practices and the country's constitutional form of government were abolished. The state and the government are headed by a military junta composed of the commanders of the three branches of the armed forces and the *carabineros* (security forces). A decree issued on Dec. 17, 1974, made the head of the junta, General A. Pinochet Ugarte, president of the republic. Pinochet wields executive power, and the junta as a whole exercises legislative authority. Established in July 1976 as the highest advisory body to the president, the Council of State prepares recommendations on the more important political and economic problems.

Natural features

Chile stretches from north to south for a distance of 4,300 km, forming a narrow band 15 to 355 km wide between the Pacific coast and the high Andes Mountains.

Topography. There are three distinct north-south belts: the Principal Cordillera of the Andes in the east, the Coastal Cordillera in the west, and the intermontane depression known as the Longitudinal Valley. Over most of its length the Coastal Cordillera, with elevations of up to 3,200 m, drops sharply to a straight

abrasion coast indented with bays. South of 41° 30′ S lat. the mountains form a transition to the island of Chiloé and other islands of southern Chile. Lying at an elevation of 1,200 m in the north, in the Pampa del Tamarugal and Atacama Desert, the Longitudinal Valley gradually descends to the Ancud Gulf and then dips beneath the ocean, forming a system of straits.

Inasmuch as the national boundary generally follows the watershed, it is primarily the western slopes of the Principal Cordillera of the Andes that face Chile, soaring to 6,880 m on Mount Ojos del Salado. In northeastern Chile is found the southwestern continuation of the Central Andes high plateaus, descending to 2,000–3,500 m in the Puna de Atacama and framed on the west by the Cordillera Domeyko. The southern and southeastern parts of Chile are occupied by the eastern slopes of the Andes and sections of the Patagonia and Tierra del Fuego plains near the Strait of Magellan.

As far as 35°S lat. the Andes peaks, frequently exceeding 6,000 m, are for the most part the cones of extinct or active volcanoes (Guallatiri, San Pedro, Tupungato, Maipo). Further south, the elevation of the Andes decreases (Mount San Valentín, 4,058 m); volcanoes arise along the foot of the western slopes (a large number of active ones are found between 37° and 43°S lat.); and there is more glaciation. Southern Chile has a typically fjord coast. The entire country is subject to frequent earthquakes.

Geological structure and mineral resources. Chile lies within the Andes (Cordillera) geosynclinal belt, which has a basement of weakly metamorphosed Paleozoic rocks in the east and possibly late Precambrian and Paleozoic metamorphic rocks in the west. These rocks are overlain by Jurassic-Cretaceous sedimentary strata in the east and by andesites in the west, as well as by Cretaceous-Paleogene vulcanites. Cretaceous-Paleogene granitoids are also widely found. Pliocene-Quaternary volcanoes crown the mountain ranges in the east. The Patagonian Andes, composed of Late Jurassic and Early Cretaceous spilite-diabase and flysch strata and late Cretaceous-Paleogene molasse, differ from the Central Andes in their more complex structure, marked by folds thrust over the slightly deformed strata of the Magallanes Foredeep.

Chile is rich in many kinds of minerals. Its copper reserves, estimated at 94 million tons, and its saltpeter reserves are the largest in the capitalist world. Moreover, it ranks second in molybdenum reserves (2 million tons) and third in native sulfur reserves (100 million tons). The country has deposits of iron, manganese, lead, zinc, barite, and other ores, as well as petroleum, natural gas, and coal. Among the ore deposits are the world's largest porphyry copper deposits (Chuquicamata, El Salvador, and El Teniente), associated with a Cretaceous-Paleogene volcanic-plutonic complex. In processing the copper ores, significant quantities of molybdenum, silver, gold, and rare and trace elements are obtained. Deposits of saltpeter (chiefly sodium nitrate), salt, gypsum, and borates are found in the salt flats (*salares*) of the Longitudinal Valley. Sulfur deposits, volcanic in origin, are found at El Tacora, Concola, and other places along the Bolivian and Argentine border. Deposits of petroleum and natural gas are associated with the late Jurassic deposits of the Magallanes Foredeep (Tierra del Fuego).

Climate. North Chile, down to 28° S lat., has a tropical desert climate. The precipitation averages less than 50 mm of rain annually, and some places receive no rainfall for several consecutive years. Washed by the cold Peru Current, the northern coast is marked by considerable relative humidity, cloudiness in winter and spring, heavy fogs and mists (*camanchaca* and *garúa*), and average monthly temperatures ranging from 12°–16° to 18°–22°C. In the Atacama Desert the average monthly temperature varies from 11°–15° to 21°–23°C, and in the Puna de Atacama (at an elevation of 3,700 m) the temperature range is 2°–10°C; in both areas daily temperatures fluctuate by as much as 25°C, and the humidity falls to 30 percent.

In subtropical Central Chile (as far as 42° S lat.) the northern regions (to 32° S lat.) have a dry climate with an annual precipitation of 100–200 mm; the central parts (to 38° S lat.) have a Mediterranean climate with winter rains (351 mm annually in Santiago); and the southern regions have a humid subtropical climate with an annual precipitation of 2,000–2,500 mm. Correspondingly, the average monthly temperatures in the northern parts of Central Chile range from 12°–16°C in July to 18°–22°C in January; in the central regions they range seasonally, from 8° to 20°C in Santiago and from 11.4° to 17.8°C on the coast in Valparaíso; and in the southern areas they vary from 8° to 15°C.

South Chile has a temperate maritime climate with heavy rainfall. The western slopes of the Andes receive as much as 3,000–7,000 mm annually, brought by cyclones and westerly winds. Temperatures are relatively low and even, varying from 3°–5° to 8°–14°C. In the eastern plains the temperature ranges are somewhat greater, and the amount of precipitation decreases toward the Atlantic Ocean to a minimum of 250 mm a year.

Rivers and lakes. Almost all the country's rivers are short and drain into the Pacific Ocean. Except for the Loa River, North Chile has no permanent streams or drainage into the ocean. In the depressions of the Puna de Atacama there are large salt flats (*salares*). Among the largest of Central Chile's many rivers are the Huasco, Limarí, and Maule. Whereas the rivers in the northern part of Central Chile have winter high water, the rivers of the central regions have two high-water periods, one in winter (rains) and the other in summer (melting snow and ice). In the southern parts of Central Chile and in South Chile the rivers are high throughout the year; the largest rivers here are the Bío-Bío and the Baker. South of 39° S lat. there are many large, primarily terminal glacial lakes (Ranco, Llanquihue), including the western portions of several Patagonian lakes (Buenos Aires, San Martín). Only the lower reaches of the rivers in the southern part of Central Chile and the large lakes are navigable.

Largely owing to the increased precipitation as one moves southward, the snow line descends abruptly from 6,000 m to 500 m, and below 46° 30′ S lat. the glaciers reach sea level. Two ice fields covering 15,000 sq km lie between 46° 30′ and 51° 30′.

Soils and flora. In North Chile a soil and vegetative cover scarcely exists except along the coast, where a characteristic desert formation called *lomas* appears during periods of heavy fog. In Central Chile the northern regions are semideserts. The central regions support xerophytic scrub (*matorrales, espinales*), growing on gray and cinnamon-colored or cinnamon-colored soils; on the middle slopes of the Andes there are beech forests (*Nothofagus oblequa*), yielding at higher elevations to mountain steppes. In the Longitudinal Valley, with its pockets of vertisols (dark soils with faint horizonation), the natural vegetation has not survived. In the southern part of Central Chile dense rain forests (*hemihylaea*) grow on brown forest volcanic (*andosols, trumao*) and marshy soils; here the Andes are clothed with beech and coniferous forests and alpine meadows. South of 46° S lat. there are sub-Antarctic mixed forests. On the eastern plains are found steppes with chernozem-like chestnut soils, and the extreme south is covered with meadows and peat bogs.

Fauna. The deserts of North Chile are inhabited by *aguarachay* foxes, pumas, and reptiles. In South Chile there are pudu and guemal deer, skunks, otters, nutrias, and culpeo foxes, as well as many birds. Typical Patagonian species include guanacos, rodents, and ostriches.

Preserves. Wilflife and flora are protected in the Villarrica, Los Paraguas, Pérez Rosales, Puyehue, and Juan Fernández national parks and in the Nahuelbuta Preserve.

and mineral resources)

Population

More than 90 percent of Chile's population is composed of Chileans, most of them mestizos of Spanish and Indian descent. The Indian population comprises Araucanians (Mapuche), inhabiting the central part of the country, small groups of Quechua and Aymara in the north, and Fuegians in the extreme south. Easter Island is settled by Polynesians (Rapanui). Spanish is the official language, and most of the population is Roman Catholic, although the Indians have to some extent preserved their languages and traditional beliefs. The official calendar is the Gregorian.

Between 1971 and 1976 the population grew at an average annual rate of 1.8 percent. In 1970 the country's work force totaled 3.3 million persons, of whom 21 percent were engaged in agricul-

ture, lumbering, fishing, and hunting (compared to 28 percent in 1960), 16 percent were employed in manufacturing (18 percent), 3 percent worked in the mining industry (4 percent), 6 percent were employed in transportation (5 percent), and 54 percent worked in the service sector (45 percent), including trade (12 percent, up from 10 percent in 1960). The average population density is approximately 14 persons per sq km (1976), but the overall distribution is extremely uneven. More than 50 percent of the population lives in the central provinces, where the density reaches 180 persons per sq km. The most sparsely settled are the southern provinces, with less than one person per sq km. The northern provinces average two to three persons per sq km. Urban dwellers account for 80.5 percent of the population (1975); 75 percent of them live in the central regions. The cities with populations of more than 100,000 (1976) are Santiago (3.4 million; the metropolitan area accounts for about 30 percent of the country's population), Valparaíso, Viña del Mar, Concepción, Talcahuano, Antofagasta, and Temuco.

Historical survey

Precolonial period (to the early 16th century). From remote times Chile was inhabited by Indian tribes, notably the Araucanians, Aymara, Chon, Chango, and Atacameño. The Chon and the Chango were essentially fishermen and hunters; the Atacameño herded llamas and alpacas, raised crops using irrigation, and worked gold, silver, and copper; and the Araucanians cultivated potatoes and corn and raised sheep. The tribes inhabiting northern Chile were subjugated by the Incas in the 15th century. By the beginning of the 16th century the indigenous peoples were organized into clans whose members owned land in common. Among the Araucanians, the most advanced and warlike of the Chilean tribes, a matriarchal clan system was giving way to a patriarchal one. The total Indian population numbered about 1 million.

Spanish colonial rule (16th to early 19th centuries). During the 1530's Chile was invaded by Spanish conquistadors. Under the leadership of D. de Almagro and P. de Valdivia the conquerors dealt cruelly with the indigenous population. The Araucanians put up a stiff resistance, inflicting a resounding defeat on the colonialists in 1553. Subsequently, there were many Araucanian uprisings, the largest ones occurring in 1571, 1655, and 1723. In the mid-16th century Chile was included in the Viceroyalty of Peru, and in 1778 it was designated a separate captaincy general.

The Spanish colonialists introduced such forms of feudal exploitation as the *encomienda* and the *repartimiento*, distributing the land together with the Indians living on it and using Indian labor in farming and in mining gold, silver, and copper. In the mid-16th century the Spaniards founded several towns, among them Santiago (1541), Concepción (1550), and Valdivia (1552). Livestock raising developed, and artisan workshops and manufacturers (*see* MANUFACTURE) were established. To prevent competition with the motherland, however, the Spanish authorities restrained the development of Chile's economy. It was not until the end of the 18th century that Chile was permitted to trade with Spain and its colonies. The creole bourgeoisie, demanding greater liberty, began to oppose colonial domination. The struggle for independence, which gathered momentum under the influence of the victory of the French Revolution, was led by J. A. Rojas, M. de Salas, and B. O'Higgins.

War of Independence (1810–18). The outbreak of a popular uprising against Spanish colonial oppression in Santiago in July 1810 was followed by the formation of a national governing junta on September 18, subsequently celebrated as National Independence Day. In 1811 a national congress was established, but inasmuch as it was dominated by pro-Spanish elements, J. M. Carrera, one of the leaders of the War of Independence, dissolved the congress and took control of the government, instituting measures to strengthen the country's independence. Nevertheless, Carrera's dictatorial regime provoked feuding that weakened the patriots' camp. The liberation army was defeated by Spanish troops, and after the battle of Rancagua (October 1814) the patriots had to flee to Argentina. A new phase of the liberation struggle began in 1817. Led by O'Higgins, the commander in chief of the patriots, and supported by the army of the Argentine general J. San Martín, the Chileans defeated the Spaniards at the battle of Chacabuco (February 1817) and entered Santiago. O'Higgins became the supreme ruler of Chile. The country's independence was proclaimed on Feb. 12, 1818, and achieved after the battle of Maipú (Apr. 5, 1818).

The development of an independent Chilean state (1818–1917). Under the constitution adopted in 1818, a republican form of government was established. The constitution guaranteed bourgeois liberties and placed all executive power in the hands of O'Higgins, the supreme ruler. Chile established diplomatic relations with other countries. In 1822, Great Britain granted Chile a loan of 5 million pesos, thereby inaugurating the flow of British capital into the Chilean economy and strengthening British influence on the country's political life. O'Higgins' struggle against the privileges of the landed oligarchy and the Catholic Church, along with his efforts to implement progressive reforms and restrict the church's influence, provoked dissatisfaction among the feudal-clerical circles. The promulgation of a new constitution in October 1822, aimed at democratizing the political system and limiting the privileges of the aristocracy, exacerbated the tense situation. Under pressure from the reactionary forces, O'Higgins resigned and emigrated.

General R. Freire, who became president in 1823, sought to continue O'Higgins' policies. The ensuing struggle for power among the various factions culminated in 1830 in the victory of the Conservatives, who represented the interests of the landowning oligarchy and the church and who relied on the support of foreign capitalists. The Constitution of 1833 strengthened the Conservatives, who remained in power until 1875. During the 1830's and 1840's many new domestic and foreign enterprises were founded. With the expansion of crafts and industry, chiefly mining, the number of workers increased. The second half of the 19th century saw an awakening of class consciousness among the workers, who began to resort to organized struggle. Marxism attracted a large following, and the first workers' newspaper, *El proletario*, began publication in 1875.

In 1879, Great Britain incited Chile to declare war on Peru and Bolivia in order to appropriate the large deposits of saltpeter on their territory. As a result of the War of the Pacific (1879–83), the Peruvian province of Tarapacá and the Bolivian province of Antofagasta were ceded to Chile. The seizure of the saltpeter deposits gave impetus to the development of capitalism in Chile and accelerated the inflow of British capital. The accession to power in 1886 of the Liberal J. M. Balmaceda—an advocate of independent economic and political development—was unpalatable to the oligarchy, which was supported by the foreign monopolies, the church, and the upper ranks of the military. After losing the civil war unleashed by his opponents, Balmaceda resigned as president in 1891. Power passed to the financial and landowning elite, which facilitated the country's subjugation to British capital and, from the early 20th century, to US capital.

The miserable living conditions of the workers gave rise to a strike movement that reached its peak between 1905 and 1907 in the towns of Iquique, Antofagasta, and Concepción. The working class became more organized: the Chilean Workers' Federation was founded in 1909 and the Socialist Workers' Party in 1912. During World War I, in which Chile remained neutral, US monopolies increased their investments in Chile's industry, particularly its copper industry, thereby strengthening their economic and political influence in the country.

Since 1918. After the war, a decline in saltpeter mining and the deterioration of the country's economy gave fresh impetus to the struggle of the toiling masses, who were certainly influenced by the October Socialist Revolution in Russia. In 1922 the Socialist Workers' Party was transformed into the Communist Party of Chile. The mid-1920's were marked by political instability. In September 1924 the government of A. Alessandri Palma was overthrown by a military junta, and in January 1925 military men led by C. Ibáñez del Campo staged another coup. The constitution that was adopted in September 1925 reflected a political alliance between the big bourgeoisie and the landed oligarchy against the working class and the toiling masses. In 1927, Ibáñez, now the defense minister, ousted the president and established a dictatorship. The Communist Party, the Workers' Federation, and the country's anarchosyndicalist organizations were outlawed.

In the early 1930's there were demonstrations protesting against the dictatorship. A mutiny in the navy in 1931 was followed in June 1932 by a military coup led by Colonel M. Grove Vallejo, who proclaimed Chile a "socialist republic." Councils of workers' and soldiers' deputies were formed in a number of cities. Yet another military putsch soon toppled the republic. In October 1932, Alessandri returned to power and pursued a policy of strengthening the position of foreign capital.

In March 1936 a Popular Front was created by the Communist, Radical, and Socialist parties. The 1938 presidential election was won by the Popular Front candidate, the radical P. Aguirre Cerda, whose government promulgated some progressive measures, notably a labor law and a law providing bank credit for peasants, but under pressure from the reactionaries it backed away from agrarian reform. The treachery of right-wing socialists caused the Popular Front to collapse in 1941. On the initiative of the Communist Party, the Democratic Alliance, a coalition of the Communist, Radical, and Democratic parties, was formed in 1942. Chile did not take part in World War II, although it declared war on Germany in February 1945 and on Japan two months later.

In 1946 the presidency was won by the Radical G. González Videla, the candidate of the Democratic Alliance, who included Communists in his government. However, with the onset of the cold war, unleashed by US reactionary circles, González Videla in 1947 expelled the Communists from his government and broke off diplomatic relations with the USSR, established in 1944. In 1948 the national Congress adopted a "law for the defense of democracy," banning the Communist Party, progressive trade unions, and other democratic organizations. US monopolies came to dominate the Chilean economy.

On the Communists' initiative the People's Front was founded in 1951, the Single Center of Chilean Workers in 1953, and the Popular Action Front (FRAP) in 1956. The FRAP coalition included not only Communists and Socialists but members of other parties as well. The strike movement that developed in 1954–55 encompassed more than 1 million persons. Under pressure from the growing FRAP movement, the law for the defense of democracy was repealed in 1958, and the Communist Party was legalized. In the 1958 presidential elections the FRAP candidate, the Socialist S. Allende Gossens, received only 30,000 votes less than the candidate of the right-wing forces and the puppet of big capital, J. Alessandri. The Alessandri government (1958–64) pursued a policy of involving the country in the plots of foreign capitalists and suppressing the labor movement.

On coming to power in 1964, E. Frei Montalva, the leader of the right wing of the Christian Democratic Party, resumed diplomatic relations with the USSR (1964) and announced a national reformist program of "revolution in liberty," providing for a number of bourgeois democratic reforms. However, the government's "Chileanization" of copper through the gradual buying up of the stock owned by American monopolies did not limit the profits of the US companies. The agrarian reform announced in 1967 was carried out extremely slowly. All this provoked discontent among the masses and strengthened the influence of the Communist Party and the FRAP.

In December 1969 the Communist, Socialist, Social Democratic, and Radical parties, the Movement for United Popular Action (MAPU), and the Independent Popular Action formed the coalition known as Unidad Popular (Popular Unity), which on the eve of the 1970 presidential elections put forward a program of radical social and economic change. The victory of the Unidad Popular candidate, S. Allende, led to the creation in November 1970 of a popular government that included representatives of all the coalition parties. The Allende government introduced far-reaching anti-imperialist and anti-oligarchic reforms; copper mines belonging to US monopolies were nationalized, restrictions were placed on the activity of the Chilean industrial, landowning, and financial oligarchy, and an agrarian reform was carried out that effectively abolished the latifundia system. Measures were adopted to raise the living conditions of workers and office employees, to improve the pension system, and to stimulate housing construction.

The Allende government strongly advocated peace and international security, supported peaceful coexistence and the cooperation of states with different social systems, and opposed colonialism and neo-colonialism. Chile's ties with the Soviet Union and other socialist countries changed materially. The government revived diplomatic relations with Cuba and established diplomatic relations with other socialist countries. The revolutionary process encountered fierce opposition from domestic reactionaries, supported by foreign imperialism: the government's efforts were deliberately undermined, economic difficulties were artificially created, and acts of terrorism and sabotage were carried out.

In September 1973 the popular government was overthrown by a military revolt planned by domestic and foreign reactionaries. President Allende was killed during an attack on the presidential palace. A military-fascist junta headed by the army commander General A. Pinochet Ugarte came to power. The junta suspended the constitution, dissolved the National Congress, and banned all political parties and mass organizations. In the subsequent reign of terror unleashed by the junta some 30,000 Chilean patriots perished in the junta's torture chambers, and another 2,500 persons "disappeared." The junta nullified the economic gains of the people, returning the land to the *latifundistas* and enterprises to their former owners and paying compensation to foreign monopolies. Diplomatic relations with thé USSR and other socialist countries were broken off. In December 1974, A. Pinochet was proclaimed president of Chile.

The junta's antinational and antipopular policies caused an abrupt deterioration of the situation in the country, the impoverishment of the working people, and a considerable rise in the cost of living. By 1976 about 20 percent of the work force was unemployed. In order to prop up the military fascist regime, the USA (and the international economic organizations associated with it) granted Chile loans and credits amounting to some $2.5 billion. Despite this assistance, Chile's financial situation has remained precarious. The junta is militarizing the economy and strengthening the country's ties with the imperialist states. In foreign policy the military fascist government is guided by the USA. In 1979 a number of trade union federations resumed their activities under government control. In 1980, the constitution, approved by referendum, confirmed Pinochet's presidency to the end of the 20th century.

Chilean patriots continue to resist the reactionary regime. The Communist Party has appealed to all the country's democratic, antifascist forces to unite firmly and broaden the struggle to overthrow the Pinochet dictatorship. The junta's domestic isolation has been reinforced by international isolation.

Political parties and trade unions

All the parties that belonged to the Unidad Popular coalition prior to the 1973 coup have been outlawed, notably the Radical

Party of Chile (Partido Radical de Chile), formed at the end of the 1850's and officially founded in 1883; the Socialist Party of Chile (Partido Socialista de Chile), established in 1933; the Communist Party of Chile (Partido Comunista de Chile), founded in 1922; and the Movement for United Popular Action (Movimiento de Acción Popular Unitaria), organized in 1969. All these parties now operate under illegal conditions. The Christian Democratic Party (Partido Demócrata Cristiano), a bourgeois-reformist party founded in 1957, has been indefinitely suspended by the junta. Since January 1977 limited activity has been permitted to the National Party (Partido Nacional), which was created in 1966 through a merger of the Conservative and Liberal parties and which drew its support from the landowning and financial-industrial oligarchy.

The Single Center of Chilean Workers (Central Unica de Trabajandores de Chile), founded in 1953, has been banned but continues to operate illegally.

Economic geography

General characteristics. Economically, Chile is one of the relatively well-developed countries of Latin America. A large role in the economy is played by foreign, chiefly US, capital, the investment of which has been especially encouraged since the military junta seized power in 1973. The leading branch of the economy is industry, whose most highly developed sectors are mining and nonferrous metallurgy, both export oriented. In 1976, Chile ranked first in the capitalist world in the mining and export of saltpeter, second (after the USA) in the production and export of copper, and third (after the USA and Canada) in the output and export of molybdenum. In 1975 the per capita gross national product amounted to $691 (in current prices), putting Chile in tenth place among the Latin American countries. In 1974 agriculture, lumbering, fishing, and hunting accounted for 6.9 percent of the GNP, the mining industry for 13.5 percent, manufacturing for 29.2 percent, and construction for 3.9 percent.

During the years when the Unidad Popular government was in power the state sector in industry was strengthened, a radical agrarian reform was promulgated, and cooperation with the socialist countries was expanded. By September 1973 more than 500 state-owned or state-controlled enterprises were providing about 50 percent of the total industrial output. Moreover, the state owned 85 percent of the rail network, as well as most of the air and maritime transport facilities. Some 3,500 large estates, totaling 5.4 million hectares (ha), were expropriated and distributed among the landless and land-poor peasants. About 70 percent of foreign trade operations were under state control.

Since the military junta has taken power there has been a sharp decline in industrial production, chiefly in consumer goods. The slowdown has affected small-scale and artisan industries, as well as large enterprises. In 1977 only 23 industrial enterprises remained under state management. Approximately 3 million ha of land have been returned to the large landowners, for the most part in provinces with fertile soils. A law enacted in 1974 gave foreign monopolies the right to import capital and transfer profits abroad without any restrictions. At the end of 1973 foreign private capital investments amounted to $1.2 billion. The workers' share in the national income fell from 65 percent in 1972 to 35 percent in 1974. In 1975 the country was struck by a severe economic crisis. The workers' standard of living declined, the GNP was reduced by 13 percent, and the output of consumer goods and food crops fell sharply.

Industry. An important branch of industry, mining is dominated by foreign companies, who own almost all the mining enterprises. Although the copper mines are still owned by the state, they are worked and managed by US monopolies. The state oil company ENAP is responsible for the exploration, extraction, and refining of petroleum. The export-oriented copper industry accounts for more than 80 percent of the country's metallic mineral output. Iron ore mining ranks second in both production and export. The largest copper-molybdenum mines are Chuquicamata in El Loa Province, El Salvador in Chañaral Province, and El Teniente in Cachapoal Province; together with the Rio Blanco and Exótica mines in Santiago Province, these three deposits yield 85 percent of Chile's copper output. The largest iron mines are El Romeral in Elqui Province and Algarrobo and Boquerón Chañar in Huasco Province.

Chile's saltpeter deposits, the world's largest, are located in the north, in the western part of the Atacama Desert. The largest output comes from the María Elena and Pedro de Valdivia mines in Tocopilla Province. In the early 20th century Chile's saltpeter mines supplied almost three-fourths of the world demand for nitrogen fertilizers. Owing to the increased production of cheap artificial nitrogen fertilizers, by the early 1960's saltpeter production had fallen to almost one-fourth of the 1929 output.

Petroleum and gas exploitation is carried out by ENAP in the southern part of the country—on Tierra del Fuego and along the northern coast of the Magellan Strait. Most of the coal mines are found around Lota and Coronel in Concepción Province. In 1975, the country's electric power plants had an installed capacity of 2.6 gigawatts, with hydroelectric power plants accounting for 1.5 gigawatts. Hydroelectric power plants supplied 70 percent of the electricity generated in 1975. The largest hydroelectric power plant (capacity, 350 megawatts) is located at Rapel, and the largest thermoelectric power plant (170 megawatts) operates at Tocopilla.

Chile's manufacturing industry, ranking fifth in Latin America in production volume, is dominated by branches producing consumer goods. The food-processing, textile, and leather-footwear branches account for two-thirds of the employees and three-fifths of the output, by value, of the manufacturing industry. Small enterprises, most of them artisan workshops, employ 50 percent of the manufacturing work force and contribute about 30 percent of the output by value. Large factories and plants, constituting 3 percent of the total number of enterprises, provide 59 percent of the value of the industrial output and employ 44 percent of the workers in manufacturing. After World War II manufacturing expanded rapidly, notably ferrous and nonferrous metallurgy, chemicals, metalworking, and the paper and pulp industry.

Nonferrous metallurgy works are found in Chuquicamata, Paipote, Potrerillos, Las Ventanas, Chagres, and Coletones, and there are machine-building and metalworking enterprises in Santiago, Valparaíso, Concepción, Arica, and Talcahuano. Most of the output of the copper-ore and copper-smelting industry is exported; in 1974 such exports totaled 702,000 tons of blister and refined copper and 156,000 tons of copper concentrates. A ferrous metallurgy works has been built at Huachipato in Concepción Province. Petroleum refineries and petrochemical plants are located for the most part in Concepción, Concón, and Manantiales, and the chemical industry is largely confined to Valparaíso, Santiago, and Antofagasta. Textiles are manufactured in Valparaíso, Santiago, and Concepción and leather footwear in Valparaíso and Santiago. Food-processing enterprises, found in almost all cities, are especially numerous in Santiago, Valparaíso, and Valdivia. About 80 percent of the country's industrial output comes from enterprises in the provinces of Santiago, Valparaíso, and Concepción; more than 50 percent of these enterprises are in the city of Santiago. See Table 2 for the output of the major industrial products.

Table 2. Output of leading industrial products
(thousand tons)

	1950	1960	1976
Copper ore[1]	363	532	1,005

Wheat	753,000	740,000	698,000	1,082,000	1,307,000	850,000
Corn	86,000	74,000	107,000	204,000	239,000	273,000
Oats	77,000	73,000	65,000	89,000	111,000	77,000
Barley	41,000	47,000	56,000	74,000	97,000	78,000
Rice	31,000	25,000	23,000[2]	85,000	76,000	76,000[2]
Sugar beets	15,000	42,000	42,000[2]	543,000	1,655,000	1,617,000[2]
Rape	42,000	54,000	60,000	48,000	70,000	64,000
Potatoes	90,000	72,000	95,000	793,000	684,000	725,000

[1]Annual average [2]1975

Agriculture. Of Chile's 17.3 million hectares (ha) of agricultural land, 5.7 million ha are arable land and 11.6 million ha are meadows and pastures (1974). Some 1.2 million ha are irrigated. Crop farming contributes about 60 percent of the value of agricultural output, and livestock raising, about 40 percent. The principal crop-growing areas are the slopes of the Coastal Cordillera and the Longitudinal Valley in Central Chile. The chief crops are wheat, corn, barley, oats, potatoes, sugar beets, rice, and rape. Rye, beans, sunflowers, and flax are also cultivated. (See Table 3 for the sown area and yield of the principal crops.) Orchards (apples, citrus fruits, peaches) and vineyards are also found, primarily in Central Chile, from Santiago Province to Linares Province.

Livestock raising, extensive rather than intensive, is carried on throughout the country. In 1975 the livestock numbered 3.6 million head of cattle, 5.9 million sheep, 800,000 goats, and 900,000 pigs. Cattle are raised primarily in Central Chile and sheep in the south. Dairy farming is thriving around the major cities. In 1976 raw wool production amounted to 19,200 tons.

Chile's timber reserves are estimated at 1.2 billion cu m. Some 8.2 million cu m of round timber, chiefly coniferous, were produced in 1975.

The country's fish catch of 1.1 million tons in 1975 was exceeded only by that of Peru in Latin America. Crabs, lobsters, and shellfish are also caught.

Transportation. Motor vehicles are the chief means of transport within the country. Of the roughly 92,000 km of roads, 11,000 km are paved and 25,400 km have a gravel surface (1974). The railroad network totals 9,800 km. The main railroad, running from Pisagua in the north to Puerto Montt in the south, has branch lines to seaports and mineral deposits. At the end of 1975 the country had 393,000 motor vehicles, including 236,800 passenger cars. Some 90 percent of all foreign trade cargo is handled by maritime shipping. The merchant marine, ships exceeding 100 gross registered tons, totaled 459,000 gross registered tons in 1975. The 1972 cargo turnover of the largest ports (in million tons) was as follows: Huasco (4.2), Valparaíso (4), Caldera (1.4), Coquimbo (1.3), and Tocopilla (1). Other major ports are Talcahuano and Chañaral. Air transport is well developed.

Foreign trade. In 1974, Chile's exports totaled $2.481 billion and its imports, $1.910 billion. Copper accounted for 71.7 percent of the total value of 1974 exports, iron ore for 5.3 percent, saltpeter and iodine for 2.2 percent, pulp and paper for 4.4 percent, and agricultural and fishery products for 4.2 percent. The leading imports in 1974 were foodstuffs (33.1 percent of the total value of imports), machinery and transport equipment (23 percent), fuel (14.3 percent), and chemical products (11.8 percent). Chile's principal trading partners are Japan (accounting for 11.2 percent of its exports and 3.7 percent of its imports), the Federal Republic of Germany (14.4 percent and 7.1 percent), the USA (8.8 percent and 29.2 percent), Great Britain (8.2 percent and 2.8 percent), Argentina (6.8 percent and 17 percent, in 1974), Brazil (5.8 percent and 4.3 percent), Italy (6.5 percent of exports), and Ecuador (4 percent of imports). The monetary unit is the peso, whose value has been falling; the exchange rate was US $1 = 6.4 pesos on Sept. 30, 1975, and US $1 = 19.82 pesos on May 31, 1977.

Economic regions. The Northern Economic Region, encompassing the First through Fourth regions, is a mining region producing copper, iron ore, and saltpeter. Agriculture is confined to the oases. Most of the agricultural output is provided by the region's southern provinces, where wheat, corn, vegetables, grapes, hemp, and tobacco are grown. Most of the country's llamas and alpacas are raised in the provinces of Arica and Iquique.

The Central Economic Region, comprising the Fifth, Sixth, and Seventh regions and Nüble and Concepción provinces in the Eighth Region, is the most highly developed economic region and the principal manufacturing and agricultural region. The leading branches of industry—food processing, textiles, clothing and footwear, and chemicals—are concentrated in Santiago, Valparaíso, and Concepción provinces. Farming is oriented toward grain growing and beef and dairy cattle raising. A substantial area is planted to orchards (plums, cherries, peaches, citrus fruits) and vineyards. Dry farming is done on the slopes of the Coastal Cordillera, and irrigation is used in the Longitudinal Valley and the river basins. The economic region produces all of the country's rice, 85 percent of its corn, 75 percent of its barley, 50 percent of its wheat, and 40 percent of its potatoes.

The agricultural South-Central Economic Region includes Arauco and Bío-Bío provinces of the Eighth Region and the Ninth and Tenth regions, excluding Chiloé Province. The main economic activities are livestock raising for meat and milk and the cultivation of grain crops. The region accounts for 60 percent of the country's cattle, 55 percent of the pigs, 30 percent of the goats, 45 percent of the wheat harvest, 85 percent of the rye, and more than 90 percent of the rape. The principal branches of industry are food processing, paper and pulp production, and coal mining.

The Southern Economic Region, consisting of the Eleventh and Twelfth regions and Chiloé Province, is an underdeveloped agricultural region. Sheep raising, the main branch of agriculture, accounts for about 70 percent of the total head of sheep in the country. The major industries are petroleum and natural gas extraction, food processing (chiefly fish), and woodworking.

Table 4. Basic indexes of economic regions (1970)
(percent)

	Northern	Central	South-Central	Southern
Area	40	14	13	33
Population	10	70	17	3
Value of GNP	17	70	10	3
Value of mining output	68	25	1	6
Value of manufacturing output	6	85	8	1
Value of agricultural output	5	55	30	10

(See Table 4 for the basic indexes of these regions.)

Armed forces

Chile's armed forces consist of an army, an air force, and a navy, totaling more than 85,000 men in 1978. The supreme commander in chief is the president, and the military junta exercises direct leadership. There are also internal security forces, the Carabineros, numbering 30,000 men. The armed forces are recruited by conscription, and the term of active military service is 12 months. Officers are trained at various military schools, in three academies (one for each branch of the armed forces), and at a military polytechnical academy. The army of about 50,000 men is organized into five infantry divisions, two tank regiments, three cavalry regiments, one airborne regiment, and several antiaircraft and service units. The air force of 11,000 men is equipped with 50 combat, 60 transport, and about 75 training aircraft, as well as 30 helicopters. The navy of about 24,000 men (3,800 marines) has three cruisers, 12 destroyers, six submarines, two frigates, four torpedo boats, six patrol boats, and six landing craft. Naval subdivisions include an air force of about 20 airplanes and ten helicopters, a marine brigade, and a coastal artillery. The armaments are mainly of US manufacture.

Health and social welfare

In 1974 the country had a birth rate of 25.4 and a mortality rate of 7.4 per 1,000 inhabitants. Infant mortality was 63.3 per 1,000 live births. The average life expectancy was 62.6 years.

There is a high incidence of infectious and cardiovascular diseases and malignant tumors. Among the more common infectious or parasitic diseases are children's infections, syphilis, gastrointestinal infectious diseases, infectious hepatitis, and helminthiases.

The central public health agency is the Ministry of Health. The new National Health Service, introduced in 1975, has reduced the number of people eligible to receive state medical care. About 70 percent of the population is not covered, including industrial workers, peasants, members of their families, and children under 15 years of age. Private practice is on the rise.

In 1974 there were 295 hospitals with 37,200 beds (3.6 beds per 1,000 inhabitants), of which 256 were state hospitals with 35,400 beds. That year the country had 4,300 practicing physicians (one for every 2,400 inhabitants), as well as 1,400 dentists and more than 22,000 secondary medical personnel. Approximately 60 percent of the physicians are located in the central province of Santiago. Physicians are trained at six university medical faculties.

Z. A. BELOVA

Veterinary services. Among the more common diseases that afflict domestic animals are tuberculosis, brucellosis, malignant anthrax, blackleg, salmonellosis, leptospirosis, foot-and-mouth disease, fascioliasis, echinococcosis, and trichinosis. Among swine, erysipelas, hog cholera and infectious atrophic rhinitis have been recorded; among poultry, Newcastle disease, infectious bronchitis, infectious laryngotracheitis, mycoplasmosis, Marek's disease, pullorosis, leukosis, and fowl cholera and pox; among sheep, infectious enterotoxemia, ecthyma contagiosum, and mange; among rabbits, myxomatosis and coccidiosis; and among horses, strangles, horse influenza, and lymphagitis ulcerosa pseudofarcinosa. These diseases are less frequently encountered in the south; since 1973 no cases of foot-and-mouth disease have been reported in Magallanes, Aisén, and Chiloé provinces. Veterinary specialists are trained at the veterinary faculty of the University of Chile and at the veterinary school of the private Southern University of Chile. In 1976 the country had 1,157 veterinarians; this figure includes only veterinarians working for the Ministry of Agriculture.

S. I. KARTUSHIN

Education

Under the Unidad Popular government the education system was democratized. The period of compulsory education was extended from six to eight years, and the number of pupils attending all schools increased sharply. Compared to 1970 figures, the enrollment in primary schools rose by 13.5 percent, in general-education secondary schools by 33.7 percent, in vocational-technical schools by 51.9 percent, in higher educational institutions by 82.4 percent, and in the adult education system by 96.8 percent. Moreover, three times as many schools were built in 1972 as in 1970. After the 1973 military coup the number of students and teachers dropped sharply, and all schools were militarized.

According to 1975 data, 5 percent of the urban population and 10 percent of the rural population are illiterate. Children are required by law to attend school between the ages of six and 15. Upon completing the compulsory eight-year primary school, students may enroll in a four-year general-education secondary school, a four-year vocational-technical school, or a four-year teacher-training school. In the 1977–78 school year the primary schools had an enrollment of 2.2 million pupils, and in the 1977–78 school year the various secondary schools were attended by more than 487,200 students.

The country's eight universities, six of them private, had a total enrollment of more than 132,000 students in the 1977–78 academic year. The largest universities are the University of Chile, the State Technical University in Santiago (founded 1947), and the Catholic University of Chile (1888). In addition, there are three colleges, a conservatory, and the School of Applied Arts. The largest of the country's 18 major libraries is the National Library, founded in 1813 and containing 1.2 million volumes in 1977. The most important museums, all located in the capital, are the National Historical Museum, the National Museum of Fine Arts, the National Museum of Natural History, and museums of education, contemporary art, and folk art of the American peoples.

L. IA. BELOVA

Scientific institutions

Most of the country's research institutions are located in Santiago. The National Commission for Scientific and Technological Research, a state agency founded in 1966 and reorganized in 1969, is responsible for planning scientific and technical policy. The leading state-financed research institutions are the Meteorological Bureau (1884) with its network of observatories and scientific stations, the Chilean Bacteriological Institute (1929), the Military Geographical Institute (1922, the country's official cartographic institution), the National Geographical, Geodetic, and Geophysical Committee (1955), the Hydrographic Institute of the Navy (1874, Valparaíso), the Geological Institute (1957), the Chilean Antarctic Institute (1963, with scientific stations in Antarctica), and the Chilean Nuclear Energy Commission.

Among the many private research institutes and learned societies are the Valparaíso Oceanographic Institute (1945), the Lebu Scientific Institute (1945), which studies the history of the Araucanians, the Chilean Academy (1885, philological studies), the Chilean Academy of Natural Sciences (1926), the Chilean Academy of History (1940), and the Chilean Academy of Sciences (1964). Several industrial firms have their own research departments. A considerable amount of scientific work is also done by the universities, notably the University of Chile and the Catholic University of Chile. The establishment of the military fascist dictatorship in 1973, followed by mass repressions, the emigration of hundreds of scientific workers, and reduced allocations for scientific research, greatly weakened Chile's scientific potential.

Press, radio, and television

In 1980, Chile had about 100 daily newspapers. After the military fascist junta came to power in September 1973, all progressive newspapers and magazines were banned. A law enacted in December 1975 permitted the government to shut down newspapers and radio stations whose news was deemed antipatriotic.

One of the most influential Santiago dailies is *El Mercurio*, founded in 1900 and having a circulation of 300,000. The proprietors of *El Mercurio* publish newspapers of the same name in Valparaíso (since 1827), Antofagasta (since 1906), and other cities, as well as the Santiago tabloid *Las Ultimas Noticias* (since 1902, circulation 85,000). The daily *La Tercera de la Hora*, an air force organ issued in Santiago since 1950, has a circulation of 450,000. The daily *La Nación* (since 1917), banned since 1973, began appearing as the official organ of the military junta on June 2, 1980. The most popular illustrated weekly magazines are *Vea* (since 1939, circulation 180,000) and *Ercilla* (since 1934, circula-

tion 300,000). Other major periodicals are the Catholic weekly *Que Pasa* and the monthly *Mensaje* (since 1944, circulation 20,000–30,000). Illegal publications include the newspaper *El Siglo*, the organ of the Communist Party of Chile, and the journal *Los Principios*, the party's theoretical organ.

The Orbe News Agency, a private agency founded in 1953, supplies news to the capital's newspapers and radio and television stations. Radio broadcasting was begun in the 1920's. In 1980 there were 134 radio stations. The government-controlled Radio Nacional de Chile broadcasts in Spanish and five other languages. Television broadcasting was initiated in 1959, and by 1978 there were 22 stations and the government-controlled company Television Nacional de Chile. M. A. SHLENOVA

Literature

A Spanish-language literature has been developing in Chile since the beginning of colonial rule in the 16th century, when the Spaniard A. de Ercilla y Zúñiga (1553–94) wrote the famous epic *La Araucana* (parts 1–3, 1569–89), describing the Araucanians' heroic resistance to the colonialists. Transplanted to the colonies, Spanish folk poetry was transformed into a distinctive Creole folklore. During the War of Independence of the Spanish-American Colonies (1810–26), when publicistic writing became the leading genre, the journalist C. Henríquez (1769–1825) founded the first Chilean newspaper, *Aurora de Chile*. The first national plays were written in the 1820's by M. Magallanes (1812–73). After independence (1818), the relative stability of Chile's political life made it a haven for literary men from other Latin American countries. One such émigré was the Venezuelan poet and scholar A. Bello (1781–1865), who played an important cultural role in Chile.

Addressing the first gathering of the Literary Society of Chile in 1842, the public figure, scholar, and prose writer J. V. Lastarria (1817–88) defined the task of creating a national literature. The poetry of S. Sanfuentes (1817–60) and E. Lillo (1826–1910) and the plays of C. Bello developed within the mainstream of romanticism. In prose there was a predilection for *costumbrismo*, colorful description of daily life. The style was initiated by J. Vallejo (1811–58), whose short stories give a satirical picture of Chilean society. *Costumbrismo* also influenced the autobiographical and memoir literature of the period.

The social and historical development of Chile, which embarked on capitalism earlier than the other Latin American countries, stimulated the appearance of critical realism in the mid-19th century. The leading exponent of critical realism, A. Blest Gana (1830–1920), won renown for his cycle of novels entitled *Human Comedy of Chile*, portraying Chilean society at mid-century. The central theme of his works, including the novel *Martín Rivas* (1862), is the moral conflict engendered by the power of money. Social conditions were also depicted critically by D. Barros Grez (1834–1904) and L. Orrego Luco (1886–1948), whose novel *The Big House* (1908) showed the degeneration of the landowning aristocracy.

At the turn of the century, under the influence of the Nicaraguan R. Darío, a number of poets experimented with new verse forms and imagery, among them Jorge González Bastias (1863–1905) and M. Jara (born 1886). The country's natural beauty was celebrated in the collections *From the Sea to the Mountains* (1903) by D. Dublé Urrutia (born 1878) and *The Chilean Soul* (published in 1912) by C. Pezoa Veliz (1879–1908), whose poems are imbued with a folk spirit and social protest.

The prose of the early 20th century mirrored Chile's severe social problems. *Underground* (1904; Russian title *Post No. 12*, 1962), a collection of short stories by B. Lillo (1867–1923), mercilessly exposed the exploitation of miners by foreign companies. The "urban novel" criticized bourgeois society from a social and moral perspective. Its leading exponents—A. d'Halmar (1882–1950), best known for his novel *Juana Lucero* (1902), and J. Edwards Bello (1877?–1968)—were attracted to the aesthetics of naturalism. The writers known as Creolists drew their inspiration from nature and rural life. The theoretical principles of Creolism were followed most consistently by M. Latorre (1886–1955), the movement's leader, who believed that national character was shaped by the natural environment. Other major Creolists were F. Gana (1867–1926), R. Maluenda (born 1885), F. Santiván (born 1886), and L. Durand (1895–1954).

From the 1920's poetry emerged as the leading genre. The mature, highly lyrical verse of Gabriela Mistral (1889–1957) presented a sharp contrast to the overly refined style of the epigones of modernism. The collections *Desolation* (1922), *Tala* (1938), and *Winepress* (1954), while recording the poet's individual feelings, also reflect the collective consciousness of the Latin American peoples. International avant-garde trends influenced the poetry of V. Huidobro (1893–1948), the theoretician and leader of Chilean *creacionismo* (from the Spanish *crear*, "to create"). The work of Chile's greatest poet, P. Neruda (1904–73), underwent a profound evolution during the 1930's. The intimate lyrics and subjective verse of *Residence on Earth* (vols. 1–2, 1925–35), imbued with a despairing rejection of the world, gave way to the civic poetry of *Spain in My Heart* (1937) and then to *General Song* (1950), an epic about the land and people of Latin America. A desire to give philosophical meaning to reality is reflected in his *Elementary Odes* (1954–57) and the lyrical and grotesque poems of *Estravagario* (1958). Neruda's poems of the 1960's and 1970's, published in 1974 in the collections *Bells and the Sea* and *Elegies*, attest to the breadth of his lyrical world.

After the first Popular Front government came to power in 1938, there was a heightened interest in social issues. Basic problems of national life were examined in several outstanding novels about the life of the proletariat: *Blood and Hope* (1943) by N. Guzmán (1914–64), *Coal* (1953) by D. Muñoz (born 1903), *The Big North* (1944) by A. Sabella (born 1912), and *Saltpeter* (1954) and *Pampas Dwellers* (1956) by L. González Zenteno (1912–62). An optimistic portrayal of the workers' struggle and political and spiritual evolution may be found in the novels *Son of Saltpeter* (1952) and *Seed in the Sand* (1957) by V. Teitelboim (born 1916) and the novels *The Cell* (1958; Russian translation, *Olga*, 1962) and *Wind of Wrath* (1961) by E. Délano (born 1910). In his books *Cape Horn* (1941), *Tierra del Fuego* (1956), and *Route of the Whales* (1962), F. Coloane depicts the inhabitants of Chile's maritime regions struggling against the natural elements and social evils. Another fine novel, *Prize Horse* (1957) by F. Alegría (born 1918), portrays a man's search for his identity in a hostile bourgeois society. In the novels of M. Rojas' (1896–1973)—*Son of a Thief* (1951), *Better Than Wine* (1958), and *Shadows on the Wall* (1964)—social problems are refracted through the prism of the hero's inner world.

New narrative techniques and psychological probing distinguish the prose of the 1950's and 1960's, notably the works of C. Droguett (born 1915) and J. Donoso (born 1926). The class struggle that shook Chile during the years that the Unidad Popular government was in power is evoked in G. Atías' novels *And the Money Flowed* (1972) and *Against the Current* (1978). A documentary prose style became popular in the 1970's. The fascist putsch of September 1973, by bringing on the persecution of progressive writers and publishers, interrupted the natural development of Chilean literature. Many writers who have emigrated are re-creating in their fictional works the tragic events of recent history. An outstanding example of such a work is A. Skarmeta's novel *I Dreamed of Burning Snow* (1975).

Architecture and art

The ancient art of the Chilean Indians, notably those living in the north, was associated with the advanced cultures of Peru. There are ruins of pre-Hispanic fortresses and settlements (one- or two-storey houses), often enclosed by high stone walls. Excavations have unearthed metal ornaments and painted figural pottery adorned with animal representations and geometric designs. Petroglyphs depicting peoples, llamas, and hunting scenes have been discovered. The pre-Hispanic traditions have to some extent been kept alive in Chilean folk art: the wooden grave posts with schematic figures made by the Araucanians, weaving, silverwork, pottery, painting, and wood carving. (*See* OCEANIA for the ancient culture of Easter Island.)

In the 16th century the Spaniards built forts, towns laid out in grid patterns, churches, and single-storey adobe houses with patios. Religious painting and sculpture made its appearance. The 18th and early 19th centuries saw the construction of town houses with inner courtyards, portals, and grillwork. Baroque and classical churches and palaces were designed by the architects J. Toesca y Richi and M. de Jara. Decorative painting and sculpture flourished, as well as portraiture and engraving (A. Santelices).

Eclecticism prevailed in architecture throughout the 19th century, to be replaced in the early 20th century by the *art nouveau* style. The leading artists of the mid-19th century were the portraitists F. J. Mandiola and A. Gana. In the second half of the 19th century P. Lira and M. A. Caro produced historical paintings on national subjects, portraits, and landscapes. Realism was strengthened at the turn of the century through the paintings of A. Valenzuela Llanos, E. Plaza, J. F. González, and A. Gordon and the sculpture of N. Plaza and V. Arias.

In the 20th century much attention has been given to town planning, particularly the rebuilding of the center of Santiago, and to adapting the traditions of folk architecture. Since about 1950 the principles of modern architecture have been employed by the architects S. Larrain, E. Duhart, R. Dávila, and J. Martínez in designing large industrial and public complexes, high-rise buildings, and residential districts on the outskirts of Santiago, Arica, and other cities. In painting and the graphic arts, along with the Montparnasse modernist group (headed by the cubist C. Mori), surrealism (R. Matta), and abstract art (N. Antúñez), there emerged the socially oriented realistic art of C. Hermosilla Alvarez, G. Nuñez, J. Venturelli, P. Lobos, and J. Escamez. Intimate lyrical images distinguish the paintings of E. Barreda and M. Lozano. Twentieth-century Chilean sculpture shows a predilection for monumental forms and the revival of ancient traditions (L. Dominguez, S. Roman Rojas).

The military fascist coup of 1973 arrested the development of Chile's art.

Music

The country's ancient musical culture has been preserved by the descendants of the Chilean aborigines, primarily the Araucanians, who have a remarkable variety of songs and dances, both solo and group. Among the favourite musical instruments of the Araucanians are the *cultrung* drum, the *huada* rattle, and the wind instruments called *trutruka, lolkin*, and *pifilka*. The Creole folk music of Chile is similar to that of Argentina. The most popular songs and song-and-dance forms are the *tonada*, the *zamacueca* (commonly called the *cueca*), and the *cuando*, performed to the accompaniment of a guitar, a harp, or a *guitarrón*.

Professional music arose at the time of the struggle for independence and the proclamation of the republic. A philharmonic society was founded in Santiago in 1827, and a music school was opened there in 1849, becoming a conservatory in 1851. The Teatro Municipal, founded in 1857, staged musical plays. Touring foreign companies figured prominently in the country's musical life; the first operatic performances were given by an Italian company that visited the country in 1830. The most important 19th-century composers were M. Robles, J. Zapiola, and E. Ortiz de Zárate, who wrote the first Chilean opera, *Flower Girl From Lugano* (1895).

During the first half of the 20th century two main schools of composition emerged. A national style was championed by the composers C. Lavín, P. H. Allende Sarón, C. Isamitt Alarcón, R. Acevedo, and J. Urrutia Blondel, whereas European musical trends were closely followed by the composers E. Soro, D. Santa Cruz (Wilson), A. Letelier Llona, J. Orrego Salas (who moved to the USA in 1961), and G. Becerra.

Prominent musicians include the conductors A. Carvajal and V. Tevah, the pianists C. Arrau, J. Reyes, and F. Guerra, the violinist P. d'Andurain, and the folklorists and folk singers V. Parra and M. Loyola. The foremost musical groups and institutions, all located in Santiago, are the Symphony Orchestra of Chile (founded 1941), the Municipal Symphony Orchestra (1955), the Chorus of the University of Chile (1945), the Santiago String Quartet (1954), the National Conservatory, and the Institute for the Advancement of the Musical Arts (1940). The journal *Revista Musical Chilena*, founded in 1945 as *Revista Musical*, has appeared since 1946.

The military junta that seized power has ruthlessly persecuted the country's progressive cultural figures. V. Jara, a performer of revolutionary songs, was brutally murdered in 1973. Many musicians have left the country.

Dance and ballet

As an independent art form Chilean ballet began to emerge during the 1940's. Prior to that time ballet performances had been given by foreign, chiefly European, companies. In 1917–18 A. P. Pavlova's company performed in Santiago for two seasons. One of the company's male dancers, Ia. Kaevskii, opened a school in Santiago in 1921, serving as its director until 1938. In 1940 a German company headed by K. Jooss performed in Santiago. The next year the company's dancers organized the School of Ballet, headed by E. Uthoff, which trained performers for the future national ballet. When a Chilean ballet company was formed in 1945, Uthoff was appointed its artistic director. The company, which made its debut in May 1945 with L. Delibes's *Coppélia*, was named the Chilean National Ballet in 1957. After Uthoff, who retained his post until 1965, the company was directed by D. Carey, V. Roncal, and P. Bunster.

Among Uthoff's most successful productions were *The Legend of Joseph*, based on music by R. Strauss (1947), *Don Juan* by C. W. Gluck (1950), and *The Prodigal Son* by S. S. Prokofiev (1955). In 1948, under the direction of Jooss, the company gave fine performances of *The Green Table* by F. Cohen, *Big City*, based on music by A. Tansman, and *Youth*, based on music by G. F. Handel as arranged by J. Orrego Salas. In 1951, M. Solari staged the first national ballet, Orrego Salas' *The Threshold of a Dream*, which incorporated folk music. During the 1950's and 1960's, a growing interest in Latin American themes led to the production of *Calaucan* by the Mexican composer C. Chávez (1959, choreographer P. Bunster), A. Ginastera's *Suraso* (1962, choreographer P. Bunster), and Orrego Salas' *Street Jugglers* (1962, choreographer Uthoff). The eminent choreographers J. Taras (USA) and B. Cullberg (Sweden) have worked with the company. From the outset two trends coexisted in the Chilean ballet—the expressionist, including modern dance, and the classical, whose leading exponent was Solari.

During the 1950's, the Chilean dancers V. Roncal, Bunster, O. Cintolesi, H. Baldrich, and Solari studied in Europe. On Solari's initiative, the Soviet choreographer and teacher E. P. Valukin was invited in 1969 to teach in the ballet school attached to the University of Chile. Valukin remained there until 1972, training teachers and performers of classical dance and introducing improved teaching methods.

In 1949 a ballet company was formed at Santiago's Teatro Municipal under the direction of V. Sulima. The company staged both expressionist and classical ballets, although showing a de-

cided preference for the latter. From 1959, when it was named the Ballet of Modern Art, until 1966, the ballet was headed by Cintolesi. Upon receiving a municipal subsidy in 1965, the company was renamed the Municipal Ballet and subsequently became the country's foremost dance company. Among its finest productions were *Tender Youth* by L. Bernstein (choreographer C. Reyes), *Don Juan* by Gluck (choreographer R. Adam), *Can-Can*, based on music by J. Offenbach (choreographer Hermannsen), and *Chopiniana*, based on music by F. Chopin (choreographer M. Fokine, revised by Cintolesi). From the 1950's through the 1970's the company's soloists have included V. Roncal, Cintolesi, I. Milovan, H. Poll, J. Poldrig, E. Harli, and R. Galgillos.

The Teatro Municipal operates a school of ballet, founded in 1949 and headed by O. Montesino, and it sponsors the Pucara folklore ensemble. In 1969 the Ministry of Education founded the Young Ballet, a school and company headed by the choreographer and teacher H. Baldrich. The next year the Ballet Folklorico Nacional was established under the direction of R. Reys. Ballet companies have also been formed in Arica, Valdivia, Concepción, and Valparaíso. After the military fascist coup many progressive ballet dancers and choreographers emigrated.

E. P. VALUKIN

Theater

The dances and rituals of the indigenous Indians, containing elements of dramatic action, may be regarded as the germ of Chile's national theater. During the 17th and 18th centuries the Jesuits staged plays on religious subjects (incorporating folklore), chiefly during church holidays. The first such play was performed in 1646. In 1693 the comedy *A Chilean Hercules* by an unknown Chilean author was presented in Santiago during a festival. Along with religious productions, Spanish theatrical companies and local amateurs staged plays by Spanish playwrights. In 1709 the first theater building was erected in Santiago, and in 1791 a small theater was built in Valparaíso. The country's first professional company was formed by J. Rubio in the latter half of the 18th century. The Coliseo Theater opened in Santiago in 1815.

Founded after Chile's independence was proclaimed in 1818, the Ramadas Theater staged national plays, among them *The Daughter of the South, or The Independence of Chile* (1823) and *The Chilean Girl* (1827) by M. Magallanes. A theater founded at the University of Chile in 1842 was reorganized in 1857 as the Teatro Municipal. Throughout the 19th century theaters, including private ones, were established in many towns. An important contribution to the development of 19th-century Chilean theater was made by famous actors and directors from other Latin American countries, notably C. Aguilar, J. Casacuberta, F. Cáceres, and H. Morales. The plays of J. Egaña, S. Sanfuentes, C. W. Martínez, J. R. Allende, and D. Izquierdo enjoyed great popularity. The leading playwright of the second half of the 19th century was D. Barros Grez, whose best works include *As in Santiago* (1875), *Birds of a Feather Flock Together* (1879), *Almost a Wedding* (1881), and *Rehearsal of a Comedy* (1889).

The founding of the Association of Dramatists in 1912 was followed three years later by the establishment of the Association of Theater Actors, headed by the actor and playwright C. Cariola. The Syndicate of Theater Actors, founded in the 1920's, merged with the Association of Theater Actors in 1954. The theatrical revival that occurred in the 1920's owed much to the fine plays of V. D. Silva, E. Barrios, A. Moock, and particularly A. Acevedo Hernández, who wrote highly original social dramas drawn from the life of various strata of working people. Of great importance for the subsequent development of the country's theater was the activity of the National Drama Company (founded 1913) and the Báguena-Bührle Troupe (formed 1917), which attracted the outstanding actors and directors A. Bührle, L. Cordoba, A. Flores, and R. Frontaura. A major event was the establishment in 1941 of the Experimental Theater of the University of Chile, headed by the director P. de la Barra; in 1959 the theater was reorganized as the Theater Institute of the University of Chile. Drama groups were also formed at the Catholic University of Chile (1943) and at the university in Concepción. In 1946 a group of professional and amateur actors created the Independent Theater, which adopted the Stanislavsky method.

During the 1950's and 1960's theater festivals were held regularly, and works by the Chilean playwrights J. Díaz, L. A. Heiremans, and I. Aguirre were frequently performed. Famous actors and directors included E. Gajardo, M. Frank, M. Maluenda, A. Siré, S. Piñeiro, O. Escámez, and M. González. Under the Unidad Popular government amateur theater groups were organized by professional actors. About 500 such groups, composed of workers, peasants, and students, put on productions in schools, factory trade union centers, and rural settlements. Theater festivals of amateur and professional groups were held. The military fascist coup of 1973 put an abrupt end to the flowering of Chile's theater arts; many persons connected with the theater have suffered persecution.

Motion pictures

The birth of Chile's national cinema dates from 1902, when an anonymous cameraman filmed a fire being put out in Valparaíso. In 1907 the first documentary, called *The President's Funeral*, was released. The gifted directors P. Sienna and N. de la Sotta began making films after 1910. In the 1920's several film companies were founded in Santiago and Valparaíso: Giambastini Films, Chile Films, and Andes Films. From 1916 to 1932 more than 80 full-length films were made, among the best of which were Sienna's *The Clowns Depart* (1921), *The Wrench of Race* (1922), and *The Hussar of Death* (1925, a historical film about the struggle for national independence); de la Sotta's *The Swallow* (1924) and *Youth, Love, and Sin* (1926); M. Derval's *Why Did This Woman Commit a Crime?* (1924); and J. Délano's *Light and Shadow* (1926) and *Dream Street* (1929). These socially conscious films are notable for their humanitarian message.

The first sound film, *North and South*, was made by Délano in 1934. In the second half of the 1930's two or three full-length motion pictures were released annually, as well as short films, newsreels, and documentaries. The director M. Frank made the outstanding film *Dawn of Hope* in 1941. Among the few exceptions to the commercial, pseudofolkloric films that were churned out in the 1940's were Délano's sociopolitical comedies *The Girl From Crillón* (1941) and *This Is Hollywood* (1944). The general economic crisis of the late 1940's brought the motion-picture industry virtually to a standstill. By 1949 only one or two feature films were being produced annually, and the country's screens were filled with American motion pictures.

A new era in film-making began in the late 1950's. A film institute established in 1957 by the University of Chile in Santiago produced documentaries. An experimental motion-picture center and a film library were founded in 1960. Young film-makers revived social themes and dealt with political events (*Return to Silence*, 1966, directed by N. Kramarenco). The political struggle of the late 1960's was reflected in such progressive films as *The Jackal of Nahueltoro* (1969, directed by M. Littin) and *Three Sad Tigers* (1968, directed by R. Ruiz). Social concern and a high artistic level mark the films *Bloody Saltpeter* (1969, directed by H. Soto), *The House We Live In* (1970, directed by P. Kaulen), *Valparaíso, My Love!* (1970, directed by A. Francia), and *Araucana* (1971, directed by J. Coll), a joint production with Spain and Italy.

Under the Unidad Popular government the state studio Chile Films was formed with Littin as president. The "Political Manifesto: Cinematographers and the UP Government," issued in 1971, called for the creation of a genuinely national and humanistic revolutionary cinema. Films were made that have become part of the golden treasury of Latin-American cinema: *Comrade President* (1970, directed by Littin), *Oath and Gun* (1971, directed by H. Soto), *Witnesses* (1971, directed by C. Elsesser), *The Benefactor* (1973, directed by B. Gebel), and *The Promised Land* (1973, directed by Littin). During S. Allende's years in office 13 feature films and 150 documentaries were made. The leading film stars were M. Romo, T. Ferrada, L. Perucci, E. Guzman, and C. Paz. Chile had 310 motion-picture theaters, three of them equipped with wide screens.

After the fascist junta seized power, progressive film-makers were subjected to repression, and many felt compelled to emigrate. American films again filled the country's screens.

CHILE, UNIVERSITY OF, the largest state higher educational institution in Chile, located in Santiago. Founded in 1738 as the Royal University of San Felipe, the school was reorganized in 1843 as the University of Chile and A. Bello was appointed its first rector.

Under the Unidad Popular government (1970–73) efforts were made to democratize the university. The social composition of the student body changed as more students of working-class background were admitted, and student organizations played an active role in university affairs. The military junta that seized power in 1973 purged the university of its progressive students and teachers.

In the 1976–77 academic year, the university had 19 faculties: physics and mathematics, chemistry and pharmacy, natural sciences, medicine (four faculties), dentistry, agronomy, veterinary science, forestry science, architecture, education, music, the humanities, fine arts, philosophy and letters, juridical and social sciences, and economics. There were eight branch campuses in other cities, including Antofagasta, Arica, Iquique, and La Serena. Affiliated institutions include the Institute for Materials Research and Testing, the Genetic Society of Chile, the National Conservatory, the National Astronomical Observatory, the Art of the American Peoples Museum, and the Contemporary Art Museum.

In 1976–77 the university had an enrollment of about 64,000 students and a faculty of 16,800 instructors. The Central Library contains more than 200,000 volumes, and the 40 other university libraries have about a million volumes. The university publishes *Anales de la Universidad de Chile*, and it oversees other higher educational institutions.

N. D. LUTSKOV [29–593–4]

CHILEAN ARCHIPELAGO, the general name of a longitudinal group of islands that includes several large islands, notably Chiloé, Wellington, and Santa Inés, dozens of smaller islands, and several thousand islets off the coast of southern Chile. The islands are continental in origin, chiefly segments of the Coastal Cordillera of the Andes, reach a maximum elevation of 1,300 m, and show strong traces of glacial action. With the exception of Chiloé, the islands are very sparsely settled. Dense evergreen and deciduous forests cover the islands, and the main economic activities are fishing and forestry.

[29–593–2]

CHILEANS, a nation and the main population of Chile, numbering about 10 million (1975 estimate). The Chileans evolved through the intermingling of Spanish conquerors with local Indian tribes, notably the Araucanians and Diaguitas. They speak Spanish and profess Catholicism.

[29–593–5]

CHILE BASIN, an ocean basin in the southeastern Pacific. It is bounded on the east by the Peru-Chile Trench, on the northwest by the Sala-y-Gómez and Nazca underwater ridges, and on the southwest by the West Chile Ridge. The maximum depth is about 4,800 m. Abyssal hills predominate, although individual underwater mountains have relative elevations of up to 4,000 m. Bottom sediments are mainly aleuritic argillaceous carbonate oozes.

[29–592–2]

CHILIK (also Shilik; in the upper course, Dzhangyryk), a river in Alma-Ata Oblast, Kazakh SSR; a left tributary of the Ili River. The Chilik is 245 km long and drains an area of 4,980 sq km. It rises on the southern slopes of the Transili Alatau and subsequently enters the Ili Basin, where it branches into the Kur-Chilik and Ul'khun-Chilik. The Chilik empties into the Kapchagai Reservoir. It is fed by glaciers and by snow. The mean flow rate 63 km from the mouth is 32.2 cu m per sec. The Chilik is used for irrigation.

[29–594–1]

CHILILABOMBWE, a city in Zambia, near the Zaïre border. Population, approximately 40,000. Chililabombwe is linked by railroad with the city of Ndola. It is a center for the exploitation of a large copper deposit.

[29–594–2]

CHIL'KHUDZHRA, an early medieval castle (late fourth to early eighth centuries) located south of the settlement of Shakhristan in Ura-Tiube Raion, Tadzhik SSR. Chil'khudzhra was excavated from 1961 to 1966. Quadrangular in plan and constructed of mud brick, it had strong walls, with round corner towers and a donjon. Three building periods were traced. The ceilings were vaulted, and a ramp linked the interior with the roof. Remains of wall paintings, wood sculptures and utensils, fragments of the oldest musical instruments in Tadzhikistan, jewelry, and a gold bracteate were found. The most valuable finds were epigraphic remains: three small boards with Sogdian inscriptions in ink (one a receipt for repayment of a debt), which solved the problem of the linguistic affiliation and written language of the population of Ustrushana.

U. P. PULATOV [29–594–7]

CHILLÁN, a city in Chile and capital of Ñuble Province. Population, 85,000 (1970). Chillán is the center of an agricultural region that produces vegetables, grapes and other fruits, cereal grains, and livestock. It has enterprises of the food-processing and leather and footwear industries.

[29–595–1]

CHILLON, a castle in Switzerland, on the shore of Lake Geneva. The earliest known reference to Chillon dates from 1150. The castle was rebuilt several times between the 13th and 14th centuries. The present chapel was built in the 13th century, and the interior ornamentation dates from the 15th and 16th centuries.

During the Middle Ages, the castle was the residence of the counts and, later, the dukes of Savoy. The Swiss political figure F. Bonivard was imprisoned in the dungeon of Chillon from 1530 until 1536.

[29–1198–2]

CHILOÉ, an island off the coast of southern Chile. The Isla de Chiloé is separated from the South American mainland by the Chacao Strait, the Golfo de Ancud, and the Golfo Corcovado. The island is approximately 8,000 sq km in area and reaches a maximum elevation of 820 m. A hilly plain lies in the eastern part of the island; the eastern coastline is highly indented.

Chiloé has a temperate oceanic climate. The average monthly temperature varies from 7° to 14°C; precipitation averages 2,000 to 3,000 mm annually. The island has evergreen mixed forests. The inhabitants engage in logging, commercial fishing, and oystering. Ancud is the principal city and port of the Isla de Chiloé.

[29–594–5]

CHILTERN HILLS, an upland in southeastern Great Britain, on the edge of the London Basin. The upland, with elevations to 260 m, is a cuesta ridge extending from southwest to northeast for 100 km. It is composed of limestones and is dissected into hills by lateral valleys. The slopes have stands of oak, beech, and hornbeam.

[29–594–6]

CHIMBAI, a city (since 1926) under republic (ASSR) jurisdiction and administrative center of Chimbai Raion, Kara-Kalpak ASSR. Situated on the right bank of the lower Amu Darya, 56 km north of Nukus. Population, 21,000 (1974). Industry is represented by a cotton-ginning plant, a vegetable-oil mill, a brickyard, a building-materials plant, and an asphalt-concrete plant. Chimbai has a sovkhoz technicum and a pedagogical school.

[29–595–5]

CHIMBORAZO, an extinct volcano in Ecuador, near the eastern slope of the Cordillera Occidental of the Andes. Mt. Chimborazo, rising to an elevation of 6,262 m, is the highest mountain in Ecuador. The slopes have high-elevation equatorial paramo meadows. Above 4,700 m the peak is permanently snow-capped. The volcano has glaciers. [29–596–1]

CHIMBOTE, a city in Peru, in the department of Ancash; situated on the Pan-American Highway, near the mouth of the Santa River. Population, 103,000 (1970). Chimbote is a port on the Pacific Ocean and has a railroad station. It has enterprises of the ferrous metallurgy industry. A large fishing center, the city produces processed fish, mainly fish meal. Fish meal and agricultural products are exported. [29–596–2]

CHIMION, an urban-type settlement in Fergana Raion, Fergana Oblast, Uzbek SSR. Located in the foothills of the Alai Range, in the Altyaryksai River valley, 24 km south of the Altyaryk railroad station (on the Kokand-Andizhan line) and 32 km southwest of Fergana. Chimion has a machine repair plant, and there is production of crude oil. A balneological health resort, Chimion has hot dry summers, with an average July temperature of 26°C, and mild winters, with an average January temperature of −3°C. The annual precipitation totals about 200 mm. Curative measures include baths in sulfide chloride-sodium-magnesium water. Disorders of the skin, the organs of motion and support, and the peripheral nervous system are treated. There is a balneological clinic in the settlement. [29–596–4]

CHIMISHLIIA, an urban-type settlement and administrative center of Chimishliia Raion, Moldavian SSR. Located 12 km from the Chimishliia railroad station on the Bessarabskaia-Bendery line and 75 km south of Kishinev. Enterprises include a winery, a butter factory, the Iantarnyi sovkhoz, and a poultry hatchery. The settlement also has a museum of local lore. [29–596–5]

CHIMKENT, a city and administrative center of Chimkent Oblast (from 1932 to 1962, Iuzhnyi Kazakhstan Oblast; from 1962 to 1964, Iuzhnyi Kazakhstan Krai), Kazakh SSR. Situated on a foothill plain, between the Badam and Sairam rivers of the Syr Darya basin. Junction of railroad lines to Dzhambul, Arys', and Lenger. Population, 303,000 (Jan. 1, 1977; 74,000 in 1939, 153,000 in 1959, and 247,000 in 1970).

Chimkent has been known since the 12th century. In 1864 it became part of the Russian Empire and was made a district capital in Syr Darya Oblast. During the years of Soviet power, the city has been transformed into a large industrial and cultural center of Kazakhstan.

Industry in Chimkent is linked primarily with the processing of local agricultural products and minerals. One of the city's largest enterprises is a lead-processing plant. Other enterprises include the Fosfor production association, the Kalinin Automatic Press Plant, plants for the production of Cardan shafts, chemicals, pharmaceuticals, and phosphorus salts, and a hydrolysis plant. An oil refinery is under construction (1978). Light industry is represented by a cotton combine, cotton-ginning and karakul plants, the Elastik hosiery and knitwear production association, the Voskhod clothing factory, and the Chimkentmebel' furniture production association. The food-processing industry is represented by a meat-packing plant, a combine for the production of oils and fats, and a production association of the milk industry. The building-materials industry is represented by a cement plant, a brickyard, and an asbestos roofing combine.

Chimkent has institutes of chemical technology and pedagogy, a pedagogical institute of culture, a branch of the Alma-Ata Institute of the National Economy, and five technicums—power, automotive, polytechnic, cooperative, and irrigation construction technicums. It also has a medical school, a music school, and an art school. There are two theaters (Kazakh and Russian) and a museum of local lore in the city.

[29–596–6]

CHIMKENT OBLAST (until 1962, Iuzhnyi Kazakhstan Oblast; until 1964, part of Iuzhnyi Kazakhstan Krai), an oblast in the southern part of the Kazakh SSR. Formed Mar. 10, 1932; present boundaries established 1973. Area, 116,300 sq km. Population, 1.501 million (1977). Chimkent Oblast has 15 administrative raions, eight cities, and seven urban-type settlements. The administrative center is the city of Chimkent. The oblast was awarded the Order of Lenin on Aug. 12, 1967.

Natural features. Chimkent Oblast lies in the eastern part of the Turan Lowland and the western spurs of the Tien-Shan. Most of the territory is a slightly hilly plain, with elevations of 200 to 300 m. The sandy ridges of the Kyzylkum are in the southwest, on the left bank of the Syr Darya, and the Muiunkum desert lies in the north, on the left bank of the Chu. In the extreme south is Golodnaia Steppe, and in the extreme north, the Betpak-Dala desert. The Karatau mountain range, with Mount Bessaz, which rises to an elevation of 2,176 m, stretches across the central part of the oblast. The southeast is occupied by the western edge of the Talas Alatau and by the Karzhantau and Ugam ranges, with elevations to 2,824 m and 4,238 m, respectively.

The climate is sharply continental and dry, with long hot, dry summers and short warm, virtually snowless winters, characterized by frequent periods of thaw and rain. The average July temperature is 26° to 29°C in the north and southwest and 19° to 25°C in the southeast. The average January temperature ranges from −11°C in the north to −2°C in the south. Annual precipitation amounts to about 100 mm in the Betpak-Dala in the north, 100 to 400 mm on the plains in the southwest, with sharp fluctuations from year to year, 400 to 800 mm in the foothills in the southeast, and as much as 1,000 mm and more in the high mountains. The growing season ranges from 230 days in the mountains to 320 days on the plains.

The largest river is the Syr Darya, which crosses the oblast from south to northwest; its tributaries include the Keles, Kurukkeles, and Arys'. These rivers flow down from the mountains and are extensively used for irrigation. The Chardara Reservoir was constructed on the Syr Darya; the principal irrigation channels are the Kirov channel, with the Dzhetysai branch in Golodnaia Steppe, the Arys' channel, and the Turkestan channel, with the Bugunskoe Reservoir in the foothills of the Karatau. The Chu River, which disappears in the sands of the Muiunkum Desert and breaks up into arms in the summer, flows through the northern part of the oblast. The Syr Darya floodplain abounds in small freshwater lakes; there are a number of salt lakes, including Lake Akzhaikyn, along the lower Chu River.

Deserts predominate on the plains, with sandy and sandy-loam brown and gray-brown soils and with grass-wormwood and saltwort vegetation, interspersed with thickets of the saxauls *Haloxylon aphyllum* and *H. persicum*, tamarisk, and other shrubs. The floodplains of the Syr Darya and the Chu have floodplain meadow, often saline, soils with thickets of reeds and belts of *tugai* forest (a type of gallery forest) of willow and poplar. High-altitude belts are widely represented in the mountains, ranging from deserts, at the foot, to alpine meadows and glaciers; the soil cover ranges from mountain-steppe sierozem, chestnut, and chernozem soils to mountain brown and gray-brown soils and, still higher, to mountain-meadow soils.

Rodents, including susliks, sand launces, and jerboas, live in the deserts. The mountains are inhabited by mountain goats (tauteke) and sheep (argali); snow leopards, bears, and vultures are also encountered. The *tugai* areas are inhabited by wolves, foxes, ermines, polecats, and wild boars, as well as by pheasants; geese and ducks are found around the lakes. Reptiles include snakes, turtles, and lizards. The Aksu-Dzhabagli Reserve is located in the spurs of the Talas Alatau.

Population. Chimkent Oblast is populated by Kazakhs (47 percent, according to the 1970 census), as well as by Russians (22 percent), Uzbeks, Ukrainians, Tatars, Azerbaijanis, Tadzhiks, and Koreans. The urban population totals 40 percent. The average population density is 12.9 persons per sq km. The most densely populated areas are the irrigated lands of the oases in the foothills and in the Golodnaia Steppe, with 30 to 40 persons per sq km. There are a number of individual seasonal settlements in the deserts. With the exception of Chimkent and Turkestan, all of the towns have sprung up in Soviet times in connection with

the exploitation of deposits of minerals (for example, Kentau and Lenger), around railroad stations (for example, Arys'), or in connection with irrigation construction (for example, Dzhetysai, Chardara, and Saryagach).

Economy. The economy combines branches of industry associated with the mining of minerals and the processing of raw agricultural products with intensive, primarily irrigated, farming and diverse stock raising.

Power production is based mainly on natural gas from the Uzbek SSR, coal from the Kirghiz SSR, local lignite from Lenger, and mazut. The oblast is part of the electric power system of southern Kazakhstan and Middle Asia.

The developed branches of industry include mining, nonferrous metallurgy, machine building, the production of chemicals and pharmaceuticals, light industry, and food processing. The mining industry is represented by complex-ore mines and ore-dressing plants in the urban-type settlement of Achisai and elsewhere. Nonferrous metallurgy is represented by the lead-processing plant in Chimkent. Machine-building enterprises include the M. I. Kalinin Automated Press Plant and plants for the production of Cardan shafts, automobile and tractor parts, and power shovels. The chemical and pharmaceutical industry is represented by a chemical-pharmaceutical plant, an antibiotic feed plant, and the Fosfor production association. Light industry enterprises include a cotton combine, a cotton-ginning plant, a karakul plant, the Elastik hosiery and knitwear production association, and clothing and footwear factories. The food-processing industry is represented by meat-packing plants, a combine for the production of oils and fats, butter factories, canned-milk and fruit plants, and wineries. The most important building-materials enterprises are cement plants (in Sastobe), brickyards, a plant for the production of *keramzit* (in Saryagach), and an asbestos roofing combine. Most of the industrial enterprises are located in Chimkent; other important centers are Turkestan, Kentau, and Dzhetysai. An oil refinery is under construction (1978) in Chimkent.

In 1976, Chimkent oblast had 116 sovkhozes and 54 kolkhozes. Agricultural lands, which total 11.4 million hectares (ha), are dominated by pastures, which occupy about 9 million ha. There are winter pastures in the deserts in the north and southwest, summer pastures in the mountains, and year-round pastures in the floodplains of the Syr Darya and Chu rivers. About 180,000 ha are occupied by natural hayfields—dry hayfields in the foothills and flooded hayfields in the Syr Darya floodplain. Arable lands occupy 1.148 million ha (1976), of which 332,000 are irrigated. The sown area totals 1,104,500 ha (1976), of which 57 percent, or 633,000 ha, are under cereal grains, primarily winter wheat and barley, as well as rice; some spring wheat, rice, and corn for grain are also planted. More than 11 percent of the sown area, or 123,700 ha, is under industrial crops, mainly cotton and oil-yielding plants. About one-third of the sown area, or 330,500 ha, is under forage crops, mainly perennial grasses, silage corn, and green fodder. Potatoes (2,600 ha), vegetables (7,900 ha), and melons and gourds (5,200 ha) are cultivated. Also developed is the growing of grapes (9,200 ha) and such fruits as apricots, peaches, pears, and apples. Chimkent Oblast is the Kazakh SSR's leading region of irrigated farming, cotton growing, viticulture, and fruit growing.

Stock raising is dominated by transhumant raising of karakul, fine-wooled, and meat and tallow breeds of sheep; the raising of beef and dairy cattle in stables and on pastures is also developed. Sheep and goats, which number 3.668 million (1976), account for most of the livestock. Cattle (320,600 head, including 136,200 cows), swine (140,700), horses (67,800), camels (10,900), donkeys, and poultry are also raised.

Intensive farming predominates in the oases of the foothill irrigated zone of Chimkent Oblast and along the irrigation channels of the Golodnaia Steppe; here, cotton, forage and grain crops, fruits, grapes, melons, gourds, and various vegetables are cultivated, and sericulture is practiced. Dairy cattle are raised, both in stables and on pastures, as are swine and poultry. Rice growing is the main occupation in the Syr Darya valley, combined with the transhumant raising of sheep, including karakuls, and camels. Nonirrigated grain farming, beef and dairy farming, and horse-breeding on summer pastures are practiced in the mountains. In the deserts, hunting and the gathering of saxaul are common, with some farming and cattle grazing on winter pastures.

Chimkent Oblast has 673 km of railroads, including a section of the Orenburg-Tashkent and Arys'–Alma-Ata main lines. Automobile roads total 5,657 km (1976), of which 4,449 km are hard-surfaced. The most important highways are the Chimkent-Tashkent, Chimkent-Dzhambul, and Chimkent–Turkestan–Kzyl-Orda highways. The city of Chimkent is linked by air with Moscow, Tashkent, Frunze, Alma-Ata, and Karatau and with various parts of the oblast.

The Bukhara–Tashkent–Chimkent–Frunze–Alma-Ata main gas pipeline passes through the oblast. O. R. NAZAREVSKII

Education, cultural affairs, and public health. In the 1914–15 academic year, there were 99 general-education schools, with 5,156 pupils and students. There were no specialized secondary or higher educational institutions. In the 1976–77 academic year, there were 404,600 pupils and students in 995 general-education schools of all types, 19,300 students in 33 vocational-technical educational institutions, including more than 9,000 students in 16 secondary vocational-technical schools, 22,200 students in 19 specialized secondary educational institutions, and more than 12,000 students at the Kazakh Institute of Chemical Technology, a pedagogical institute, a pedagogical institute of culture, and a branch of the Alma-Ata Institute of the National Economy, all in Chimkent. In 1976 more than 55,000 children were attending 395 preschool institutions

Scientific institutions in Chimkent Oblast include the Kazakh Scientific Research Institute of Karakul Raising, the Southern Kazakhstan Scientific Research Veterinary Station, and the Southern Kazakhstan Interbranch Territorial Center of Scientific and Technical Information. As of Jan. 1, 1977, the oblast had 905 public libraries, with 6.114 million books and journals; the Chimkent Oblast Museum of Local Lore, with a branch in the city of Kentau; the Oblast Kazakh Drama and Russian Oblast Drama theaters in Chimkent and the Oblast Musical Drama Theater in Dzhetysai; and 781 clubs, 602 motion-picture projection units, and 92 extracurricular institutions.

The oblast newspapers *Ontustik Kazakstan* (Southern Kazakhstan, published in Kazakh since 1932) and *Iuzhnyi Kazakhstan* (Southern Kazakhstan, since 1925) are published. All-Union radio broadcasts are transmitted 28.5 hours per day; republic and oblast broadcasts are transmitted in Kazakh and Russian nine hours per day and 1.5 hours per day, respectively. Television programs from Vostok are relayed from Moscow 12.9 hours per day; the oblast also receives republic programs from Alma-Ata in Kazakh and Russian, totaling eight hours, and from Tashkent in Uzbek and Russian, totaling seven hours.

As of Jan. 1, 1977, the oblast had 154 hospitals, with 16,200 beds (10.8 beds per 1,000 inhabitants), and 2,900 physicians (one physician per 525 inhabitants). The balneological health resort of Saryagach is located in the oblast.

CHIMPANZEE, a large anthropoid ape of the genus *Pan* of the family Pongidae. The chimpanzee measures 150–165 cm in height and weighs 45–80 kg; the females are somewhat smaller than the males. The arms are longer than the legs. The fingers are long, and a relatively short thumb is in opposition to the rest of the fingers. The ears are large, the upper lip is high, and the nose protrudes little. Supraorbital and occipital ridges are developed on the skull. The skin on the face, hands, and feet is wrinkled. The hair is black and coarse. The skin is light-colored. There are two species: the common chimpanzee (*Pan troglodytes*) and the dwarf chimpanzee (*P. paniscus*). Both species have a set of 48 chromosomes. Some zoologists consider them to be subspecies of a single species.

Chimpanzees are distributed in equatorial Africa. Semiterres-

trial animals, they inhabit tropical rain and mountain forests, up to elevations of 3,000 m. Each night they build a new nest in a tree. They live in groups of five to 25 individuals under a hierarchical system. They feed on fruits, leaves, shoots, various insects, bird eggs, nestlings, and, sometimes, small mammals. Gestation lasts about 225 days. Sexual maturity is reached at the age of six to ten years. Life expectancy is 50–60 years.

Chimpanzees are curious by nature and are capable of learning through imitation. They are distinguished by the development of social instincts. They are characterized by a considerable variety of facial expressions and gesticulations, and they use about 30 different sounds to communicate. Many scientists have noted that chimpanzees have the capability of goal-oriented activity and possibly of rudimentary abstract thought. According to many biochemical features, they are closer to man than the other anthropoid apes and are therefore used in medicobiological and psychophysiological experiments. Their numbers are few. The dwarf chimpanzee is listed as an endangered species in the *Red Data Book* of the International Union for Conservation of Nature and Natural Resources.

CHIN, a national administrative division in Burma, in the mountainous northwestern section of the country. Area, 33,000 sq km. Population, 354,000 (1969). The district is inhabited primarily by people of the Chin nationality. Falam is the principal city. Agriculture and logging are the basis of the economy. [29–602–2]

CHINADIEVO, an urban-type settlement in Mukachevo Raion, Transcarpathian Oblast, Ukrainian SSR. Chinadievo is located on the Latoritsa River of the Tisza basin and has a railroad station on the Batevo-Stryi line. Industry is represented by a lumber combine, a wood-products shop of the raion-wide industrial combine, and an experimental plant for the manufacture of heels and shoe lasts. [29–603–2]

CHINAKAL, NIKOLAI ANDREEVICH. Born Nov. 7 (19), 1888, in the village of Nur-Ali, in what is now Evpatoriia Raion, Crimean Oblast. Soviet scientist; specialist in mining. Corresponding member of the Academy of Sciences of the USSR (1958). Hero of Socialist Labor (1967). Member of the CPSU since 1944.

Chinakal graduated from the Ekaterinoslav (now Dnepropetrovsk) Institute of Mines in 1912. In the early 1920's he helped reconstruct and mechanize underground mines in the Donets Coal Basin, and in 1935 he proposed the shield system for working large beds in the Kuznetsk Coal Basin. From 1944 to 1973 he served as director of the Institute of Mining of the Siberian Division of the Academy of Sciences of the USSR (until 1957, the Institute of Mining and Geology of the Western Siberian Branch of the Academy of Sciences of the USSR).

Chinakal's principal work has been devoted to the creation and improvement of systems of movable ceiling supports for mining large coal beds. Chinakal received the USSR State Prize in 1943 and the Lenin Prize in 1966. He has been awarded two Orders of Lenin, two other orders, and several medals. [29–603–4]

CHINANTEC, the language of the Chinantec, spoken in the northeastern part of the state of Oaxaca, Mexico. Chinantec is an Otomian-Mixtecan-Zapotecan language.

Chinantec has a rich vowel system. Its dialects have eight short vowels and long and nasalized vowels, and its relatively sophisticated system of consonants includes a glottal *h* and a glottal stop. Chinantec has a complex system of phonological tones: depending on the dialect, there may be three or four simple tones and a sequence of two or three of these tones may occur in a single syllable. The complicated syllabic structure permits initial and final clusters made up of a glottal and a consonant and allows of initial clusters composed of a consonant followed by a glide (*w* or *j*): *hŋĩɑn*$^{2+3}$ ("he kills") and *ry*^{2}*kwəhn*^{1} ("I will give"), with tones indicated by numerals. Grammatical meaning is expressed through affixes (syllabic and nonsyllabic) and alterations in tone, as in *ry*^{2}*kwəhn*^{1} ("I will give") and *ry*$^{2+3}$*kwəh*$^{2+3}$ ("he will give"). Grammatical meaning may also be expressed by auxiliary words and through word order.

CHINAZ, a city (since 1972) and the administrative center of Chinaz Raion, Tashkent Oblast, Uzbek SSR. Chinaz has a railroad station 63 km southwest of Tashkent. The city also has a cotton-ginning plant and combines for the production of building materials, structural components, and nonmetallic construction materials. [29–603–3]

CHINCHILLA, a genus of rodents of the family Chinchillidae. The body length is 22–38 cm, and the tail length 7–15 cm. The head and eyes are large, the ears orbicular (5–6 cm), and the whiskers long. The four-toed hind legs are twice as long as the five-toed fore legs. There are 20 teeth, including 16 molars that grow throughout the animal's life. The soft, thick fur reaches 3 cm in length. The coloration is white on the abdomen and blue-gray with dark overtones on the back and sides. Seasonal and sexual dimorphism is absent. There are two species—the long-tailed (*C. laniger*) and the short-tailed (*C. brevicaudata*).

Chinchillas are found in the arid mountainous regions of the Chilean, Peruvian, Bolivian, and Argentinian Andes. They live in colonies in crevices of cliffs; they are nocturnal throughout the year. Chinchillas feed on grasses, shrubs, and cacti. One to three litters are produced yearly, with an average of two young in each (a litter may contain one to six young).

By the early 20th century chinchillas had almost been hunted to extinction for their valuable fur. The animals are now protected by law and bred in small numbers on farms in many countries. In the USSR chinchillas have been bred since 1960 on the test farm of the All-Union Research Institute of Hunting and Fur Farming near Kirov; the animals are also being raised by amateur breeders in 40 oblasts. Experiments on acclimatizing the animals in the Pamirs and Transcaucasia are in progress.

I. B. KIRIS [29–1208–3]

CHINCHILLIDAE, a family of mammals of the order Rodentia. The body length is 22–66 cm; the tail length is 7–32 cm. The family consists of three genera—*Chinchilla, Lagostomus* (with one species, the viscacha), and *Lagidium*. The animals, which inhabit South America, are commercially valuable. Their number is decreasing, but they are now protected animals. [29–1208–2]

CHINDWIN, a river in western Burma. The Chindwin flows into the Irrawaddy from the right and is the Irrawaddy's main tributary. It has a length of approximately 1,100 km and drains an area of approximately 114,000 sq km; part of its basin is in India. The Chindwin rises on the western slopes of the Kumon Range. The upper and middle courses flow through a winding, forested valley, and the lower course flows through a vast intermontane basin, where some of the river's water is used for irrigation. Fed by rain, the river has a monsoonal regimen, with high water occurring in summer. The mean flow rate is greater than 4,000 cu m per sec. The Chindwin is navigable up to the mouth of its main tributary, the Uyu; the total distance is more than 600 km. In the dry season the river is navigable for 400 km upstream. The city of Monywa is situated on the Chindwin. [29–605–4]

CHINGIZTAU, a mountain range in the eastern Kazakh Melkosopochnik, in the Kazakh SSR. The Chingiztau measures approximately 200 km in length and rises to elevations of 1,078 m at Mt. Kosbastau in the northwest and 1,305 m at Mt. Kosoba in the Akshatau Range in the southeast. The range is composed of Paleozoic sandstones, shales, limestones, and porphyrites. Mountain steppes, as well as aspen-birch forests and osier thickets, are found in the valleys. [29–604–2]

CHINGOLA, a city in Zambia. Population, 130,000 (1972, estimate). Linked by railroad with the city of Ndola, Chingola is one of the centers of the Copperbelt of Central Africa. [29–605–1]

CHINGUNJAV (also Chingunzhab). Date of birth unknown; died June 12, 1757. Mongol *noion* (feudal lord). Leader of an anti-Manchu movement in Khalkha in the summer of 1756.

The movement resulted from an intensification of political and economic oppression by the Ch'ing Dynasty, which had long waged war against the Oirat Khanate in Dzungaria, and from the increased repression that followed the outbreak of the uprising led by the Oirat prince Amursana. However, the immediate cause of Chingunjav's uprising was the execution in Peking of Erintsindorji, a Mongol military leader and brother of the *bogdo-gegen* (head of the Lamaist sect in Mongolia).

In July 1756, Chingunjav, who was serving in the Manchu army in Dzungaria as the leader of a 2,000-man detachment of Mongol troops, returned to his native nomad territories near Lake Khubsugul. There he made energetic efforts to incite the Mongol feudal lords to rebel against the Manchus. He also established contact with Amursana.

The Ch'ing responded by dispatching troops from Dzungaria to Khalkha to fight Chingunjav's rebel detachments. Captured in January 1757, Chingunjav and his sons were taken to Peking and executed.

CHINHAE, a city and port in South Korea, in Kyongsang-namdo (South Kyongsang Province), on Chinhae Bay of the Korea Strait. Population, approximately 100,000. Chinhae is a transportation junction and an important center of the chemical industry. Other economic activities include fishing, food processing, and the production of consumer goods. [29–612–2]

CHINILIN, ANATOLII IVANOVICH. Born Aug. 8 (21), 1913, in the village of Izheslavl', in what is now Riazan' Oblast. Soviet athlete, one of the founders of the Soviet school of volleyball. Honored Master of Sport (1944); international-class official (1951); Honored Coach of the USSR (1956).

Chinilin was volleyball champion of the USSR on several occasions in the 1930's. A member of the CPSU since 1943, he is also a veteran of the Great Patriotic War (1941–45). Chinilin has been awarded two orders and several medals. [29–606–1]

CHINIOT, a city in Pakistan, in Punjab Province, near the Chenab River. Population, 47,000 (1961). Chiniot has a railroad station and cotton-ginning enterprises Local artisans carve ivory, and copperware and fabrics are also produced by hand. [29–606–2]

CHINJU, a city in South Korea, in Kyongsang-namdo (South Kyongsang Province), on the Nam-gang, a tributary of the Naktong-gang. Located west of Pusan. Population, 119,400 (1970). Chinju is an important transportation junction, and it is the center of an agricultural region that produces rice, cotton, and tobacco. The city has food-processing and textile industries. [29–605–3]

CHINK (literary form of the Kazakh and Turkmen word *shïn*), a precipice or scarp at the edge of a plateau or mesa. The term, which is widespread in Kazakhstan, Turkmenistan, and Uzbekistan, is most often used for the precipices of the Ustiurt Plateau. Chinks are 300–350 m high. They form as a result of erosion, denudation, or tectonic processes. [29–606–3]

CHINKOV (also Vorkadin). Date of birth unknown; died after 1612. A Mordovian who became a rebel leader in Nizhny Novgorod Krai during the Peasant Uprising under I. I. Bolotnikov.

Data in the Nizhny Novgorod tax rolls indicate that Chinkov came from the village of Tepelevo in Staryi Berezopol'skii Stan (subdistrict), Nizhny Novgorod District. Between the fall of 1606 and the early months of 1607, Chinkov, Moskov, and the *dvorianin* (nobleman) I. B. Domozhirov, who had been elected as leaders by the rebels, directed the siege of Nizhny Novgorod for several months. [29–606–5]

CHINOOK, a southwesterly foehn that blows on the eastern slopes of the Rocky Mountains in Canada and the USA and on the adjacent parts of the prairie. The chinook is accompanied by a very sudden, sharp increase in air temperature of as much as 20° to 30°C, which facilitates increased melting of snow, faster ripening of fruit, and so on. The chinook is observed year-round but is especially frequent in the winter. The term "chinook" is also applied to the moist southwesterly wind that blows from the Pacific Ocean along the western coast of the USA. [29–612–1]

CHINOVNICHESTVO, a term that was used in Russia to designate all persons holding official rank or employed in state service. This class of state functionaries, or *chinovniki*, grew out of the administrative system of *prikazy* (offices) that arose in the Russian state in the 16th century.

The hierarchy of ranks that developed within the *prikaz* system—including the rank of judge (or chief administrator), *dumnyi d'iak* (duma clerk), *d'iak* (clerk), and *pod'iachii* (lowest-ranking administrative official)—was soon extended to the local official state bodies as well. The *prikaz* judges, *namestniki* (vicegerents; until the mid-16th century), *voevody* (military governors), and *d'iaki* were appointed by the tsar and the Boyar Duma. They were given fiefs and serfs as rewards for service. The *pod'iachie* were appointed by the Razriadnyi Prikaz (War Office). The *d'iaki* and *pod'iachie* multiplied in number with the growth of the state's administrative machinery. In the early 17th century the total number of *d'iaki* was 55; in 1676 there were 103 *d'iaki* in the *prikazy* and 35 in the district offices; in the 1680's approximately 2,000 *pod'iachie* served in 37 *prikazy*.

With the establishment of absolutism in Russia in the early 18th century the *prikazy* were replaced by the collegia (*kollegii*). Peter I introduced legislation establishing obligatory lifelong service for noblemen; former clergymen, merchants, members of the lower middle class, and state peasants were encouraged to enter state service. The status of the *chinovnichestvo* was formally legalized in the first quarter of the 18th century. The higher functionaries—namely, the collegium presidents and the provincial governors (*gubernatory*)—were appointed by the tsar and the Senate; after 1711, when the Razriadnyi Prikaz was abolished, the lower ranks were appointed by the Senate.

The General Statute of 1720 established a uniform structure and a prescribed system of activities for the collegia and other government institutions. The Table of Ranks of 1722 introduced a unified system of ranks and legalized appointments to army and state positions on the basis of individual merit, ability, and experience (see Table 1). The *chinovnichestvo* was divided into the *tabel'noe* (registered) and *vnetabel'noe* (unregistered) *chinovnichestvo*; the former consisted of the 14 classes listed in the Table of Ranks, and the latter, of the state functionaries not included therein (clerks, copyists, and junior clerks).

Beginning in 1764, the functionaries' state salaries were paid in money; in addition, however, such incentives as royal grants of inhabited state lands to members of the upper *chinovnichestvo* remained in use until the early 19th century. Although the Manifesto on Freedom of the Nobility of 1785 abolished compulsory state service for members of the nobility, they continued to be drawn to such services because of the *chinovnichestvo*'s privileged status.

By the middle of the 18th century the number of state functionaries was close to 5,000. Approximately 150 of them—namely, senators, collegium presidents, heads of the most important bu-

Table 1. Table of Ranks (with amendments and addenda, 18th to early 20th centuries)

Class	*Military rank*		*Civilian rank*	*Court rank*
	Army	*Navy*		
1	General field marshal	Admiral general	Chancellor Active privy councillor, first class	
2	General in chief (1716–96) *From 1796* General of the infantry General of the cavalry General of the artillery General of the engineers	Admiral	Active privy councillor	High chamberlain High marshal of the court Senior gentleman squire Senior huntmaster High master of the court Over-butler Senior gentleman of the chamber Senior gentleman carver (from 1856)
3	Lieutenant general (from the 1730's to the late 18th century the term *poruchik* was used instead of "lieutenant")	Vice admiral	Privy councillor	Marshall of the court Gentleman squire Huntmaster Master of the court Senior gentleman of the chamber Senior gentleman carver (from 1856)
4	Major general	Rear admiral	Privy councillor (to 1724) Active civil councillor	
5	Brigadier (1722–99)	Commodore admiral (1722–99)	Civil councillor	Gentleman of the chamber (from 1884)
6	Colonel	Captain, or captain first class	Collegial councillor	*Kamer-fur'er* (to 1884)
7	Lieutenant colonel Host *starshina* (from 1884)	Commander, or captain second class	Aulic councillor	
8	First major and second major (1731–97) *Until 1884* Major Host *starshina* *From 1884* Captain *Rotmistr* *Esaul*	Captain third class (18th century) Lieutenant commander (to 1884 and in 1907–11) Senior lieutenant (from 1912)	Collegial assessor	
9	*Until 1884* Captain *Rotmistr* *Esaul* *From 1884* Staff captain Staff *rotmistr* *Pod"esaul*	Lieutenant commander (18th century) Lieutenant (from 1884) Senior lieutenant (1907–11)	Titular councillor Collegial secretary	
10	*Poruchik* captain (1705–98) *Until 1884* Staff captain Staff *rotmistr* *Pod"esaul* *From 1884* Lieutenant *Sotnik*	Lieutenant (to 1884) *Michman* (from 1885)		
11	*Until 1884* Lieutenant *Sotnik*		Ship's secretary (originally a naval rank)	
12	Second lieutenant and sub-lieutenant (18th century) *Podporuchik* *From 1884* Cornet *Khorunzhii*	*Michman* (to 1885)	Provincial (*gubernskii*) secretary	
13	Ensign *Until 1884* Cornet *Khorunzhii*		Subprovincial (*provintsial'nyi*) secretary Senatorial registrar Synodal registrar Cabinet registrar	
14	*Fendrik* (18th century)	*Michman* (18th century)	Collegial registrar	

reaus and offices, and provincial governors—made up the first four classes of the Table of Ranks. The next group consisted of fifth- to eighth-class functionaries—prosecutors, provincial *voevody*, and members of various bureaus (numbering approximately 600). Classes 9 to 14 constituted the bulk of the executive manpower in state institutions. Two-thirds of the *chinovnichestvo* consisted of functionaries not registered in the Table of Ranks. Almost 80 percent of the last two groups were former members of the nonprivileged estates.

The first half of the 19th century saw a rapid acceleration of the bureaucratization of the state's administrative machinery. The establishment of the ministries between 1802 and 1811 led to the rise of bureaucratic agencies with a complex internal organization and elaborate paper work. The number of registered functionaries grew from approximately 13,200 in 1804 to 71,800 in 1850 and 82,300 in 1856. Similarly, the number of unregistered functionaries grew from 26,300 in 1850 to 31,600 in 1856. The system of service appointments and promotions, as well as the rewards, incentives, penalties, and retirement provisions, were defined in 1832 by the Statute on State Service.

In the first half of the 19th century the *chinovnichestvo* was divided into four groups. The first group, comprising classes 1 to 5, was made up of the upper levels of the bureaucracy, which in effect determined government policy. The second group, made up of classes 6 to 8, included functionaries holding executive positions. Members of these two groups enjoyed great privileges and drew high salaries. The third group—classes 9 to 14—consisted of clerks and lower-level executives. The fourth group, which comprised the unregistered functionaries and was employed for technical work only, differed from the registered groups in both material and legal respects. During the rapid increase in the total number of functionaries, this last group was the most immediate source of recruitment for the registered *chinovnichestvo*.

Until the early 19th century, no educational qualifications were required for appointment to state service. As stipulated in a ukase of 1809 proposed by M. M. Speranskii, a certain level of education was required of state functionaries; for promotion to classes 8 through 5 they had to present a university diploma or pass a series of examinations. The following terms of service were established for promotion to a higher class: three years of service in each class for classes 14 up to 9, four years of service in class 9, five years in class 8, six years in class 7, four years in class 6, five years in class 5, and ten years in class 4. Promotions to classes 2 and 1 were granted at the personal discretion of the tsar and without term-of-service requirements.

Between 1836 and 1843 approximately 7,200 persons were promoted to eighth-class rank, which conferred hereditary nobility; approximately 4,700 of them were not of noble birth. Beginning in 1845, hereditary nobility was conferred on sixth-class ranks in the military service and fifth-class ranks (fourth-class from 1856) in the civil service; personal nobility was conferred on ninth-class ranks.

The upper levels of the prereform *chinovnichestvo* were chiefly composed of the landed nobility. In the words of V. I. Lenin, "the noble landowner had ruled in the absence of a 'plutocracy' . . . and in the absence of a growing third element" (*Poln. sobr. soch.*, 5th ed., vol. 21, p. 81). Inasmuch as the *chinovnichestvo* was viewed as the underpinning of the autocracy, those who were regarded as compromised in terms of their service or found to be politically unreliable were expelled from its ranks. Article 3 of the law of Nov. 7, 1850, gave the authorities the right to dismiss subordinates without explanation; there was no right of appeal.

The organizational form of the *chinovnichestvo* system as it had evolved in the first half of the 19th century was maintained in the subsequent period of capitalist development, when the regime took the first step toward a bourgeois monarchy (see *ibid.*, vol. 20, p. 165); nevertheless, while the upper strata of the *chinovnichestvo* were still made up of the landed nobility, the middle and lower ranks were now enlisting the wealthier elements of the bourgeoisie—that is, the plutocracy.

The new local self-government bodies—established during the city reform of 1870 and the *zemstvo* (district and provincial) reform of 1864–employed hired personnel (such as doctors, teachers, technicians, and agronomists) who came to be known in bureaucratic circles as the third element. In the late 1860's several state agencies began hiring women. In 1897 the number of women employed in various offices was 38,000 (including 28,900 women working in educational institutions); this figure amounted to almost 9 percent of all functionaries, who numbered approximately 440,000. In 1901 the number of functionaries in Russia was close to 500,000, including 120,000 to 125,000 not listed in the Table of Ranks.

In the late 19th and early 20th centuries, as Russia entered the age of imperialism, close contacts were established between the monopolies and government institutions. Individual monopolists served as consultants at various levels in the ministries of Trade and Industry, Communications, Finance, Army, and Navy, as well as in the Main Administration for Land Tenure and Agriculture.

Among those formally included in the *chinovnichestvo* were members of the St. Petersburg Academy of Sciences and Academy of Arts, professors of the universities and other higher educational institutions, *Gymnasium* teachers, and certain other cultural and scientific figures who had a given class rank and were considered to be in state service.

The Revolution of 1905–07 forced the autocracy to grant the right of admission into state service to members of all the estates (excluding some of the non-Russian peoples). In actuality, because of class barriers and educational requirements, this right did not extend to workers and peasants. As early as 1903, V. I. Lenin compared the *chinovnichestvo* to a dense forest through which "a mere worker can never make his way" (*ibid.*, vol. 7, p. 137). The changing social composition of the *chinovnichestvo* in the early 20th century affected the political reliability of some of its members. A special ruling by the Senate on Apr. 30, 1908, affirmed that state service was incompatible with revolutionary and oppositionist activities.

Even after the Revolution of 1905–07 the upper ranks of the *chinovnichestvo* retained many of the elements and traits of the bureaucratic landowning nobility. As Lenin wrote in late 1911, "the bureaucracy is . . . recruited . . . from the old, very old, not only pre-revolutionary (before 1905), but even pre-Reform (before 1861), landed and office-holding nobility"; and this bureaucracy "lends its bourgeois activity *a tendency and a form* that is purely and solely feudal" (*ibid.*, vol. 21, p. 58).

During World War I a great number of military functionaries filled the ranks of Russia's *chinovnichestvo*; at the same time the various state offices made greater efforts to recruit women into service. The third element grew in numbers and in strength throughout the public and state agencies concerned with war supplies and services—particularly the All-Russian Zemstvo Union, the All-Russian Union of Cities, the Zemgor, and the war industries committees. Tsarist functionaries worked together with members of the bourgeoisie in the special conferences, thus initiating the gradual merging of the state apparatus and the imperialist monopolies (*see* SPECIAL CONFERENCES).

The old state apparatus and the *chinovnichestvo* were retained by the Provisional Government after the February Revolution of 1917. While the government was forced to replace certain state functionaries—for example, in the administrative sphere, in the police, and to some extent in the courts—most of those who were dismissed continued to receive government salaries, supplemental allowances, and sizable pensions. The state service system continued to be governed by the Table of Ranks and the Statute on State Service.

After the October Revolution of 1917 the functionaries of the central state institutions began sabotaging the Soviet government, but the counterrevolutionary *chinovnichestvo* failed in its attempt at nationwide sabotage. Many of the saboteurs were fired, and the ringleaders were arrested. At the same time the Soviet government raised the salaries of the lower-ranking employees and offered them jobs in the institutions set up by the soviets. Russia's landowner-bourgeois *chinovnichestvo* was abolished by the first decrees issued under Soviet power—the decree of Nov. 10 (23), 1917, which abolished the estates and state service ranks, and the decree of Dec. 16 (29), 1917, which gave equal rights to all members of the military services. The establishment of a new type of state and of a state apparatus based on new principles signaled the disappearance of the *chinovnichestvo* as a distinct social group and its replacement by the institution of Soviet state employees.

CHIPPENDALE, THOMAS. Baptized June 5, 1718, in Otley, Yorkshire; buried Nov. 13, 1779, in London. English cabinetmaker.

Chippendale settled in London around 1738, where in time he established the unique Chippendale style. Chippendale's furniture designs, which favored the use of mahogany, combined utility of form, comfort, and clarity of structure with delicate lines and intricate patterns. The designs combined motifs of Chinese art, the Gothic, and the rococo. In the 18th century, furniture in the Chippendale style was known throughout Europe, including Russia. In 1754, Chippendale published his album of furniture designs, *The Gentleman and Cabinet Maker's Director*.

CHIPROVETS UPRISING OF 1688, a revolt of the Bulgarian population of the city of Chiprovets (now Chiprovtsi, northern Bulgaria) and its environs against the Turkish yoke in September 1688. It took place during the war between the Ottoman Empire and the anti-Turkish coalition of European states known as the Holy League.

The uprising was provoked by the Austrians' occupation of Belgrade on Sept. 6, 1688, and their advance on Vidin and Sofia. The rebel forces consisted of artisans and merchants of Chiprovets, who were for the most part Catholics, and Orthodox peasants from nearby villages. The rebel detachments, whose commanders included G. Peiachevich, I. Stanislavov, and L. Andrenin, were crushed by the forces of the Hungarian feudal lord I. Thököly, an ally of the Ottoman Turks. Chiprovets and the various villages that had taken part in the uprising were plundered and burned. Many of the inhabitants were killed; others fled. [29–613–4]

CHIQUINQUIRÁ, a city in Colombia, in Boyacá Department. Situated at an elevation of 2,550 m. Population, 28,000 (1968). Chiquinquirá is linked by railroad with Bogotá. Cottage industry includes the manufacture of musical instruments and wood products. The Muzo emerald mines are nearby. [29–561–4]

CHIR, a river in Rostov Oblast, RSFSR (lower course in Volgograd Oblast); a right tributary of the Don. The Chir is 317 km long and drains an area of 9,580 sq km. It rises in the Don Ridge and empties into the Tsimliansk Reservoir. The river is fed chiefly by snow, and high water occurs in late March and April. The mean flow rate 10 km from the mouth is 12 cu m per sec. The upper course of the Chir sometimes dries up. The river's principal left tributary is the Kurtlak. The city of Surovikino is located near the Chir's mouth. [29–614–1]

CHIRCHIK, a city under oblast jurisdiction in Tashkent Oblast, Uzbek SSR. Situated in the valley of the Chirchik River (a tributary of the Syr Darya), between spurs of the Karzhantau and Chatkal ranges. Railroad station 32 km northeast of Tashkent. Population, 131,000 (1977; 15,000 in 1939).

Chirchik was formed in 1935 from several workers' settlements that had grown up in connection with the construction of the Chirchik Hydroelectric Power System and an electrochemical combine. During the Great Patriotic War of 1941–45, Chirchik became a center for machine building. The Chirchiksel'mash and Uzbekkhimmash plants, as well as a transformer plant, were outfitted with equipment from evacuated factories. The Uzbek Refractory and Heat-resistant Metals Combine and enterprises of the construction industry are in operation in Chirchik. Light industry and the food industry are represented by footwear and garment factories and a meat-packing plant. Chirchik has an evening department of the Tashkent Polytechnic Institute, an industrial technicum, and a medical school, as well as a museum of local lore.

Chirchik has a rectangular street plan, wide main streets, and standardized apartment houses. Master plans were drawn up between 1933 and 1936 by Gidrostroiproekt, Moscow (architects G. M. Orlov, M. I. Tarakanov, and V. A. Lavrov, with V. A. Vesnin as consultant), and in 1964 by Uzgosproekt (chief architect P. A. Duda-Dudinskii).

CHIRCHIK, a river in Tashkent Oblast, Uzbek SSR; a right tributary of the Syr Darya.

The Chirchik is 155 km long and drains an area of 14,900 sq km. It is formed by the confluence of the Chatkal and Pskem rivers. Its upper course flows for approximately 30 km through a canyon; farther downstream the valley widens and becomes less clearly delineated. The river is fed by mixed sources, with snow predominating. The mean flow rate at its source is 221 cu m per sec. There is some ice on the river between November and March.

The Chervak Hydroelectric Power Plant is situated on the upper course of the Chirchik. Upstream from the Gazalkent Dam, water is diverted at an average rate of 183 cu m per sec via the right upstream diversion canal into the Chirchik-Bozsu Hydroelectric System. Upstream from the Troitsk Dam, the Karasu Canal branches off to the left with a mean flow rate of 47 cu m per sec. Farther downstream the Chirchik feeds other canals.

The cities of Gazalkent, Chirchik, and Tashkent are situated in the valley of the Chirchik. [29–618–1]

CHIRCHIK-BOZSU HYDROELECTRIC SYSTEM, a complex of hydroengineering structures on the Chirchik River. The system's total rated power is approximately 1.2 gigawatts, with an average annual production of 4.7 billion kilowatt-hours. In 1976, 18 of the system's 19 power plants were in service: Charvak; Khodzhikent; Tavak; F. G. Loginov Chirchik; Akkavak I, II, and III; Kadyria; Salar; Bozsu; Sheikhantaur; Burdzhar; Aktepa; and Nizhniaia Bozsu I, II, III, IV, and VI. The Gazalkent Hydroelectric Power Plant was still under construction in 1976.

The system is situated in the middle and lower basin of the Chirchik River. The region is the most densely settled and industrially developed area of the Uzbek SSR, and it has a vast irriga-

tion system. Harnessing the power resources of the Chirchik River began in 1926, when the first of 12 hydroelectric power plants was built on the main Bozsu irrigation canal. Between 1940 and 1943, the following major hydroelectric power plants were put into service: Tavak (73 megawatts), F. G. Loginov Chirchik (86 megawatts), and Akkavak I and II. Construction of the main power plant—Charvak (600 megawatts)—was begun in 1963 and was completed in 1972. The hydroengineering complex includes a rock-fill dam 168 m high that forms a reservoir with a volume of 2 cu km; the reservoir makes it possible to control the discharge of water used for irrigation. The total irrigated area served by the system is approximately 300,000 hectares.

L. B. SHEINMAN [29–618–3]

CHIRI-IURT, an urban-type settlement in Shali Raion, Chechen-Ingush ASSR. Chiri-Iurt is situated on the Argun River in the Terek basin, 35 km south of the city of Groznyi. It has plants for the production of cement, lime, and silicates. [29–616–3]

CHIRIKOF ISLAND, an island in the northern Pacific, in the Gulf of Alaska. Chirikof Island is part of the state of Alaska (USA). It has an area of approximately 160 sq km and a maximum elevation of 300 m. Subarctic meadows are found on the island. Cattle raising is the primary economic activity. The island was discovered by A. I. Chirikov in 1741 and was named in his honor by the English navigator G. Vancouver in 1798. [29–615–3]

CHIRIKOV, ALEKSEI IL'ICH. Born 1703; died November 1748 in Moscow. Russian navigator. Commodore admiral.

Chirikov graduated from the Naval Academy in 1721. He was V. Bering's aide on the First (1725–30) and Second (1733–43) Kamchatka expeditions. On July 16, 1741, aboard the packet boat *Sv. Pavel* (*St. Paul*), Chirikov became the first European to reach the western coast of North America; he also discovered several of the Aleutian Islands. In 1742, while sailing in search of the packet boat *Sv. Petr* (*St. Peter*), which was commanded by Bering, Chirikov fixed the position of Attu Island. In 1746 he took part in the final charting of Russian discoveries in the Pacific Ocean. Capes on Kyushu Island, the Anadyr' Gulf, Taui Guba, and Attu Island, as well as an underwater peak in the Pacific Ocean, have been named after Chirikov.

CHIRIKOV, EVGENII NIKOLAEVICH. Born July 24 (Aug. 5), 1864, in Kazan; died Jan. 18, 1932, in Prague. Russian writer.

The son of a member of the *dvorianstvo* (nobility), who had achieved noble rank through state service, Chirikov was expelled from the University of Kazan in 1887 during his fourth year of study for having taken part in revolutionary disturbances. His poems and realistic stories were first published in 1885. Such plays as *Jews* (1904), *Ivan Mironych* (1905), and *Muzhiks* (1906) enjoyed great success. Chirikov's work often appeared in the *Sborniki tovarishchestva "Znanie"* (Collections of the Znanie Association).

In the autobiographical novel *The Life of Tarkhanov* (books 1–4, 1911–25) and in the short-story collections *The Flowers of Memories* (1912), *Early Shoots* (1913), and *Volga Tales* (1916), Chirikov dealt with childhood, with pure love, with the provincial intelligentsia, and with nature in the Russian countryside. He emigrated in 1920. Although written from an anti-Soviet point of view, Chirikov's novel *Beast from the Abyss* (published 1926) truthfully portrays the moral decay of the White Army.

CHIRIK-RABAT, a settlement dating from the second half of the first millennium B.C., located in what is now the Kazakh SSR. The site is situated in the Kyzylkum Desert, on the dry riverbed of the Zhanadar'ia, 200 km southwest of the city of Kzyl-Orda. It was discovered and excavated by S. P. Tolstov in 1946 and 1948–49.

In the middle of the first millennium B.C., Chirik-Rabat was inhabited by one of the Massagetae tribes—probably the Apasiacae mentioned by Strabo. The fortifications were rebuilt in the typical Khwarazmian style shortly before the beginning of the Common Era. The settlement, built on an oval plan, is girdled by two rows of ramparts and walls made of mud bricks. The southeast section of the site has a rectilinear fortification characteristic of ancient Khwarazm. Cattle raising played a major role in the local economy.

CHIRIN, PROKOPII IVANOVICH. Died in the mid-17th century. Russian painter of the Stroganov school.

In the 1620's, Chirin was a favorite artist of the tsar and a master of the Oruzheinyi Prikaz (State Armory). His works are noted for a refined, yet somewhat dark and monochrome, palette and for delicacy and precision of line. Examples of his icons are *St. Nikita* (early 17th century, Russian Museum, Leningrad), *St. John the Warrior* (early 17th century, Russian Museum, Leningrad), and *The Tikhvin Virgin* (late 16th–early 17th century, Tret'iakov gallery, Moscow). [29–616–1]

CHIRKA-KEM', a river in the Karelian ASSR, a right tributary of the Kem' River of the White Sea basin. The Chirka-Kem' is 221 km long and drains an area of 8,270 sq km. It is formed by the confluence of the Chirka and Kem' rivers, which rise on the West Karelian Elevation. The river flows through a number of lakes before emptying into Lake Iashkoiarvi. Fed by snow and rain, it has a mean flow rate of approximately 81 cu m per sec. The Chirka-Kem' freezes over between late October and December, and the ice breaks up in late April or May. [29–616–4]

CHIRKEI HYDROELECTRIC POWER PLANT, a power plant constructed on the Sulak River in Buinaksk Raion, Dagestan ASSR, between 1963 and 1976. It has an installed capacity of 1,000 megawatts (MW), supplied by four 250-MW units, and an average annual output of 2.43 billion kilowatt-hours. The maximum head is 206 m. The hydroengineering complex has a concrete arch dam 231 m high and 338 m along the crest (one of the largest in the world), a water intake, a powerhouse integrated in the dam, and a tunnel spillway. It forms a reservoir with a volume of 2.8 cu km; the Tishiklin Dike, which provides 10 cu m of water per sec for irrigation, has been built on the reservoir. The power generated by the Chirkei Hydroelectric Power Plant is supplied to the integrated power grid of the Northern Caucasus.

[29–616–5]

CHIRKOV, BORIS PETROVICH. Born July 31 (Aug. 13), 1901, in the village of Lozovaia-Pavlovka, in what is now Dnepropetrovsk Oblast. Soviet Russian actor. People's Artist of the USSR (1950); Hero of Socialist Labor (1975). Member of the CPSU since 1945.

Chirkov, after graduating from the Leningrad Institute of Stage Arts in 1926, performed with the Leningrad Theater for Young Audiences and the New Theater for Young Audiences. He later appeared in several Moscow theaters: the Central Film Actors' Theater Studio, the Pushkin Theater (1950–65), and the Gogol Theater (since 1966).

Chirkov has appeared in motion pictures since 1928. He became especially well known as the title character in the Maksim trilogy: *The Youth of Maksim* (1935), *The Return of Maksim* (1937), and *The Vyborg Side* (1939). In these films he created a romantic and yet deeply realistic portrait of a hero of the revolutionary era, the young worker Maksim, who learns profound lessons from his experiences in the class struggle and becomes a prominent Bolshevik revolutionary.

Chirkov's other motion-picture roles include Stepan Lautin in *The Teacher* (1939), Makhno in *Aleksandr Parkhomenko* (1942), the title role in *Glinka* (1947), and Chizhov in *True Friends* (1954). In the theater he has played the roles of Kuzovkin in Turgenev's *The Boarder*, Lebedev in Chekhov's *Ivanov*, and Rasputin in *The Empress's Plot* by Shchegolev and A. N. Tolstoy.

Chirkov was a deputy to the third convocation of the Supreme Soviet of the USSR. A recipient of the State Prize of the USSR in 1941, 1947, 1949, and 1952, Chirkov has been awarded three Orders of Lenin, two other orders, and several medals.

CHIRVINSKII, NIKOLAI PETROVICH. Born Apr. 28 (May 10), 1848, in Chernigov; died Jan. 5, 1920. Russian specialist in animal husbandry.

Chirvinskii graduated from the St. Petersburg Agricultural Institute in 1872. From 1879 to 1894 he worked at the Petrovskoe Farming and Forestry Academy (now the K. A. Timiriazev Moscow Agricultural Academy); he was made a professor in the academy's department of animal husbandry in 1891. From 1898 to 1919, Chirvinskii was a professor in the agricultural department of the Kiev Polytechnic Institute.

Chirvinskii primarily studied livestock feeding, in particular, the utilization of feeds by animals of various ages and the effects of mineral supplements, especially on the formation of body fat. His work in sheep breeding included classification of domestic coarse-wooled breeds and analysis of conditions leading to the formation of karakul fur. Chirvinskii also studied the growth and development of sheep and swine under various management and feeding conditions.

CHIRVINSKII, PETR NIKOLAEVICH. Born Jan. 26 (Feb. 7), 1880, in Petrovsko-Razumovskoe, now within the city limits of Moscow; died June 21, 1955, in Perm'. Soviet geologist. Doctor of sciences in geology and mineralogy (1919). Son of N. P. Chirvinskii.

P. N. Chirvinskii graduated from the University of Kiev in 1902. He became a professor at the Don Polytechnic Institute in Novocherkassk in 1909 and at the University of Perm' in 1943.

Chirvinskii's main works dealt with such fields as mineralogy and petrology, geochemistry, paleohydrogeology, the study of useful minerals, and the history of science. Chirvinskii was the first to determine the average chemical and mineral composition and atomic structure of granites and other plutonic rocks (1911), of the earth as a whole (1919), and of meteorites. He ascertained the laws governing the crystallization of plutonic rocks and meteorites. He also explained the origin of a number of deposits of various minerals, such as iron ores, phosphorites, tuffs, and potassium salts.

Chirvinskii wrote *A Course in Deposits of Useful Minerals* (parts 1 and 2; 1926) and *A Textbook for Hydrogeology* (1922).

CHISANA, a valley glacier in North America, on the northeastern slope of the Wrangell Mountains of southern Alaska. The glacier, which measures 25.8 km in length, is the source of the Chisana River, a left tributary of the Tanana River (Yukon River basin). [29–619–2]

CHISHMY, an urban-type settlement and the administrative center of Chishmy Raion, Bashkir ASSR. Located 57 km southwest of Ufa, Chishmy is a junction for railroad lines to Ufa, Kuibyshev, and Ul'ianovsk. The settlement has a sugar factory, a butter factory, a brickyard, a poultry-packing plant, a grain elevator, and a sovkhoz where fruit plants are raised for transportation. [29–667–4]

CHISLO, a state tax system introduced in the 1250's in territories subject to the Mongol khans. The *chislo* replaced the system of tax farming in the lands conquered by the Mongols.

Under the great khan Mangu (ruled 1251–59), the *chislo* was introduced in China, Middle Asia, Iran, and Armenia and was also extended to Russian lands, including northeastern Rus', the principalities of Riazan' and Murom, and the Novgorod Feudal Republic. To aid in collecting the tax, the Mongol officials took a house-to-house census of the population, which was divided for the purpose into groups of ten, one hundred, one thousand, and ten thousand; the clergy were not included in the census. The persons who implemented the *chislo* were called *chislenniki* or *pistsy*. The counting of the population was accompanied by numerous abuses, and it provoked uprisings, such as the uprising of 1257 in the Novgorod Feudal Republic. In Rus', the practice of dividing the population into groups of tens to facilitate the payment of ordinary taxes and extraordinary horde taxes was retained until the 15th century.

CHISTALEV, VENIAMIN TIMOFEEVICH (also Tima Ven'). Born Oct. 8 (20), 1890, in the village of Pomozdino, in what is now the Komi ASSR; died Oct. 13, 1939, in Syktyvkar. Soviet Komi writer.

The son of a peasant, Chistalev became a schoolteacher. His first literary efforts belong to the prerevolutionary period. His nature lyrics glorify the Komi land. In the narrative poem *In the Days of the Transformation of the Land* (1927), Chistalev depicts the heroism of socialist construction in the north. He is the author of the first essays and short stories written in the Zyrian (Komi) language. Chistalev also translated works by various Russian writers.

CHISTIAKOV, IVAN DOROFEEVICH. Born October 1843 in the Caucasus; died June 3 (15), 1877, in Moscow. Russian botanist.

Upon graduation from Moscow University in 1868, Chistiakov joined the university's teaching staff. In 1871 he was appointed

professor and director of the university's botanical gardens. Chistiakov was the founder of the Moscow school of plant embryologists and cytologists. He was one of the first to observe and describe mitosis in plants (1874).

CHISTIAKOV, IVAN MIKHAILOVICH. Born Sept. 14 (27), 1900, in the village of Otrubnivo, in what is now Kashin Raion, Kalinin Oblast. Soviet military leader; colonel general (1944). Hero of the Soviet Union (July 22, 1944). Member of the CPSU since 1926.

The son of a peasant, Chistiakov joined the Red Army in 1918. He fought in the Civil War of 1918–20 as an assistant platoon commander. He graduated from machine gunner's school in 1920, Vystrel courses in 1930, and the Advanced Academic Courses of the K. E. Voroshilov Higher Military Academy in 1949. During the Great Patriotic War of 1941–45, he commanded the 64th Infantry Brigade on the Western Front from 1941 to 1942 and the 8th Guards Rifle Division and the II Guards Rifle Corps in 1942 on the Kalinin Front. He served as troop commander of the First Guards Army (September–October 1942), Twenty-first Army (October 1942–April 1943), and Sixth Guards Army (April 1943 to the end of the war) on the Stalingrad, Don, Voronezh, First and Second Baltic, and Leningrad fronts. In 1945, Chistiakov commanded the Twenty-fifth Army, which fought in the Harbin-Kirin Operation during the defeat of the Japanese forces in the Soviet Far East. After the war he held various command positions. He was the first deputy commander of the Transcaucasian Military District from 1954 to 1957 and inspector general of the Inspectorate of Ground Forces of the Main Inspectorate of the Ministry of Defense of the USSR from 1957 to 1968. He retired in July 1968.

Chistiakov was a deputy to the second and fourth convocations of the Supreme Soviet of the USSR. He has been awarded two Orders of Lenin, five Orders of the Red Banner, two orders of Suvorov First Class, two orders of Kutuzov First Class, the Order of Suvorov Second Class, and various medals. He has also received various foreign orders and medals. [29–647–4]

CHISTIAKOV, MIKHAIL NIKOLAEVICH. Born Nov. 6 (18), 1896, in St. Petersburg. Soviet military leader; marshal of the artillery (1944). Member of the CPSU since 1944.

The son of a railroad employee, Chistiakov fought in World War I from 1915 as an artillery scout and was twice awarded the Cross of St. George. In 1917 he was promoted to ensign and made a platoon commander. He joined the Red Army in September 1918. During the Civil War of 1918–20, Chistiakov commanded a platoon, a battery, and a battalion. He graduated from courses for senior command personnel in 1926 and from advanced courses for higher command personnel at the M. V. Frunze Military Academy in 1930.

During the Great Patriotic War of 1941–45, Chistiakov was commander of artillery on the Western Front and later commanded the Thirty-fourth Army on the Northwestern Front (1941). He was named head of the Directorate of Combat Training of the Main Artillery Directorate in December 1941 and deputy artillery commander of the Red Army in June 1943. As a representative of the commander of the artillery, Chistiakov helped prepare and execute several operations on the Stalingrad, Don, Southern, Voronezh, Steppe, Third and Fourth Ukrainian, Third Byelorussian, and First, Second, and Third Baltic fronts. As acting commander of the artillery under the commander in chief of Soviet forces in the Far East, he participated in the defeat of the Japanese forces in the Far East in 1945.

In April 1946, Chistiakov was named deputy artillery commander of the armed forces of the USSR. He became inspector general of the Main Inspectorate of the Ministry of Defense in November 1957 and military inspector-adviser of the Group of Inspectors General of the Ministry of Defense in December 1964. Chistiakov has been awarded three Orders of Lenin, the Order of the October Revolution, three Orders of the Red Banner, the Orders of Suvorov First and Second Class, two orders of Kutuzov First Class, the Order of Bogdan Khmel'nitskii First Class, the Order of the Patriotic War First Class, the Order of the Red Star, the Order for Service to the Motherland in the Armed Forces of the USSR Third Class, and various medals. He is also the recipient of foreign orders and medals. [29–648–1]

CHISTIAKOV, PAVEL PETROVICH. Born June 23 (July 5), 1832, in the village of Prudy, in present-day Kalinin Oblast; died Nov. 11, 1919, in Detskoe Selo, now the city of Pushkin. Russian educator and painter.

Chistiakov studied at the Academy of Arts with P. V. Basin from 1849 to 1861. From 1862 to 1870 he studied on a stipend at the academies of arts in Paris and Rome. Chistiakov taught at the Drawing School of the St. Petersburg Society for the Encouragement of the Arts from 1860 to 1864 and at the St. Petersburg Academy of Arts from 1872 to 1912. He was a professor at the academy's studio from 1908 to 1910 and head of the academy's mosaic department from 1890 to 1912. His students included V. M. Vasnetsov, M. A. Vrubel', V. D. Polenov, I. E. Repin, V. A. Serov, and V. I. Surikov.

Chistiakov's system of teaching art developed in constant struggle with the stagnant system of academism and played an enormous role in the development of realism in Russian art of the second half of the 19th century. Chistiakov's goal was the preparation of a citizen-artist of high professional skill. His teaching method presupposed the blending of the artist's direct perception of the subject with a scientific study of it. In his own work he strove for drama in his historical compositions and psychological depth in his historical and genre portraits. Examples of his works are *Head of a Chuchara* (1864, Russian Museum, Leningrad) and *The Boyar* (1876, Tret'iakov Gallery, Moscow).

CHISTIAKOVO, until 1964, the name of the city of Torez, Donetsk Oblast, Ukrainian SSR. [29–649–1]

CHISTOE, an urban-type settlement in Chkalovsk Raion, Gorky Oblast, RSFSR. Chistoe is located 34 km southwest of the Zavolzh'e railroad station, the terminus of a spur from Gorky. The settlement has a peat enterprise. [29–642–2]

CHISTOOZERNOE, an urban-type settlement and the administrative center of Chistoozernoe Raion, Novosibirsk Oblast, RSFSR. The settlement has a railroad station on the Tatarskaia-Karasuk line, 528 km west of Novosibirsk. Chistoozernoe also has a butter factory. [29–643–2]

CHISTOP, a mountain massif in the northern Urals, in Sverdlovsk Oblast, RSFSR. The Chistop Range rises to an elevation of 1,292 m and is composed mainly of gabbro. The weakly dissected slopes have mountain taiga of spruce, larch, and birch, while at elevations higher than 900 m there is moss and lichen tundra. [29–644–1]

CHISTOPOL', a city under republic jurisdiction and the administrative center of Chistopol' Raion, Tatar ASSR. Landing on the Kuibyshev Reservoir. Located 144 km southeast of Kazan. Population, 67,000 (Jan. 1, 1977). The Avtospetsoborudovanie Plant is located in Chistopol'. The city also has a watch and clock plant, a ship repair yard, a motor-vehicle repair plant, a plant producing liqueurs and spirits, a clothing factory, a knitwear factory, a footwear factory, and a furniture factory. Educational and cultural institutions include a sovkhoz technicum, a medical school, a pedagogical school, a museum of local lore, and a people's amateur theater. [29–644–2]

CHISTOVICH, NIKOLAI IAKOVLEVICH. Born Dec. 2 (14), 1860, in St. Petersburg; died Mar. 29, 1926, in Leningrad. Soviet internist and microbiologist; specialist on infectious diseases. Academician of the Academy of Military Medicine (1914).

Upon graduation from the Academy of Military Medicine in 1884, Chistovich worked in S. P. Botkin's clinic. In 1887 he defended his dissertation on experimental cardiology, which he wrote under the direction of I. P. Pavlov. Between 1887 and 1890, Chistovich worked abroad, at the Koch Institute in Berlin and in I. I. Mechnikov's laboratory in Paris. In 1898 he became a professor in the subdepartment of contagious diseases and bacteriology at the Academy of Military Medicine; in 1910 he was made a professor in the academy's clinic of internal medicine. From 1900 he occupied the chair of descriptive pathology and treatment of internal diseases at the Women's Medical Institute (now the First Leningrad Medical Institute).

Chistovich was one of the first in Russia to regard infectious diseases as a scientific discipline and a subject to be taught. His research was on lobar pneumonia, cholera, tuberculosis, and other infectious diseases. He also studied aspects of local immunity, antiphagins, the bacteria carrier state, hematology, and the history of medicine. In 1922, Chistovich wrote the first Soviet textbook of descriptive pathology and treatment of internal diseases. He also founded a clinical school (M. I. Arinkin, S. I. Zlatogorov, S. M. Ryss, N. N. Savitskii).

CHITA, a city and administrative center of Chita Oblast, RSFSR. Located in Transbaikalia, at the influx of the Chita River into the Ingoda River. Population, 294,000 (1977; 121,000 in 1939, 172,000 in 1959, and 241,000 in 1970). A transportation junction on the Trans-Siberian Railroad and a highway junction, Chita has an airport. It is divided into four city districts. It was awarded the Order of the October Revolution on Oct. 23, 1972.

Chita has existed since 1653, when it was known as the settlement of Ingodinskoe Zimov'e. In 1690 it became a *sloboda* (tax-exempt settlement), populated by cossacks and trappers (it was renamed Chitinskaia in 1706), near which a stockade was built, where many Decembrists later served their sentences of hard labor. In 1851 it became a city and administrative center of Transbaikalia Oblast. Chita's economic importance grew after the building of the Transbaikal Railroad in 1900. Gold mining and the lumber industry developed in the city's environs. Chita was the seat of the administration of the Nerchinsk Mining District. In 1902, under the direction of E. M. Iaroslavskii, a Social Democratic organization and a committee of the RSDLP were established. The workers and soldiers of Chita took an active part in the Revolution of 1905–07 (*see* CHITA REPUBLIC).

Soviet power was established on Feb. 16, 1918. On Aug. 26, 1918, the city was seized by White Guard bands. On Oct. 22, 1920, partisan units of the Amur Front liberated the city, which became the capital of the Far East Republic. In 1922 it was made the administrative center of Transbaikalia Province, in 1926, of the Chita District of the Far East Krai, and in 1937, of Chita Oblast.

Chita is a major industrial and cultural center of Eastern Siberia. The most important enterprises are the automotive assembly plant, the machine-building plant, the machine-tool plant, the K. E. Voroshilov Locomotive and Railroad Car Repair Plant, and the furniture and wood-products combine. A state district power plant is located in the city, as is the Vostochnaia lignite mine. Light industry is represented by worsted cloth and leather-footwear combines, a chrome-leather tannery, and a sheepskin and fur factory. The food industry is represented by flour-milling, meat-packing, and milk combines and by enterprises of the Ingoda food firm.

Among the research and educational institutions in Chita are the Transbaikalia Integrated Scientific Research Institute of the Ministry of Geology of the USSR, the Transbaikalia Scientific Research Technological Institute of Sheep and Beef Cattle Raising, a branch of the institute of experimental veterinary medicine of Siberia and the Far East, pedagogical, medical, and polytechnic institutes, a branch of the Khabarovsk Institute of Railroad Engineers, a correspondence law school of the University of Irkutsk, and 12 specialized secondary educational institutions. Also in Chita are a dramatic theater, a puppet theater, a philharmonic society, and the oblast museum of local lore.

CHITA OBLAST, part of the RSFSR. Formed on Sept. 26, 1937. Located in Transbaikalia. Area, 431,500 sq km. Population, 1.227 million (Jan. 1, 1977). Chita Oblast, which includes the Aga-Buriat Autonomous Okrug (formerly Aga-Buriat National Okrug), is divided into 30 raions and has ten cities and 42 urban-type settlements. The administrative center is the city of Chita. Chita Oblast was awarded the Order of Lenin on Dec. 14, 1957.

Natural features. Most of the oblast lies between the Iablonovo Range in the west and the Argun' River in the east. The relief is dominated by mountains of medium elevation (600–700 m). Among the ranges east of the Iablonovo Range are the Cherskii, Borshchovochnyi, and Daurian ranges, which are separated by intermontane basins. The vast Onon Plain lies in the south. In the north, the mountains rise to an elevation of 3,000 m, in the Kodar Range, and are extremely dissected; there are alpine-type peaks.

The climate is sharply continental. The winters are long and dry, with average January temperatures between −26° and −33°C. Summers are very warm and short, with average July temperatures of 17° to 21°C. Annual precipitation ranges between 240 and 400 mm, most of which occurs in the summer. The growing season lasts 120 to 160 days. Permafrost is widespread.

The largest rivers are the Shilka and the Argun' (the sources of the Amur). The other major rivers, the Khilok and the Chikoi, belong to the Lake Baikal basin. The Vitim and the Olemka flow into the Lena River. The potential hydroelectric power resources are 9.4 gigawatts. The largest lakes are Bol'shoi Leprindo, Leprindokan, Nichatka, the Chita Lakes group, Kenon, Zun-Torei, and Barun-Torei. There are several mineral springs in the oblast.

Mountain taiga podzolic soils predominate in Chita Oblast. There are chernozems and chestnut soils in the steppes and meadow-frost and meadow-chernozem soils in the intermontane basins. Forests cover about one-half of the oblast's area. The total timber reserves are 2.3 billion cu m; 78.6 percent of the forested area is covered by Dahurian larch, 12 percent by pine, 4.9 percent by cedar, and 3.2 percent by birch. The steppes are covered with various grasses and forbs.

The forests abound in various valuable fur-bearing animals, including the sable, squirrel, Siberian weasel, ermine, fox, brown bear, and lynx. Ungulates include the elk, roe deer, wild boar, reindeer, and Manchurian deer. Badgers, wolves, chipmunks, hares, and susliks inhabit the forest-steppe and steppe regions. Muskrats have been acclimatized. Common birds include capercaillies, hazel hens, grouse, woodpeckers, cuckoos, larks, ducks, cranes, and bustards. The rivers contain such valuable fish as the cisco, sturgeon, taimen (*Hucho taimen*), and common whitefish.

The Sokhondo Wildlife Preserve is located in Chita Oblast.

Population. Among the peoples living in Chita Oblast are Russians (89.6 percent; 1970 census), Buriats (4.5 percent), Ukraini-

ans (2.2 percent), and Tatars (1.3 percent). The average population density is 2.8 persons per sq km (1977). The most densely populated areas are along the Trans-Siberian Railroad and in the valleys of the Ingoda, Shilka, and Argun' rivers.

The urban population constitutes 63 percent. The principal cities are Nerchinsk and Sretensk; Petrovsk-Zabaikal'skii, Balei, Borzia, Shilka, Mogocha, Khilok, and Krasnokamensk have been built during the years of Soviet power.

Economy. The economy is dominated by industry. Between 1940 and 1976 the gross industrial product increased by a factor of 7.

Mining is an important branch of industry. The mines and ore-dressing combines are highly mechanized. Gold (at the Balei and other deposits), fluorite and molybdenum (at Davenda), tin (at Sherlovaia Gora), and lead-zinc ores (at Khapcheranga) are mined. Ferrous metallurgy is represented by the Petrovsk-Zabaikal'skii Metallurgical Works. Coal is mined at the Kharanor and other deposits. The Chita State District Power Plant produces 530 megawatts of electricity, and the Kharanor State District Power Plant is under construction (1978). There are thermal steam-turbine power plants in Krasnokamensk, Sherlovaia Gora, Priargunsk, and Petrovsk-Zabaikal'skii.

The lumber industry is well developed. Various wood products are manufactured by the Olengui Combine, including lumber, sleepers, and crates. The Amazar Wood-products Combine is under construction (1978). Machine building specializes in "northern style" automobile assembly and in the production of mobile compressor units, refrigeration units, drilling equipment, rock-loading machines, metal-cutting machine tools, diesel boats, fishing vessels, bridge cranes, and saw frames (plants in Chita, Nerchinsk, and the settlements of Darasun, Kokui, Oloviannaia, and Tarbagatai).

The principal enterprises of light industry are the worsted-wool combine, leather-footwear combine, chrome-leather tannery, and sheepskin and fur factory in Chita and the boot factory in Sretensk. The food-processing industry is also developed, with meat-packing plants in Chita, Borzia, Oloviannaia, Petrovsk-Zabaikal'skii, Nerchinsk, Sretensk, and Pervomaisk; there are a number of enterprises of the butter and milk industry. Mineral water is bottled (Darasun, Kuka, and Molokovka mineral waters).

The main branch of agriculture is stock raising, which is dominated by the raising of fine-wooled and semifine-wooled sheep. Cattle are also raised, as are reindeer (in the north). The oblast has (Jan. 1, 1977) 4.311 million sheep and goats, 664,000 head of cattle, and 128,000 hogs. The major stock-raising regions are the Aga-Buriat Autonomous Okrug and the southern and southeastern parts of the oblast. The hunting and trapping of sable, squirrel, and muskrat for fur is important in the mountain and taiga regions.

Agricultural lands total (1976) 6.8 million hectares (ha), of which the sown area accounts for 31.8 percent, pastures for 50.4 percent, and hayfields for 17.8 percent. The oblast has (1976) 151 kolkhozes and 99 sovkhozes. The lands under cultivation total (1976) 1.8 million ha, with grains, occupying 1.2 million ha, predominating. Potatoes and vegetables occupy 30,000 ha, and fodder crops, 60,000 ha. Grains include wheat (400,000 ha in 1976), oats, barley, and buckwheat.

Transportation. The oblast has 2,126 km of railroads (1976). It is crossed from west to east by the Trans-Siberian Railroad, of which the Petrovskii Zavod–Karymskaia section is electrified; there is a branch line to Mongolia and China. Plans are under way to construct a section of the Baikal-Amur Railroad in northern Chita Oblast.

Motor vehicles provide local transportation. The total length of roads is 13,400 km (1976), of which 7,000 km are hard-surfaced. The main highways are Ulan-Ude–Chita–Zabaikal'sk, Chita-Darasun-Khapcheranga, Chita-Aginskoe-Nerchinsk-Sretensk, Borzia–Nerchinskii Zavod–Sretensk, and Petrovsk-Zabaikal'skii–Krasnyi Chikoi–Iamarovka.

The Shilka River is the principal artery. There are 2,100 km of waterways. The city of Chita is linked by air with Moscow, Irkutsk, Khabarovsk, and other cities.

INTERNAL DIFFERENCES. The Khilok-Ingoda Region is noted for ferrous metallurgy, machine building, light industry, the food-processing industry, logging, timber processing, and the mining of lignite. Agriculture is dominated by the production of dairy products and vegetables. There is also fur trapping.

The Shilka-Argun' Region is the center of the ore-mining (nonferrrous metals) industry. Coal and lignite are also mined. Meat, wool, and other agricultural products are processed. Sheep are raised on pastures, and grains are grown.

The Vitim-Amur Region is known for gold and molybdenum mining and logging. There is also hunting and reindeer breeding. The area abounds in mineral and water resources. Preparations are under way for the construction of a section of the Baikal-Amur Railroad and for exploitation of the Udokan Mining Region.

Education, cultural affairs, and public health. In the 1914–15 academic year, the area that is now Chita Oblast had 637 general-education schools, with 32,600 pupils and students, and one specialized secondary educational institution, with 76 students. There were no higher educational institutions. In the 1976–77 academic year, Chita Oblast had 779 general-education schools of all types, with about 191,500 pupils and students, 40 vocational-technical educational institutions, with more than 14,900 students, and 21 specialized secondary educational institutions, with about 21,700 students. Its higher educational institutions, including polytechnic, medical, and pedagogical institutes, a branch of the Khabarovsk Institute of Railroad Engineers, and the correspondence law school of the University of Irkutsk, all located in Chita, had an enrollment of 11,800.

The largest scientific establishments are the Transbaikalia Integrated Scientific Research Institute of the Ministry of Geology of the USSR, the Transbaikalia Scientific Research Technological Institute of Sheep and Beef Cattle Raising, and a branch of the institute of experimental veterinary medicine of Siberia and the Far East.

Chita Oblast has (Jan. 1, 1977) 734 public libraries, with 7.094 million books and journals, and four museums of local lore—the Chita Oblast Museum of Local Lore, the Aga Okrug Museum of Local Lore, the Nerchinsk Interraion Museum of Local Lore, and the Sretensk Raion Museum of Local Lore. It also has an oblast dramatic theater and an oblast puppet theater, both in Chita, as well as 879 clubs and 1,096 motion-picture projection units.

The oblast newspapers *Zabaikal'skii rabochii* (Transbaikal Worker; since 1905) and *Komsomolets Zabaikal'ia* (Transbaikal Komsomol; since 1951) are published. Broadcasts from the All-Union Radio, totaling 38 hours per day, are relayed. Local broadcasts total 11 hours, including seven hours of basic programming and seven hours of VHF and FM. Television broadcasts over two programs total 15.5 hours per day, of which 12 hours are programs relayed by way of the Orbita system and 3.5 hours are local programs.

As of Jan. 1, 1977, Chita Oblast had 191 hospitals, with 14,100 beds (11.5 beds per 1,000 inhabitants), and 3,400 physicians (one physician per 364 inhabitants). Health resorts include the balneological and balneoclimatic resorts Kurort-Darasun, Shivanda, Kuka, Urguchan, Iamkun, Molokovka, Olentui, and Iamarovka, the Ugdan pelotherapeutic resort, the Shiviia and Darasun-Nerchinsk balneological therapeutic districts, and 11 sanatoriums. Tourist sites include the Chary Depression and the Kodar and Udokan ranges. There are five tourist centers, near Chita and at Kuka and the settlement of Arei.

CHITA OPERATIONS OF 1920, during the Civil War of 1918–20, combat operations conducted from April to October 1920 by the People's Revolutionary Army (PRA) of the Far East

Republic and partisans against the White Guards and interventionists for the liberation of Chita. The western and eastern parts of the Far East Republic were separated by the "Chita plug"—the region including Chita, Karymskaia, Sretensk, and Nerchinsk occupied by White Guards (groups led by G. M. Semenov and V. O. Kappel') and the Japanese interventionists. In order to eliminate the Chita plug, three operations were launched, during which the PRA command, in adhering to Lenin's directive on the impermissibility of military actions against the Japanese forces, was compelled to avoid clashes with the Japanese at all costs.

By the end of March 1920, the White Guard forces under the command of Lieutenant General G. M. Semenov numbered approximately 20,000 men, 496 machine guns, and 78 guns. The activities of the eastern Transbaikalia partisans forced the White Guard command to tie up more than half of its forces in the Sretensk and Nerchinsk areas; west of Chita and in the city itself, the White Guards numbered 8,500 men, 255 machine guns, and 31 guns. Also here were units of the Japanese Fifth Infantry Division, which numbered 5,200 men and 18 guns. The PRA, then in the organizing stage (commander in chief G. Kh. Eikhe; members of the Military Council N. M. Goncharov and A. A. Shiriamov), numbered, including the partisan detachments, approximately 9,800 men, 72 machine guns, and 24 guns.

In the first Chita operation (April 10–13), the PRA launched the main attack on Chita from the north across the Iablonovo Range and a secondary attack from the southwest. The main forces—V. I. Burov's column—managed to reach the outskirts of Chita but were soon pushed back by the Japanese forces. In the west, E. V. Lebedev's column advanced after the withdrawing Japanese forces to the Gongota station, where its advance was halted by the enemy.

In the second Chita operation (April 25 to May 5), a lack of coordination in the operations of three small columns of PRA forces and partisans (who had formed the Amur Front on April 22) enabled the enemy, strengthened by reinforcements, to halt the attack with a maneuver in the interior operational sectors and to throw the main PRA forces back to the west between May 3 and May 5. In the summer of 1920, the Far East Republic's position became firmly established and, on July 17, the Japanese command was compelled to sign the Gongota agreement on the cessation of hostilities and to begin the evacuation of its forces from Chita and Sretensk on July 25. A neutral zone was established west of Chita. As a result, the focus of the struggle between the PRA and the White Guards was shifted to the Amur Front (commanded first by D. S. Shilov and then by S. M. Seryshev; members of the Military Council Ia. P. Zhigalin and S. G. Velezhev), where the PRA forces numbered approximately 30,000 men, 35 guns, two tanks, and two armored trains. The White Guards had approximately 35,000 men, 40 guns, and 18 armored trains.

In the third Chita operation (October 1–31), the partisans to the north and south of Chita launched various military actions, while the forces of the Amur Front passed to the offensive on October 15 and took the Karymskaia railroad station and Chita on October 22. Counterattacks by the White Guard forces were repulsed. On October 30, PRA units occupied the stations Byrka and Oloviannaia, and the remaining White Guards fled to Manchuria.

The crushing defeat of the White Guards made possible the unification of the Transbaikalia and Amur oblasts, forced the Japanese to hasten the evacuation of their troops from Khabarovsk, and paved the way for the liberation of the Far East. [29–659–2]

CHITA REPUBLIC, a revolutionary democratic dictatorship of workers and peasants, established as a result of a de facto takeover of Chita by the Chita committee of the RSDLP and the Chita soviet of soldiers' and cossacks' deputies in December 1905 and January 1906.

In August 1905 the workers of the railroad shops and depots, under the leadership of the Bolsheviks, began forming a militia, which during the October All-Russian political strikes of 1905 grew to 2,000 persons. On October 15, the arming of all the workers was begun, and subsequently the number of workers in the militia, headed by A. A. Kostiushko-Voliuzhanich, reached 4,000. On November 22, at the suggestion of the Bolsheviks, a soviet of soldiers' and cossacks' deputies was formed. On November 24, political prisoners from the Chita prison were freed, soon followed by the release of prisoners from Akatui prison. In December, control of postal and telegraph communications was established and an eight-hour workday at railroad and commercial enterprises was instituted. Government institutions were virtually paralyzed. Power had in fact passed into the hands of the Chita committee of the RSDLP and the soviet of soldiers' and cossacks' deputies.

On December 7, the Bolshevik newspaper *Zabaikal'skii rabochii* (Transbaikal Worker) began publication under the editorship of V. K. Kurnatovskii; it played a significant role in rallying the revolutionary forces in Transbaikalia. After crushing the December uprising in Moscow and Central Russia, the tsarist government sent punitive expeditions to Siberia. A detachment under General P. K. Rennenkampf advanced on Chita from the east, and a detachment under General A. N. Meller-Zakomel'skii from the west. In light of the superiority of the government forces, the Chita committee of the RSDLP decided to avoid a confrontation. On January 22, Rennenkampf's forces occupied Chita. Reprisals against revolutionary workers, soldiers, and cossacks began. Among those executed by firing squad were many Bolsheviks, including I. V. Babushkin, A. A. Kostiushko-Voliuzhanich, and A. I. Popov.

CHITTAGONG, a city in Bangladesh, on the Karnaphuli River; located 15 km from the Bay of Bengal. Capital of Chittagong Division and District. Population, 416,000 (1974). A major transportation junction, Chittagong is the largest seaport in Bangladesh; in 1975 it handled 4.7 million tons of freight. The city is the country's most important economic center after Dacca. It has jute, cotton, chemical, food-processing, match, wood-products, metalworking, and cement industries. It also has a metallurgical plant, an oil refinery, a shipyard, and trading companies. There is a university in the city. [29–660–2]

CHITTARANJAN, a city in northeast India, in West Bengal. Population, 40,800 (1971). Chittaranjan is a new industrial center located in the country's major region of heavy industry, in the Damodar River valley. The city has a locomotive plant. [29–660–3]

CHIVILIKHIN, VLADIMIR ALEKSEEVICH. Born Mar. 7, 1928, in Mariinsk, Kemerovo Oblast. Soviet Russian writer. Member of the CPSU since 1952.

The son of a worker, Chivilikhin graduated from the faculty of journalism of Moscow State University in 1954. In 1957 he published the documentary novella *The Life Force*. In the novellas *Of Klava Ivanova* (1964), *Fiddlesticks!* (1965), *Above Sea Level* (1967), and *The Many-colored Rock* (1969) he shows human personalities in the process of formation and presents a positive image of contemporary man.

Chivilikhin explores his principal subjects—man, society, and nature—in both artistic and publicist works, including *Land in Distress* (1969), *Does She Love You?* (1968), *Swedish Stops* (1974), and *By Cities and Hamlets* (1976). He published *Poems* in 1974.

Chivilikhin received the Lenin Komsomol Prize in 1966 and the M. Gorky Prize of the RSFSR in 1977; he has been awarded two orders.

CHIZHAPKA, a river in Tomsk Oblast, RSFSR; a right tributary of the Vasiugan of the Ob' River basin. The Chizhapka is 511 km long and drains an area of 13,800 sq km. It flows through the Vasiugan'e region. The river is fed primarily by snow; high water occurs between May and July. The mean flow rate 24 km from the mouth is 85.5 cu m per sec. The Chizhapka freezes over in late October or early November, and the ice breaks up in late April or in May. The river is used for timber flotation. The Chizhapka is navigable for a distance of 108 km from its mouth. [29–550–4]

CHIZHEVSKII, ALEXSANDR LEONIDOVICH. Born Jan. 26 (Feb. 7), 1897, in the city of Ciechanowiec, now in Poland; died Dec. 20, 1964, in Moscow. Soviet biophysicist; founder of heliobiology and aeroionification. Son of L. V. Chizhevskii.

Chizhevskii graduated from the Moscow Archaeological Institute in 1917 and the Moscow Commercial Institute in 1918. He also studied at the faculties of physics and mathematics (1915–19) and medicine (1919–22) of Moscow University. From 1917 to 1927 he taught a course on the physical methods of archaeology at Moscow University and the Moscow Archaeological Institute. From 1922 to 1924 he was a consultant at the Institute of Biophysics, and from 1925 to 1931, a senior research worker (professor) at the laboratory of animal psychology of the People's Committee of Education of the RSFSR. In 1931, Chizhevskii organized the Central Scientific Research Laboratory of Ionization. From 1937 to 1942 he headed two laboratories of the Construction Administration of the Palace of Soviets of the Council of People's Commissars of the USSR; from 1958 to 1962 he was head of the laboratory of aeroionification under the State Planning Commission of the USSR.

While studying the effects of cosmic physical factors on processes in living nature, Chizhevskii established the relationship between the cycles of solar activity and many phenomena in the biosphere; he showed that the physical fields of the earth and its environment should be included among the basic causes affecting the condition of the biosphere. In 1935 he discovered the metachromasia of bacteria, known as the Chizhevskii-Vil'khover effect, which makes it possible to predict solar emissions harmful to man on earth as well as in space. Chizhevskii was the first to experimentally determine the opposite physiological effects of negative and positive air ions on living organisms, the pathologic effect of air with reduced ion concentration, and the stimulating effect of negative air ions on living organisms (1919–30). He also made use of the artificial aeroionization in medicine, agriculture, and stock raising (1930–36). The importance of Chizhevskii's work on aeroionification was noted in a resolution of the Council of People's Commissars of the USSR in 1931. Chizhevskii also discovered the spatial arrangement of the structural elements in flowing blood.

Chizhevskii was honorary president of the international congress on biological physics and space biology (United States, 1939).

CHIZHEVSKII, LEONID VASIL'EVICH. Born Jan 1 (13), 1861, in Kiev; died Apr. 14, 1929, in Kaluga. Russian artilleryman and scholar. Major general (1916). Hero of Labor of the Workers' and Peasants' Red Army (1928).

Chizhevskii graduated from the Alexander Military School in 1881. During World War I, he commanded an artillery battalion and a brigade on the Southwestern Front. He joined the Red Army in 1918 and served as director of courses for Red Army commanders in Kaluga. In 1885, Chizhevskii invented and tested an azimuth instrument for commanders that made it possible to deliver parallel sheaf fire on unseen targets.

CHIZHEVSKII, NIKOLAI PROKOP'EVICH. Born Mar. 27 (Apr. 8), 1873, in Kazan; died Apr. 22, 1952, in Moscow. Soviet metallurgist; specialist in the chemistry of coke. Academician of the Academy of Sciences of the USSR (1939).

Chizhevskii graduated from the faculty of physics and mathematics at St. Petersburg University in 1899, the faculty of metallurgy at the Mining Academy in Leoben, Austria, in 1902, and the faculty of chemistry at the Kiev Polytechnic Institute in 1904. He became an instructor at the Tomsk Institute of Technology in 1909 and served as head of the institute's faculty of ferrous metallurgy from 1910 to 1923; he gained a professorship at the institute in 1911. Chizhevskii became a professor at the Moscow Academy of Mines in 1923 and a professor at the Moscow Institute of Steel in 1930. From 1935 he also worked at the Institute of Fuel Resources of the Academy of Sciences of the USSR.

Chizhevskii's major work was on the metallurgy of iron and steel, the direct reduction of iron ore, expansion of the fuel base for metallurgy, and the design of coke ovens. He received the State Prize of the USSR in 1943. He was also awarded two orders and several medals.

CHIZHIKOV, DAVID MIKHAILOVICH. Born Nov. 5 (17), 1895, in Novaia Priluka, in what is now Vinnitsa Oblast; died Aug. 24, 1974, in Moscow. Soviet metallurgist. Corresponding member of the Academy of Sciences of the USSR (1939). Member of the CPSU from 1921.

Upon graduation from the Moscow Academy of Mines in 1924, Chizhikov worked as an engineering director at various enterprises. From 1933 to 1941 he worked at the Moscow Institute of Nonferrous Metals and Gold, where he became a professor in 1934. He worked at the Institute of Metallurgy of the Academy of Sciences of the USSR from 1939 to 1974.

Chizhikov's principal work dealt with the theory and technology of electrothermal production of nonferrous and rare metals, the chlorination of complex metal and tin ores, and the electrolysis of sulfide materials. Chizhikov received the State Prize of the USSR twice (1942 and 1951). He was also awarded the Order of the October Revolution, two other orders, and several medals.

N. K. LAMAN [29–552–1]

CHIZHOV, MATVEI AFANAS'EVICH. Born Nov. 10 (22), 1838, in the village of Pudovo, in present-day Moscow Oblast; died May 28 (June 10), 1916, in Petrograd. Russian sculptor.

Chizhov studied at the Stroganov Commercial Art School in Moscow from 1856 to 1857, the Moscow School of Painting, Sculpture, and Architecture from 1857 to 1860, and the St. Pe-

tersburg Academy of Arts from 1860 to 1867 (with N. S. Pimenov and P. K. Klodt). In 1893 he became a member of the Academy of Arts. Chizhov taught at Baron Shtiglits' Central School of Technical Drawing in St. Petersburg from 1879 to 1910.

Chizhov's works are devoted to themes from the life of the people. His treatment of figures is similar to that of the *peredvizhniki* (the "wanderers"—a progressive art movement). Examples are *Peasant in Misery* (bronze, 1872, Russian Museum, Leningrad; marble, 1873, Tret'iakov Gallery, Moscow) and *Mother Teaching Her Daughter the Mother Tongue* (plaster of paris, 1873, Russian Museum, Leningrad). Chizhov also sculpted a number of portraits.

CHKALOV, VALERII PAVLOVICH. Born Jan. 20 (Feb. 2), 1904, in the village of Vasilevo, now the city of Chkalovsk, Chkalovsk Raion, Gorky Oblast; died Dec. 15, 1938, in Moscow. Soviet aviator. Hero of the Soviet Union (July 24, 1936); brigade commander. Member of the CPSU from 1936.

The son of a worker, Chkalov volunteered for the Red Army in 1919 and worked as an airplane assembler with an airpark in Nizhny Novgorod. From 1921 to 1924, he studied at the Egor'evsk and Borisoglebsk flight schools, the Moscow School of Aerobatics, and the Serpukhov Higher School of Air Gunnery and Bombing. In 1924 he joined the Red Banner Fighter Squadron, distinguishing himself as a skillful pilot. In 1930 he became a test pilot at the Air Force Research Institute. He tested more than 70 types of airplanes and developed and introduced new aerobatic maneuvers, namely, the ascending spin and the slow roll.

Chkalov was exceptionally courageous, persistent, and tenacious. Between July 20 and 22, 1936, Chkalov, together with G. F. Baidukov and A. V. Beliakov, made a nonstop flight from Moscow to Udd Island via Petropavlovsk-na-Kamchatke, covering 9,374 km in 56 hours and 20 minutes. Between July 18 and 20, 1937, Chkalov, Baidukov, and Beliakov flew nonstop from Moscow to Vancouver (USA) over the North Pole, covering 8,504 km in 63 hours and 16 minutes.

Chkalov was a deputy to the first convocation of the Supreme Soviet of the USSR. He was awarded two Orders of Lenin and the Order of the Red Banner. He died while testing a new fighter plane. He is buried on Red Square at the Kremlin wall.

CHKALOVSK (until 1937, Vasilevo) a city (since 1955) and the administrative center of Chkalovsk Raion, Gorky Oblast, RSFSR. A landing on the right bank of the Volga, on the Gorky Reservoir, Chkalovsk is located 40 km from the Zavolzh'e railroad station and 95 km northwest of Gorky. Industry is represented by the Ul'ianov (Lenin) Shipyard, a drawn-thread embroidery workshop, a furniture factory, a clothing factory, and a winery. The city was renamed for V. P. Chkalov, who was born in Vasilevo; a memorial museum devoted to Chkalov is located in the city. [29–668–2]

CHKALOVSK, a city (since 1956) under oblast jurisdiction in Leninabad Oblast, Tadzhik SSR. Located on the Leninabad-Kokand highway, 3 km from the Leninabad railroad station on the Khavast-Kokand line. Population, 27,000 (1974). Chkalovsk has a theater of drama and comedy and a puppet theater. [29–668–3]

CHKHARTISHVILI, ARCHIL EVSTAF'EVICH. Born Jan. 6 (19), 1905, in Tiflis. Soviet stage director. People's Artist of the USSR (1968). Member of the CPSU since 1945.

Chkhartishvili began his theatrical career in 1921. He staged plays at the Kutaisi Theater and served as artistic director of the Chechen-Ingush and Batumi theaters. During the years 1949–52 and 1963–64 he headed the Mardzhanishvili Theater in Tbilisi. He was a director at the Rustaveli Theater in Tbilisi from 1957 to 1962 and principal director from 1965 to 1968.

Chkhartishvili's most outstanding works have included *The Good Soldier Švejk* (after the novel by Hašek, 1931), Shanshiashvili's *Anzor* (1935), Tsagareli's *Times Are Different Now* (1939), Sophocles' *Oedipus Tyrannus* (1946), Mosashvili's *His Star* (1951), Vazha Pshavela's *The Exile* (1956), Vishnevskii's *An Optimistic Tragedy* (1958), Gamzatov's *Mountain Girl* (1960), Ebralidze's *A Modern Tragedy* (1961), Euripides' *Medea* (1962), and Eliozishvili's *Old Zurnachi* (1966).

Chkhartishvili's productions are noted for their brilliant theatricality, skillful and dynamic staging of mass scenes, and rhythmic integration of action and music.

Chkhartishvili received the State Prize of the USSR in 1952. He has been awarded four orders and several medals.

E. M. KRASNOVSKAIA [29–778–2]

CHKHEIDZE, NIKOLAI SEMENOVICH (also Karlo Chkheidze). Born 1864 in the village of Puti, in what is now Zestafoni Raion, Georgian SSR; died 1926 in Paris. Menshevik leader.

Chkheidze became involved in the social-democratic movement in the late 1890's. He represented Tiflis Province as a deputy to the Third State Duma of 1907–12 and the Fourth State Duma of 1912–17 and served as chairman of the latter's Menshevik faction. During World War I he was a centrist; he favored worker participation in the war industries committees and opposed the national-liberation movement in Georgia.

After the February Revolution of 1917, Chkheidze was a member of the Provisional Committee of the State Duma, chairman of the Executive Committee of the Petrograd Soviet of Workers' and Soldiers' Deputies, and chairman of the first convocation of the All-Russian Central Executive Committee. While invested with the authority of the soviets, he sought to conceal the counterrevolutionary nature of the policies of the bourgeois Provisional Government. He took part in the State Conference in Moscow in 1917.

After the October Revolution of 1917, Chkheidze served as chairman of the counterrevolutionary Transcaucasian Seim of 1918. In 1919 he became chairman of the Constituent Assembly, which was the Menshevik government of Georgia. Chkheidze emigrated in 1921. [29–779–2]

CHKHEIDZE, NODAR GEORGIEVICH. Born Aug. 18, 1917, in Tiflis. Soviet Georgian actor. People's Artist of the Georgian SSR (1966). Member of the CPSU since 1950.

In 1942, Chkheidze graduated from the Georgian Theatrical Institute and was accepted into the company of the Rustaveli Theater in Tbilisi. He plays dramatic and comedy roles and is noted for his acute characterizations, brilliant, typically Georgian sense of humor, and dramatic force. His roles have included Giko in Sundukian's *Pepo*, Chinchakhov in Buachidze's *There Is a Ferocious Dog in the Yard*, Hamlet and Edgar in Shakespeare's *Hamlet* and *King Lear*, Neznamov in Ostrovskii's *Guilty Though Guiltless*, and Franz Moor in Schiller's *The Robbers*. [29–779–3]

CHKHEIDZE, REVAZ DAVIDOVICH. Born Dec. 8, 1926, in Kutaisi. Soviet motion-picture director. People's Artist of the Georgian SSR (1966). Member of the CPSU since 1958.

Chkheidze studied in the directing department of the Tbilisi Shota Rustaveli Theatrical Institute from 1943 to 1946 and graduated in 1953 from the All-Union State Institute of Cinematography, where he studied in the workshop of M. I. Romm and S. I. Iutkevich. He is a director at the Gruziia-fil'm studio, where, together with the director T. E. Abuladze, he has produced several documentary films, as well as the feature film *Lurdzha Magdany* (1956; prizewinner at the Ninth International Film Festival in Cannes). Chkheidze's most outstanding works as a director have been *The Father of a Soldier* (1965), the leading actor of which, S. A. Zakariadze, was awarded the Lenin Prize in 1966, and *The Seedlings* (1972). His other films have included *Our Yard* (1957), *Maia From Tskhneti* (1960), and *Those Young People!* (1969).

Chkheidze was a deputy to the ninth convocation of the Supreme Soviet of the USSR. He has been awarded the Order of Lenin, two other orders, and several medals. [29–780–1]

CHKHEIDZE, USHANGI VIKTOROVICH. Born Nov. 27, 1898; died Dec. 1, 1953, in Tbilisi. Soviet Georgian actor. People's Artist of the Georgian SSR (1935).

Chkheidze enrolled in G. Dzhabadari's theater studio in 1919, and after graduating he joined the company of the Workers' Theater of the Avchal Auditorium. In 1921 he became an actor at the Shota Rustaveli Theater, and in 1928 he helped organize a theater in Kutaisi, now named the K. A. Mardzhanishvili Georgian Theater and relocated in Tbilisi. In 1935 he left the stage because of illness.

Chkheidze gained renown for his performances as Hamlet and Iago in the Shakespearean tragedies *Hamlet* and *Othello* and in the title role in Gutzkow's *Uriel Acosta*. In the Georgian repertoire he played the title role in Kakabadze's *Kvarkvare Tutaberi* and the police officer Chaliani in Dadiani's *Yesterdays'*. He also played Godun in Lavrenev's *The Break*. He was the author of the historical drama *Georgii Saakadze*, which was staged in 1940 at the Mardzhanishvili Theater, and the books *Kote Mardzhanishvili—Director and Teacher* (1949) and *Reminiscences and Letters* (1956). Chkheidze also appeared in motion pictures. [29–780–2]

CHKHENKELI, AKAKII IVANOVICH. Born 1874 in the city of Khoni, now the city of Tsulukidze, Georgian SSR; died 1959, in Paris. A leader of the Georgian Mensheviks.

Chkhenkeli joined the social democratic movement in 1898. Between 1907 and 1914 he was a Liquidator. Chkhenkeli served in the Fourth State Duma (1912–17) as a deputy from Kars and Batumi oblasts and Sukhumi Okrug. During World War I he was a defensist; that is, he supported the war on the grounds of national defense.

After the February Revolution of 1917, Chkhenkeli became a commissar of the bourgeois Provisional Government in Transcaucasia and a member of the Special Transcaucasian Committee. In April 1918 the Transcaucasian Seim confirmed him as head of the Transcaucasian Provisional Government. He subsequently served as minister of foreign affairs in the Menshevik government of Georgia and as the Menshevik government's envoy to France. Chkhenkeli became an émigré in 1921. [29–780–3]

CHKHENKELI, IVAN NOEVICH. Born Sept. 16 (29), 1910, in Batumi. Soviet Georgian architect. Honored Artist of the Georgian SSR (1961). Member of the CPSU since 1945.

Chkhenkeli studied at the Civil Engineering Institute in Tbilisi from 1928 to 1933. He has taught at the Academy of Arts in Tbilisi since 1944. From 1959 to 1972 he was chief architect of Tbilisi, and since 1962 he has been chairman of the board of the Architects' Union of Georgia. Most of Chkhenkeli's major works are in Tbilisi. They include apartment houses on Plekhanov Prospect (1950), the renovated Communications Building (1954), and the Concert Hall of the Georgian State Philharmonic (1971). Chkhenkeli won the Rustaveli State Prize of the Georgian SSR in 1973. He has also been awarded two orders and various medals. [29–780–4]

CHKHIKVADZE, NOE. Born July 18 (30), 1883; died May 24, 1920. Georgian poet.

The son of a poor peasant, Chkhikvadze took part in the Revolution of 1905–07. His first collection of verse was published in 1908. In his poetry Chkhikvadze strove to express the ideas of social and national liberation. He was a major representative of the democratic school in Georgian poetry. Chkhikvadze's intimate and philosophic lyrics sometimes exhibit pessimistic attitudes and motifs of loneliness and impending doom.

CHKHIKVADZE, VIKTOR MIKHAILOVICH. Born Dec. 19, 1911 (Jan. 1, 1912), in the village of Zorveti, in what is now Zestafoni Raion, Georgian SSR. Soviet jurist. Corresponding member of the Academy of Sciences of the USSR (1964). Member of the CPSU since 1939.

Chkhikvadze was director of the Institute of State and Law of the Academy of Sciences of the USSR from 1964 to 1973. He was president of the International Association of Legal Science from 1968 to 1972 and vice-president of the International Political Science Association from 1968 to 1970. He was named a foreign member of the Bulgarian Academy of Sciences in 1970.

Chkhikvadze has been awarded four orders and the Joliot-Curie Gold Peace Medal of the World Peace Council.

CHKHOROTSKU, an urban-type settlement and the administrative center of Chkhorotsku Raion, Georgian SSR. Chkhorotsku is located on the Khobi River, which empties into the Black Sea. The settlement lies 40 km north of the Tskhakaia railroad junction. Chkhorotsku has a tea factory and a winery. [29–781–5]

CHKONIIA, LAMARA GRIGOR'EVNA. Born Dec. 27, 1930, in Batumi. Soviet Georgian singer (lyric-coloratura soprano). People's Artist of the USSR (1976). Member of the CPSU since 1974.

Chkoniia graduated from the Tbilisi Conservatory in 1956, where she studied voice under V. S. Kashakashvili and G. M. Gogichadze. From 1956 to 1960 and since 1968 she has been a soloist at the Georgian Theater of Opera and Ballet; from 1960 to 1968 she was a soloist at the Ukrainian Theater of Opera and Ballet.

Chkoniia possesses a voice of delicate silvery timbre, as well as extraordinary musicality and impeccable technique. Her roles have included Marfa in Rimsky-Korsakov's *The Tsar's Bride*, Tat'iana and Iolanthe in Tchaikovsky's *Eugene Onegin* and *Iolanthe*, the title roles in Puccini's *Madame Butterfly* and Massenet's *Manon*, Violetta in Verdi's *La Traviata*, Rosina in Rossini's *The Barber of Seville*, and Maro and Eteri in Z. Paliashvili's *Daisi* and *Abesalom and Eteri*.

Chkoniia was a prizewinner at the Young Opera Singers' Competition in Sofia in 1963 and at the Glinka All-Union Vocalists Competition in Moscow in 1960. She gives recitals in addition to her theater performances. Chkoniia has been awarded the Order of the Badge of Honor and several medals. [29–668–4]

CHLIA, a lake in Khabarovsk Krai, RSFSR. The lake has an area of 140 sq km; its average depth is 0.9 m, with a maximum of 2.6 m. The banks are generally steep and covered with forest, but those in the southwest are low and swampy. The Podgornaia River connects Lake Chlia with Lake Orel'; the Glinskaia River connects it with the Amur River. The highest water levels occur in August and September, with a range of fluctuation of about 4.5 m. Lake Chlia freezes over in late October or early November. [29–674–1]

CHMI, a group of archaeological remains dating from the Bronze Age, the early Iron Age, and the late Middle Ages, located near the settlement of Chmi on the left bank of the Terek River, 22 km south of the city of Ordzhonikidze. Among the finds was a large burial ground from the sixth to ninth centuries belonging to the ancestors of the Ossetians—the Alani. The site was excavated beginning in 1882 by various archaeologists, including D. Ia. Samokvasov. The catacomb burials yielded weapons (swords, axes, arrows, and chain mails), gold, silver, and bronze ornaments, Byzantine and Arabic coins, beads, and clay and glass vessels. The burial inventory at Chmi is similar to that of other Alani burial grounds (*see* SALTOVO-MAIATSKOE CULTURE) and reflects the process of social differentiation among the Alani.

CHMSHKIAN, GEORG ARUTIUNOVICH. Born Mar. 7 (19), 1837, in Tbilisi; died Dec. 28, 1915 (Jan. 10, 1916), in Petrograd. Armenian actor, stage director, and theatrical figure.

Chmshkian, who first appeared on the stage in Tbilisi in 1862, helped establish the Armenian professional theater in that city. One of the best educated men of his time, he was a man of progressive views. He was the first to stage and popularize the works of Shakespeare and Molière on the Armenian stage, as well as the Russian classics, especially the plays of N. V. Gogol and A. N. Ostrovskii. He translated Russian and French plays and wrote vaudevilles, comedies, and dramas, including *The Teacher* (1890).

Chmshkian was a friend and colleague of the playwright G. M. Sundukian and was regarded as the best interpreter of roles in Sundukian's plays. The professional association of the two furthered the establishment of realism and a reform of the Armenian theater. Chmshkian's company toured in many cities of Transcaucasia with large Armenian populations. In 1879 he invited into his company several outstanding Armenian actors who were then performing in Constantinople, including P. Adamian and Sirandish.

Chmshkian's best roles were Othello and Shylock in Shakespeare's *Othello* and *The Merchant of Venice*, the title role in Sundukian's *Pepo*, and Krechinskii in Sukhovo-Kobylin's *Krechinskii's Wedding*.

CHMUTOV, KONSTANTIN VASIL'EVICH. Born Mar. 8 (21), 1902, in Moscow; died there May 29, 1979. Soviet physical chemist. Corresponding member of the Academy of Sciences of the USSR (1953). Member of the CPSU from 1947.

A student of N. A. Shilov's, Chmutov graduated from the Moscow Higher Technical School in 1928 and taught there from 1928 to 1932; he also taught at other higher educational institutions in the USSR. In 1950 he joined the staff of the Institute of Physical Chemistry of the Academy of Sciences of the USSR. Chmutov's principal works are devoted to the study of surface phenomena and ion-exchange chromatography.

Chmutov has been awarded six orders and various medals.

CHOBANIAN, ARSHAK. Born July 15, 1872, in Istanbul; died June 9, 1954, in Paris. Armenian writer, critic, and historian. Wrote in Armenian and French.

In 1885, Chobanian moved to Paris, where he published the journal *Anait* from 1898 to 1911 and from 1929 to 1949. He attempted to attract western support for the liberation of the Armenian people from the Ottoman yoke. He was one of the first prominent Armenians outside Russia to embrace the October Revolution of 1917.

In the 1930's and 1940's, Chobanian published in *Anait* material dealing with the culture and arts of Soviet Armenia. His works *Armenia, Its History and Literature and Its Role in the East* (1897) and *Armenian Folk Singers* (1906) are widely known. Chobanian's work *The Beauty of Armenia* (1918–29) is an outstanding monument of Armenian culture.

CHOBANU, ION KONSTANTINOVICH. Born Nov. 6, 1927, in the village of Budei, in what is now Teleneshty Raion. Soviet Moldavian writer. Member of the CPSU since 1947.

Chobanu's novel *Kodry* (books 1–2, 1952–57; Russian translation, 1958) is a broad epic narrative that depicts the hard lot of the Moldavian people in the past and portrays the struggle waged by the working people under Communist leadership for liberation and for reunification with the Soviet motherland. The novel *Bridges* (1966; Russian translation, 1968) deals with life in a Moldavian village during and immediately after the war. The novel *Kukoara* (1975) was written as a sequel.

Between 1961 and 1965, Chobanu was chairman of the administrative board of the Writers' Union of the Moldavian SSR. He served as a deputy to the sixth through ninth convocations of the Supreme Soviet of the USSR. Chobanu has been awarded two orders and various medals.

CHOBAN-ZADE, BEKIR VAGAP OGLY. Born Jan. 9 (21), 1893, in the village of Argyn in the Crimea; died Apr. 18, 1938. Soviet Crimea Tatar poet and Turkic scholar.

Choban-zade studied at the Sultanî Lycée in Istanbul from 1909 to 1914 and graduated from the University of Budapest in 1918. He became a doctor of philology in 1920 and was a professor at the universities of Budapest and Lausanne in 1919 and 1920. In 1919 he was a prominent member of the Hungarian Commune.

Choban-zade returned to his homeland in 1920 and joined the Crimean Central Executive Committee in 1921. He became a professor at the Crimean University in 1922 and the University of Azerbaijan in 1924. In 1935 he became a member of the Azerbaijan branch of the Academy of Sciences of the USSR and the Paris Linguistic Society.

Choban-zade was the author of several books of poetry, including narrative poems, and many works on the history of the literature and folklore of the Crimean Tatars and other Turkic peoples. He helped create a Turkic alphabet based on the Latin alphabet.

CHOCANO, JOSÉ SANTOS. Born May 14, 1875, in Lima; died Dec. 13, 1934, in Santiago, Chile. Peruvian poet.

Chocano's poetic works *Soul of America* (1906) and *Let There Be Light!* (1908) revealed traits characteristic of Spanish-American modernism of the turn of the century—the rich use of metaphor, interest in national tradition, and recognition of the prophetic mission of the poet.

Chocano led an active political life in many countries of Latin America. He took part in several risky political undertakings, and as a result he was murdered in Chile.

CHOCÓ, a department in Colombia. Area, 47,200 sq km. Population, 202,000 (1973). The capital is Quibdó. Livestock is raised on pastureland, and fields are cultivated to aid animal husbandry. Gold, silver, and platinum are mined in Chocó. Industry includes sawmilling. Banana plantations are found near the Gulf of Urabá. [29–679–1]

CHOCOLATE, a confectionery obtained by processing cacao beans with sugar and other food products. Chocolate was long used as a beverage in Mexico. During the 16th century, the Spanish brought cacao beans from Mexico to Europe.

A distinction is made between natural chocolate, which contains only cacao products (cacao beans and cocoa butter) and sugar, and chocolate with additives, such as dried milk, coffee, and nuts. Depending on the fineness of the particles, chocolate is subdivided into plain and dessert chocolate. Chocolate confectioneries often contain various fillings. The fat content of chocolate is 35–37 percent; the caloric value is 2,240 kilojoules, or 540 kilocalories, per 100 g.

After cleaning, sorting, and roasting, cacao beans are broken up into nibs, which are then ground into a plastic liquor. The liquor is then pressed to obtain cocoa butter. Chocolate is obtained by mixing the liquor, cocoa butter, sugar (usually powdered), and the necessary flavorings and aromatic additives. This mixture is then ground until the size of the solid particles does not exceed 20 micrometers. The resulting mass is mixed once more with cocoa butter and cooled to 30°–31°C, whereupon it is ready to be produced into plain chocolate or chocolate-coated candy by chocolate-molding equipment. To produce dessert chocolate, which has improved flavor and aroma, the chocolate mass is subjected to additional processing, at a temperature of 70°C for an average of three nights and days, before it is molded.

Chocolate is manufactured in the form of blocks, various figures, and round medallions; chocolate confectioneries are produced as bars or assorted candies. Natural chocolate can be stored up to six months, and mixed chocolate, up to three months. G. A. MARSHALKIN [29–1337–1]

CHOCOLATE-MOLDING EQUIPMENT, a group of automated integrated machines, linked by conveyors, for molding chocolate confectioneries, both with and without candy centers. The following operations are performed by chocolate-molding equipment: the molds are heated to 32°C and the chocolate is deposited into the molds, compacted by vibration, cooled, and removed from the inverted mold by impact or vibration.

In the production of chocolate confectioneries with candy centers, a chocolate shell with one open end is initially formed and cooled and then the candy filling is deposited into it. The filled shell is condensed and cooled and then chocolate is poured over it. The candy product is recooled and then removed from the mold onto a conveyor belt or plate moved by a conveyor. There is specialized and general-purpose chocolate-molding equipment, as well as equipment for the manufacture of certain chocolate items. Chocolate confectioneries with candy centers are produced using all the components of a general-purpose chocolate-molding machine, while chocolate bars, decorated chocolate confectioneries, and hollow figures are produced by excluding some components.

CHODRISHVILI, MIKHAIL IOSIFOVICH (also Mikha Chodrishvili). Born Aug. 15 (27), 1853, in Signakhi, in what is now the Georgian SSR; died Dec. 25, 1929, in Tbilisi. Figure in the Russian revolutionary movement. Member of the Communist Party from 1896.

The son of an artisan, Chodrishvili became a worker in Transcaucasia in 1868. He began taking part in Narodnik (Populist) circles in 1873 and became an organizer of social democratic workers' circles in 1895. From 1904 to 1909 his joiner's workshop in Tbilisi was the clandestine meeting place of the Caucasian Union and Tiflis committees of the RSDLP.

Chodrishvili undertook party work in Rostov-on-Don in 1910 and in Tbilisi in 1913. Between 1917 and 1920 he was a member of the Tiflis party committee. He was arrested a number of times, first by the tsarist authorities and later by the Georgian Mensheviks. In 1921 he became a member of the collegium of the Peoples's Commissariat of Justice, a member of the Central Control Commission of the Communist Party (Bolshevik) of Georgia, and the chairman of the republic committee of the Society for Assistance to Defense, Aviation, and Chemical Construction. Chodrishvili was a member of the Central Executive Committee of the Georgian SSR and of the Transcaucasian Federation. [29–677–1]

CHOE CHI-WON (pseudonym, Koun). Born 857 in Kyongu; year of death unknown. Korean poet and scholar.

Choe Chi-won's poetry and prose collections *Chungshan pokkwe chip* and *A Collection of Verse* have not been preserved. Some parts of his *Literary Works From the Garden of Cinnamon Trees* have survived, and some of his writings were preserved in the works of later authors. Choe Chi-won's poetry, written in *hanmun*, includes lyrical nature poems, descriptions of the calamitous history of the Korean people, and criticism of the Confucian policies of the government.

CHOE IK-HYON. Born 1833 in Po-chon, Kyonggi-do (Kyonggi Province); died 1906 (according to some sources, 1909) on the island of Tsu-shima. Korean political figure and Confucian scholar.

Choe Ik-hyon protested against the establishment of Japanese rule in Korea. In the summer of 1906 he and his followers organized a partisan detachment, which took up armed struggle against the Japanese. Choe Ik-hyon was captured by the Japanese and was banished to the island of Tsu-shima, where he committed suicide. [29–778–3]

CHOE NAM-SON (pen name, Yuktan). Born 1890 in Seoul; died there October 1957. Korean literary figure and historian. One of the founders of modern Korean literature.

From 1904 to 1906, Choe Nam-son studied at Waseda University in Japan. He first published his works in 1906. In 1908 he began publishing *Son yon*, Korea's first literary monthly of enlightened thought; in this journal he printed his own verses and narrative poems, which firmly established free verse in Korean poetry, and he wrote articles on politics, culture, and literature as well.

After drafting the Declaration of Independence, which was signed by the bourgeois nationalists on the eve of the March 1919 uprising in Korea, Choe Nam-son was arrested. In 1925 he switched allegiance and worked for the Japanese colonial powers. After the liberation of the country in 1945 he lived in South Korea, having lost his public influence. He opposed the Korean Federation of Proletarian Art.

Choe Nam-son, a prominent bourgeois historian, wrote works on Korean history and published many old Korean historical documents and literary works.

CH'OERH HO, a river in Northeast China; a right tributary of the Nonni River (Nen Chiang) of the Sungari River basin. The Ch'oerh Ho is 610 km long and drains an area of about 24,000 sq km. It rises in the Greater Khingan Mountains and flows through mountains and hills before crossing the Sung-Liao Plain in the

lower course. The river empties into the Nonni through two arms. The water level is highest in spring and summer and lowest in winter. The mean flow rate is approximately 70 cu m per sec. The Ch'oerh Ho freezes over for five or six months a year. The river is used for floating timber, and in the lower course it is navigable by small vessels. [29–680–1]

CHOE SUH-HAE (pen name of Choe Hak-song). Born Jan. 12, 1901, in Songjin District, Hamgyang-pukdo (North Hamgyang Province); died July 9, 1932, in Seoul. Korean writer.

Choe Suh-hae's cycle of short stories consisting of "Yearning for the Homeland" (1925), "The Madman" (1926), "Tongues of Flame" (1926), and "Man tu" (1931) is devoted to the hard life of Korean settlers in Manchuria. The writer stated his aesthetic credo in his autobiographical story "Confession of a Fugitive" (1925) and the collection *Trail of Blood* (1926). He protested against violence and oppression in the stories "Hunger and Murder" (1925) and "The Death of Pak Tol" (1925).

Choe Suh-hae's works are distinguished for their genuinely Korean national character, psychological depth, and simple, laconic style. Choe Suh-hae was one of the founders of the New Direction School of literature (*singyonghyangpa*) and of the Korean Federation of Proletarian Art.

CHOGORI (also Mt. Godwin Austen), the highest mountain peak in the Karakoram. Mt. Chogori rises to an elevation of 8,611 m, making it the second highest mountain in the world after Chomolungma (Mt. Everest). It is composed of granites and gneisses. The Baltoro Glacier lies along the southern slope. The mountain was first ascended in 1954 by the Italians L. Lacedelli and A. Compagnoni. [29–676–3]

CHOGUK KWANGBOKHOE (Society for the Revival of the Fatherland), a people's front organization founded by Korean Communists in May 1936 in order to unify the patriotic forces in their armed struggle against the Japanese occupiers of Northeast China and the northern regions of Korea. The chairman of the society was Kim Il-sung.

The program of the Choguk Kwangbokhoe, which was published on May 5, 1936, set forth in ten points the chief tasks of the antifeudal and anti-imperialist revolution in Korea. These tasks included the liquidation of Japanese colonial supremacy; the establishment of an independent, democratic Korean state; the formation of a people's government; the confiscation of all enterprises, banks, railroads, and lands owned by Japanese imperialists and their Korean accomplices; and the realization of political, socioeconomic, and cultural transformations.

The Choguk Kwangbokhoe had sections in both Korea and Northeast China, where approximately 1 million Koreans were in residence and the main Korean partisan forces were operating. The society published illegal literature, including the journals *Samil* (The First of March) and *Hwa cheng ming* (Peasant of the Fiery Field). It also directed the activities of various mass social organizations. Supported by the Choguk Kwangbokhoe, Korean Communists intensified the armed struggle against the Japanese in Northeast China and Korea.

After the liberation of North Korea, the tasks set forth in the society's program were further developed in the political platform of the people's regime.

CHOIBALSAN, KHORLOGIIN. Born Feb. 8, 1895, in Tsetsenkhan Aimak (now Eastern Aimak); died Jan. 26, 1952, in Moscow; buried in Ulan Bator. Mongolian political and state figure.

The son of a poor Mongolian *arat* (livestock-raising serf), Choibalsan in 1912 made his way to Urga (now Ulan Bator), where he worked as a porter and a watchman. After teaching himself to read and write, he entered a school for translators and learned Russian. In 1914 he was sent to Irkutsk to continue his education, and he remained there until 1917.

The revolutionary events in Russia strongly influenced Choibalsan. In 1919, D. Sukhe-Bator organized a revolutionary circle in Urga; Choibalsan formed a similar circle in the city later that year. In 1920 the two groups merged, forming the Mongolian People's Party (since 1925, the Mongolian People's Revolutionary Party). In the summer of 1920, Choibalsan went to Soviet Russia as a member of the first Mongolian delegation sent by the revolutionaries; the delegation requested the government of the RSFSR to render assistance to the Mongolian people in its struggle for liberation from foreign aggressors.

After returning to Mongolia in November 1920, Choibalsan helped organize units of the People's Revolutionary Army, and he took part in preparations for the First Congress of the Mongolian People's Party, which was held in March 1921. He served in the Provisional People's Government, which was established in March 1921, and in July 1921, after the victory of the Mongolian People's Revolution, he became a member of the People's Government. In 1924 he was elected for the first of several times to the Central Committee of the Mongolian People's Party and to the Presidium (Politburo) of the Central Committee.

From 1921 to 1923, Choibalsan served as deputy commander in chief of the Mongolian People's Army, and in 1923 and 1924 he studied at the Military Academy in Moscow; from 1924 to 1928 he was commander in chief of the Mongolian People's Revolutionary Army. Choibalsan served as chairman of the Presidium of the Lesser People's Khural of the Mongolian People's Republic from 1928 to 1930, as minister of foreign affairs in 1930, and as minister of land cultivation and livestock raising from 1931 to 1935. Choibalsan was the first deputy premier of the Mongolian People's Republic from 1935 to 1939, when he became premier. He served as commander in chief of the Mongolian People's Revolutionary Army during the joint Soviet-Mongolian operations that defeated the Japanese aggressors in the region of the Khalkin-Gol in 1939; he was also commander in chief during the Manchurian Operation of 1945.

Choibalsan was given the rank of marshal in 1936. The title of Hero of the Mongolian People's Republic was conferred on him twice, and a city in Mongolia was named for him. Choibalsan was awarded such Mongolian orders as the Order of Sukhe-Bator and the Order of the Red Banner of Combat; among the Soviet orders he received were two Orders of Lenin.

[29–677–3]

CHOIBALSAN (until 1921, San-Beise; until 1941, Baian-Tumen), a city in the eastern Mongolian People's Republic, near the Chinese border, on the Kerulen River. Administrative center of Eastern Aimak. Population, 22,500 (1975). Choibalsan is connected by railroad with the Solov'evsk station of the Trans-Siberian Railroad in the USSR. It is a highway junction and is connected by air with Ulan Bator. Building materials are manufactured in Choibalsan, and the city has automotive-repair facilities. A milling combine, a meat-packing plant, and a wool-scouring plant are located there. Brown coal and fluorite (in Berkh) are mined in the area. [29–678–1]

CHOIBALSAN ULA (also Bogdo Ula, Bogd Khaan Uul), a preserve in Mongolia, near Ulan Bator. In 1649 the mountain Bogdo Ula (2,257 m) was declared sacred. Its status as a preserve was established by an act of legislation in 1809. Choibalsan Ula covers an area of 36,600 hectares (1976). The typical southern-taiga complex on the slopes and the steppe vegetation of the foothills are protected. [29–678–2]

CHOIMBOL, SONOMYN. Born 1907 in Lun, Arakhangai Aimak. Mongolian sculptor.

Choimbol studied in Moscow under S. D. Merkurov from 1943 to 1946. He has designed severe, impassioned monuments for the squares of Ulan Bator, notably *Sukhe-Bator* (artificial granite, 1946) and *Choibalsan* (concrete, 1947), as well as smaller free-standing pieces, such as *The Fighter's Entrance* (gypsum, 1958, Museum of Fine Arts of Mongolia, Ulan Bator), and portraits. [29–678–3]

CHOISEUL, ÉTIENNE FRANÇOIS DE (Comte de Stainville, Duc de Choiseul). Born June 27 or 28, 1719; died May 8, 1785, in Paris. French state figure.

Choiseul achieved a high rank in the army during the War of the Austrian Succession. He was ambassador to Rome from 1754 to 1757 and to Vienna in 1757 and 1758. Between 1758 and 1761 he served as minister of foreign affairs. He strengthened France's ties to Austria with the Alliance Treaty of Versailles of 1758 and signed the Family Compact of 1761.

Choiseul was minister of war from 1761 to 1770. He also served as minister of the navy from 1761 to 1766 and for a second time as minister of foreign affairs from 1766 to 1770. Between 1758 and 1770 he was the dominant figure in the French government.

After France's defeat in the Seven Years' War of 1756–63, Choiseul began preparing the country to take revenge. His measures included reorganizing the army and navy and reinforcing the artillery. In 1770, Choiseul was removed from office and exiled to his estates at Chanteloup. [29–1510–3]

CHOISEUL, an island in the Pacific Ocean; one of the Solomon Islands. Population, more than 8,000 (1970). Choiseul Island covers an area of 2,600 sq km and rises to a maximum elevation of 1,067 m. The island has evergreen forests. Coconut palms are raised, and copra is exported. [29–1510–4]

CHOKHA, a man's overcoat made of cloth, popular in the past among Georgians and other peoples of the Caucasus. The *chokha* was similar to the common Caucasian *cherkeska*. Unlike the *cherkeska*, however, it had a stand-up collar and elbow-length sleeves with slits, and it came only to the knees. The *chokha* was often girded by a sash instead of a belt. [29–689–2]

CHOKHATAURI, an urban-type settlement and administrative center of Chokhatauri Raion, Georgian SSR. Chokhatauri is situated on the Supsa River, which empties into the Black Sea. It is located on the Novorossiisk-Batumi highway, 20 km south of the Sadzhevakho railroad station on the Samtredia-Batumi line.

Chokhatauri has three tea factories, a winery, and a branch of the Kutaisi Automotive Plant. The city has a museum of local lore and a people's amateur theater. [29–689–3]

CHOKHOV, ANDREI (also Andrei Chekhov). Year of birth unknown; died between Jan. 23 and Dec. 8, 1629. Russian maker of cannons and bells.

For more than 60 years, Chokhov worked at the Cannon Yard (Pushechnyi Dvor) in Moscow, where he made many heavy artillery pieces. More than 20 of these were mentioned in historical documents, including the Tsar Cannon (1576). Chokhov usually gave a name to each cannon, for example, Lisitsa (Vixen, 1575), Volk (Wolf, 1576), Inrog (Unicorn, 1577), Lev (Lion, 1590), Aspid (Asp, 1590), and Tsar Akhilles (King Achilles, 1617). Chokhov's cannons were outstanding examples of artillery engineering. They were decorated with high relief, ornate floral ornamentation, and inscriptions in keeping with their names. Some of the sturdy weapons were used in the Northern War (1700–21). Of the 12 Chokhov cannons that have survived, seven are in Leningrad, at the Military History Museum of the Artillery and Engineer and Signal Corps, and three are in the Moscow Kremlin. Two others, the Volk models produced in 1576 and 1578, are housed in Gripsholm Castle, near Stockholm; they were brought to Sweden during the Livonian War. Tsar Peter I ordered that Chokhov's cannons be preserved as historical monuments.

Chokhov also made bells, including the Reut (Howler, 1621–22), which weighed 2,000 poods (about 32 tons), for the Bell Tower of Ivan the Great. He taught his craft to many pupils.

CHO KI-CHON. Born Nov. 16, 1913, in the village of Yuaedugou, near Nikol'sk-Ussuriiskii (present-day Ussuriisk); died July 31, 1951, in Pyongyang. Korean poet.

Cho Ki-chon graduated from the philology department of the Omsk Pedagogical Institute in 1937. He worked as a correspondent and translator in the Korean press from 1945. In his early poems and the narrative poems *Song of the Land* (1946) and *Hymn of Life* (1950), he celebrated the new life in free Korea and the valor of the Soviet soldiers. The poem cycle *Uprising in Yosu* (1949) is devoted to the people of South Korea. The narrative poem *Paektu-san* (1947; National Prize First Class, 1948) deals with the struggle between the Korean partisans and the Japanese colonizers in the 1930's. For his poem cycle *Korea in Battle* (1951) he was posthumously awarded the National Prize First Class in 1952.

Cho Ki-chon was killed while serving as a military journalist.

CHOKRAK LAKE (also Messir), a salt lake in Crimean Oblast, Ukrainian SSR. Located in the northern part of the Kerch' Peninsula. Chokrak Lake is separated from the Sea of Azov by a sand barrier and has an area of 8.5 sq km. It is fed by seawater and underground water. On the bottom of the lake is a layer of mud 2 to 3 m thick; the mud is used for pelotherapy. [29–679–3]

CHOLA, the name of an ancient and medieval state in southern India and the dynasty that ruled the state. The capital of the state, Cholamandalam, was located in the region of Thanjavur. The state language was Tamil.

The feudal despotism of the Chola dynasty reached its height between the late tenth and early 12th centuries, when the rulers subjugated other regions of Tamil Nadu (including Panyamandalam, Tondaimandalam, and Kongumandalam) and parts of what are now Kerala, Karnataka, Andhra Pradesh, and Sri Lanka. During the same period, the economy and culture of Tamil Nadu flourished. From the 13th to 18th centuries, branches of the Chola family governed a number of small princely states in various regions of southern India. [29–680–2]

CHOLPON-ATA, a city (since 1975) under oblast jurisdiction and the administrative center of Issyk-Kul' Raion, Issyk-Kul' Oblast, Kirghiz SSR. Cholpon-Ata is located at an elevation of more than 1,600 m, on the northern shore of Lake Issyk-Kul', 225 km east of the city of Frunze and 75 km from the Rybach'e railroad station. It is a climatic health resort. The summers are moderately warm, with an average July temperature of 17°C, and the winters are mild, with an average January temperature of −3°C; annual precipitation totals 250 mm. Therapeutic remedies include climatotherapy and the silt mud and mineral water from Lake Issyk-Kul'. Persons suffering from disorders of the nervous system and the musculoskeletal system are treated. Medical facilities include sanatoriums for adults, a children's pulmonary tuberculosis sanatorium, and a hydropelotherapeutic clinic. There is a milk combine in Cholpon-Ata. Also in the city is the house-museum of the Kazakh writer Mukhtar Auezov. [29–680–3]

CHOLUTECA, a city in southern Honduras, on the Pan-American Highway; capital of Choluteca Department. Population, 22,000 (1972). Choluteca is the center of an agricultural region

that raises cotton, coffee, sesame, maize, and cattle. In addition to sawmills, the city has plants for the processing of raw agricultural products. [29–680–4]

CHO MYONG-HI (pen name, Posok). Born 1894; died Feb. 20, 1942. Korean writer. Born in the village of Pyogam-ni, Chinchon District, Chungchong-pukto (North Chungchong Province). One of the founders of modern Korean literature. Ideologist of the Korean Federation of Proletarian Art.

Cho Myong-hi, a participant in the March 1919 uprising in Korea, studied in the philosophy department of the Oriental Institute in Tokyo from 1919 to 1923. In the stories "To the Land" (1925), "Comrade" (1926), and "Low Atmospheric Pressure" (1926), he depicted his fellow countrymen and their lack of rights. The story "The Naktong River" (1927) reveals the basic features of Cho Myong-hi's writing—subtle lyricism, sincerity, and optimism.

In 1928, Cho Myong-hi emigrated to the USSR. He wrote poetry, essays, stories, and publicist articles on the life of the land of the Soviets. In 1934 he was accepted for membership in the Writers' Union of the USSR. In 1937 he wrote the novel *Manchurian Partisans* (unpublished), which dealt with the Korean partisan movement in northeastern China.

CHON, a group of linguistically related South American Indian tribes of Argentina and Chile that included the Tehuelche of Patagonia and the Ona, or Shelknam, who constituted the eastern group of the Fuegians. The Chonan languages have been little studied. Most of the Indians of the Chon group had been exterminated by the early 20th century, and in the mid-20th century they numbered in the dozens. [29–682–1]

CHONA, a river in Irkutsk Oblast and the Yakut ASSR, a right tributary of the Viliui River of the Lena basin. The Chona is 802 km long and drains an area of 40,600 sq km. It flows over the Central Siberian Plateau and empties into the Viliui Reservoir. The lower 170 km of the river valley is flooded. The Chona is fed by snow and rain. The mean flow rate is approximately 125 cu m per sec. The Chona freezes over in October, and the ice breaks up in May. [29–682–3]

CHONAN, a city in South Korea, in Chungchong-namdo (South Chungchong Province). Population, approximately 100,000. Chonan, an important transportation junction on the Seoul-Taejon-Pusan route, has textile and food-processing industries. [29–781–2]

CHON BURI, a city in Thailand, on the Gulf of Thailand. Capital of the *changwat* (province) of Chon Buri. Population, 40,500 (1965). A transportation and trade center on the Bangkok-Sattahip highway, Chon Buri has a food-processing industry, the principal product of which is sugar. [29–682–5]

CHONDON, a river in the Yakut ASSR. The Chondon is 606 km long and drains an area of 18,900 sq km. It rises on the slopes of the Selenniakh Range and flows mainly through the Iana-Indigirka Lowland before emptying into Chondon Bay of the Laptev Sea. The river is fed by snow and rain. It freezes over in late September or early October, and the ice breaks up in June. The river is sometimes entirely frozen. Fish found near the mouth of the Chondon include the arctic cisco, the least cisco, the nelma, and the muksun. [29–683–2]

CHONG CHOL (pen name, Songgang). Born Jan. 27, 1536, in Seoul; died Feb. 7, 1594, on the island of Kanghwa-do. Korean poet.

Chong Chol left seven volumes of poetry and prose known as *Songgang Chip*, which were written in *hanmun*. His *Songgang Kasa*, his first collection of Korean-language poetry, includes more than 80 *sijo* (short lyrical poems) and five *kasa* (narrative poems). His most famous works are his *kasa*, including *Longing for My Beloved* and *Still Longing for My Beloved* (1585–87). Chong Chol's works are distinguished for their range, expressiveness, and dynamism. His *kasa*, which were written in the lyrical folk-song tradition, helped writers of the following centuries justify the writing of poetry in their native tongue under bilingual conditions.

CHONG IN-JI. Born 1396 in Soksong; died 1478 in Seoul. Korean scholar and state figure.

From 1444 to 1446, Chong In-ji helped design the *hunmin chongum* alphabet (now called *hangul*). He also took part in the compilation of a number of works on the exact sciences, politics, military affairs, and history (including *The History of Koryo*, 1451). He was the chief minister in the government of the *wang* (ruler) Sejo, who held power from 1456 to 1468. Because he opposed the policy of encouraging Buddhism, however, he was banished to Puyo in central Korea. Under the next *wang*, Chong In-ji returned to the capital and received general recognition. [29–683–3]

CHONGJIN, a city in the northeastern People's Democratic Republic of Korea, an ice-free port on the Sea of Japan. Capital of Hamgyong-pukto (North Hamgyong Province). Population, 290,000 (1972). Chongjin is a transportation junction and an important center of ferrous metallurgy, which is based on the Musan iron ore deposits. The city has machine-building (including shipbuilding), textile (including the manufacture of artificial-silk fabrics), chemical, food-processing, and building-materials industries. Fishing is also of some importance in the local economy. [29–781–3]

CHONGJU, a city in South Korea, on a river in the Kum-gang system. Capital of Chungchong-pukto (North Chungchong Province). Transportation junction. Population, 141,000 (1970). Chongju is a major center of the textile (including silk weaving) and tobacco industries. Other industries include agricultural machine building, the assembly of motor vehicles, food processing, and the manufacture of wood products. Products of the city's chemical industry include rubber goods and soap. Nickel is mined in the vicinity of Chongju. [29–781–4]

CHONG PONG-JUN. Born 1853 in Kobu District, Cholla-do (Cholla Province), southern Korea; died 1895. Leader of a Korean peasant rebellion.

Chong Pong-jun was the son of a minor district official who was

executed for organizing a peasant rebellion. In 1888, Chong joined the Tonghak sect and assumed the leadership of its branch in Kobu. In 1894 he became the leader of a peasant rebellion that started in Cholla-do but quickly spread through the entire country. Chong Pong-jun was captured and executed by the authorities. [29–682–4]

CHONGURI. (1) A Georgian four-stringed plucked instrument. The *chonguri* has a pear-shaped body that is truncated at the bottom. The long neck, which has fastened or carved frets, terminates in a curved pegbox with three pegs, one for each of the main strings; the short fourth string fastens to a peg midway up the side of the neck. The silk or nylon strings are tuned to D, G, and B of the one-line octave and D of the two-line octave. Played primarily by women, the *chonguri* is used to accompany singing. Improved versions of the *chonguri* are used in Georgian folk-instrument orchestras.

(2) One of the names of the *panduri*, a Georgian three-stringed plucked instrument.

CHONG YAK-YONG (also Chong Tasan). Born Aug. 5, 1762, in the village of Mahyong, Kwangju, Kyonggi-do (Kyonggi Province); died there Apr. 7, 1836. Korean scholar and encyclopedist; representative of the *sirhak p'a* movement.

Born into a noble family, Chong Yak-yong entered government service in 1789. He proved to be a talented engineer and architect, and he introduced vaccination into Korea. He denounced the arbitrariness and venality of state officials. In 1801, charged with spreading Christianity, he was condemned to death; however, the sentence was commuted to 18 years in exile.

Chong Yak-yong devoted his years of banishment and his later life to scholarly and literary activities. In his works he criticized the principles of the prevailing Confucian ideology, assailed feudalism, and expressed profound sympathy for the oppressed people. Recognizing material force (*ch'i*) as the basis of the universe, he approached philosophical materialism. Chong Yak-yong regarded state authority as the result of a social contract; he declared absolute rule from above to be unjust and opposed class distinctions, royal privileges, and the despotic monarchy. His plan for land reform foreshadowed the eventual liquidation of landlord property rights.

Although Chong Yak-yong's theories could not be realized under the conditions of feudalism, his ideas and contribution to learning were of enormous importance for the subsequent development of the antifeudal ideology and culture of the Korean people.

CHONJU, a city in South Korea and capital of Cholla-pukdo (North Cholla Province). Population, 277,000 (1973). Chonju, a transportation junction, is linked by railroad with the ports of Kunsan on the Yellow Sea and Yosu on the Korea Strait. The city has enterprises of the food-processing (including rice-polishing), textile, wood-products, and paper industries. [29–683–1]

CHONKADZE, DANIEL GEORGIEVICH. Born Mar. 18, 1830, in Kvavili; died June 17 (29), 1860, in Tiflis. Georgian writer. Son of a village priest of peasant origin.

Chonkadze graduated from the Tiflis Theological Seminary in 1851. He is highly esteemed in the history of Georgian literature as the author of the realistic novella *The Surami Fortress* (1859). The work, which deals with a peasant and his struggle against serfdom, influenced the social consciousness of Georgia on the eve of the abolition of serfdom. It played an important role in popularizing the Georgian literary language. Chonkadze also collected Ossetian proverbs.

CHONOS, ARCHIPIÉLAGO DE LOS, an archipelago off southern Chile, between 44° S lat and the Taitao Peninsula. The islands include Melchor and James. The archipelago is separated from the mainland by the Moraleda Channel. The maximum elevation is 1,680 m. Mixed evergreen forests grow on the islands. There is fishing in the area. [29–683–5]

CHOP, a city (since 1957) in Uzhgorod Raion, Transcarpathian Oblast, Ukrainian SSR. Chop, located near the border of Hungary and Czechoslovakia, is a junction for railroad lines to Uzhgorod, Mukachevo, Budapest, and Prague. The city has enterprises servicing the railroad industry, a plant for the production of brick and tile, and a garment division of the Uzhgorod Textile and Clothing Accessory Factory. [29–684–2]

CHOPIN, FRÉDÉRIC-FRANÇOIS (also Fryderyk Franciszek Chopin). Born Feb. 22, 1810 (according to some sources, Mar. 1, 1810), in Zelazowa Wola, near Warsaw; died Oct. 17, 1849, in Paris. Polish composer and pianist.

Chopin's father, Nicolas Chopin, was a French emigrant who took part in the Polish Uprising of 1794, and his mother, J. Krzyżanowska, was a Polishwoman. Chopin received his first piano lessons from his sister Ludvika (Louise) Chopin. In 1816 he began studying with the Czech pianist and composer W. Zywny in Warsaw. Chopin's gifts as a pianist and composer were manifested at a very young age; in 1817 he wrote two polonaises in the style of M. K. Ogiński, and in 1818 he performed in public for the first time. While studying at the lyceum (1823–26), he continued to perfect his playing technique and to perform in public; beginning in 1822 he studied the theory of composition with J. Elsner and later graduated from his class at the Central School of Music in Warsaw, where he studied from 1826 to 1829.

Chopin's creative development proceeded amid an upsurge in Polish national culture. While still a student, Chopin established close ties with the progressive intelligentsia and the revolutionary-minded youth. In the years 1825–29, during travels in various parts of Poland, he became acquainted with folk art and the life of the people. In 1828 he visited Berlin, and in 1829, Vienna, where he composed a number of works and gave concerts, performing, among other things, his own work Variations on "Là ci darem" from Mozart's *Don Giovanni* for piano and orchestra.

The Warsaw period of Chopin's life (up to November 1830) played a crucial role in the formation of Chopin's creative art. In his native land, having absorbed the influence of Ogiński, Elsner, M. Szymanowska, F. Lessel, K. Kurpiński, and F. Ostrowski, among others, Chopin composed two concerti for piano and orchestra (1829–30), a piano trio (1829), the Grand Fantasy on Polish Airs for piano and orchestra (1830), the Krakowiak, or Grand Rondo de Concert, for piano and orchestra (1828), a sonata (1828), a number of polonaises and mazurkas, the Nocturne in E Minor (1827), and the first of the 12 grand studies (1829–30), which he later completed in Paris, where he also completed other cycles of piano pieces. The works composed in Poland reflect the influence of national folk music, which is particularly evident in the melodic turns and the nature of the rhythms, linked with the Polish dances, such as the mazurka and polonaise, and with the characteristics of the harmonic texture, as well as with the structure of the forms. They fully reflect the uniqueness of Chopin's music, namely, the extensive use of the devices of alternation, especially with respect to the subdominant, that is, the "Slavic fourth" (the alternation of a natural and an augmented fourth), a feature characteristic of Chopin's mature works as well. Based on

the national dances, Chopin also composed poetic miniatures and grand concerti for piano and orchestra, imbuing them with traits of epic poems. In his native land he also composed songs to the words of Polish poets; of the several dozen written, only 19 have been preserved, all published posthumously.

A milestone event in Chopin's life and work was the Polish Uprising of 1830–31; it found him in Vienna, from where he set out for Paris, stopping along the way in Munich and Stuttgart (it was in Stuttgart that Chopin learned of the fall of Warsaw). In Vienna and Stuttgart (1830–31), Chopin composed or began composing his first scherzo (1831–32) and first ballade (1831–35), the Revolutionary Etude in C Minor (1831), which soon became famous (one of the streets in Warsaw has been named the Street of the Revolutionary Etude), and other works, many of which were completed in Paris.

Chopin settled in Paris in September 1831, although he retained spiritual ties with Poland until the end of his life. In 1832 he began his triumphant concert appearances in Paris, in the course of which he met the leading literary and art figures of France and other countries, including F. Liszt, H. Berlioz, V. Bellini, G. Meyerbeer, H. Heine, and E. Delacroix. In 1834–35, Chopin journeyed along the Rhine with F. Hiller and F. Mendelssohn; in 1835 he made the acquaintance of R. Schumann in Leipzig. In 1835–36 he traveled to Bohemian health resorts. He spent late 1838 on the island of Majorca with George Sand, and in subsequent years he spent several summers on her estate at Nohant. The liaison between Chopin and George Sand ended abruptly in 1847, which adversely affected Chopin's health and hastened his death. In 1848, Chopin toured Great Britain. Chopin died in Paris and was buried there; his heart, in accordance with his deathbed wishes, was brought by his sister to Warsaw and placed into one of the columns of the Holy Cross Church.

Chopin's most important works of the Paris period are dominated by heroic-dramatic and tragic images, stemming from bitter contemplation about the failure of the Polish Uprising. The music is imbued with a unique passion and intensity of feeling and a sense of conflict and is characterized by the power and breadth of the images; at the same time, the features of national folk music are more pronounced. The most important theme is the glorification of patriotic endeavors and hopes, whose defeat evoked intense grief. The culmination of the sense of the tragic in Chopin's creative work of the 1830's is the famous Funeral March (the "Mont Blanc of the musical Alps," in the words of A. V. Lunacharskii), composed in 1837 and included in 1839 as the third part of the Sonata in B Flat Minor. The march, which combines a lofty sense of tragedy with an intense lyricism, is now part of numerous funeral rituals throughout the world. Patriotic, nationalistic ideas are particularly vividly expressed in the B Minor Sonata and in the polonaises, characterized by emotional richness, ranging from the nobly festive (the A Flat Major Polonaise) to the tragic (the F Sharp Minor Polonaise). National folk elements are also evident in the numerous mazurkas, on which Chopin worked since his youth. He developed their metric and rhythmic structure, stressing the uniqueness of Polish dance music, and achieved melodic and emotional diversity, ranging from brilliant danceability to the elegiac. His mazurkas present elegant sketches of Polish daily life (Chopin referred to his mazurkas as vignettes) and brief emotional stories of the destiny of his native land. The features of Polish dance music are also evident in Chopin's waltzes, imbued with profound meaning (they influenced the development of the Parisian waltz).

Chopin's treatment of the pianoforte genres was inventive. Chopin transformed the prelude (including a cycle of 24 piano preludes, one in each of the keys, composed during the 1830's and published in 1839) from a mere "introduction" to the fugue or other work into an independent instrumental miniature, condensing considerable emotional feeling; each is an imagistic sketch, reflecting various moods. The nocturne was considerably developed by Chopin, who imbued it with contrasts and drama. Chopin also introduced new and more profound content into the impromptu and transformed the scherzo, imbuing it with passion, the fantastic, and emotional diversity. He treated the etude in a new way, completely subordinating complex, virtuoso aspects of piano-playing technique to the imagery and musical expressiveness.

Chopin's creative work is one of the greatest achievements of Polish and world artistic culture. As the founder of Polish classical music, Chopin raised the national musical art to the highest artistic level through his enormous compositional and performing talents and mastery, innovative development of folk traditions, and transformation of the experience of the masters of national and world musical culture (he particularly valued the music of J. S. Bach and W. A. Mozart), as well as through his progressive ideology, lofty intellect, and ethical, aesthetic, and political convictions (he placed his hopes in the people and their liberty-seeking aspirations). His works are a lofty embodiment of the full range of human emotions, ranging from high tragedy to intense lyricism.

An inspired pianist, Chopin possessed an original performing style, characterized by a *cantabile* style and elegance and combining virtuosic brilliance with profundity and intimacy. His innovativeness was understood only by a few of his contemporaries, primarily F. Liszt and E. Delacroix (who painted several portraits of Chopin), as well as M. I. Glinka, A. S. Dargomyzhskii, the masters of the The Five (Balakirev Circle), and subsequent generations of Russian composers.

Since 1927, Warsaw has been the site of the International Chopin Piano Competition, whose winners have included many Soviet pianists (first prize at the first competition was won by L. N. Oborin). Warsaw is also the site of the Frédéric Chopin Society, which engages in extensive concert, scholarly, publishing, and organizational activity.

I. F. BELZA [29–1347–4]

CHOPIN, JEAN (Russian, Ivan Ivanovich Shopen). Born 1798 in France; died Aug. 3 (15), 1870, in St. Petersburg. Ethnographer and historian.

Chopin, who was French by birth, moved to Russia in the 1820's. He worked for many years in the Caucasus. At the behest of the *namestnik* (vicegerent) of the Caucasus, he compiled a detailed description of the region. Chopin also wrote the important work *A Historical Record of the Condition of the Armenian Region at the Time of Its Union With the Russian Empire* (1852).

[29–1347–3]

CHOPOVICHI, an urban-type settlement in Malin Raion, Zhitomir Oblast, Ukrainian SSR. Situated near the Irsha River of the Dnieper basin, Chopovichi is 6 km from the Chopovichi railroad station. The settlement has a flax-processing plant and factories for the production of furniture and clothing. [29–685–2]

CHORNYI, KUZ'MA, (pen name of Nikolai Karlovich Romanovskii). Born June 11 (24), 1900, in the village of Borki, in what is now Kopyl' Raion, Minsk Oblast; died Nov. 22, 1944, in Minsk. Soviet Byelorussian writer. Member of the CPSU from 1943.

Chornyi was of peasant stock, the son of a hired hand. He studied in the division of literature and linguistics of Byelorussian State University from 1923 to 1925. His early published works appeared in 1921 and were followed by the short-story collections *The Silver of Life* (1925), *Along the Road* (1926), *Feelings* (1926), and *September Nights* (1929) and the novels *The Sister* (1927–28) and *The Earth* (1928). Chornyi's works reveal a desire common to many Byelorussian writers to master the methods of psychological prose, especially as exemplified by L. N. Tolstoy and F. M. Dostoevsky. The novella *Levon Bushmar* (1930) and the novel *The Fatherland* (1931) re-create revolutionary life in their portrayal of full-scale characters.

The true hero of Chornyi's works is history, philosophically interpreted. The novel *The Third Generation* (1935) and the novella *Liuba Luk'ianskaia* (1936) were intended as parts of a cycle of sociophilosophical works embracing several decades of Byelorussian history. During the Great Patriotic War (1941–45), Chornyi continued to work on the cycle, producing the war novels *The Great Day* (published 1947), *Search for the Future* (published 1950), and *Skip'evskii Forest* (published 1955) and the philosophical novel *The Milky Way* (published 1954).

Chornyi translated the works of A. S. Pushkin, N. V. Gogol, and other Russian classics. His works have been translated into the languages of the peoples of the USSR. Chornyi was awarded the Order of the Red Star and several medals.

CHORTKOV, a city (since 1939) and administrative center of Chortkov Raion, Ternopol' Oblast, Ukrainian SSR. Situated on the Seret River, 76 km southeast of Ternopol'. Railroad station. Population, 22,000 (1974). Chortkov has enterprises servicing the railroad industry, a repair plant, a sugar refinery, a cheese factory, a vodka distillery, a meat-packing plant, a bread-baking combine, a garment factory, and a factory for the manufacture of down and feather articles. The city has a historical museum. [29–686–2]

CHORUKH-DAIRON, an urban-type settlement in Leninabad Oblast, Tadzhik SSR, under the jurisdiction of the Kairakkum city soviet. Chorukh-Dairon is located in the foothills of the Mogoltau, 30 km northwest of Kairakkum. Nonferrous metals are mined nearby. [29–686–4]

CHOSENIA, a genus of plants of the family Salicaceae. There is a single species, *C. arbutifolia* (formerly *C. macrolepis*). A rapidly growing tree, it has an erect trunk measuring 25–30 m in height (sometimes to 37 m). The tree is found in Korea, Japan, Northeast China, and the USSR (in the Far East and East Siberia—west to Baikal). The wood is used for telegraph poles, bridges, and various small articles.

CHOSON, the first state in the history of Korea. Because few details are given in written sources, many questions concerning the history of ancient Choson still remain unanswered.

The state of Choson emerged circa the first millennium B.C. Before the 1960's, Choson was generally regarded as a tribal alliance on the threshold of civilization; since the 1960's, however, scholars in the People's Democratic Republic of Korea have regarded Choson as the first slaveholding state in Korean history. In the late second century B.C., Choson was conquered by the Han Dynasty of China. In the early part of the first millennium A.D., during the people's struggle against the Chinese conquerors, the early feudal Korean states of Koguryo, Paekche, and Silla were formed.

CHOSON (literally, "morning beauty"; often rendered in translation as Land of the Morning Calm), one of the names of Korea. The etymology of the name remains obscure, but many authors think that the word was used to designate the east, or the direction in which the sun rises. Choson was originally the name of a tribe or of a group of tribes whose alliance gave rise to the first Korean state, also known as Choson. The name later fell into disuse, but it was revived in 1392 when the Yi dynasty was founded and gave the name "Choson" to the state; the Korean state retained the name until 1897, when it was renamed the Taehan Empire. With the formation of the People's Democratic Republic of Korea, the name was incorporated into the official designation of the state, which is known in Korean as the Choson Minjujuui Inmin Konghwaguk. [29–688–2]

CHOTA NAGPUR, a plateau in India that forms the northeastern part of the Deccan plateau and descends in stages to the Gangetic Plain. The Chota Nagpur is approximately 400 km long and up to 200 km wide. Its highest point is Parasnath Hill, which has an elevation of 1,366 m. The plateau consists of gneisses and quartzites that are overlain by basalts in the west. Its rolling surface, with pinnacle-like remnants of dense sandstone, is dissected by broad valleys. Savanna predominates in the plateau. A considerable measure of the plateau is farmed, and its irrigation systems are based on the Damodar River and its tributaries. [29–781–6]

CHOU, a Chinese dynasty and a period in the history of ancient China (1027–256 B.C.; according to some sources, 1027–249 B.C.). The period is divided into the Western Chou period (1027–771 B.C.) and the Eastern Chou period (770 B.C. to 256 or 249 B.C.).

The Chou Dynasty was founded by Wu Wang, leader of the Chou tribe, who in 1027 B.C. defeated the early Shang state and united all the tribes and territories of North China. The country was governed through the allotment of fiefs, in which power was given to relatives, associates, and allies of the *wang* (monarch). The Chou aristocracy, which was supported by Chou warriors, constituted an alien element in a number of the fiefs that had been granted it, and therefore its rule resulted in both social and tribal oppression. The fiefs struggled against the central authority and fought among themselves. Consequently, some were gradually destroyed or weakened, and new kingdoms appeared, which became independent or semidependent states.

In the eighth century B.C., in the Ch'un Ch'iu, or Spring and Autumn, period, the authority of the Chou *wangs* weakened, and in the seventh and sixth centuries the rulers of the most powerful states by turns ruled the country as hegemon. During the Chan Kuo, or Warring States, period (fifth to third centuries), seven powerful kingdoms emerged and warred against one another for control over the country. The Chou Dynasty waned still further, ruling only the Chou family possessions, which were overrun by the Ch'in kingdom between 256 and 249.

The introduction of iron in the sixth century led to a dramatic upsurge of productive forces and an improvement in tillage. The Chou period was marked by the formation of several philosophic schools, including Confucianism, Taoism, and Fa-chia (the Legist school), and the development of literature, the visual arts, and music.

CHOUANS, rebels who engaged in counterrevolutionary activity in northwestern France during the French Revolution and under the Directory and the Consulate. The name "Chouan" is often said to derive from *chat-huant*, or screech owl, the bird whose cry the rebels imitated as a signal.

The first bands of Chouans formed in southern Maine in the summer of 1792. By 1793, the year usually taken as the beginning of the revolt, the Chouan movement had spread throughout northwestern France. Many of the rebels were peasants from economically and politically backward areas who had fallen under the influence of the royalists and counterrevolutionary clergy. Other peasants in the movement wished to avoid the conscription that had been announced in February 1793.

After the Jacobins came to power, rich peasants who had been alienated by government requisitions and by the introduction of the Law of the Maximum joined the Chouans. Ideological leadership of the rebels subsequently passed to the petty nobility and to priests who had refused to take the oath of allegiance.

Republican troops dealt the movement a heavy blow in 1794. Nevertheless, in 1795, G. Cadoudal led more than 10,000 Chouans in support of the Quiberon expedition. The Chouans, who were linked to the royalist émigrés in Great Britain, continued the struggle until 1803, when the rebel movement was finally suppressed. [29–1510–6]

CHOU EN-LAI. Born Mar. 5, 1898, in Shaohsing District, Chekiang Province; died Jan. 8, 1976, in Peking. Chinese state and political figure.

Chou En-lai was the son of a landowner. As a student at Nank'ai University in Tientsin he took part in the anti-imperialist May Fourth Movement in 1919. From 1920 to 1924 he worked and studied in France and Germany. In 1922 he joined the Communist Party of China (CPC). From 1924 to 1926 he was head of the political department of the Whampoa Military Academy and head of the political department of the I Corps of the National Revolutionary Army.

In 1927, Chou became a member of the Central Committee of the CPC and helped organize and lead the Nanch'ang Uprising. In August of that year he became a candidate member of the Politburo of the Central Committee of the CPC, and in 1928, at the Sixth Congress of the Comintern, he was elected a candidate member of the Executive Committee of the Communist International. From 1927 to 1930, Chou was head of the organizational department of the Central Committee of the CPC, and from 1931 to 1934 he headed the Central Committee's bureau for the Central Soviet Region. From 1934 to 1956 he was a secretary of the Central Committee.

In 1934 and 1935, Chou was a leader of the Long March. In 1935, at the Seventh Congress of the Comintern, he was elected a member of the Executive Committee of the Communist International. From 1937 to 1945 he was chairman of the Central Committee of the CPC in the Kuomintang Government, which was located first in Nanking and later in Chungking.

From 1949 to 1954, Chou was premier of the State Administrative Council of the People's Republic of China (PRC), and from 1949 to 1958 he served as foreign minister of the PRC. He became premier of the State Council of the PRC in 1954 and a member of the Standing Committee of the Politburo of the Central Committee of the CPC in 1956. He was vice-chairman of the Central Committee of the CPC from 1956 to 1966 and from 1973 until his death.

Chou delivered the political report of the Central Committee of the CPC to the Tenth Congress of the CPC in 1973 and the report on the work of the government at the 1975 session of the National People's Congress; on both occasions he called for Maoist principles in the domestic and foreign policy of the Chinese leadership. V. I. ELIZAROV [29–538–2]

CHOU HSIN-FANG. Born 1895 in Chekiang Province; died 1966 in Peking. Chinese actor and theatrical figure. Performer of Peking opera, a genre of Chinese traditional theater.

Chou began his stage career in 1902, conventionally cast as an elderly hero, or *lao-sheng*. His first successful roles were in *The Gates of Wenchaokuan* and *The Fisherman's Revenge*. He also appeared in the dramatic theater. In the 1920's and 1930's he substantially broadened his repertoire, appearing in *The Fifth Madame Chao, The Fresh-wind Arbor, The Hall of the Black Dragon, Four Officials*, and *Sung Chiao-jen*.

Chou served in the patriotic movement against Japanese intervention and, after the formation of the People's Republic of China, helped reform the traditional repertoire. He created his own school of acting, distinguished by highly refined vocal skills and the laconic use of expressive devices, based on traditional national technique.

In 1954, Chou became a deputy to the All-China National People's Congress. He became director of the Shanghai Theater of Peking Musical Drama in 1955. He toured several countries, including the USSR in 1956.

CHOUK'OUTIEN, a habitation site of the early Paleolithic in the K'uoch'ieht'ang cave, located near the Chouk'outien railroad station, about 45 km from Peking. Remains of *Sinanthropus* (Peking man) were discovered at the site. [29–537–1]

CHOU LI-PO. Born 1908 in Iyang District, Hunan Province. Chinese writer. Member of the Chinese Communist Party since 1934.

Chou attended the economics faculty of the University of Shanghai. He was imprisoned by the Kuomintang for being implicated in the revolutionary movement. He worked for the Chinese League of Left Writers from 1934 to 1936 and later served in the ranks of the Chinese Red Army. In 1939 he began teaching in the department of literature of the Lu Hsün Academy of Literature and Art in Yenan.

Chou first published his works in 1938. In 1948 he wrote the novel *Hurricane* (Russian translation, 1951; State Prize of the USSR, 1952). He was also the author of the novel *Big Changes in a Mountain Village* (parts 1–2, 1958–60); the first part was translated into Russian as *Spring Comes to the Mountains* (1960), and the second part as *Clear Streams* (1962). These works depict the socialist reorganization of agriculture. The working class was portrayed in the novel *The Molten Iron Flows* (1955; translated into Russian as *The Steel Stream*, 1957). Chou wrote short stories, essays, and critical articles and translated into Chinese A. S. Pushkin's novel *Dubrovskii* and M. A. Sholokhov's novel *Virgin Soil Upturned*.

Chou was awarded the State Prize of the USSR in 1951.

CHOUSHAN, a group of islands in the East China Sea, off China; situated near the entrance to the gulfs of Hangchou Wan and Hsiangshan Kang. The islands have a total area of 1,554 sq km, the largest being Choushan. Their maximum elevation is 500 m. They have shrub vegetation. Fishing is practiced in the area. The cities of Choushan and Shenchiamen are situated on the islands. [29–538–1]

CHOU TUN-I (also Chou Lien-hsi). Born 1017; died 1073. Chinese philosopher. One of the founders of neo-Confucianism.

Chou Tun-i wrote the philosophic treatises *An Explanation of the Diagram of the Great Ultimate* and *The Book of Understanding*. Drawing on tenets of Taoism and ideas from the *I Ching* (Book of Changes), he put forth the concept of *t'ai chi* (the Great Ultimate) as the foundation of the world. When *t'ai chi* moves, it engenders yang, or motion; when it is stationary, it gives rise to yin, or repose. The interaction of yang and yin produces the five elements water, fire, wood, metal, and earth.

In a mysterious union with *t'ai chi*, yin, and yang and through the medium of the masculine base (Heaven) and feminine base (Earth), the five elements engender the multiplicity of things, which continuously reproduce themselves. The crown of this process is man, who possesses the five moral principles humanity, justice, decency, knowledge, and fidelity and who distinguishes good from evil. Chou Tun-i also put forth the idea that *ch'eng* (sincerity, honesty), an attribute identical to inaction, is the basis of moral qualities and the source of any activity. [29–536–5]

CHOW CHOW, a breed of dog. The chow chow originated in China and Manchuria, where it was bred as a hunting dog and was also used for food. It was brought to Great Britain in the 19th century and considerably improved. Because of its distinctive appearance, it is now bred as a show dog and pet. The chow chow is of medium height, 45 cm or higher. It has a massive head, a short muzzle, and a broad chest. The front legs are massive; the hind legs have short shins and straight hocks. The tail is highly placed and curved over the back. The fur is straight, with a thick undercoat, and is especially long on the neck, the extremities, and the tail. Its color is various shades of yellow, black, gray, or white. Chow chows are found all over the world. [29–109–4]

CHREVO, in Russian, an archaic word synonymous with the modern Russian *zhivot* ("belly") and *utroba* ("womb"). The noun *chrevougodie* (literally, "belly-pleasing") refers to a passion for food, a satisfying of the appetite, or gluttony. [29–690–1]

CHTENIIA V ISTORICHESKOM OBSHCHESTVE NESTORA-LETOPISTSA (Readings in the Historical Society of Nestor the Chronicler), nonperiodical collections published in Kiev by the Historical Society of Nestor the Chronicler from 1879 to 1914. There were 24 volumes, with Volumes 14 to 24 each having several fascicles.

The first section of each volume contained the minutes of the society's meetings and information about its membership and activities. In addition to reports on archaeological excavations, the second section contained source materials and articles on the history of Russia, the Ukraine, and other Slavic countries. A bibliographic section was added in 1893.

Among the materials and studies published were church polemical literature, "Acta of the History of Land Ownership in Little Russia," articles by V. S. Ikonnikov on events in Russia in the early 17th century, and articles by M. F. Vladimirskii-Budanov on the history of law. Some volumes were published as topical collections. A list of scholarly reports by members of the society that were published in *Chteniia v Istoricheskom obshchestve Nestora-Letopistsa* is given in N. P. Dashkevich's book *The 25th Anniversary of the Historical Society of Nestor the Chronicler* (1889). [29–695–2]

CHTENIIA V OBSHCHESTVE ISTORII I DREVNOSTEI ROSSIISKIKH (Readings in the Society for History and Russian Antiquities), a periodical publication of the Moscow Society of History and Russian Antiquities, which was associated with Moscow University. *Chteniia* contained important studies on the history of the peoples of Russia and the Slavs (some volumes were as large as 60 printer's sheets), extremely rich historical and ethnographic documentary materials, and translations of foreign works about Russia. It was issued as separate books for 72 years, with a ten-year interruption.

The first book came out in January 1846. For the first three years publication was irregular, with books appearing as sufficient material accumulated. Each book consisted of four sections: historical studies, domestic historical documents, foreign materials, and miscellaneous materials. The historical studies and materials were concerned with the history of the peoples of Russia from the eighth to the 19th centuries. The remaining studies and materials dealt with archaeology, ethnography, numismatics, paleography, and other subsidiary historical disciplines.

By June 1848, 23 books had been published. O. M. Bodianskii's inclusion of J. Fletcher's work on the Muscovite state in the book for June 1848 incurred the displeasure of Nicholas I. *Chteniia* was forced to suspend publication, and Bodianskii was dismissed from Moscow University.

Publication did not resume until 1858, when Bodianskii again became secretary of the society. *Chteniia* adopted a Slavophile orientation, and a section of Slavic materials was added to the former four sections. Beginning in 1858, *Chteniia* was published four times a year. From 1858 to 1877, Numbers 24 to 101 appeared, edited by Bodianskii; from 1877 to 1881, Numbers 102 to 117, edited by A. N. Popov; from 1881 to 1907, Numbers 118 to 222, edited by E. V. Barsov; from 1907 to 1916, Numbers 223 to 258, edited by M. K. Liubavskii; and from 1916 to 1918, Numbers 259 to 264, edited by S. A. Belokurov.

The most prominent Russian historians contributed to *Chteniia*, including D. I. Bagalei, D. N. Bantysh-Kamenskii, S. A. Belokurov, I. D. Beliaev, M. M. Bogoslovskii, S. K. Bogoiavlenskii, A. F. Bychkov, S. B. Veselovskii, Iu. V. Got'e, I. E. Zabelin, V. O. Kliuchevskii, and D. F. Maslovskii. Translations of Šafařík and other writers were printed in *Chteniia*.

L. B. LEONIDOV [29–696–1]

CHU, a city under oblast jurisdiction in Chu Raion, Dzhambul Oblast, Kazakh SSR; situated on the left bank of the Chu River, 230 km northeast of Dzhambul. Chu has a railroad station on the Alma-Ata–Dzhambul line. The city has a machinery repair plant, a sugar factory, a milk plant, and enterprises serving railroad transportation. [29–702–2]

CHU, a river in the Kirghiz and Kazakh SSR's. The Chu is 1,067 km long and drains an area of 62,500 sq km. It is formed by the confluence of the Dzhuvanaryk and Kochkor rivers, which originate at glaciers in the Terskei-Alatau and Kirghiz ranges. Below their confluence the Chu enters the Issyk-Kul' Basin, where it flows past the lake Issyk-Kul'; during high water, the Chu discharges some of its water into the lake via the Kutemaldy Arm. After passing the lake, the river flows through Boam Gorge into the Chu Valley, where it receives numerous tributaries from the surrounding mountains. In its lower course it crosses the desert known as the Muiunkum and disappears in the Ashchikol' Depression.

The Chu is fed by glaciers and snow, and subsurface drainage plays an important role. The mean flow rate at the place where the river emerges from the mountains (area of drainage basin, approximately 25,000 sq km) is 130 cu m per sec; maximum flow is in July and August. The lower course dries up in late July or early August, but the flow of water resumes in December. From November to April there is some ice in the upper course, which freezes over only occasionally and usually for about ten days; the lower course is frozen over from December to March. The main tributaries are the Chon-Kemin, Yrgaity, and Kakpatas on the right and the Alamedin, Aksu, and Kuragaty on the left. The Orto-Tokoi Reservoir and three water-raising dams are on the Chu. There are also numerous irrigation canals; 55 percent of the river's water is used for irrigation. The cities of Tokmak and Chu are situated on the Chu. [29–702–1]

CHUANG (self-designation, *puchuang, pupu, pui*, or *punung*), a people in the People's Republic of China, mainly in the Kwangsi Chuang Autonomous Region. According to a 1975 estimate, the Chuang number approximately 10 million. Their language is one of the Thai languages. The predominant religion is animism, but Taoism is also widespread.

The Chuang are one of the most ancient peoples of South China; their ancestors created the ancient state of Nanyüeh, which existed from 207 B.C. to 111 B.C. The Chuang took part in the Taiping Rebellion of 1850–64. Between 1927 and 1937 they helped establish a number of soviet regions in China in the area between the Tso Chiang and the Yu Chiang. They also aided in the formation of the Seventh and Eighth Red Armies.

For centuries the primary occupation of the Chuang has been farming, especially the cultivation of rice; part of the population, however, is now engaged in heavy industry. The Chuang have their own system of writing; in medieval times it was hieroglyphic, but in 1958 they adopted the Latin alphabet. The Chuang have a rich national literature.

CHUANG-TZU. Born circa 369 B.C.; died circa 286 B.C. Author of the ancient Chinese classic Taoist treatise *Chuang-tzu* (c. 300 B.C.).

Very little is known about the life of Chuang-tzu. It has been established that he deliberately refused to occupy any civil service posts. His treatise, written in the form of parables, short stories, and dialogues, harshly criticizes Confucianism and the teachings of Mo Tzu and preaches fusion with the tao, a certain inexpressible totality of universal life. Chuang-tzu contrasts nature, in which the tao is embodied, with human beings and the world created by them—government, culture, and morality, all of which are based on force.

WORKS

"Chuang-tzu chi shih." In *Chu-tzu chi-ch'eng*. (Collection of Works of Ancient Thinkers), vol. 3. Peking, 1957.

CHUBAR', VLAS IAKOVLEVICH. Born Feb. 10 (22), 1891, in the village of Fedorovka (now the village of Chubarovka, Pologi Raion, Zaporozh'e Oblast); died Feb. 26, 1939. Soviet state and party figure. Member of the CPSU from 1907.

The son of a peasant, Chubar' studied at the Aleksandrovsk School of Mechanical Engineering (now the V. Ia. Chubar' Zaporozh'e Institute of Machine Building) from 1904 to 1911. He was a veteran of the Revolution of 1905–07. Beginning in 1911 he worked at plants in Kramatorsk, Mariupol', Moscow, and Petrograd. After the February Revolution of 1917, Chubar' became chairman of the factory committee at an ordnance plant and later a member of the Central Council of Factory Committees and a deputy to the Petrograd soviet. During the October Revolution of 1917, after serving as commissar of the Military Revolutionary Committee in the Main Artillery Directorate, he was a member of the Council of Workers' Control.

In 1918 and 1919, Chubar' was chairman of the board administering machine-building plants (the State Association of Machine Building Plants, or GOMZA) and a member of the Presidium of the Supreme Council on the National Economy. Between 1919 and 1922 he served as chairman of the Organizational Bureau for the Restoration of Industry in the Ukraine, as a member of the All-Ukrainian Revolutionary Committee, and as chairman of the Presidium of the Supreme Council on the National Economy of the Ukraine. He became chairman of the Council of People's Commissars of the Ukrainian SSR and deputy chairman of the Council of People's Commissars of the USSR in 1923, deputy chairman of the Council of People's Commissars of the USSR and of the Council of Labor and Defense in 1934, and people's commissar of finances of the USSR in 1937.

Chubar' was a member of the Politburo of the Central Committee of the Communist Party (Bolshevik) of the Ukrainian SSR from 1920 to 1934. He was a delegate to the Eleventh through the Seventeenth Congress of the ACP(B) and was a candidate member of the Central Committee at the Tenth Congress. He became a member of the Central Committee of the ACP(B) in August 1921, a candidate member of the Politburo of the Central Committee in 1926, and a member of the Politburo in 1935. Chubar' was a member of the All-Russian Central Committee, and the Central Executive Committee of the USSR and its Presidium. He was a deputy to the first convocation of the Supreme Soviet of the USSR. Chubar' was awarded the Order of the Red Banner of Labor.

CHUBAROV, SERGEI FEDOROVICH. Born circa 1845 in Penza Province; died Aug. 10 (22), 1879. Russian revolutionary Narodnik (Populist).

Chubarov was of noble birth. He was a student at the Voronezh Cadet Corps in the late 1860's but did not complete the course of study; he subsequently enrolled as an auditor at Moscow University and then at the Forestry Institute in St. Petersburg. In 1869 he moved to the USA to establish a labor commune. He returned to Russia in 1872 and took up residence in Stavropol', Samara Province.

Chubarov joined the Southern Rebels group in 1875 and took part in the Chigirin conspiracy. He became a member of V. A. Osinskii's circle in 1877 and joined a circle of Russian Jacobins in Odessa in 1878. He organized a demonstration to protest the death sentence given to I. M. Koval'skii. On Aug. 5, 1878, in Odessa, Chubarov offered armed resistance to arrest. Sentenced to death by the Odessa military district court, Chubarov, with D. A. Lizogub and others, was hanged in Odessa.

CHUBINSKII, PAVEL PLATONOVICH. Born Jan. 15 (27), 1839, near Borispol', in what is now the Ukrainian SSR; died Jan. 14 (26), 1884. Bourgeois democratic ethnographer and folklorist specializing in the Ukraine and Russia.

Chubinskii studied the economic resources and ethnography of the northern provinces of Russia in 1867. In 1869 and 1870 he headed an expedition to the country's southwestern provinces. The materials gathered on this trip are a rich source for the historical ethnography of the Ukraine and for the customary law, way of life, folklore, and dialects of the Ukrainians and other peoples. These materials were published in *Works of an Ethnographic-Statistical Expedition to the Western Russian Region Sponsored by the Russian Geographical Society* (vols. 1–7, St. Petersburg, 1872–79).

REFERENCE

Kunitskii, A. S. "Ukrainskii etnograf P. P. Chubinskii (1839–1884)." *Sovetskaia etnografiia*, 1956, no. 1. (Contains bibliography.) [29–704–1]

CHUBUT, a province in southern Argentina, in the Chubut River basin. Area, 224,700 sq km. Population, 195,000 (1970). The capital of Chubut is Rawson. Petroleum and natural gas are extracted in the province; industry includes oil refining in Comodoro Rivadavia and nonferrous metallurgy in Puerto Madryn and Comodoro Rivadavia. Agriculture in Chubut is dominated by sheep raising. [29–704–6]

CHUBUT, a river in southern Argentina. The Chubut is 810 km long and drains an area of about 138,000 sq km. It rises on the eastern slopes of the Patagonian Andes, crosses the semidesert plateaus of Patagonia in a narrow, deep valley, and empties into the Atlantic Ocean near Rawson. The main tributary is the Rio Chico on the right. The mean flow rate is about 50 cu m per sec. The Chubut carries a small volume of water; small freshets occur in winter. [29–704–5]

CHU CHIANG (also Pearl River, Canton River), a river in Southeast China; left (northern) channel of the delta of the Hsi Chiang. The Pearl River empties into the Chu Chiang K'ou (Bay of Canton) of the South China Sea, forming an estuary. The river is more than 40 km long. The seaport of Canton (Kuangchou) is

situated on the river, above the estuary. The Chu is navigable; it is fished commercially and is a source of pearls. The name "Chu Chiang" is frequently applied to the entire Hsi Chiang system. [29–540–2]

CHU CHIANG K'OU (also Bay of Canton), a bay of the South China Sea, along the southern coast of China. The bay has a length of 63 km and a width of 31 km at the mouth; its maximum depth is 26 m. The Chu Chiang (Pearl River) empties into the bay, which has numerous small islands and shoals. There are mixed tides, with a maximum height of 2.5 m. The port of Hong Kong is situated at the mouth of the bay. [29–540–3]

CHUCHIN, FEDOR GRIGOR'EVICH. Born Feb. 5 (17), 1883, in the village of Zaimishche, Kirillov District, Novgorod Province; died Jan. 15, 1942, in Moscow. Participant in the Russian revolutionary movement. Member of the Communist Party from 1904.

The son of a peasant, Chuchin graduated from the teachers' seminary in Cherepovets in 1904. He took part in the Revolution of 1905–07 and was a member of the Moscow okrug committee and the St. Petersburg committee of the RSDLP. He was arrested and exiled several times. After the February Revolution of 1917, Chuchin became a member of the Tomsk soviet. During the October Revolution of 1917 he was commissar of the Anzhero-Sudzhensk mines and a member of the Siberian oblast bureau of the RSDLP(B). He was a member of the Central Executive Committee of Siberian Soviets in 1918 and 1919 and a member of the provincial committee and chairman of the district committee of the RCP(B) in Cherepovets in 1919 and 1920.

From 1921 to 1924, Chuchin was chairman of the All-Russian Extraordinary Commission for the Liquidation of Illiteracy and chairman of the commission of experts of the People's Commissariat for Foreign Trade. In 1921 he was named commissioner of the All-Russian Central Executive Committee for matters concerned with philately and bonds and commissioner of the Central Committee of the Central Commission for Famine Relief for matters pertaining to stamp donations. He was the founder and editor of the journal *Sovetskaia filateliia*; under his editorship the first Soviet catalogues of postage stamps were issued. Chuchin was a delegate to the Ninth Congress of the RCP(B) in 1920. He took up pedagogical and scholarly work in Moscow in 1924. Chuchin was granted a personal pension in 1931.

CHUCHKOVO, an urban-type settlement and the administrative center of Chuchkovo Raion, Riazan' Oblast, RSFSR. Chuchkovo has a railroad station on the Riazan'-Ruzaevka line. Industry is represented by an ironworks, a milk plant, a brickyard, an asphalt-concrete plant, and a poultry hatchery. [29–777–2]

CHUCHOU, a city in China, in Hunan Province; situated on the Hsiang Chiang, which empties into the lake Tungt'ing Hu. Population, 510,000 (1973). Chochou's industries include food processing and the repair of railroad cars and locomotives. [29–541–1]

CHUD', the name given in Old Russian chronicles to the Estonians and related Finno-Ugric tribes (Zavoloch'e Chud') living in the domains of the Novgorod Feudal Republic east of Lake Onega, along the Onega and Severnaia Dvina rivers. [29–739–3]

CHUDAKOV, ALEKSANDR EVGEN'EVICH. Born June 16, 1921, in Moscow. Soviet physicist. Corresponding member of the Academy of Sciences of the USSR (1966). The son of E. A. Chudakov.

A. E. Chudakov graduated from Moscow State University in 1947. From 1946 to 1971, he was on the staff of the Institute of Physics of the Academy of Sciences of the USSR. In 1971 he joined the staff of the Institute of Nuclear Research of the Academy of Sciences of the USSR.

Chudakov's main works deal with the nature and properties of cosmic rays. Chudakov developed a technique for measuring the energy of a particle that caused a cosmic-ray shower. He used the technique to search for local sources of high-energy gamma quanta. Together with S. N. Vernov and others, Chudakov discovered and investigated the earth's outer radiation belt; for this achievement, he received a Lenin Prize in 1960.

Chudakov has been awarded three orders and various medals. [29–735–1]

CHUDAKOV, EVGENII ALEKSEEVICH. Born Aug. 20 (Sept. 1), 1890, in the village of Sergievskoe, in what is now Tula Oblast; died Sept. 19, 1953, in Moscow. Soviet scientist, specialist in machine science and automotive engineering. Academician of the Academy of Sciences of the USSR (1939; corresponding member, 1933).

Chudakov graduated from the Moscow Higher Technical School in 1916. Between 1918 and 1928, he taught at the school. From 1936 until his death, he was the head of the automotive subdepartment at the school. In 1918, Chudakov organized an automotive scientific laboratory. From 1921 to 1930, he was the director of the Scientific Motor Vehicle Institute, which was founed on the basis of the laboratory. Between 1930 and 1940, he was the deputy director of the Tractor Scientific Research Institute and then the head of a section of the institute. From 1939 to 1950, Chudakov was the director of the Institute of Machine Science of the Academy of Sciences of the USSR. He was a vice-president of the Academy of Sciences of the USSR from 1939 to 1942, becoming a member of the academy's Presidium of 1942. From 1949 to 1953, he was a member of the Chief Editorial Board of the *Great Soviet Encyclopedia*.

Chudakov's main works dealt with the development of automotive theory. In 1928, Chudakov published *A Dynamic and Economic Study of Motor Vehicles*, in which he demonstrated the relationship between the design features of a motor vehicle and the vehicle's road and overall economic performance. He studied the stability of motor vehicles and the strength and wear of automotive parts.

For a number of years, Chudakov was the chairman of the All-Union Council of Scientific and Engineering Societies and a member of the Presidium of the Society for the Dissemination of Political and Scientific Knowledge. He received the State Prize of the USSR in 1943 and 1951 and was awarded two Orders of Lenin, the Order of the Red Banner of Labor, and various medals.

CHUDIC MINES, the collective name for ancient mine workings of which traces have been discovered in the USSR. In particular, Chudic mines have been found in the Minusinsk Basin, Western Siberia, and the Urals. The mines were first worked in roughly the first half of the third millennium B.C. The mining was most intensive in the 13th and 12th centuries B.C.; it ceased in the fifth and sixth centuries A.D. in Western Siberia and in the 11th and 12th centuries A.D. in the Central and Northern Urals.

The implements used by the ancient miners in digging the mines included the following: stone hammers, wedges, pestles, and crushers; horn and bone picks; copper, bronze, and (later) iron picks, pickaxes, and hammers; wooden troughs and log ladders; wicker baskets; leather pouches and mittens; and clay lamps. The first step in the working of the mineral deposits was usually the digging of test holes. After reaching a depth of 6–8 m along the dip of a deposit, the miners usually sank funnel-shaped shafts that were slightly inclined and were tapered downward. The miners sometimes excavated adits of small cross section or drove crosscuts through small veins.

The depth of the workings was 10–14 m on the average. Some

of the workings were quite large, since ore was mined in them for hundreds of years. For example, an open-pit copper mine near the city of Orsk was 130 m long and 15–20 m wide.

CHUDINA, ALEKSANDRA GEORGIEVNA. Born Nov. 6, 1923, in the village of Kramskaia, Kurkino Raion, Tula Oblast. Soviet athlete and coach. Honored Master of Sport (1948).

Chudina, competing on the Moscow Dynamo team, was champion of the USSR in track and field (running, jumping, and the pentathlon) 35 times from 1945 to 1955 and in volleyball seven times from 1947 to 1963. She was European champion in the pentathlon in 1954 and in volleyball four times from 1949 to 1958, and world volleyball champion three times from 1952 to 1960. From 1953 to 1956 she held the world record in high jump and the pentathlon.

Chudina has been awarded the Order of Lenin. [29–736–3]

CHUDNOV, an urban-type settlement and administrative center of Chudnov Raion, Zhitomir Oblast, Ukrainian SSR. The settlement is situated on the Teterev River, a tributary of the Dnieper, 5 km from the Chudnov-Volynskii railroad station on the Kazatin-Shepetovka line. Chudnov has a distilling plant, a food-processing combine, a furniture factory, a peat enterprise, and a feedlot sovkhoz. [29–737–1]

CHUDNOVSKII, GRIGORII ISAAKOVICH. Born Oct. 3 (15), 1890, in Ekaterinoslav (now Dnepropetrovsk); died Apr. 8, 1918. Participant in the October Revolution of 1917 and the Civil War of 1918–20. Joined the revolutionary movement in 1905. Member of the CPSU from August 1917.

The son of a lawyer, Chudnovskii studied law at the University of St. Petersburg. After being exiled to Siberia in 1910 for revolutionary activities, he fled the country in 1913. A centrist during World War I, Chudnovskii returned to Russia in May 1917 and joined the Mezhraiontsy. With them he was accepted into the Bolshevik party at the Sixth Congress of the RSDLP(B).

Chudnovskii served as a member of the corps committee of the Southwestern Front. In October 1917 he became a member of the All-Russian Bureau of Military Organizations of the Central Committee of the RSDLP(B), a member of the Petrograd Military Revolutionary Committee, and commissar of the military revolutionary committee in the Preobrazhenskii Regiment. He was a delegate to the Second All-Russian Congress of Soviets and was elected a member of the All-Russian Central Executive Committee.

As one of the leaders in the taking of the Winter Palace, Chudnovskii arrested the ministers of the bourgeois Provisional Government and escorted them to the Peter and Paul Fortress. He was wounded while helping to crush the Kerensky-Krasnov Rebellion of 1917. Appointed extraordinary commissar of the Southwestern Front in November 1917, Chudnovskii took part in the struggle against the Central Rada. He was arrested by the Central Rada in December and sentenced to death. In the early morning of Jan. 26, 1918, however, he was freed by Soviet troops in Kiev, where he was subsequently appointed commissar of civil affairs. Chudnovskii was killed during a Soviet troop retreat from the Ukraine.

CHUDNOVSKII, SOLOMON LAZAREVICH. Born Mar. 13 (25), 1849, in Kherson; died Aug. 21 (Sept. 3), 1912, in Odessa. Revolutionary populist.

The son of a merchant, Chudnovskii graduated from the Kherson Gymnasium in 1868. He was expelled from the St. Petersburg Medical and Surgical Academy for his part in the student unrest of 1868–69 and was sent back to Kherson, where he organized a number of activist groups. In 1871, Chudnovskii moved to Odessa, where he became a member of the Chaikovskii circle.

Studying in Vienna in 1872 and 1873, Chudnovskii became close with the Austrian Social Democrats. Upon his return to Russia, he and A. I. Zheliabov were in charge of transporting illegal literature into the country. He was arrested in Odessa on Jan. 27, 1874, and sentenced in the Trial of the 193 to five years at hard labor, which was commuted to exile in Tobol'sk Province.

While in Siberia, Chudnovskii studied peasant society, took part in geographical expeditions, and contributed to the journal *Severnyi vestnik* and the newspaper *Vostochnoe obozrenie*. He returned to Odessa in 1893 and served as secretary of the board of the Southern Russia Printing Society. In 1905 he became a Constitutional Democrat. Chudnovskii contributed to the journals *Byloe, Minuvshie gody*, and *Vestnik Evropy*.

WORKS
Iz davnikh let. [Moscow, 1934.] [29–737–3]

CHUDOV, MIKHAIL SEMENOVICH. Born Sept. 5 (17), 1893, in the village of Khoneevo, Bezhetsk District, Tver' Province; died Oct. 30, 1937. Soviet and party figure. Member of the CPSU from 1913.

A printer in St. Petersburg, Chudov took part in the February and October revolutions of 1917. He was chairman of the Bezhetsk district party committee and the Bezhetsk district executive committee between 1918 and 1920. Beginning in 1920, he served as chairman of the Tver' provincial executive committee, secretary of the Tver' provincial committee of the RCP(B), secretary of the okrug committee in Rostov-on-Don, and secretary of the Northern Caucasus Krai Committee of the ACP(B). Chudov held the position of second secretary of the Leningrad oblast party committee from 1928 to 1936.

Chudov was a delegate to the Eleventh through Seventeenth Congresses of the ACP(B). He was elected a candidate member of the Central Committee of the ACP(B) at the Twelfth and Thirteenth Congresses and a member of the Central Committee at the Fourteenth through Seventeenth Congresses. Chudov was a member of the All-Russian Central Executive Committee and the Central Executive Committee of the USSR. [29–738–1]

CHUDOV MONASTERY (Monastery of Metropolitan Aleksei and the Archangel Michael), a monastery founded in the Moscow Kremlin circa 1358–65 by Metropolitan Aleksei. Until 1561 the superior of the monastery was considered first among the fathers superior of Russian monasteries. In the late 14th century, the monastery became a major center of Russian culture. From the 15th to the 17th centuries it included a workshop for transcribing manuscripts, where Maksim Grek worked from 1518 to 1525. Under Filaret a Greco-Latin school was opened in the monastery.

In the 1930's the monastery's buildings, which had been constructed in the 16th to 19th centuries, were razed. The monastery's collection of manuscripts from the 11th to 18th centuries is now preserved in the manuscript department of the State Historical Museum.

CHUDOVO, a city (since 1937) and administrative center of Chudovo Raion, Novgorod Oblast, RSFSR. Situated on the Kerest' River (basin of Lake Ladoga). Chudovo is a railroad junction at the intersection of the Bologoe-Leningrad and Novgorod-Volkhov lines. The Leningrad-Moscow highway runs through the city.

Chudovo has a match factory, a glassworks, a plant producing reinforced-concrete sleepers, a branch of the Novgorod Glove Production Association, a food-processing combine, and a milk plant; a branch of the Nevskii Zavod Production Association is

under construction. Points of interest include the house-museums of N. A. Nekrasov, who spent summers in Chudovo from 1871 to 1876, and G. I. Uspenskii, who lived there in the 1880's. [29–738–4]

CHUDSKOE-PSKOV, LAKE (also Lake Gdov, Peipsi Järv, or Lake Peipus), a lake in the Estonian SSR and Pskov Oblast, RSFSR. The lake's area is 3,550 sq km. The average depth is 7.1 m, and the maximum depth, 15 m.

Lake Chudskoe-Pskov consists of three parts: Lake Chudskoe, with an area of 2,670 sq km, Lake Pskov, with an area of 710 sq km, and the channel between them, Lake Teploe, with an area of 170 sq km. The lake is a relict of a large glacial reservoir. The shores are mostly low and covered with peat bogs. The lake bottom is flat and consists of a thick layer of gray silt. A sand bar, overgrown in places with pine, extends along the northern and eastern shores of Lake Chudskoe. Islands abound in Lake Chudskoe-Pskov, the largest being Pirissar (Porka). The highest water levels usually occur in mid-April to early May; the range of fluctuation is 3.0 m. Some changes in water level are caused by wind-driven waves. The lake freezes in late November or early December. Lakes Pskov and Teploe open up earlier than Lake Chudskoe, in late April or early May.

About 30 rivers empty into Lake Chudskoe-Pskov, the largest of which are the Velikaia and the Emajõgi (Ema River). The Narva River of the Gulf of Finland basin flows out of it. The lake is navigable. There is commercial fishing for European bream (*Perca fluviatilis*), Eurasian perch, roach, pike perch, whitefish, and lacustrine smelt (*Osmerus ereplanus ereplanus*).

In 1242, a battle between Russian forces and German Livonian Knights took place on the ice in the southern part of the lake (*see* BATTLE ON THE ICE OF 1242). [29–739–2]

CHUDZ'IAVR, a lake on the Kola Peninsula, in Murmansk Oblast, RSFSR. The Chudz'iavr covers an area of 57.8 sq km. The banks are indented, with steep slopes in the west and southwest. The lake is fed by snow and rain. The Chudz'iok River (Voron'ia River basin) flows from the lake. [29–736–1]

CHUFA (*Cyperus esculentus*), also earth almond, ground almond, or rush nut; a perennial herb of the family Cyperaceae. During the first year of vegetation, chufa forms as many as 240 fascicles of leaves and 400 underground shoots with terminal tubers. A single plant may have as many as 1,000 tubers. There are three to 12 leaves in a fascicle. The sessile leaves are long (up to 80 cm) and narrow (5–10 mm). The small flowers are located in the axils of the upper leaves and gathered in umbellate inflorescences. The fruit is a nut.

Chufa is distributed in Egypt, Italy, and Spain, as well as in Asia Minor and in the countries of tropical and southern Africa. In the USSR it is found in Transcaucasia and the Volga Region. The main region of commercial production of chufa is Spain. In the USSR it is found in collection and experimental plantings.

Chufa is cultivated as an annual. The vegetative period is 110 to 120 days. The best soils are sandy loams, light loams, and chernozems; saline and waterlogged soils are unsuitable. Chufa is propagated by tubers or by seedlings. The yield of tubers is 20–30 quintals per hectare (ha) or, if irrigated, 40–50 quintals per ha. The tubers contain 30–35 percent starch, 15–20 percent sugar, 20–25 percent oil, and 3–7 percent protein. Chufa may be eaten raw, fried, or boiled. It is used in the production of confectioneries, beverages, coffee and cocoa substitutes, and cooking oil. The cut green mass can be fed to animals directly, or it can be ensiled.

CHUFAROV, GRIGORII IVANOVICH. Born Nov. 1 (14), 1900, in the settlement of Kasli (since 1942, a city), in what is now Cheliabinsk Oblast. Soviet physical chemist. Corresponding member of the Academy of Sciences of the USSR (1953). Member of the CPSU from 1939.

Chufarov graduated from the Urals Polytechnic Institute in 1928. He served as director of the Institute of Chemistry of the Urals Branch of the Academy of Sciences of the USSR from 1939 to 1946 and as rector of the Urals University from 1946 to 1956. In 1956 he began conducting research at the Urals Branch of the Academy of Sciences of the USSR. (In 1971 the Urals Branch and two other institutions were combined to form the Urals Scientific Center.)

Chufarov's principal works are devoted to the physical chemistry of metallurgical processes. He studied the mechanism and kinetics of the dissociation and reduction of metal oxides. He also investigated the etching of metals with acids and the action of inhibitors, and he studied hot tinning, zinc plating, and the decarbonization of ferrosilicon steel.

Chufarov has been awarded two Orders of Lenin, two other orders, and various medals.

CHUFAROVO, an urban-type settlement in Veshkaima Raion, Ul'ianovsk Oblast, RSFSR. Located on the Barysh River in the Volga basin, Chufarovo has a railroad station on the Ul'ianovsk-Inza line. The settlement has a hardware plant. [29–774–1]

CHUFUT-KALE (or Chufutkale), a medieval cave city-fortress on the outskirts of Bakhchisarai, Crimean Oblast. It is thought that Chufut-Kale was founded in the fifth or sixth century; remains of a defensive wall (known as the middle wall) date from the tenth century. After the Mongol-Tatar invasion (13th century), Chufut-Kale, which is mentioned in various sources as Kyrk-Er in the land of the As-Alani, was the center of a small feudal principality. In the 14th and 15th centuries, a commercial and artisan settlement grew outside the walls. The city gradually fell into decline as Bakhchisarai flourished and, by the mid-19th century, was abandoned by its inhabitants. In the western part of the city, surrounded by the middle wall, there are remains of caves cut into the cliffs, the ruins of a mosque, a mausoleum (1437), and two Karaite cenotaphs. In the eastern part of the city, behind the 15th-century wall, there were a mint and numerous dwellings.

CHUGACH MOUNTAINS, a mountain massif in southern Alaska, bounded in the north by the valleys of the Matanuska and Copper rivers. The mountains measure more than 400 km in length and rise to an elevation of 4,016 m at Mt. Marcus Baker. There are glaciers, the largest of which is Columbia, which reaches sea level. High coniferous forests grow on the slopes to 600 m, and higher there are alpine meadows. [29–729–3]

CHUGAEV, LEV ALEKSANDROVICH. Born Oct. 4 (16), 1873, in Moscow; died Sept. 23, 1922, in the city of Griazovets, in what is now Vologda Oblast. Soviet chemist.

After graduating from Moscow University in 1895, Chugaev became head of the chemistry department at the Bacteriological Institute in Moscow. From 1904 to 1908 he was a professor at the Imperial Technical School (renamed the Moscow Higher Technical School in 1917). From 1909 to 1922 he was a professor at the St. Petersburg Technological Institute; during the same period, from 1908 to 1922, he was also a professor at St. Petersburg University (renamed Petrograd University in 1914). Chugaev was the founder and director, from 1918, of the Institute for the Study of Platinum and Other Noble Metals (in 1934 the institute was incorporated into the Institute of General and Inorganic Chemistry of the Academy of Sciences of the USSR).

Chugaev's first studies were devoted to bacteriology and biochemistry: Chugaev discovered a sensitive reaction for the common colon bacillus (*Escherichia coli*), making it possible to distinguish it from typhoid fever bacteria. In organic chemistry he

investigated a number of terpenes and camphor and developed a "xanthogenic" method of synthesizing unsaturated hydrocarbons (Chugaev method). He developed a method of determining mobile hydrogen atoms in organic compounds, known as the Chugaev-Tserevitinov method. In 1911 he discovered a new type of anomalous rotary dispersion, governed by the presence of two assymetrical centers in a molecule of an organic compound.

Chugaev made major contributions to the chemistry of complex compounds. He established that the most stable inner complex compounds contain five- or six-membered rings (the Chugaev law of rings). He was the first to synthesize (1920) the pentammine compounds—predicted earlier by theory—of tetravalent platinum $[Pt(NH_3)_5Cl]X_3$, where X is a monovalent anion (Chugaev salts). Chugaev discovered (1915) the conversion of complex amino compounds into the corresponding amide compounds. Of importance to analytical chemistry is Chugaev's discovery of the sensitive reagent for nickel—dimethylglyoxime (1905)—and for osmium—thiourea (1918).

Chugaev founded a scientific school of complex compounds in the USSR. He was posthumously awarded the V. I. Lenin Prize (1927).

CHUGAEV METHOD, the conversion of alcohols into olefins by the thermal dissociation of methyl xanthates obtained from these alcohols; for example,

$$(CH_3)_2CHOH + NaOH + CS_2 \longrightarrow$$
$$(CH_3)_2CHOC(S)SNa \xrightarrow{CH_3I} (CH_3)_2CHOC(S)SCH_3 \xrightarrow{t^\circ}$$
$$CH_3CH{=}CH_2 + COS + CH_3SH$$

The methyl xanthates of tertiary alcohols decompose most readily, already at the time of formation. The methyl xanthates of secondary alcohols decompose less readily (upon heating), while the methyl xanthates of primary alcohols decompose very poorly. The reaction in the Chugaev method is usually not accompanied by secondary reactions, such as isomerization of the carbon skeleton and shifting of double bonds, which are typical of many other methods of producing olefins by the dehydration of alcohols, and hence its importance in the study of structurally complex alcohols.

The Chugaev method has made it possible to successfully determine the formation of many labile structures, such as terpenes. It was discovered by L. A. Chugaev in 1899. [29–729–1]

CHUGAL' (from Russian *chugun*, "cast iron," and *aliuminii*, "aluminum"), a heat-resistant cast iron with a high aluminum content (19–25 percent). *Chugal'* also contains 1.6–2.5 percent C, 1–2 percent Si, 0.4–0.8 percent Mn, up to 0.2 percent P, and up to 0.08 percent S.

Chugal' has a high heat resistance at temperatures of up to 1100°–1150°C in air and up to 1000°C in various corrosive gaseous media, such as furnace gases, sulfur dioxide, or sulfur vapor. It does not react with nitric acid or seawater. It has satisfactory casting properties and is machinable.

Chugal' is used to fabricate furnace accessories, such as blast-furnace tuyeres, lining plates in combustion chambers of gas-turbine installations, and exhaust hoods of cryolite baths. It may also be used as a corrosion-resistant, refractory, or nonmagnetic material. In the USSR, two types of *chugal'* are produced: ZhChIu-22 and ZhChIuSh-22.

CHUGUCHAK (in Chinese, T'ach'eng), a city in Northwest China, in the Sinkiang-Uighur Autonomous Region. Situated in the southern foothills of the Tarbagatai Range, near the border with the USSR. Population, more than 30,000 (1957). Chuguchak is a transportation checkpoint on the highway from Urumchi to Aiaguz in the USSR. The city has flour-milling, wood-products, and leather enterprises. Uranium ores are mined in the Chuguchak area. [29–734–3]

CHUGUEV, a city and the administrative center of Chuguev Raion, Kharkov Oblast, Ukrainian SSR. Located on the Severskii Donets River and the Kiev–Rostov-on-Don highway. Railroad station on the Bezliudovka-Kupiansk line. Population, 26,000 (1974).

The first mention of Chuguev in historical sources dates from 1627. A city since 1780, it became the administrative center of a military-settlements district in 1817. In 1819 an uprising of military settlers in Chuguev was cruelly suppressed by government troops. Chuguev became part of Zmiev District of Kharkov Province in 1857. In 1932 it was made the administrative center of a raion of Kharkov Oblast.

Industry in Chuguev is represented by a plant for the production of fuel equipment, a repair plant, a pilot plant for the manufacture of precision equipment, the Gidrozhelezobeton Plant, a building-materials plant, a furniture combine, an embroidery shop, and food-processing enterprises (including a meat-packing plant). Cultural institutions include an art gallery and the I. E. Repin House-museum (Repin was born in Chuguev).

CHUGURIN, IVAN DMITRIEVICH. Born Aug. 15 (27), 1883, in Sormovo; died Feb. 8, 1947, near Moscow. Participant in the revolutionary movement in Russia. Member of the Communist Party from 1902.

The son of a worker, Chugurin began working at the Sormovo Plant in 1894. He took part in the Revolution of 1905–07 in Sormovo, and he attended the party school in Longjumeau in 1911. In 1916 he became a member of the St. Petersburg committee of the RSDLP(B), and in 1917 he was named secretary of the party's Vyborg urban district committee. On Apr. 3 (16), 1917, on behalf of the Vyborg committee, he went to Finland Railroad Terminal to deliver party membership card number 600 to V. I. Lenin, who was returning from abroad. During the October Days of 1917, Chugurin served at the urban district headquarters that directed the uprising.

From 1918 to 1920, in addition to carrying out political work in the Red Army, Chugurin served as a member of the Presidium and as the executive secretary of the All-Russian Extraordinary Commission (All-Russian Cheka). In 1921 he turned to administrative work in industry. Chugurin served as deputy director of the Krasnoe Sormovo Plant, chairman of the administrative board of Sibugol', director of the Northern Shipyard, and director of the Elektropribor Plant.

CHUGUSH, a mountain peak in the western Greater Caucasus, at the sources of the Belaia River, in Krasnodar Krai, RSFSR. Mt. Chugush, which rises to an elevation of 3,238 m, is composed of gneisses, schists, and granites. Spruce and fir forests grow on the slopes, and subalpine meadows are found at high elevations. The landscape features cirque and hanging glaciers. [29–734–4]

CHU HSI. Born 1130; died 1200. Chinese philosopher, historian, and commentator on the Confucian classics. Leading exponent of neo-Confucianism.

Chu Hsi wrote more than 20 scholarly treatises, including works on jurisprudence, military affairs, astronomy, and geogra-

phy. As prefect of Nank'ang, in Kiangsi Province, from 1179 to 1183 he established the Pai Lu Tung (White Deer Grotto) Academy, which became known throughout China.

Chu Hsi synthesized the major ideas of Confucian thinkers, from Confucius to Chou Tun-i, Chang Tsai, and the brothers Ch'eng I and Ch'eng Hao. He developed the dualistic concept of two interconnected and indivisible principles: the ideal, or *li* (literally, "law," "principle," or "rule"), which precedes all things and transcends all things; and the material, or *ch'i* (literally "substance" or "material force"). *Li* must be joined to a particular *ch'i* and is, at the same time, necessary to the *ch'i* as a condition of the latter's being. Both principles are united in the formless T'ai Chi, or Great Ultimate, which exists in all things taken as a whole and in each thing individually and which, as the highest principle, unites all actual and potential principles and all things and beings.

Chu Hsi's neo-Confucian synthesis became the dominant trend in subsequent Chinese philosophy and a major influence on philosophic thought in Korea and Japan. The Confucian *Ssu shu* (Four Books), selected and with commentary by Chu Hsi, served as the basis for the government examinations in China from the 14th to early 20th centuries. Chu Hsi wrote the historical work *T'ung-chien kang-mu* (The Main Principles of the Comprehensive Mirror), a reworking of Ssu-ma Kuang's *Tzu chih t'ung-chien* (The Comprehensive Mirror for Aid in Government).

S. KUCHERA [29–540–1]

CHUIA, a river in the Altai, in Gorno-Altai Autonomous Oblast; a right tributary of the Katun' of the Ob' River basin. The Chuia is 320 km long and drains an area of 11,200 sq km. It is a typical mountain river in its upper course. It subsequently crosses the Chuia and Kurai basins, where it branches; farther downstream, it flows through a narrow valley. The Chuia is fed primarily by snow, with high water occurring between May and September. The mean flow rate is 42.1 cu m per sec. The Chuia freezes over in October or early November, and the ice breaks up in late April or in May. Freeze-up is variable. A hydroelectric power plant is situated on the Chuia, and the Chuia Road runs along the river. [29–777–4]

CHUIA (also Bol'shaia Chuia), a river in the Buriat ASSR and Irkutsk Oblast, a right tributary of the Lena. The Chuia is 512 km long, as measured from the source of the Bol'shaia Chuia. The Chuia proper—the segment below the confluence with the Malaia Chuia—is 52 km long. The river drains an area of 18,400 sq km. It rises in the Synnyr Range and crosses the Severo-Baikal Highland. The Chuia is fed primarily by rain and has a mean flow rate of 206 cu m per sec. The Chuia freezes over in October, and the ice breaks up in May. [29–778–1]

CHUIA ROAD, a segment of the Novosibirsk-Biisk-Tashanta highway (Route 34). The Chuia Road is 626 km long. Built between 1903 and 1913 as a cart road to Western Mongolia, it traverses the basins of the Katun' and Chuia rivers. The West Mongolian Road is a continuation of the Chuia Road in the Mongolian People's Republic.

The Chuia Road serves the intermediate points of Maima, Cherga, Shebalino, Tuekta, Ongudai, Inia, and Kosh-Agach, and there is a 38-km access road from it to the mountain climatic health resort of Chemal. The Maima–Gorno-Altaisk–Choia highway extends from the Chuia Road to the highway running from Biisk through Turochak to Artybash (Teletskoe Lake). The road is also joined by the Tuekta–Ust'-Kan highway, which is 95 km long, and by the Inia–Nizhnii Uimon–Ust'-Koksa highway, which is 130 km long.

The Chuia Road provides interoblast and intraoblast transportation links for the Gorno-Altai Autonomous Oblast and handles commercial traffic with Mongolia. It is linked with the country's railroad system at the Biisk station. Most of the freight hauled in the oblast travels via the road. All consumer goods and goods meant for industrial and agricultural enterprises enter the oblast by the road, and livestock-raising products are the principal commodities trucked out of the oblast. There is regular bus service on the Chuia Road. [29–742–3]

CHUIA STEPPE, an intermontane depression in the southeastern Altai, on the upper Chuia River, situated between the Kurai Range in the north and the South Chuia Range in the south. It rises to elevations of 1,750–2,200 m and measures as much as 70 km in length and 30–40 km in width. It is composed of glacial, lake, and river deposits. Predominant in the landscape are semideserts, which are used for pasture. The Chuia Road from the USSR to Mongolia runs through Chuia Steppe. [29–742–1]

CHUIKA, a man's outer garment made of dark cloth, common in Russia in the late 19th and early 20th centuries among urban craftsmen, merchants, and peasants who had come under urban influence. The cut of the *chuika* was originally straight and robelike; later the *chuika* was fitted at the waist and had gussets, or it was truncated in back and had gathers. It was usually knee-length. The collar of a *chuika* was sometimes edged with velvet or fur. [29–740–3]

CHUIKOV, SEMEN AFANAS'EVICH. Born Oct. 17 (30), 1902, in Pishpek (now Frunze); died May 19, 1980, in Moscow. Soviet painter. People's Artist of the USSR (1963); member of the Academy of Arts of the USSR (1958).

Chuikov studied in Vernyi (now Alma-Ata) with N. G. Khludov and in Moscow at the Vkhutemas Vkhutein (State Higher Arts and Technical Studios–Higher Art and Technical Institute) from 1924 to 1930. In the early 1930's he organized the Kirghiz Artists' Union and the Kirghiz Museum of Fine Arts in Frunze. He taught in Moscow at the Academy of Arts from 1930 to 1932 and the V. I. Surikov Art Institute in 1947 and 1948.

Using the traditions of Russian realistic art, Chuikov developed Kirghiz national themes. His genre and landscape paintings depict the life of the people and the natural features of Kirghizia. In the 1950's and 1960's, after travels to India, Chuikov included images from that country in his works. His paintings are noted for spatial clarity, compositional strictness and simplicity, and subtle yet expressive color relationships. He conveys the significance of the common man in his small-figured compositions, resolving differently in each work the relationship of the figure to the landscape and to the plane of the canvas. As Chuikov's style developed, traits of monumentality appeared increasingly. In his last years he frequently used the triptych form.

Examples of his works are the cycles *Kirghiz Kolkhoz Suite* (1939–48), *With Us in Kirghizia* (1946–67), and *Our Brothers* (1952–67). Individual works include *Morning* (1947, Tret'iakov Gallery, Moscow), *Daughter of Soviet Kirghizia* (1948, Tret'iakov Gallery), *On the Road* (1954, Tret'iakov Gallery), *The Himalayas* (1954, Tret'iakov Gallery), *On an Embankment in Bombay in the Evening* (1954, Tret'iakov Gallery), *The Shepherd's Daughter* (1956, Tret'iakov Gallery), *The Simple People of India* (triptych, 1957–60, Russian Museum, Leningrad), *Black Madonna* (1962, Russian Museum), *Living Water* (1966, Tret'iakov Gallery), *They Want to Live* (triptych, 1967, Art Fund of the USSR), and *In Touch With Eternity* (1973).

Chuikov was awarded the State Prize of the USSR (1949, 1951), the I. Satylganov State Prize of the Kirghiz SSR (1972), the Order of Lenin, four other orders, and various medals.

CHUIKOV, VASILII IVANOVICH. Born Jan. 31 (Feb. 12), 1900, in the village of Serebrianye Prudy, now an urban-type settlement in Moscow Oblast. Soviet military leader; Marshal of the Soviet Union (1955). Twice Hero of the Soviet Union (Mar. 19, 1944, and Apr. 6, 1945). Member of the CPSU since 1919.

Chuikov, the son of a peasant, joined the Red Army in April 1918. He fought in the Civil War of 1918–20 as deputy commander of a company and a regiment and as commander of a regiment. He graduated from the M. V. Frunze Military Academy in 1925 and the eastern department of the academy in 1927 and completed the academic courses at the Military Academy of Mechanization and Motorization of the Workers' and Peasants' Red Army in 1936. He commanded a mechanized brigade, a rifle corps, the Bobruisk Army Group of Troops, and finally an army. During the liberation of western Byelorussia and during the Soviet-Finnish War of 1939–40, he commanded an army. From December 1940 through March 1942 he was a military attaché in China.

During the Great Patriotic War (1941–45), Chuikov was commander of the First Reserve Army (later renamed the 64th Army) from May to August 1942, the Sixty-second Army from September 1942 to April 1943, and the Eighth Guards Army from April 1943 until the end of the war on the Stalingrad, Don, Southwestern, Third Ukrainian, and First Byelorussian fronts.

After the war, Chuikov was a deputy and first deputy of the Group of Soviet Troops in Germany between May 1945 and March 1949 and commander in chief from March 1949 to May 1953. Beginning in May 1953, he was commander of the troops of the Kiev Military District. Beginning in April 1960, he was commander in chief of the ground forces and deputy minister of defense and at the same time, from July 1961, head of Civil Defense of the USSR. Beginning in June 1964, he was head of the Civil Defense of the USSR. In July 1972 he became inspector-general of the Group of Inspectors-general of the Ministry of Defense of the USSR.

Chuikov was a candidate member of the Central Committee of the CPSU from 1952 to 1961. Since 1961 he has been a member of the Central Committee of the CPSU. A deputy to the second through ninth convocations of the Supreme Soviet of the USSR, he has been awarded eight orders of Lenin, the Order of the October Revolution, four orders of the Red Banner, three orders of Suvorov First Class, the Order of the Red Star, an honorary saber, and various medals of the USSR. He has also been awarded many foreign orders and medals.

CHU-ILI MOUNTAINS, a group of mountains in the Northern Tien-Shan, in the Kazakh SSR. In the south, the Chu-Ili Mountains adjoin the Kindyktas Range, a northwestern spur of the Zailiiskii Alatau. The mountains extend for 220 km, with elevations to 1,294 m. They are composed of granites, shales, limestones, and gypsiferous argillaceous rocks. Desert-steppe vegetation grows on the slopes of the Chu-Ili. [29–740–2]

CHUISKIE BELKI, two mountain ranges in the Altai, connected by a transverse mountain chain. The maximum elevations are 3,960 m in the Iuzhno-Chuia Range and 4,173 m in the Severo-Chuia Range. [29–742–2]

CHUKARIN, VIKTOR IVANOVICH (Victor Tchoukarine). Born Nov. 9, 1921, in the village of Krasnoarmeiskoe, Donetsk Oblast. Soviet gymnast. Honored Master of Sport (1951); Honored Coach of the Ukrainian SSR (1972). Docent (1963); head of the subdepartment of gymnastics of the L'vov Institute of Physical Culture (since 1971). Member of the CPSU since 1951.

Chukarin was overall men's champion of the Olympics in 1952 and 1956, of the world in 1954, and of the USSR from 1949 to 1951 and in 1953 and 1955. He was Olympic champion in various events five times in 1952 and 1956, world champion in 1954, and champion of the USSR 13 times from 1948 to 1956.

Chukarin has been awarded the Order of Lenin and several medals.

WORKS

Put' k vershinam. [Moscow] 1955. [29–742–4]

CHUKCHAGIR LAKE, a lake in the basin of the Amgun' River (a left tributary of the Amur), in Khabarovsk Krai, RSFSR. Chukchagir Lake has an area of 366 sq km, an average depth of 2 m, and a maximum depth of 6 m. It has a winding shoreline, and its northern shores are low and swampy. The islands of Godban'ki and Dzhalu divide the lake into three parts. The lake is fed by precipitation and groundwater and is drained by the Ol'dzhikan River, a tributary of the Amgun'. Chukchagir Lake freezes over in late October or early November, and the ice breaks up in May. [29–755–5]

CHUKCHI (Luorawetlan), the language of the Chukchi people. Chukchi is spoken by some 11,000 people (1970 census), most of them living in the Chukchi Autonomous Okrug and in Nizhnekolymsk Raion of the Yakut ASSR. The language is genetically related to the Chukchi-Kamchatka group and consists of five dialects that differ only slightly: Uelen (the eastern dialect, on which the literary language is based), Chaun (western), Enmylin, Nunligran, and Khotyr'.

The phonetic system is characterized by vowel synharmony and a great variety of consonant assimilations and dissimilations. In its grammatical structure, Chukchi is a prefixal-suffixal agglutinative language. It has well-developed declension and conjugation systems. Nouns are inflected by person, and verbs have two types of conjugations: one subject and the other subject-object. A typical feature of the syntax is the presence of a nominative and an ergative construction, as well as incorporation. The vocabulary contains many borrowings from the Russian. A writing system based on the Latin alphabet was created in 1931. Since 1936 the Russian alphabet has been used.

I. A. MURAV'EVA [29–751–4]

CHUKCHI, a people that constitutes the indigenous population of the Chukchi Autonomous Okrug (formerly Chukchi National Okrug), Magadan Oblast, RSFSR. Chukchi also live in the northern part of the Koriak Autonomous Okrug (formerly Koriak National Okrug) and Nizhnekolymsk Raion, Yakut ASSR.

Chukchi who raise reindeer on the interior tundra call themselves *chavchu* ("reindeer" Chukchi), as distinct from those who inhabit the coasts, who use the term *an'kalyn* (coast dweller). The general self-designation—*luoravetlan* (real person)—has not become established as the designation for the people as a whole. The Chukchi number 14,000 (1979 census). They speak mainly the Chukchi language. Their religion was shamanism and various cults centering on the family, hunting, and fishing.

The Chukchi first came into contact with Russians in 1642 on the Alazeia River, but they remained virtually independent from the tsarist administration until the 19th century. A natural barter economy was maintained between the nomadic reindeer-raising Chukchi and the settled maritime Chukchi, who hunted marine mammals. Under Soviet power, radical changes have taken place in the Chukchi way of life: reindeer raising has been reorganized, and large sovkhozes and kolkhozes have been established; modern technology has been introduced in the hunting of marine mammals. Educational materials and literature are now published in the Chukchi language.

CHUKCHI AUTONOMOUS OKRUG, part of Magadan Oblast of the RSFSR. The okrug was formed on Dec. 10, 1930, as the Chukchi National Okrug. Located in the extreme northeastern part of the USSR, the okrug includes the Chukchi Peninsula, the adjacent part of the continent, and a number of islands, among them Vrangel', Aion, Arakamchechen, and Ratmanov. Its coasts are washed by the East Siberian, Chukchi, and Bering seas. The okrug has an area of 737,700 sq km and a population of 127,000 (Jan. 1, 1977). It is divided into eight administrative raions and has two cities and 18 urban-type settlements. The administrative center is Anadyr'.

Natural features. The coast of the East Siberian and Chukchi seas is only slightly indented with one large inlet, Chaun Bay. The Bering Sea has a number of deep fjords (Provideniia, Glubokaia), providing good harbors, and large gulfs, notably Lavrentii, Mechigmen, Krest, and Anadyr'. The seas around the okrug are covered by ice for most of the year. The topography is dominated by plateaus and mountains. North of the marshy Anadyr' Lowland, occupying the central part of the okrug, rise the Pekul'nei Mountains (highest point 1,381 m) and the Chukchi Highlands (highest point 1,843 m), consisting of numerous ranges and medium-elevation massifs. Northwest of the Anadyr' Lowland lies the Anadyr' Plateau, bounded on the west by the Aniui Range (highest point 1,735 m). The ranges of the Koriak and Kolyma highlands extend into the okrug from the south. The edge of the Yukagir Plateau, with elevations between 500 m and 700 m, occupies the southwest. Along the coast in the north lie the Chaun and Vankarem lowlands. Mineral resources include tin and mercury ore, hard and brown coal, and natural gas.

The okrug has a harsh climate, cold marine along the coast and severely continental in the interior. Winter, a time of strong winds, lasts eight or nine months. The mean January temperature ranges from −15° to −21°C on the coast of the Bering Sea and from −27° to −39°C in the interior. Minimum temperatures vary from −38° to −55°C. Summers are short, cool, and rainy. The mean July temperature, 5°–8°C in the north and 9°–10°C along the coast of the Bering Sea, rises to 13°–14°C at the settlement of Markovo in the Anadyr' Lowland. The annual precipitation increases from 200 mm in the west to 300–500 mm along the middle course of the Anadyr' River. The growing season ranges from 75 days at Pevek and 88 at Anadyr' to 101 at Markovo. Permafrost occurs everywhere.

The okrug's rivers, of which the largest is the Anadyr', flow into the Arctic and Pacific oceans. Icebound seven or eight months of the year, the rivers have an uneven flow and high and rapid flooding. Many rivers freeze to the bottom. Also characteristic is the phenomenon known as *naledi*, whereby bodies of ice are formed on rivers by the layer-by-layer freezing of waters that flood the surface of the ice. Most of the rivers may be classified as mountain rivers. The Anadyr', whose main tributaries are the Belaia, Main, and Taniurer, drains into the Bering Sea. The Kolyma, which receives the waters of the Omolon, Bol'shoi Aniui, and Malyi Aniui, flows into the East Siberian Sea. The largest lakes are Krasnoe, El'gygytkhyn, and Pekul'nei.

Mountain tundra soils predominate. Gley, gley-swamp, and peat-gley soils are found in the lowlands, and gley-podzolic soils occur along the river valleys and beneath open larch woodlands. The alluvial and peat-podzolic soils of the river valleys and the Anadyr' basin are the best suited for agriculture.

The vegetation consists chiefly of tundra species. Dry mountain tundra with stunted or low-growing shrubs and saxifrage covers large areas. The lowlands are occupied by lichen tundra of reindeer moss and *Cetraria* and by moss and hummock tundras with a sparse growth of cotton grass (*Eriophorum*), sedges, *Pedicularis*, bog bilberries (*Vaccinium uliginosum*), and cowberries (*Vaccinium vitis-idaea*). The lichen and hummock tundras are used as reindeer pasture. In the basins of the Anadyr' and other rivers grow forests of larch, poplar, *Chosenia* (a genus of willows), and birch, interspersed with thickets of willows, alders, wild currants and raspberries, and wild roses. The coastal strip along the Arctic Ocean and the islands are classified as arctic desert.

The fauna consists primarily of tundra animals, but some taiga species are also encountered. Commom animals include the arctic fox, fox, wolf, wolverine, burunduk, squirrel, suslik (*Citellus undulatus*), lemming, blue hare, brown and polar bear, reindeer, bighorn sheep, muskrat, and mink. There are numerous birds, chiefly willow ptarmigans (*Lagopus lagopus*), ptarmigans (*Lagopus mutus*), ducks, geese, and swans; on the coast murres, eiders, and gulls nest in colonies. The seas abound in chum salmon (*Oncohynchus keta*), pink salmon (*Oncorhynchus gorbuscha*), arctic char (*Salvelinus alpinus*), and such marine animals as the walrus, ringed seal, and gray whale. The rivers and lakes contain broad whitefish (*Coregonus nasus*), nelma (*Stenodus leucichthys*), and graylings (*Thymallus*). Insects are numerous, particularly mosquitoes, black flies, and horseflies.

Population. Northern peoples, notably Chukchi, Eskimo, Evenki, and Yukagirs, constitute 12 percent of the population. The great majority of the inhabitants are Russians (70 percent, 1970 census), and there are small numbers of Ukrainians (10.3 percent), Byelorussians, Tatars, and other nonindigenous peoples. The average population density is 0.2 persons per sq km. Most of the population is located along the coast and in the river valleys. Urban dwellers make up 73 percent of the population. Cities and urban-type settlements were established in connection with the development of mining (Bilibino, Iul'tin, Beringovskii) and maritime transport (Pevek, Provideniia, Egvekinot). B. F. SHAPALIN

Historical sketch. The okrug's territory was settled as early as the Paleolithic. At the end of the second millennium and early in the first millennium B.C., maritime hunters and fishermen, the ancestors of the Eskimo, invented the harpoon and hide-covered frame boat, which allowed them to hunt whales, walrus, and ringed seals. Late in the first century A.D. the ancestors of the Chukchi and Koriaks, who were inland reindeer hunters, domesticated these animals and became reindeer herders. In the 17th century the Chukchi region was absorbed into the Russian state, and a Russian settlement was founded at Anadyr'. Inclusion in Russia promoted the development of large-scale reindeer herding.

From the mid-19th century American entrepreneurs and traders began pushing into the area, introducing alcohol and plundering the indigenous population. In the early 20th century the Chukchi and other native peoples of the okrug had a clan social organization and a patriarchal economy, but already there were signs of property and social differentiation, influenced by trade with the Russians and Americans.

The October Revolution of 1917 liberated the indigenous peoples from national oppression and exploitation. After the Chukchi Revolutionary Committee was formed in the settlement of Anadyr' on Dec. 16, 1919, the fishing rights of the American Swenson Company and local merchants were abolished, and steps were taken to improve trade. On Jan. 31, 1920, however, remnants of Kolchak's forces staged a counterrevolutionary coup and executed the members of the Revolutionary Committee. In July 1920 a detachment of Red Guards routed the Kolchak forces, and Soviet power was restored. The Anadyr' district executive committee was elected and subsequently reorganized as a people's revolutionary committee on Jan. 6, 1921.

In October 1921 the Birich-Bochkarev White Guard bands arrived on the Okhotsk coast and Kamchatka from Vladivostok. In April 1923 an expeditionary Red Army detachment led by G. I. Chubarov crushed the main White Guard forces. Representatives of village and *volost* (small rural district) revolutionary committees attended the First Anadyr' District Congress on Aug. 2–5, 1923. The formation of the Chukchi Regional Soviet at Uelen in 1923 signaled the final establishment of Soviet power throughout the Chukchi Peninsula. A campaign was launched to overcome the region's economic and cultural backwardness.

In the course of the prewar five-year plans agriculture, fishing, and hunting were collectivized, and the working people of the okrug made notable progress in reindeer herding and hunting sea animals. Writing systems were introduced for the Chukchi and Eskimo languages, and illiteracy was basically eradicated. A national intelligentsia emerged among the indigenous population. On Dec. 10, 1930, the Chukchi National Okrug was formed from

Anadyr' and Chukchi raions of the Far East Krai and part of the Yakut ASSR. (In 1977 it was renamed the Chukchi Autonomous Okrug.)

During the Great Patriotic War the peoples of the okrug took an active part in the struggle against the fascist German aggressors. Since the war they have achieved new successes in building socialism. The mining of gold and nonferrous metals has been expanding rapidly, and the transportation network has been considerably enlarged. The constant, unselfish assistance of the Russian and other peoples of the USSR has facilitated economic and cultural growth. On Dec. 9, 1970, the okrug was awarded the Order of the Red Banner of Labor, and on Dec. 29, 1972, it received the Order of Friendship of Peoples. K. G. KUZAKOV

Economy. The leading branch of the okrug's economy is mining, represented by enterprises that extract tin (Val'kumei), mercury (Plamennoe), and hard coal (Bering and Anadyr' deposits). Between 1960 and 1976 the gross industrial output increased by a factor of 3.7. Electricity is supplied by the Bilibino Atomic Power Plant, the Chaun Heat and Electric Power Plant, and the Egvekinot State Regional Power Plant. The okrug's flourishing fishing industry makes use of the resouces of the Bering and Chukchi seas. Other major industries are the production of building materials (Anadyr', Pevek, Bilibino) and food processing.

In 1976 there were 28 sovkhozes in the okrug. The main agricultural sector is reindeer herding. On Jan. 1, 1977, the okrug's reindeer herd of 547,000 accounted for 24 percent of the reindeer in the RSFSR. The traditional occupations of the indigenous population are fishing and the hunting of fur-bearing and marine animals, chiefly arctic foxes and, in coastal waters, ringed seals, walruses, and whales. Dairy farming, poultry raising, and hog raising have been recently introduced. On Jan. 1, 1977, the livestock included 1,900 cattle (about 1,100 of them dairy cows) and 2,600 hogs. Arctic foxes are raised in cages on fur farms. Greenhouse agriculture is developing.

The chief means of transportation are maritime and air transport. The main ports are Pevek, Provideniia, Anadyr', Egvekinot, and Beringovskii. The principal highways link Pevek with Krasnoarmeiskii and Komsomol'skii; Egvekinot with Iul'tin; and Zelenyi Mys with Bilibino. The Anadyr' River is navigable for 572 km, as far as the settlement of Markovo; shipping is also done on the Velikaia River and on the Bol'shoi and Malyi Aniui rivers. The okrug has a well-developed network of local air routes. B. S. SHAPALIN

Cultural development. Before the October Revolution of 1917 the Chukchi were illiterate. In 1914–15 the territory of the present-day okrug was served by one primary school, attended by 40 students. There were no secondary schools. In the 1977–78 school year the okrug's 98 general-education schools of all types had an enrollment of about 27,100 students. Specialized training was provided by a vocational-technical school (200 students). In 1976, 11,200 children were cared for at 112 preschool institutions.

On Jan. 1, 1977, cultural facilities included 94 public libraries (more than 1 million books and magazines), a museum of local lore in Anadyr', 114 clubs, 176 motion-picture projection units, and 18 extracurricular institutions.

There are two okrug newspapers: *Sovetken Chukotka*, published in Chukchi since 1953, and *Sovetskaia Chukotka*, issued in Russian since 1933. Two programs of All-Union Radio are transmitted 17 hours daily, and local broadcasts, in Chukchi and Russian, are on the air seven hours daily. Programs of the Central Television Studios are relayed by two Orbita stations (13.1 hours daily). Local television broadcasts, in Chukchi and Russian, are on the air 1.4 hours daily.

Literature. Before the October Revolution of 1917 the Chukchi had various kinds of oral lore but no written literature. Several factors contributed to the creation of a Chukchi literature: the cultural policies of the Soviet government, the development of a written Chukchi language in 1931, and the spread of the Russian language. Chukchi literature was influenced by the Russian classics and the work of such Soviet writers as V. G. Tan-Bogoraz, T. Z. Semushkin, and N. E. Shundik. The first Chukchi writer was Tynetegyn (F. Tinetev, 1920–40), whose *Chauchu Fairy Tales* was published in Chukchi and Russian in 1940.

In the 1950's and 1960's a number of gifted writers appeared, notably the prose writers Iu. S. Rytkheu (born 1930) and V. Iatyrgin (born 1919) and the poets V. G. Keul'kut (1929–63), A. A. Kymytval' (born 1938), V. Tymnetuvge (1935–65), M. V. Val'girgin (born 1939), and V. Tyneskin (born 1945). Rytkheu's works have become known throughout the USSR and abroad. Among his finest works are the short-story collection *Chukchi Saga* (1956), the trilogy *Time of Melting Snow* (1958), and the novels *Frost on the Threshold* (1970) and *White Snows* (1975), depicting the historical destiny of the Chukchi people and the social transformation and cultural awakening of the Chukchi region. Iatyrgin shows the development of the new man in his autobiographical novella *Fate Does Not Pamper a Man* (1967).

Among the best verse collections are *My Chukotka* (1958) and *Rain Doesn't Hinder* (1963) by Keul'kut, *Songs of the Heart* (1960), *To You* (1967), and *Listening to Music* (1972) by Kymytval', and *Hello, Bright Life!* (1968) and *The Whale Boats Go Out to Sea* (1970) by Val'girgin. Tyneskin is noted for his narrative poem *Heart in Hand* (1970). Lenin is a recurrent theme in the poems of Val'girgin and Tyneskin, and folklore traditions are strong in all Chukchi literature. The works of Chukchi writers are translated into other languages of the peoples of the USSR, and many works by Soviet writers of other nationalities are available in Chukchi. IU. M. SHPRYGOV

CHUKCHI HIGHLANDS (also Chukchi Range, Anadyr' Range), a system of medium-elevation mountain ranges and massifs in northeastern Asia, stretching for about 450 km eastward from Chaun Bay. The highest elevations are found west of the Amguema River, in the Shelagskii (1,105 m), Ekiatap (1,522 m), and Pegtymel' (1,810 m) ranges; east of the river the ranges give way to uplands and ridges with elevations of 500 to 1,000 m. The northern ranges are composed chiefly of sandstones and shales intruded by granites. In the south volcanic deposits predominate. The Chukchi Highlands form the watershed between rivers flowing into the Arctic Ocean (Pegtymel', Paliavaam, Amguema) and rivers draining into the Bering Sea (upper reaches of the Belaia River, Kanchalan).

The climate is severe, with long winters, lasting seven or eight months, and short and cool summers. Mean January temperatures range from −15°C in the southeast to −30°C in the northwest, and mean July temperatures vary from 3°C in the north to 10°C in the south. The annual precipitation ranges from 250 mm to 400 mm. Fogs occur frequently in the east. Wet hummock tundras of sedges and cotton grass, as well as hypnum moss-grass bogs, are widespread in the coastal regions. The lower parts of the mountain slopes are also covered by alpine tundra vegetation, and arctic mountain deserts are found on the summits. The highlands contain deposits of tin, mercury, and hard coal.

N. I. MIKHAILOV [29–754–1]

CHUKCHI IVORY CARVING, a folk artistic craft of the Chukchi and Eskimo inhabiting the northeastern coast of the Chukchi Peninsula. A major center is the settlement of Uelen. Archaeo-

logical excavations have uncovered examples of such ivory carving dating from the first years of the Common Era.

An ivory carving workshop, now called the Severnye Suveniry Ivory-carving Workshop, was established in 1931. The modern craftsmen carve pieces of walrus tusk into expressive, stylized figurines of northern animals. Their sculptural groups, full of life and movement, frequently depict fights between animals, hunting scenes, or reindeer and dog teams. Whole walrus tusks and such domestic articles as letter openers, earrings, bracelet charms, and pendants are decorated with colored engravings—hachured figures rubbed with colored pencils—depicting subjects from folklore or the daily life of the peoples of the North. Masters of the craft include Aie, Vukvutagin, Tukkai, Khukhutan, Emkul', and Ianku.

[29–744–2]

CHUKCHI-KAMCHATKA LANGUAGES, an isolated family of languages spoken by a small number of people who constitute the principal native population of the Chukchi region and Kamchatka. The total number of native speakers is approximately 18,000 (1970 census). The Chukchi-Kamchatka languages, which are included among the Paleo-Asiatic languages, are divided into two branches: Chukchi-Koriak and Itel'men. The Chukchi-Koriak branch includes four closely related languages: Chukchi, Koriak, Aliutor (Aliutor proper and the Palana and Karaga dialects), and Kerek (the Maino-Pilgin and Khatyrka dialects). The Itel'men branch consists only of the Itel'men (Kamchadal) language and has a number of substratum features. Some scholars regard the Aliutor and Kerek languages as dialects of Koriak. The Itel'men branch formerly included three languages: Northern and Southern Itel'men, both of which disappeared in the late 19th century, and Western Itel'men, which is represented by the present-day Itel'men dialects.

The Chukchi-Kamchatka languages exhibit vowel harmony (*see* SYNHARMONY) and assimilation and dissimilation of consonants; obstruents are represented by a single series of unvoiced stops, and there is a relatively large number of sonants. The grammatical structure of the Chukchi-Kamchatka languages shows them to be agglutinative languages of the prefixing-suffixing type; they have discontinuous affixes. The case system is well developed; in some positions nouns are inflected for person. The verb has two conjugations: subject and subject-object. The aspectual-temporal system is well developed. In most of the Chukchi-Kamchatka languages verbs and nouns are marked for three numbers—singular, dual, and plural. The numerals are based on a quinary system of counting. A nominative construction and an ergative construction are used in sentences with a verbal predicate. The languages typically exhibit incorporation. The vocabularies of the Chukchi-Kamchatka languages contain borrowings from Russian. Chukchi and Koriak have their own writing systems; Latin-based alphabets were created in 1931, and the current Cyrillic-based alphabets have been used since 1936.

I. A. MURAV'EVA [29–754–2]

CHUKCHI PENINSULA, a peninsula in northeast Asia, in Magadan Oblast, RSFSR. Washed by the Anadyr' Gulf of the Bering Sea and by the Chukchi Sea, it is separated from North America by the Bering Strait. On the mainland, the boundary of the peninsula runs through the valley of the Vel'mai River to the Chukchi Sea, the banks of which are strongly indented, with Koliuchin Guba in the north, the Mechigmen Gulf in the southeast, and the Krest Gulf in the southwest. At the northeast end of the Chukchi Peninsula is the Dezhnev Cape. The Chukchi Highlands occupy much of the peninsula. [29–751–2]

CHUKCHI SEA, a marginal sea of the Arctic Ocean along the coast of Asia and North America, washing the northern coast of the Chukchi Peninsula and the northwestern shores of Alaska. In the west it is connected with the East Siberian Sea through Long Strait, and in the south it is joined to the Bering Sea by the Bering Strait. Its northern boundary with the Arctic basin and its eastern boundary with the Beufort Sea (along the meridian of Point Barrow) are arbitrary and not morphologically delineated. The sea has an area of 582,000 sq km (according to some sources, 587,100 sq km), a water volume of 45,400 cu km, and an average depth of 77 m. The largest inlets are Kotzebue Sound and Koliuchin Bay, and the major islands are Vrangel', Geral'd, and Koliuchin. The Amguema, Kobuk, and Noatak rivers flow into the sea. The shoreline is fairly regular, and the predominantly mountainous coast is fringed with lagoons and spits in many places.

The Chukchi Sea lies on the continental shelf. The isobaths of 10 m and 25 m come close to the continent and follow the outline of the shore. Fifty-six percent of the bottom area is less than 50 m deep, and 6 percent is more than 100 m deep. In the north depths increase to 200 m or more, reaching a maximum of 1,256 m. The shelf is cut by two submarine canyons: Geral'd at approximately 175°W long., and Barrow, which runs roughly parallel to the coast of Alaska. There are several rises in the northern part of the sea. Most of the bottom is covered by a thin layer of unconsolidated silt, sand, and gravel.

The sea's position between Asia and North America and between two oceans, the Arctic and the Pacific, determines the special characteristics of its climate and hydrological regime. The polar night lasts more than 70 days, beginning in mid-November, and the polar day goes on for 86 days, beginning in mid-May. During the winter, northerly winds prevail over the sea; they are very steady in the south, especially in the Bering Strait. The average wind velocity is 6.2 m per sec. In summer, southerly winds predominate in the southern part of the sea, and light winds of variable direction in the north. The mean February temperature ranges from −21° to −27°C; the minimum temperature may be as low as −47°C. In July the mean temperatures are 2.5°–5.5°C, with a maximum of 25°C and a minimum of −6°C. The sea is completely covered with ice from late October or November until May or June, when the ice begins to break up. During the summer a warm current coming from the Bering Strait divides the sea's ice pack into two large masses, the Chukchi and the Vrangel'. Navigation becomes possible in the southern part of the sea usually in the second half of July; the ice floes in Long Strait presents the greatest hazard to navigation.

The system of permanent currents and drifting ice is determined by the annual influx of about 30,000 cu km of relatively salty water carried by the Bering Sea Current through the Bering Strait. In the Chukchi Sea the current divides into three branches—the Alaskan, Geral'd, and Long currents—which flow, respectively, along the coast of Alaska, to the northwest (east of Geral'd Island), and into Long Strait. In the summer this current is warm, with a temperature of up to 12°C; in the winter the temperature does not exceed −1.8°C. In the course of a year it brings about 27×10^{15} kcal of heat, enough to melt the ice on more than one-third of the sea. The cold Chukchi Current arises along the coast of the Chukchi Peninsula in summer and continues to flow throughout the fall and winter. Moving southeastward toward the Bering Strait, the current carries water that has been freshened in the East Siberian Sea and that is cold in the summer and relatively warm in the winter (temperature of about −1.6°C). In the winter this current brings surface water and ice from the Chukchi Sea to the Bering Sea, forming what is known as the Polar Current.

The fresh-water component of the water balance has a very slight influence on the water circulation. The river runoff of the basin is about 78 cu km per year; the annual precipitation and evaporation total 275 mm and 119 mm, respectively. The low runoff (13 cm) is one of the reasons that the surface waters of the Chukchi Sea are more saline than those of the other Arctic seas, with the exception of the Barents, Greenland, and Norwegian seas. In summer the salinity in the Chukchi Sea is 30–32‰ (24–27‰ along the coast). The summer water temperature is 4°C in the west, 6°C in the central part, and 10–12°C in the south. In winter the water temperature from the surface to the bottom

ranges from −1.6° to −1.8°C, and the salinity is 32.5–33.5‰. The sea has regular semidiurnal tides of up to 0.9 m. Storm surges may cause the water level to rise by as much as 1.4 m generally and by up to 3 m at Point Barrow. In gale winds, wind-driven waves up to 6.5 m high develop in the ice-free parts of the sea.

The fauna of the Chukchi Sea, a mixture of Arctic and Pacific species, includes whales, seals, ringed seals, walruses, and polar bears. The most common fish are the grayling, navaga, arctic char, and polar cod. In the summer ducks, geese, gulls, and other seabirds inhabit the coast and islands.

The sea is a connecting link between the ports of the Far East, the mouths of the Siberian rivers, and the European USSR, as well as between the Pacific ports of Canada and the United States and the mouth of the Mackenzie River. The indigenous coastal population engages in reindeer herding, the hunting and breeding of fur-bearing animals, and the hunting of marine animals. The settlement of Uelen is a well-known center of walrus ivory carving.

CHUKHADZHIAN, TIGRAN GEVORGOVICH. Born 1837 in Constantinople; died Mar. 11 (23), 1898, in İzmir. Armenian composer, conductor, and figure in the music world.

Chukhadzhian lived in Constantinople, where he studied with the composer G. Eranian; he pursued further study in Milan from 1861 to 1864. Joining with other progressive members of the Armenian community in Turkey in their effort to develop a national culture, he helped organize an Armenian music society, music theaters, a music press, and public concerts and lectures.

Chukhadzhian combined European compositional techniques with the modal harmonies found in the folk music of the western Armenian mountaineers. His compositions include works for piano, songs (including art songs), chamber music, symphonic works, and music for the theater. In addition to the first Armenian opera, *Arshak II* (1868; excerpts performed 1873; performed in its entirety 1945, Yerevan), Chukhadzhian composed the opera–fairy play *Zemire* (1890) and satiric musical comedies involving humble characters, including *Arif* (1872; plot inspired by Gogol's *The Inspector-General*), *The Bald Village Elder* (1873), and *The Pea Vendor* (1875).

CHUKHANOV, ZINOVII FEDOROVICH. Born Oct. 8 (21), 1912, in the village of Novinki, in what is now Krasnogorsk Raion, Moscow Oblast. Soviet scientist, specialist in thermal power engineering and power production technology. Corresponding member of the Academy of Sciences of the USSR (1939). Member of the CPSU since 1944.

Chukhanov studied at the Moscow Institute of Chemical Engineering. In 1938 he became the head of a laboratory at the Institute of Power Engineering of the Academy of Sciences of the USSR.

Chukhanov's main works deal with problems of the combustion, gasification, and pyrolysis of solid fuels. Chukhanov developed a theory of the high-speed pyrolysis of fuels and proposed new methods for the energy-efficient use of fuels in electric power plants. A number of his works are devoted to heat-transfer theory, diffusion, and systems analysis as applied to the evaluation of the efficiency of new equipment.

Chukhanov has been awarded three orders and various medals.

CHUKHLOMA, a city and the administrative center of Chukhloma Raion, Kostroma Oblast, RSFSR. Chukhloma is situated on Chukhloma Lake, 45 km northeast of the Galich railroad junction and 171 km from Kostroma. It has a logging and timber distribution establishment, an industrial combine, and a creamery. Educational and cultural institutions include a branch of the Kostroma Forestry Machinery Technicum and the A. F. Pisemskii Museum of Local Lore (Pisemskii was born in Chukhloma Raion). [29–775–2]

CHUKHNO, ANDREI VASIL'EVICH. Born Sept. 12 (25), 1904. Chairman (1928–68) of the Kommunisticheskii Maiak Kolkhoz (one of the leading farms in the Northern Caucasus), Georgievsk Raion, Stavropol' Krai. Hero of Socialist Labor (1957). Member of the CPSU since 1929.

Chukhno was granted a personal pension in 1968. He was a deputy to the second through fourth convocations of the Supreme Soviet of the USSR and a delegate to the Twenty-first Congress of the CPSU. Chukhno has been awarded two Orders of Lenin, the Order of the October Revolution, and various medals.

CHUKHNOVSKII, BORIS GRIGOR'EVICH. Born Mar. 28 (Apr. 9), 1898, in St. Petersburg; died Sept. 30, 1975, in Moscow. Soviet polar aviator; colonel. Member of the CPSU from 1932.

Chukhnovskii graduated from the school for naval pilots in Oranienbaum in 1917. During the Civil War of 1918–20 he served as chief of naval aviation in the combat operations of the Volga-Caspian Flotilla and took part in the operations that moved the base of the Baltic Fleet from Helsingfors to Kronstadt in 1918.

Chukhnovskii's first arctic flight, to Novaia Zemlia, was made in 1924. (Ia. I. Nagurskii made the first flight to Novaia Zemlia.) The purpose of the flight was to conduct hydrographic work and to escort the ships of the Kara Expedition. He flew in the search for U. Nobile's expedition in 1928, in an ice reconnaissance of the Northern Sea Route between 1929 and 1932, and in the search for S. A. Levanevskii's crew in 1937 and 1938. Between 1933 and 1936, Chukhnovskii and R. L. Bartini designed the DAR airplane, a long-range arctic reconnaissance plane.

During the Great Patriotic War of 1941–45, Chukhnovskii flew as a naval pilot in the combat operations of the Northern Fleet. After the war he was a polar aviator in the Main Northern Sea Route Administration. Chukhnovskii was awarded the Order of Lenin, three Orders of the Red Banner, and various medals.

CHUKHRAI, GRIGORII NAUMOVICH. Born May 23, 1921, in Melitopol'. Soviet motion-picture director. People's Artist of the RSFSR (1969). Member of the CPSU since 1944.

In 1953, Chukhrai graduated from the department of directing of the All-Union State Institute of Cinematography, where he studied under S. I. Iutekevich and M. I. Romm. One of the leading directors of the postwar cinema, he has made a number of significant films that have gained popularity throughout the Soviet Union and the world; several of his films have won prizes at international film festivals. His most outstanding works have been *The Forty-first* (1956, based on the novella by B. A. Lavrenev), *Clear Sky* (1961), and *Memory* (1970). Chukhrai's *Ballad of a Soldier* (1959) was awarded the Lenin Prize in 1961. From 1966 to 1971, Chukhrai worked at the All-Union State Institute of Cinematography.

Chukhrai has been awarded five orders and several medals.

CHUKHROV, FEDOR VASIL'EVICH. Born July 2 (15), 1908, in the city of Egor'evsk, Moscow Oblast. Soviet mineralogist and geochemist. Academician of the Academy of Sciences of the USSR (1970; corresponding member, 1953). Member of the CPSU since 1953.

Chukhrov graduated from the Moscow Geological Prospecting Institute in 1932. From 1936 to 1956 he worked at the Institute of Geological Sciences of the Academy of Sciences of the USSR, where he was appointed deputy director in 1950. In 1956 he became director of the Institute of the Geology of Ore Deposits, Petrography, Mineralogy, and Geochemistry of the Academy of Sciences of the USSR.

Chukhrov's main works deal with the mineralogy of ore deposits and the geochemistry of ore-forming processes. He established the science of natural colloids and developed the principles of the theory of the typomorphism of minerals. He contributed to the development of the mineralogy and geochemistry of the supergene zone: he conducted research on the mineralogy of the oxidation zone of sulfide deposits and studied clay minerals, iron oxides, and sulfur isotopes. He is the editor of the multivolume reference work *Minerals*, which has been published since 1960 using the crystallochemical classification of minerals that he developed.

Chukhrov received the State Prize of the USSR in 1951. He has also been awarded the Order of Lenin, three other orders, and several medals.

Chukhrovite, a sulfate-fluoride of calcium, aluminum, and rare-earth elements, was named in honor of Chukhrov.

CHUKOCH'E, a lake in the delta of the Kolyma River, in the Yakut ASSR. Lake Chukoch'e has an area of 120 sq km. It is shallow and has an irregular shoreline. The lake is fed by snow and rain and is linked with the nearby Lake Maloe Chukoch'e (area, 55 sq km) by a channel. Lake Chukoch'e is connected by a series of channels and lakes with Lake Nerpich'e and the left branch of the Kolyma River. [29–755–1]

CHU-KO LIANG. Born 181; died 234. Chinese military and state figure of the Three Kingdoms period.

Chu-ko Liang was the son of a small-scale landowner. In 207 he joined the service of Liu Pei, who was fighting Ts'ao Ts'ao for power in China. In 221, Liu Pei founded the Shu kingdom and made Chu-ko Liang his chief counselor. As such, Chu-ko Liang waged war against the Wei kingdom while maintaining friendly relations with the Wu kingdom. He subjugated several southwestern tribes. The military accomplishments of Chu-ko Liang are celebrated in the classic Chinese novel *The Three Kingdoms* (14th century). [29–539–1]

CHUKOVSKII, KORNEI IVANOVICH (real name, Nikolai Vasil'evich Korneichukov). Born Mar. 19 (31), 1882, in St. Petersburg; died Oct. 28, 1969, in Moscow. Soviet Russian writer, critic, literary scholar, and translator. Doctor of philology (1957).

Chukovskii was expelled from a *Gymnasium* in Odessa in the fifth grade because of his social origin (his mother was a peasant). He subsequently worked and studied on his own. He began his journalistic career in 1901, publishing essays on contemporary writers that were later collected in such books as *From Chekhov to Our Times* (1908) and *Faces and Masks* (1914). Although sharp and penetrating, Chukovskii's literary portraits at times exhibited excessive subjectivity and paradoxicality of judgment. In *Nat Pinkerton and Modern Literature* (1908), he mocked petit bourgeois literature with great skill.

In 1916, M. Gorky invited Chukovskii to work at the Parus Publishing House and advised him to write for children. Chukovskii's fairy tales in verse "Moidodyr" (1923), "The Giant Roach" (1923), "Mukha-tsokotukha" (1924; under the title "The Fly's Wedding"), "Barmalei" (1925), and "Aibolit" (1929; under the title "The Adventures of Aibolit") were elegant, witty, and free of didacticism. They quickly found their way into the hearts of young readers. Chukovskii's painstaking study of children's speech, ability to create words, and psychology resulted in *Little Children* (1928), republished later as *From Two to Five* (21st ed., 1970).

Chukovskii dealt with the legacy of N. A. Nekrasov in *Nekrasov as Artist* (1922), the collection of articles *Nekrasov* (1926), and the 1927 edition of Nekrasov's *Complete Collected Poems*. His work on Nekrasov culminated in his definitive study, *The Mastery of Nekrasov* (1952; Lenin Prize, 1962).

A translator for many years, Chukovskii was the first to acquaint Russian readers with W. Whitman's *Leaves of Grass* (1907). He analyzed contemporary methods of translation in *Principles of Artistic Translation* (1919) and *High Art* (1968). In his literary and historical memoirs, such as *Contemporaries* (1962) and *Chekhov* (1967), Chukovskii drew vivid portraits of Russian cultural figures. He also worked extensively as an editor.

Chukovskii received an honorary doctorate in literature from Oxford University in 1962. Many of his books have been translated into languages of the USSR and foreign languages. Chukovskii was awarded the Order of Lenin, three orders of the Red Banner of Labor, and various medals.

CHUKOVSKII, NIKOLAI KORNEEVICH. Born May 20 (June 2), 1904, in Odessa; died Nov. 4, 1965, in Moscow. Soviet Russian writer. Son of K. I. Chukovskii.

N. K. Chukovskii graduated from the Leningrad Institute for the History of Arts in 1930 and was first published in 1922. He wrote biographical novellas about famous navigators and novellas and novels about the Civil War, such as *Glory* (1935), *The Village of Kniazhii Ugol* (1936) and *Yaroslavl'* (1938). Chukovskii's most significant work is his novel *The Baltic Sky* (1954; film with the same title, 1961), which describes the courage of the pilots of the Baltic Fleet who defended Leningrad during the siege. In his novellas and short stories "Mésalliance" (1963), "Little Girl Life" (1965), and "Bloomed the Wild Strawberries" (1965), Chukovskii treats moral and ethical problems in a psychologically authentic way. Chukovskii was awarded the Order of the Red Banner of Labor and various medals.

CHULAKI, MIKHAIL IVANOVICH. Born Nov. 6 (19), 1908, in Simferopol'. Soviet composer, teacher, and figure in the music

world. People's Artist of the RSFSR (1969). Member of the CPSU since 1943.

In 1939, Chulaki graduated from the Leningrad Conservatory, where he had studied composition with V. V. Shcherbachev. From 1937 to 1939 he was associated with the Leningrad Philharmonic Society, first as director and later as artistic director. He was deputy chairman of the Committee for the Arts of the Council of Ministers of the USSR in 1951 and 1952 and assistant head of the Central Board for the Arts under the Council of Ministers of the USSR from 1952 to 1955.

Chulaki was with the Bolshoi Theater from 1955 to 1959 and from 1963 to 1970, first as director and later as artistic director. He began teaching at the Leningrad Conservatory in 1933, and in 1948 he accepted a teaching post at the Moscow Conservatory, where he was named a professor in 1962.

Chulaki's finest works are the ballets *The Tale of the Priest and His Worker, Blockhead* (1940), based on the narrative poem by A. S. Pushkin; *The False Fiancé* (1946), based on the play by C. Goldoni; and *Youth* (1947), based on themes from N. A. Ostrovskii's novel *How the Steel Was Tempered*. Other notable works are the Symphony No. 2 (1945), *Symphonic Concerto* (1959), and the orchestral work *Songs and Dances of Old France* (1959). In addition to articles on music, Chulaki has written the book *Instruments of the Symphony Orchestra* (1950), which has been reprinted many times.

Chulaki was a deputy to the sixth and seventh convocations of the Supreme Soviet of the RSFSR. He received the State Prize of the USSR in 1947, 1948, and 1950. Chulaki has been awarded three orders and various medals. [29–756–2]

CHULKOV, MIKHAIL DMITRIEVICH. Born 1743 or 1744 in Moscow; died there Oct. 24 (Nov. 4), 1792. Russian writer and journalist.

Chulkov was one of the *soldatskie deti* (children not from the *dvorianstvo* [nobility] who were educated in regimental schools and allowed to enter military service at the same level as members of the *dvorianstvo*). He was an actor, a court servant, and a Senate official; he obtained hereditary nobility in 1779.

Chulkov's works were oriented toward the common reader. His collection of short stories and novellas *The Mocker, or Slavonic Tales* (parts 1–5, 1766–89) contained picaresque works and works dealing with magic and chivalry. It represented the first use of Slavic mythology in Russian literature. Chulkov later systematized Slavic mythology in special mythological dictionaries, the most complete of which was *The ABC of Russian Superstitions* (1786).

Chulkov's *The Comely Cook, or The Adventures of a Debauched Woman* (1770, unfinished) was the first Russian picaresque novel written from the viewpoint of a woman. Chulkov published a number of 18th-century folk and professionally composed songs in *A Collection of Various Songs* (parts 1–4, 1770–74), which was supplemented and republished by N. I. Novikov in 1780 and 1781. (Parts 1–3 were reissued as *The Works of M. D. Chulkov*, vol. 1, St. Petersburg, 1913.) He published the journals *I to i s'o* (1769) and *Parnasskii shchepetil'nik* (1770) and took part in the journalistic polemic Novikov conducted with Catherine II on the nature of satire. In the last years of his life, Chulkov worked on *A Historical Account of Russian Commerce* (vols. 1–7, 1781–88), a detailed collection of legislative acts and other documents dealing with trade.

CHUL'MAN, an urban-type settlement in the Yakut ASSR, under the jurisdiction of the Neriungri city soviet. Chul'man is situated on the Chul'man River of the Lena River basin, on the Amur-Yakutsk highway, 402 km north of the Bol'shoi Never railroad station on the Trans-Siberian Railroad and 40 km north of the Berkakit railroad station on the Tynda-Berkakit line. Coal is mined in the area, and the settlement has a state regional power plant and an enterprise serving motor-vehicle transportation. [29–761–1]

CHULPAN (pen name of Abdul-Khamid Suleiman ogly Iunusov). Born 1893 in Andizhan; died 1938. Soviet Uzbek writer.

Chulpan studied in a *madrasa* and later in a Russian school for local nationalities. He began his literary career in 1914. His prerevolutionary works, including the novella *Doctor Mukhammed"iar* (1914) and short stories, are deeply pessimistic. Chulpan's works of the Soviet period reveal contradictions in the author's ideology and approach to literature. Bourgeois nationalist sentiments are apparent in the poetry collections *The Awakening* (1922), *Springs* (1924), and *Secrets of the Dawn* (1926).

In the latter 1920's, Chulpan repudiated his errors, abandoned his delusions, and recognized the historical and social superiority of the new reality. The evolution of his world view found expression in the romantic drama *Iarkin-Oi* (1920; 2nd version, 1926), the novel *By Night and by Day* (part 1, 1936), and his plays. *Saz* (1931), a collection of verse, celebrates the October Revolution of 1917 and the successful building of socialism in Uzbekistan. Chulpan translated into Uzbek the works of A. S. Pushkin and N. V. Gogol, Shakespeare's *Hamlet*, the plays of C. Gozzi and C. Goldoni, and V. V. Ivanov's *Armored Train 14–69*.

CHULUTYN-GOL, a river in Mongolia; the main tributary of the Ider River of the Selenga basin. The Chulutyn-Gol flows into the Ider from the right. It is 415 km long and drains an area of approximately 20,000 sq km. The river rises on the northern slopes of the Khangai. High water occurs in the summer. The mean flow rate is estimated to be 25 cu m per sec. The Chulutyn-Gol freezes over for five or six months. It is nonnavigable. [29–759–2]

CHULYM, a city and the administrative center of Chulym Raion, Novosibirsk Oblast, RSFSR; situated on the Chulym River. Chulym has a railroad station on the Barabinsk-Novosibirsk line, 131 km west of Novosibirsk. The city has a creamery and enterprises serving railroad transportation. [29–760–2]

CHULYM, a river in Novosibirsk Oblast, RSFSR. The Chulym is 392 km long and drains an area of 17,900 sq km. It rises in the swamps of the Baraba Steppe, and its lower course passes through Lakes Sargul' (34.6 sq km) and Urium (84.1 sq km) before emptying into Lake Malye Chany. The Chulym is fed mainly by snow. High water occurs between mid-April and early November. The river is frozen from December to March, and the ice breaks up in April or early May. The Kargat is a right tributary of the river. The city of Chulym is situated on the Chulym. [29–760–1]

CHULYM, a river in Krasnoiarsk Krai and Tomsk Oblast, RSFSR; a right tributary of the Ob'.

The Chulym is 1,799 km long and drains an area of 134,000 sq km. It is formed by the confluence of the Belyi Iius and Chernyi Iius rivers, which rise in the Kuznetskii Alatau. From its source to the city of Achinsk the river flows through mountains, but from Achinsk to Tegul'det it flows first between high banks and then through the Chulym-Enisei Basin, where it branches and frequently shifts course. The Chulym then flows over a floodplain up to 10 km wide, where it forms numerous lakes and oxbows; the channel, which is up to 1,200 m wide, has many branches.

The Chulym is fed primarily by snow, with high water occurring between May and July. The mean flow rate is 785 cu m per sec, with a maximum rate of 8,220 cu m per sec (131 km from the mouth) and a minimum rate of 108 cu m per sec. The river freezes over in early November, and the ice breaks up in late April or early May; ice jams often occur in the spring. The average sediment discharge is 68 kg per sec, and the river carries a sediment load of 2.1 million tons per year. The largest tributaries are the Serezh, Uriup, Kiia, and Iaia on the left and the Kemchug, Chichkaiul, and Bol'shoi Ului on the right.

The Chulym is used for floating timber. The river is navigable for a distance of 1,173 km from the mouth; however, the river bars and the twisting course make navigation difficult. The cities of Nazarovo, Achinsk, and Asino are situated on the Chulym. [29–759–3]

CHULYM-ENISEI BASIN (also Enisei-Chulym Basin), the northern part of the vast intermontane Minusinsk Depression in the southern part of Krasnoiarsk Krai. The basin is bounded on the east by spurs of the Vostochnyi Saian, on the west by the Kuznetskii Alatau, on the north by the Solgon Ridge, and on the south by the Batenevskii Ridge. The terrain consists mainly of rolling hills, with *melkosopochnik* in the south (*see* MELKOSOPOCHNIK). Elevations range from 170 m to 500–550 m.

The basin is composed mainly of sandstones, conglomerates, shales, and extrusive rocks of the Paleozoic and Mesozoic, during which deposits of brown coal were formed. The Enisei River flows along the eastern margin of the basin, and the Chulym River runs through the central and western parts. Characteristic of the area are broad hollows and a large number of lakes, including Lakes Shira and Bele. Typical grass steppes have developed in the south on common and southern chernozems; forest steppes are found in the north and in the foothills on alkaline chernozems and gray forest soils. The Chulym-Enisei Basin is an important agricultural region of Krasnoiarsk Krai. [29–760–3]

CHULYMTSY, a Turkic-speaking territorial group that lived along the middle and lower course of the Chulym River, a tributary of the Ob'. Russians referred to the Chulymtsy as the Chulym Tatars. The group was formed in the 17th and 18th centuries when several Turkic groups had advanced eastward after the fall of the Siberian Khanate. These groups and, partly, Teleut and Enisei Kirghiz mixed with small numbers of Selkups and Ket. The Chulymtsy led a settled way of life, having adopted agriculture and nonnomadic livestock raising from local Russian peasants. The descendants of the Chulymtsy intermingled with the Khakass and with Russians.

CHULYSHMAN, a river in the Altai, in Gorno-Altai Autonomous Oblast. The Chulyshman is 241 km long and drains an area of 16,800 sq km. In its upper course it flows across the Chulyshman Plateau, passing through a series of lakes, the largest of which is Dzhulukul' (area, 29.5 sq km). It then enters a deep valley between the Chulyshman Plateau and the Ulagan Plateau. The river empties into Teletskoe Lake. It is fed by mixed sources, chiefly by snow; high water occurs between May and September. The mean flow rate is 158 cu m per sec. The river freezes over between late October and early December, and the ice breaks up between late March and early May. The principal tributary of the Chulyshman is the Bashkaus. [29–760–5]

CHULYSHMAN PLATEAU, an upland plain in the eastern Altai, between the Chulyshman River valley on the southwest and the Shapshal Range on the northeast. In the western and southern parts of the Chulyshman Plateau, massifs composed of crystalline schists and granites rise to a maximum elevation of 3,148 m above the generally flat surface, whose average elevation is 2,000–2,200 m. The Chulyshman Plateau is drained by right tributaries of the Chulyshman River, including the Chul'cha and the Shavla. Larch and nut pine–larch taiga grow on the slopes of the plateau to elevations of 2,000 m; stony mountain tundra is found at higher elevations. [29–760–6]

CHUM, the Russian name of a portable dwelling used by the Nentsi of the European part of the USSR and by the peoples of Siberia, including the Ket, Northern Yakuts, Oroki, Evenki, Nganasani, and Tuvinians-Todzhintsy.

The *chum*, built of 30 to 50 poles, was conical, with a round or slightly oval base and a floor diameter of 3 to 8 m. In the winter it was covered with sewn hides of reindeer, Manchurian deer, or elk, and in the summer, with boiled birch bark or, sometimes, canvas or burlap. The entrance was covered with hides in the winter and coarse fabric in the summer. In the center of the *chum* was a hearth. On both sides of the entrance were the sleeping areas; birch bark, willow mats, and dry grass were spread on the floor and reindeer hides were placed on top. With the transition of the nomadic peoples to a settled way of life, the *chumy* gradually fell into disuse and were replaced in some places by tents. [29–761–2]

CHUMACHESTVO, a special form of trade and goods conveyance in the Ukraine and in southern Russia. *Chumachestvo* grew out of the salt trade in the second half of the 16th century in the Dnieper region, to which salt was brought from the Black Sea coast, the Crimea, and Galicia.

Initially the haulers and traders known as *chumaki* were primarily cossacks; later they included state peasants and, less frequently, serfs and townspeople. Beginning in the 17th century the *chumaki* dealt not only in salt but in dried fish, handicrafts, and lumber. They transported their goods on ox-drawn wagons (*mazhi*) and, until the end of the 18th century, rode under an elected ataman in armed convoys of 100 or more wagons to protect themselves against attack by Crimean Tatars.

As a result of the decline of the feudal-serf system and the development of trade, *chumachestvo* became a major rural occupation in southern Russia by the mid-18th century. Grain shipped abroad from southern ports, such as Odessa, came to be the principal commodity traded.

A source of primitive accumulation of capital, *chumachestvo* widened the socioeconomic differences among the peasant and cossack masses. Such prominent Ukrainian merchants and landowners as the Tereshchenkos and Kharitonenkos came from the ranks of the *chumaki*. A topic in Ukrainian folklore and in the works of such Ukrainian writers as T. G. Shevchenko and G. P. Danilevskii, *chumachestvo* ceased to exist by the 1870's and 1880's as a result of the development of rail and water transport.

CHUMAKOV, MIKHAIL PETROVICH. Born Nov. 1 (14), 1909, in the village of Ivanovka, in what is now Volyn' Raion, Orel Oblast. Soviet microbiologist and virologist. Academician of the Academy of Sciences of the USSR (1960; corresponding member, 1948). Member of the CPSU since 1940.

Chumakov graduated from the First Moscow Medical Institute in 1931. He was director of the D. I. Ivanovskii Institute of Virology of the Academy of Medical Sciences of the USSR from 1950 to 1954. He was director of the academy's Institute of Poliomyelitis and Viral Encephalitides (founded on his initiative) from 1955 to 1972; he served as scientific director of the institute from 1972 to 1976.

Chumakov's work has mainly been devoted to the etiology, immunology, laboratory diagnosis, epidemiology, prophylaxis, and treatment of human viral diseases. Among the diseases he has studied are Russian spring-summer and mosquito-borne encephalitides, poliomyelitis, enteroviral diseases, measles, influenza, and trachoma. Chumakov discovered several viruses that are pathogenic for man and developed a theory of hemorrhagic fevers. He assisted in the development of vaccines for poliomyelitis, measles, Russian spring-summer and Japanese B encephalitides, and other diseases. He also helped organize mass immunization campaigns against poliomyelitis, which resulted in the rapid eradication of poliomyelitis epidemics in the USSR and many other countries.

Chumakov has been awarded three orders, several medals, the Lenin Prize (1963), the State Prize of the USSR (1941), and the D. I. Ivanovskii Prize of the Academy of Medical Sciences of the USSR (1953). He became a member of the Leopoldina German Academy of Naturalists in 1969.

CHUMIZA (*Setaria italica maxima*), an annual cultivated subspecies of foxtail millet (family Gramineae). The erect, nearly cylindrical stem varies in height from 25 cm to 2 m. The leaves, which are broadly lanceolate and pointed, measure 25–65 cm in length. The inflorescence is a spicate panicle, and the fruit is a grain.

This foxtail millet subspecies is cultivated in Korea, China, India, Mongolia, Japan, the USSR, and other countries. In the USSR it is grown in the Byelorussian SSR, the Ukrainian SSR, the republics of Middle Asia, the Kazakh SSR, the Georgian SSR, the Northern Caucasus, and the Far East. It is cultivated on small plots. Chumiza is used as a food crop in the form of groats and flour and as a feed crop in the form of grain, hay, and green feed.

The plant is drought resistant and thermophile. It grows well in chernozems, gray forest soils, and soddy podzols. Germination occurs at a temperature of 5°C; the shoots are sensitive to frost. Three varieties are distinguished based on the length of the vegetative period: early varieties, with a vegetative period of 100 to 110 days; average varieties, with a vegetative period of 110 to 130 days; and late varieties, with a vegetative period of more than 130 days.

For plantings raised for grain, the seeds are sown in wide rows 45–60 cm apart. Continuous drilling is used if the crop is to be used as hay or green chop. The rate for wide-row sowing is 10–12 kg/hectare (ha); the seed rate in continuous drilling is 14–20 kg/ha. The depth of seeding is 2.5–4.5 cm. Chumiza is grown with vetch, clover, and other legumes. The crop is harvested for grain during the phase of waxy ripeness or at the beginning of the phase of complete maturity. Harvesting for hay is done at the beginning of panicle formation, and harvesting for green feed takes place ten to 14 weeks earlier. The yield per ha is 250–300 centners of green mass, 50–70 centners of hay, and 15–30 centners of grain. One hundred kg of green mass contain 17.5 feed units and 1.8 kg of digestible protein. In 100 kg of hay there are 55 feed units and 5.4 kg of digestible protein. Green mass, hay, and silage may be fed to cattle, sheep, and horses. The grain may be fed to all agricultural animals.

CHUMYSH, a river in Altai Krai and Kemerovo Oblast, RSFSR; a right tributary of the Ob'. The Chumysh River is 644 km long and drains an area of 23,900 sq km. It rises in the Salair Ridge at two sources, the Kara-Chumysh and the Tom'-Chumysh. The upper course has many rapids; near the mouth the river divides into two branches. The Chumysh is fed primarily by snow. The mean flow rate 74 km from the mouth is 146 cu m per sec. The river freezes in the first half of November and opens up in the second half of April. It is used to float timber. The river is navigable for 196 km to the Zakharovo landing [29–766–2]

CHUNA (called the Uda River in the upper course), a river in Irkutsk Oblast and Krasnoiarsk Krai, RSFSR; right headstream of the Taseeva River in the Enisei basin. The Chuna River is 1,203 km long and drains an area of 56,800 sq km. It rises in the Uda Range of the Vostochnyi Saian. The upper course flows through a narrow intermontane valley; the lower course flows through the Central Siberian Plateau. As the river intersects traps, it forms the Tiumenets, Voron, Arakan, and Kosoi rapids. It is fed mainly by rain and snow. The mean flow rate is 300 cu m per sec. The Chuna freezes in late October or November, and the ice breaks up in late April or May. The river is used to float timber, and there is local navigation. The city of Nizhneudinsk is on the Chuna. [29–766–3]

CHUNATUNDRA, a mountain massif on the Kola Peninsula, west of Lake Imandra; located in Murmansk Oblast, RSFSR. The massif rises to an elevation of 1,114 m at Mt. Ebruchorr. It is part of the Lapland preserve. [29–767–1]

CH'UN CH'IU, a period of the Eastern Chou in China that lasted from 722 B.C. to 481 B.C.; named after the *Ch'un ch'iu* (Spring and Autumn Annals), which chronicled the events of these years.

During the Ch'un Ch'iu period, the kingdoms and principalities that had been formed from early Chou fiefs became in fact independent states embroiled in internecine strife. Because many of the nobles perished in the strife and the large kingdoms gained strength at the expense of the smaller ones, the institution of hereditary fiefs and the aristocracy itself were weakened. In the conquered, escheated, or newly acquired lands of the large kingdoms, regions and prefectures were created and placed under the leadership of officials trained by the central government. [29–768–1]

CHUNCHON, a city in South Korea, in the Soyang River valley (Pukhan River basin). Capital of Kangwon-do (Kangwon Province). Population, 121,000 (1970). Chunchon, a transportation junction, manufactures textiles, food products, and mineral fertilizers. [29–782–1]

CHUNGJU, a city in South Korea, in North Chungchong Province. Population, more than 50,000. Chungju is a transportation junction. It produces textiles, including silk, foods and spices, and tobacco products, and chemicals, including mineral fertilizers. Machinery is also manufactured. [29–781–7]

CHUNGKING (also Ch'ungch'ing), a city in Southwest China, in Szechwan Province. Forms a series of terraces on the slope of a promontory at the confluence of the Chialing Chiang and the Yangtze River. Population, approximately 5 million (including rural areas under the city's jurisdiction; 1974). Chungking is a river port that handles more than 6 million tons of freight annually. It is connected by water with Shanghai and by railroad with Paochi, in Shensi Province, and with the seaport of Chanchiang, in Kwangtung Province. The city has an airport. There is a bridge across the Yangtze at Chungking.

Chungking developed as a major industrial center during the Sino-Japanese War, when factories were evacuated to the city from the eastern regions between 1938 and 1945; since that time industry has undergone further development. Approximately 10 million tons of coal are mined annually in the Chungking area; the substantial electric power industry includes two fossil-fuel-fired steam power plants and a hydroelectric power system on the Lungch'i Ho.

In 1970, Chungking's complex of integrated iron and steel plants produced 1.5 million tons of pig iron and 1.2 million tons of steel. The city's diversified machine-building industry manufactures hydroturbines, equipment for the power-engineering industry, machine tools, pneumatic and drilling equipment, construction machinery, ships, bearings, agricultural machinery, and instruments. The chemical industry is represented by plants producing plastics, chemical fibers, toxic chemicals, and pharmaceuticals. The building-materials industry is represented by cement factories. The city also has mills for the production of wool and silk fabrics, a meat-packing plant, a cannery, a butter factory, a tea factory, and flour mills. I. M. FEDOROV

Chungking is first mentioned in the 11th century B.C., when Chiangchou, the capital of the kingdom of Pa (Pah), stood on the site of the modern city. In 316 B.C. the kingdom of Pa was incor-

porated into the Ch'in state, and Chiangchou became a district capital. In 1189 the city received its present name. Long a major commercial center of Southwest China, Chungking was opened to foreign trade in 1891, after which it was used by the capitalist nations as a base from which to penetrate the economy of Szechwan and neighboring provinces. From 1913 to 1929 the city was called Pahsien. In October 1938 the Japanese captured Hank'ou, where the nationalist government had been located since late 1937; from the fall of Hank'ou until early 1946, Chungking was the capital of China. The city was freed from Kuomintang rule by the People's Liberation Army of China on Nov 30, 1949.
[29–767–7]

CHUNHYANG-JON ("Tale of Chunhyang"; also known as *Fragrance of Spring*), an anonymous late 18th-century Korean tale of the romance between a girl of the lower class and a noble youth. Certain passages of the work criticize contemporary Korean society. The tale has survived in different versions. The libretto of the Korean opera *Chunhyang-jon* is based on the tale.

CHUNI (singular, *chunia*), *lapti* made from hemp cord.
[29–767–3]

CHUNIA, a river in Krasnoiarsk Krai, RSFSR, a right tributary of the Podkamennaia Tunguska. The Chunia River is 727 km long and drains an area of 70,500 sq km. It is formed at the confluence of the Iuzhnaia Chunia and Severnaia Chunia rivers. The river flows over the Central Siberian Plateau and is full of rapids, including Chunskii Zamok. It is fed by snow and rain. High water is in May and June, and flooding occurs in summer and, especially, in fall. The mean flow rate is about 435 cu m per sec. The Chunia freezes in October, and the ice breaks up in May. Right tributaries are the Paimbu, Verkhnii Chunku, and Nizhnii Chunku; left tributaries are the Kimchu, Mutorai, and Tychany. The river is navigable by boats of shallow draft.
[29–768–2]

CHUNIRI (also *chunir*), a Georgian (primarily Svanetian) bowed stringed folk instrument. The *chuniri* has a wooden drumlike body covered on one side by a leather membrane. The instrument's flat neck passes through the body, terminating at the bottom in a supporting leg and at the top in a spade-shaped pegbox. The short bow is arched. The two or three horsehair strings are tuned to a third or to a second and third. The *chuniri* is used in ensemble playing with the *changi* (a plucked stringed instrument) to accompany singing and dancing; improved versions of the instrument are used in the folk orchestras of the Georgian SSR.

CHUNIZHEKOV, CHALCHIK ANCHINOVICH. Born Oct. 29 (Nov. 10), 1898, in the *urochishche* (locality) of Kuium, in what is now Gorno-Altai Autonomous Oblast; died July 1, 1973, in Gorno-Altaisk. Soviet Altai writer.

The son of a peasant, Chunizhekov was first published in 1925. In the narrative poem *Tuudi* (1947) he depicted the *skazitel'* (singer of epic folk songs) N. U. Ulagashev. In the autobiographical novella *Munduzak* (1962; Russian translation, 1964), Chunizhekov described life in the Altai during the early years of Soviet power.

CHUNSKII, an urban-type settlement and the administrative center of Chunskii Raion, Irkutsk Oblast, RSFSR. Chunskii is situated on the Chuna River in the Enisei River basin. It has a railroad station (Chuna) on the Taishet-Lena line, 808 km northwest of Irkutsk. A logging combine, a logging and timber distribution establishment, and enterprises serving railroad transportation are found in the settlement. [29–767–6]

CHUPA, an urban-type settlement in Loukhi Raion, Karelian ASSR. Chupa is a landing on Chupa Bay of the White Sea, 4 km from the Chupa railroad station on the Murmansk-Leningrad line. The Karelsliuda Ore-dressing Combine, a logging and timber distribution establishment, and a fish-processing plant are located in Chupa. [29–768–3]

CHUPAKHOVKA, an urban-type settlement in Akhtyrka Raion, Sumy Oblast, Ukrainian SSR; situated 29 km from the Akhtyrka railroad station. Chupakhovka has a sugar refinery. [29–768–4]

CHUPROV, ALEKSANDR ALEKSANDROVICH. Born Feb. 6 (18), 1874, in Mosal'sk, in what is now Kaluga Oblast; died Apr. 19, 1926, in Geneva. Russian statistical theorist; founder of the modern system of teaching statistics. Corresponding member of the Russian Academy of Sciences (1917), member of the International Statistical Institute, corresponding member of the Royal Economic Society and Royal Statistical Society in London. Son of A. I. Chuprov.

A. A. Chuprov graduated from the faculty of physics and mathematics of Moscow University in 1896 and studied economic sciences in Germany in 1901. His study of Marxist philosophy had a profound influence on the formation of his materialist views. From 1902 to 1917, Chuprov headed the department of statistics at the St. Petersburg Polytechnic Institute. He organized a seminar on statistics that trained many Russian statisticians; the participants in the seminar came to be known as Chuprovtsy. In 1917, Chuprov emigrated.

In his dissertation *Essays on the Theory of Statistics* (1909), Chuprov developed a number of original ideas on causality, probability, and the law of large numbers. His scientific work was concerned primarily with problems and methods of the stochastic (probabilistic) theory of statistics, which he attempted to place on a materialist foundation. He fought against the Machism, German neo-Kantianism, and American neopositivism that had crept into the theory. Chuprov contrasted these schools of thought to the ideas of the Russian scholars P. L. Chebyshev and A. A. Markov, in particular their method of mathematical expectations.

CHUPROV, ALEKSANDR IVANOVICH. Born Feb. 6 (18), 1842, in Mosal'sk, in what is now Kaluga Oblast; died Feb. 24 (Mar. 8), 1908, in Moscow. Russian bourgeois economist, statistician, and journalist. Corresponding member of the St. Petersburg Academy of Sciences (1887).

The son of a priest, Chuprov graduated from the faculty of law at Moscow University in 1866. From 1878 to 1899 he was a professor of political economy and statistics at the university. A founder of Russian statistics, he wrote numerous works on political economy, the agrarian question, and the economics of railroad transport. He organized the Society for the Dissemination of Technical Knowledge in 1869 and the Statistics Divison of the Moscow Juridical Society in 1882.

Chuprov was the leading exponent of the liberal Narodnik (Populist) school of bourgeois economics, which called for partial agrarian reforms—such as the improvement of farming techniques, the organization of cottage artels, and the resettlement of the peasantry—that would leave intact the peasant commune and the ownership of land by the gentry. He edited the liberal Populist collection *The Influence of Harvests and Grain Prices on Certain Aspects of the Russian National Economy* (1897), which was sharply criticized by V. I. Lenin (see *Poln. sobr. soch.*, vol. 3, p. 207, note; p. 311, note).

Chuprov took part in the *zemstvo* (district and provincial self-government) movement and was a frequent contributor to the newspaper *Russkie vedomosti*.

CHUQUICAMATA, a city in northern Chile, in Antofagasta Province. Population, 28,800 (1966). Chuquicamata is situated at an elevation of approximately 3,000 m. It has a railroad station. Copper ores are mined and dressed and copper is smelted in the city. [29–743–1]

CHUQUICAMATA, the world's largest copper deposit, located in northern Chile, in the Central Andes at an elevation of 2,840 m, 240 km northeast of the city of Antofagasta. The total geological reserves of commercial ores are estimated at about 900 million tons, with an average copper content of 0.99 percent (1978). Chuquicamata, a hydrothermal deposit of porphyry copper, is confined to a large meridional intrusion (20 km long and 3 to 4 km wide) of porphyritic monzonite. The commercial ores connected with the thick (more than 300 m) zone of oxidation form a steep stockwork that is 0.8 km wide and about 3 km long.

Three submeridional zones are distinguished in the Chuquicamata deposit: the western, the central, and the eastern zones. The western zone, which consists of copper-molybdenum ores, is 100 to 200 m wide and is the most intensively mineralized. It is composed of quartz-sericite rocks and quartzites; metalliferous minerals are represented (in addition to oxidized minerals) by pyrite, chalcocite, enargite, molybdenum, and chalcopyrite. The central zone, which consists of copper ores, is characterized by intensive kaolinization of porphyries and the development of chalcopyrite-chalcocite ores. The eastern zone consists of complex ores. The rocks are chloritized, and chalcopyrite is developed. Bornite, sphalerite, and galena are found less often.

The Chuquicamata deposit has been worked since 1915. By 1952, 4.6 million tons of copper had been extracted; 420,000 tons were mined in 1974. V. I. STAROSTIN [29–742–5]

CHUR, an urban-type settlement in Iakshur-Bod'ia Raion, Udmurt ASSR, on the Chur River, a tributary of the Izh River. Chur has a railroad station on the Izhevsk-Igra line, 44 km northwest of Izhevsk. Limestone is quarried and processed in the settlement, and wood products are manufactured. A silicates plant was under construction in 1978. [29–769–2]

CHURCH, ALONZO. Born June 14, 1903, in Washington, D.C. American logician and mathematician.

Church was a professor at Princeton University from 1947 to 1967, when he became a professor of mathematics and philosophy at the University of California at Los Angeles.

Church's works deal with various branches of logic. He developed the notion of separating the concept of function from that of set. In 1936 he advanced the fundamental hypothesis of the theory of computable functions; now known as Church's thesis, it states that every effectively computable function is general recursive (*see* RECURSIVE FUNCTION). In 1935, Church adduced an example of an undecidable queue problem, and in 1936 he proved that the decision problem for predicate calculus is unsolvable. These results greatly influenced the development of mathematical logic. Church also made an important contribution to the development of combinatory logic and carried out research in logical semantics and modal logic.

Vvedenie v matematicheskuiu logiku, vol. 1. Moscow, 1960.
[29–333–2]

CHURCHILL, LORD RANDOLPH (Randolph Henry Spencer-Churchill). Born Feb. 13, 1849, in Blenheim, near Woodstock, Oxfordshire; died Jan. 24, 1895, in London. British political figure.

The third son of the seventh duke of Marlborough, Churchill was elected to Parliament in 1874 as a member of the Conservative Party. Criticizing the party leadership's policies, Churchill deemed it necessary for the Conservatives to adapt to new historical conditions, in particular by appealing to the working class, which had received the right to vote. Churchill was a supporter of colonial expansion, and in 1885–86 he was secretary of state for India and chancellor of the exchequer. [29–334–6]

CHURCHILL, WINSTON LEONARD SPENCER. Born Nov. 30, 1874, in Blenheim, near Woodstock, Oxfordshire; died Jan. 24, 1965, in London. British statesman; a leader of the Conservative Party.

Churchill was a descendant of the dukes of Marlborough and a son of Lord Randolph Churchill. He was educated at the privileged Harrow school and at the military academy at Sandhurst. From 1896 to 1898 he served in India and took part in the suppression of an uprising on the Northwest Frontier. Churchill saw action in the Sudan in the campaign that led to the conquest of the country by British troops. He was a war correspondent in South Africa during the Boer War (1899–1902).

Churchill left military service to enter politics. In 1900 he was elected to Parliament as a Conservative. In 1904 he switched to the Liberal Party for careerist reasons. He was under-secretary for the colonies from 1906 to 1908, president of the board of trade from 1908 to 1910, and home secretary in 1910–11; in 1911 he sent troops against striking Welsh miners. Churchill became first lord of the admiralty in 1911. In World War I he initiated the Dardanelles Operation of 1915, the failure of which led to his resignation (1915). In 1917–18 he was minister of munitions in Lloyd George's cabinet.

Churchill served as secretary for war and as air minister from 1919 to 1921. In this period Churchill, whom V. I. Lenin characterized as the most bitter enemy of Soviet Russia (see *Poln. sobr. soch.*, 5th ed., vol. 41, p. 350), was one the main organizers of the anti-Soviet intervention. As colonial secretary (1921–22), he approved the use of the air force for the suppression of the national liberation movement in the colonies. In the 1920's, as the Liberal Party lost its political power, Churchill returned to the Conservative Party, to whose political philosophy and policies he

had always been close. He was a Conservative member of Parliament from 1924 until the end of his life.

From 1924 to 1929, Churchill was chancellor of the exchequer in S. Baldwin's cabinet. As a result of Churchill's efforts, the pound sterling was restored to the gold standard (1925), a move aimed at restoring London's role as the center of world finance. In the 1930's Churchill vigorously opposed the foreign policy of Baldwin and N. Chamberlain; he considered their policy of appeasing the fascist aggressors as short-sighted and extremely risky. In September 1939, after Great Britain entered World War II, Churchill was appointed first lord of the admiralty in Chamberlain's government. In May 1940, after Chamberlain's resignation, Churchill became prime minister in a coalition government. He headed a radical reorientation of the whole country for war against Germany and the other countries of the fascist bloc.

On June 22, 1941, after Germany's attack on the USSR, Churchill, realizing that Great Britain could not avoid defeat in the war without a military alliance with the USSR, announced his support for the struggle of the Soviet people. The Churchill government signed an agreement with the USSR on joint actions against fascist Germany (July 1941) and a treaty of alliance in the war against Germany (May 1942). Subsequently, however, his government procrastinated in meeting its treaty obligations, in particular, on the pledge to open a second front. Churchill participated in the Tehran Conference (1943), the Yalta Conference (1945), and the Potsdam Conference (1945).

Churchill resigned after the defeat of the Conservatives in the parliamentary elections in July 1945. As leader of the opposition in Parliament, Churchill assumed leadership of the campaign to unleash the cold war. In a speech delivered on Mar. 5, 1946, in the presence of US president H. Truman in Fulton, Mo., Churchill called for the formation of a military and political alliance of Great Britain and the USA against the USSR and the people's democratic countries. Churchill was again prime minister from 1951 to 1955. In these years Great Britain played an active role in the rearming of West Germany and in the forming of imperialist military blocs. In 1955, Churchill, now at an advanced age, resigned from office and abandoned active political life.

Churchill is also known as a publicist and as the author of historical works and of memoirs. He was awarded the Nobel Prize for literature in 1953.

V. G. TRUKHANOVSKII [29–334–7]

CHURCHILL, a city in Canada, in northeastern Manitoba. Population, 1.6 million (1971). A seaport on the western shore of Hudson Bay, at the mouth of the Churchill River, Churchill is the terminus of a railroad branch line. It has a grain elevator and is a grain-shipping point. The city was founded in 1688. [29–334–4]

CHURCHILL (until 1965, Hamilton), a river in Canada, on the Labrador Peninsula. The Churchill River drains a large group of lakes in central Labrador. It empties into Lake Melville, which is linked by a channel with Hamilton Inlet of the Atlantic Ocean. The Churchill is 560 km long and drains an area of 80,000 sq km. Waterfalls include Churchill Falls and Muskrat Falls; among the river's rapids are the Mouni. The mean flow rate is 1,558 cu m per sec. There are several hydroelectric plants on the river. [29–334–3]

CHURCHILL, a river in Canada. The Churchill River flows out of Methy Lake in Saskatchewan and empties into Hudson Bay. The river is 1,600 km long and drains an area of 282,000 sq km. Its course consists of a chain of lakes separated by rapids. The many large lakes in the Churchill system, such as Reindeer Lake, Northern Indian Lake, Southern Indian Lake, and Lac La Ronge, cause the flow to be well regulated. The Beaver River is a large right tributary of the Churchill. The Churchill River is fed by snow and rain, and high water occurs in spring and summer. The mean flow rate is 1,200 cu m per second. The river freezes over for about eight months. A hydroelectric plant is located on the Churchill River at Island Falls, and the port of Churchill is situated at the river's mouth. [29–334–2]

CHURCHILL FALLS (until 1965, Grand Falls), a waterfall in the upper course of the Churchill River in Canada, on the Labrador Peninsula. Churchill Falls is formed by the river's crossing of the precipitous edge of a plateau. The falls have a drop of about 75 m. A hydroelectric plant with a total installed capacity of 2.5 megawatts has been built at Churchill Falls. [29–334–5]

CHURIKOVTSY, an ethicoreligious movement in Russia, part of the temperance movement. The Churikovtsy were named for their founder, I. A. Churikov, a merchant from Samara (born 1862; died after 1930). Churikov preached moral and religious salvation through rejection of alcoholic beverages and smoking. His followers claimed that he possessed the power to cure drunkenness. The Churikovtsy had some influence among the urban lower classes of St. Petersburg and Moscow.

CHURINGA, a sacred object of certain Australian tribes. Churingas are flat, decorated pieces of wood or stone that were kept in special hiding places and used in religious rites. They were regarded as totemic incarnations. Ornamented pebbles similar to churingas have been uncovered at habitation sites of the Mesolithic Azilian culture. [29–770–1]

CHURKIN, NIKOLAI NIKOLAEVICH. Born May 9 (21), 1869, in the village of Dzhalal-Ogly (present-day Stepanavan, Armenian SSR); died Dec. 27, 1964, in Minsk. Soviet composer and folklorist. People's Artist of the Byelorussian SSR (1949).

Churkin graduated from M. M. Ippolitov-Ivanov's composition class at the Tbilisi Music School in 1892. He worked as a music teacher from 1892 to 1914 in Baku, Kaunas, and Vilnius. He moved to Byelorussia in 1914 and lived in Minsk from 1935. Churkin collected musical folklore, including more than 3,000 examples of Byelorussian folk music and dances, many of which were published in collections in 1910, 1949, and 1959. Churkin was the first to attempt a Soviet Byelorussian opera, *The Liberation of Labor* (1922), and he originated national genre symphonic music, for example, *Byelorussian Pictures* (1925). His other works include the children's radio opera *The Mitten* (1940) and the musical comedy *Song of Berezina* (1947). He also wrote works for symphony orchestra, wind orchestra, folk-instrument orchestra, and instrumental chamber ensemble (including 11 quartets), as well as choral works and songs set to the words of Soviet poets.

Churkin was awarded three orders and several medals.

CHURRIGUERA, a family of Spanish architects and sculptors of the 17th and 18th centuries. The most famous family member was José Benito Churriguera (born Mar. 21, 1665, in Madrid; died there Mar. 2, 1725), after whom the Spanish version of the baroque style—the Churrigueresque—was named. José combined baroque techniques with Gothic and plateresque motifs in his buildings, altars, and retables. He used fanciful architectural ornament (curved, wavy cornices and columns) and abundant

sculptural decoration. José's works include the retable of the Church of San Estéban in Salamanca (1693–96), a palace in Madrid (after 1689; now the San Fernando Royal Academy of Fine Arts, rebuilt in 1774), and the town of Neuvo Baztán (1709–13; palace, church, and factory). José's brothers, Joaquin (1674–1724) and Alberto (1676–1740), worked in Salamanca. [29–770–3]

CHURSIN, SERAFIM EVGEN'EVICH. Born Dec. 27, 1905 (Jan. 9, 1906), in Voronezh. Soviet military commander; admiral (1964). Member of the CPSU since 1929.

The son of a worker, Chursin joined the navy in 1926 and graduated from the M. V. Frunze Naval School in 1931. He completed special courses for command personnel in 1932, and he graduated from the Higher Military Academy in 1954. During the Great Patriotic War of 1941–45, Chursin commanded a submarine brigade in the Pacific Fleet until 1943 and in the Black Sea Fleet beginning in 1944. After the war he commanded the Danube Naval Flotilla from 1948 to 1952 and the Caspian Naval Flotilla in 1954 and 1955. He was appointed chief of staff of the Black Sea Fleet in 1955, first deputy commander of the fleet in 1956, and commander in 1962.

Chursin became a consulting professor at the Naval Academy in 1969, and in 1971 he retired. He was a deputy to the seventh convocation of the Supreme Soviet of the USSR. Chursin has been awarded four Orders of Lenin, the Order of the October Revolution, three Orders of the Red Banner, two Orders of the Red Star, and various medals. [29–770–4]

CHU SHIH-CHIEH. Chinese mathematician of the 13th century.

In his treatise *Precious Mirror of the Four Elements*, Chu described a method for solving numerical equations similar to Horner's method and presented methods for forming equations. Chu developed a notation for equations of higher degree in four unknowns and solved a number of problems that reduce to such equations. [29–541–2]

CHU SI-GYONG (pen name, Han Hin-saem). Born Dec. 22, 1876, in Pongsan District, Hwanghae-do (Hwanghae Province); died July 27, 1914. Korean scholar and thinker.

After graduating from the Pai Jai School, Chu worked for the newspaper *Tongnip shinmun*. In the late 19th century he led the movement to spread the use of the Korean language and to unify its writing system. He played a major role in the development of Korean linguistics. After joining the educational movement, Chu wrote patriotic articles that called for the independence and democratic development of the country.

CHUSOVAIA (upper course, Poludennaia Chusovaia), a river in Sverdlovsk and Perm' oblasts of the RSFSR (with its source in Cheliabinsk Oblast); a left tributary of the Kama. The Chusovaia is 592 km long and drains an area of 23,000 sq km. It originates in the Central Urals. The upper course flows through a broad valley. The middle course flows through a narrow canyon-like valley or a broader valley with gentle slopes. In its lower reaches, the Chusovaia is a typical flatland river. It empties into Chusovaia Bay of the Kama Reservoir. The river is fed by mixed sources, with snow predominating. High water lasts from mid-April to mid-June. The mean flow rate is 222 cu m per sec. The greatest flow rate is 4,570 cu m per sec, and the lowest, 8.4 cu m per sec. Six or seven flash floods occur each summer. The Chusovaia freezes between late October and early December and opens up in April or early May. Ice jams, which raise the water level as much as 2.8 m, are typical in the lower course.

The principal tributaries are the Mezhevaia Utka, Serebrianka, Koiva, and Us'va, on the right, and the Revda and Lys'va, on the left. The Chusovaia is used extensively for water supply: water from the Volchikhinskoe Reservoir (37 sq km) is transported to the Verkhnii Iset' Reservoir, which supplies the Sverdlovsk area. There are 15 smaller reservoirs on the tributaries of the Chusovaia. Timber can be floated on the river for about 500 km. The Chusovaia is navigable from the city of Chusovoi. The cities of Pervoural'sk and Chusovoi are located on the river, which is a popular tourist area.

Iastrebov, E. V. *Po reke Chusovoi*, [2nd ed.]. [Sverdlovsk] 1963. [29–771–2]

CHUSOVOI, a city under oblast jurisdiction in Perm' Oblast, RSFSR, on the western slope of the Central Urals, on the Chusovaia River near the mouth of the Us'va River, 136 km northeast of Perm'. Junction (Chusovskaia) for railroad lines to Perm', Nizhnyi Tagil, and Solikamsk. Population, 59,000 (Jan. 1, 1977). Chusovoi has metallurgical and machine-repair factories, as well as plants for the manufacture of reinforced-concrete structures and metal products. The city also has a milk plant, a food-processing combine, railroad-transport enterprises, and a housebuilding combine. The Chusovles Association is located in the city. Chusovoi has an evening industrial technicum, a medical school, and a museum of local lore. [29–771–3]

CHUSOVOI METALLURGICAL WORKS, one of the oldest plants in the Urals, located in the city of Chusovoi, Perm' Oblast. The USSR's leading fully integrated enterprise for the production of ferrovanadium, the Chusovoi Metallurgical Works is a major supplier of complex shaped sections, quality spring strips, and finished automotive springs.

The works was founded in 1879 by a French joint-stock company and produced commercial metal until the October Revolution in 1917. It was nationalized in 1918. The workers of the enterprise were active in the revolutionary movement. A mass meeting to protest against the Lena massacre was held at the works in 1912, and one of the largest strikes in the Urals took place there in 1914.

During the Civil War and Military Intervention of 1918–20, the Chusovoi Metallurgical Works filled military orders, producing steel armor for armored trains and river vessels. During the Soviet period, the works was completely modernized. In the 1930s, a blast furnace, a new model 370 section mill for rolling spring strips, a model 800 billet mill, and a ferroalloy pilot plant were put into operation. During the Great Patriotic War of 1941–45, the works produced special ammunition for the needs of the front; a sintering plant, a new blast furnace, and the first Bessemer plant in the Urals were put into operation.

Between 1950 and 1980, two open-hearth furnaces, a new ferroalloy plant, and a new automotive-spring plant were built. Between 1966 and 1975, the output of pig iron increased by 20 percent, the output of steel increased by 16 percent, and the output of finished rolled products increased by 13 percent.

I. N. GUBAIDULLIN [29–772–1]

CHUST, a city (since 1969) under oblast jurisdiction; the administrative center of Chust Raion, Namangan Oblast, Uzbek SSR. Population, 31,000 (1974). Chust is located on the northern edge of the Fergana valley, 12 km north of the Chust railroad station (on the Kokand-Uchkurgan line). The city has a cotton-cleaning plant and a factory for the production of confectioneries. Artistic goods and traditional knives of the local peoples are also produced. [29–772–2]

CHUST SETTLEMENT, a settlement dating from the Bronze Age (beginning of the second and end of the first millennia B.C.), located near the city of Chust, Namangan Oblast, Uzbek SSR. Excavations by V. I. Sprishevskii and others, conducted between 1950 and 1961, revealed part of a defensive system, the remains of dwellings, refuse pits, and burials. Characteristic finds included painted pottery, with black geometric designs on a red background, as well as objects made of bronze, stone, or wood and molds for the casting of weapons. The Chust settlement is typical of the agricultural population of the Fergana Valley (the Chust culture).

CHU TEH. Born Nov. 6, 1886, in Ilung District, Szechwan Province; died July 6, 1976, in Peking. Chinese military, state, and political figure.

Chu Teh graduated from a military school in the city of K'unming. He joined the revolutionary organization T'ung-meng Hui in 1909 and subsequently took part in the Hsinhai Revolution of 1911–13. From 1922 to 1925 he studied in Germany, where he joined the Communist Party of China (CPC) in 1922. In 1925 and 1926 he was in the USSR. He was an organizer and leader of the Nanch'ang Uprising of 1927.

Chu Teh became a candidate member of the Central Committee of the CPC in 1930, commander of the Chinese Red Army in 1931, and a member of the Central Committee and the Politburo of the Central Committee of the CPC in 1934. From 1934 to 1936 he was a leader of the Long March, and in 1937 he was appointed commander of the Eighth Army. Chu Teh served as a secretary of the Central Committee of the CPC from 1945 to 1956 and commander of the People's Liberation Army of China from 1945 to 1954.

Chu Teh was vice-chairman of the People's Republic of China (PRC) from 1949 to 1954. From 1955 to 1965, when military ranks were abolished in the PRC, he held the title of marshal of the PRC. From 1956 to 1969 he was a member of the Standing Committee of the Politburo of the Central Committee of the CPC; he again became a member in 1973. In 1959 he was named chairman of the Standing Committee of the National People's Congress of the PRC. During the Cultural Revolution Chu Teh came under attack by the Red Guards.

V. I. ELIZAROV [29–539–2]

CHUTKIKH, ALEKSANDR STEPANOVICH. Born Aug. 2 (15), 1903, in the village of Pavelets, in what is now Skopin Raion, Riazan' Oblast. Soviet innovator in light industry. Member of the CPSU since 1950.

Chutkikh spent most of his career at the Krasnokholmskii Worsted Combine in Moscow—from 1922 to 1958. Between 1927 and 1930, without leaving work, he completed evening courses at a general-education school. He served as deputy foreman in a textile shop from 1937 to 1950 and as technical foreman from 1950 to 1958. He has received a personal pension since 1958.

In 1949, Chutkikh initiated socialist competition of work brigades for high-quality production. As a total master of his work specialty, he serviced 34 (instead of the usual 24) wide looms. Chutkikh was a deputy to the third and fourth convocations of the Supreme Soviet of the USSR. He received the State Prize of the USSR in 1949.

CHUTOVO, an urban-type settlement and the administrative center of Chutovo Raion, Poltava Oblast, Ukrainian SSR. Chutovo is on the Kiev-Kharkov highway, 12 km from the Skorokhodovo railroad station on the Poltava-Kharkov line. The settlement has an industrial combine, a feedlot sovkhoz, and a pedigree stock farm. [29–773–2]

CHUTSKAEV, SERGEI EGOROVICH. Born Mar. 6 (18), 1876, in the village of Sugat, in Kamyshlov District, Perm' Province; died Mar. 1, 1944, in Sverdlovsk. Soviet state and party figure. Member of the Communist Party from 1903.

The son of a railroad employee, Chutskaev was a student at the University of St. Petersburg in 1896, when he became associated with the St. Petersburg League of Struggle for the Emancipation of the Working Class. He studied at the University of Heidelberg in Germany from 1902 to 1904. He was named a member of the Ekaterinburg committee of the RSDLP in 1905 and later became a member of the Ural'sk oblast committee of the RSDLP. He was arrested and exiled several times.

After the February Revolution of 1917, Chutskaev became a member of the Orenburg committee of the RSDLP and a member of the Orenburg soviet. In 1918 he was chairman of the Ekaterinburg soviet, a member of the Ural'sk oblast soviet, and deputy chairman of the Ural'sk oblast extraordinary commission (cheka). In August 1918, Chutskaev became a member of the collegium of the People's Commissariat of Finance, deputy people's commissar of finance, and a member of the Minor Council of People's Commissars of the RSFSR. In 1921 and 1922 he was deputy chairman and then chairman of the Siberian Revolutionary Committee and a member of the Siberian Bureau of the Central Committee of the RCP(B). He was a candidate member of the Presidium of the Central Control Commission of the ACP(B) in 1923 and 1924. Between 1924 and 1927 he was a member of the Presidium of the Central Control Commission, a candidate member of the Secretariat of the Central Control Commission, and deputy people's commissar of the Workers' and Peasants' Inspectorate of the USSR.

Chutskaev was chairman of the Far East Krai Executive Committee of the ACP(B) and a member of the bureau of the krai committee between 1927 and 1929. From 1929 to 1933 and from 1935 to 1938 he was a member of the Presidium of the Central Executive Committee of the USSR. He was plenipotentiary of the USSR in Mongolia from 1933 to 1935. Chutskaev was a delegate to the Twelfth through Seventeenth Congresses of the party. He was elected a member of the Central Control Commission at the Twelfth through Fourteenth Congresses, a candidate member of the Central Committee at the Fifteenth and Sixteenth Congresses, and a member of the Central Auditing Commission of the ACP(B) at the Seventeenth Congress. Chutskaev was a member of the All-Russian Central Executive Committee and of the Central Executive Committee of the USSR.

CHUVAL, an open hearth that was placed against a wall and had a straight flue mounted above it. The *chuval* was used until the 1920's and 1930's by certain peoples of, for example, Siberia (the Yakuts, the Khanty, and the Mansi) and the Volga Region (the Bashkirs). The hearth was constructed of unhewn stones or of clay-coated logs. The flue consisted of thin clay-coated poles and was topped by a chimney. [29–704–8]

CHU VALLEY, part of the valley of the Chu River. The Chu Valley, situated in the river's middle course, extends from the Boam Gorge in the southeast to the eastern edge of the Muiunkum Desert in the northwest, in the Kirghiz SSR and the Kazakh SSR. It measures approximately 200 km in length and ranges in width from 15 km in the southeast to 100 km in the northwest. Elevations range from 500 to 1,200 m. The climate is distinctly continental, with a frost-free period of as much as 180 days. Precipitation totals 250–400 mm annually, mainly in the spring. Almost all of the Chu Valley's territory is cultivated and irrigated. The main crops are sugar beets, grains, and fruit, including grapes. The city of Frunze is located in the south. [29–741–2]

CHUVANS, one of the Yukaghir groups. In the 17th century, the Chuvans were nomads who wandered in the region of the upper Anadyr' River and along the Malyi Aniui River; they engaged in hunting, fishing, and reindeer herding. In the 18th century, under pressure from the Chukchi, some of the Chuvans moved to the Kolyma River and became russianized; the remaining Chuvans were assimilated by the nomadic Koriaks (Chavchyv) and the Chukchi. [29–704–9]

CHUVASH (self-designation, Chuvash), a nationality in the USSR, numbering 1,751,400 persons (1979 census), of whom 887,700 live in the Chuvash ASSR. Large groups of Chuvash also inhabit the Tatar and Bashkir ASSR's and Ul'ianovsk, Kuibyshev, and Saratov oblasts, where they migrated in the 17th and 18th centuries. The Chuvash living in Siberia and Middle Asia settled there in the 19th and 20th centuries. Anthropologically, the Chuvash combine Europeoid and Mongoloid elements. They speak Chuvash, and the believers among them are Orthodox.

Prior to their conversion to Christianity in the mid-18th century, the Chuvash adhered to tribal religions.

In the opinion of most scholars, the major role in the ethnogenesis of the Chuvash was played by the Turkic-speaking Volga-Kama Bulgars, who in the last quarter of the first millennium A.D. moved into the forest-steppe regions on the right bank of the Volga, where they mixed with local Finno-Ugric tribes. After the destruction of Bulgaria on the Volga by the Mongol-Tatars, the mass migration of Bulgar Suvars (or Suvaz, from whom the name "Chuvash" is derived) to the right bank of the Volga in the 13th and 14th centuries intensified the turkization of the local tribes. The Chuvash lands were annexed by the Kazan Khanate in the second quarter of the 15th century.

The Chuvash nationality, which essentially evolved in the 15th century, comprises two basic ethnographic groups: the upstream Chuvash, or Vir'ial, in northwestern Chuvashia and the downstream Chuvash, or Anatri, in northeastern and southern Chuvashia. The area between them is inhabited by a transitional group, the middle-downstream Chuvash (Anat Enchi), who are linguistically close to the Vir'ial but whose mores are similar to those of the Anatri. The overwhelming majority of the Chuvash who live outside the Chuvash ASSR belong to the downstream group. The Chuvash inherited from their Bulgar ancestors farming techniques, handicrafts, and many other aspects of material and spiritual culture.

The inclusion of Chuvashia in the Russian state in 1551, freeing the Chuvash from the oppression of the Kazan Khanate, was of great importance for the subsequent development of the Chuvash people. The Chuvash adopted from the Russians more advanced implements, architectural and clothing styles, and other elements of culture. Despite the national oppression of the tsarist government and local bourgeoisie and the forcible Christianization, the Chuvash kept alive their language, indigenous culture, rich folklore, music, and applied art, and they created their own written literature. Before the establishment of Soviet power the Chuvash lived in rural communes, preserving vestiges of the patriarchal system in their social and family life.

In the Soviet period the Chuvash have made great strides in economic and cultural development. The Chuvash ASSR has become one of the country's most important industrial areas and a region with an advanced socialist agriculture. The Chuvash have developed into a socialist nation as a result of the victory of socialism. A national intelligentsia has emerged. Among the traditional folk arts that continue to flourish are choral singing, embroidery, artistic weaving, and wood carving. (For more information on the history, economy, and culture of the Chuvash *see* CHUVASH ASSR.)

CHUVASH, the language of the Chuvash, spoken in the Chuvash ASSR and, beyond its borders, mainly in the Tatar and Bashkir ASSR's and in Ul'ianovsk, Kuibyshev, Orenburg, Saratov, and Penza oblasts of the RSFSR. According to the 1970 census the language is spoken by 1,694,000 people.

Chuvash is a Turkic language with two dialects: the Upstream, or Vir'ial, dialect ("o" dialect) and the Downstream, or Anatri, dialect ("u" dialect), which are divided into subdialects. Distinctive phonetic features include the relatively long vowels *a, e, ï, i, u, ü*, which contrast with the short vowels *ă* and *ĕ*. The consonants *r* and *l* correspond to Turkic *z* and *sh*. Morphological characteristics include the plural affix *-sem* instead of the *-lar* or *-ler* typical of most Turkic languages; the presence of the demonstrative pronouns *ku* (this) and *leshĕ* (that); and the past tense verb form ending in *-nă* or *-nĕ*. The predominant Common Turkic and native Chuvash vocabulary has been enriched by borrowings from other Turkic languages and also from Arabic, Iranian, Mongolian, Russian, and the Finno-Ugric languages.

The literary language is based on the Downstream dialect. The first printed grammar and translations into Chuvash appeared in the 18th century. The writing system, based on the Russian alphabet, was not widely accepted, however. In 1871–72, I. Ia. Iakovlev created a new Russian-based Chuvash alphabet that played an important role in the development of the Chuvash written language.

CHUVASH AUTONOMOUS SOVIET SOCIALIST REPUBLIC (Chăvash Avtonomillĕ Sovetlă Sotsializmla Respubliki, Chuvashia), a part of the RSFSR. The Chuvash ASSR was formed on Apr. 21, 1925, superseding the Chuvash Autonomous Oblast, which had been established on June 24, 1920. It is situated in the eastern part of the East European Plain, almost entirely on the right bank of the Volga, between two of the river's tributaries, the Sura and Sviiaga. Area, 18,300 sq km. Population, 1,281,000 (Jan. 1, 1977). Chuvashia is divided into 21 raions and has nine cities and six urban-type settlements. The capital is Cheboksary.

Constitution and government. The Chuvash ASSR is a socialist state of workers and peasants and an autonomous Soviet socialist republic. Its present constitution was adopted by the Eighth Extraordinary Session of the Supreme Soviet of the Chuvash ASSR on May 31, 1978. The highest bodies of state power are the unicameral Supreme Soviet of the Chuvash ASSR, composed of 200 deputies elected by constituencies with equal populations for terms of five years, and its Presidium. The Supreme Soviet forms the government, the Council of Ministers of the Chuvash ASSR. The republic sends 11 deputies to the Soviet of Nationalities of the Supreme Soviet of the USSR. Local bodies of state power include city, raion, settlement, and village soviets of people's deputies, elected by the population for terms of 2½ years.

The Supreme Soviet elects the Supreme Court of the Chuvash ASSR for a five-year term. The Supreme Court is composed of two judicial divisions, one hearing criminal and the other civil cases, and the Presidium of the Supreme Court. The procurator of the Chuvash ASSR is appointed by the procurator-general of the USSR for a term of five years.

Natural features. The republic's right-bank region is occupied by the Volga Upland. In the northeastern part of the upland, the Chuvash Plateau, lying at an elevation of 175 m to 227 m, descends precipitously toward the Volga. The plateau is crisscrossed by ravines and gullies, whose density may be as much as 0.5–0.9 km per sq km. The left bank, or Trans-Volga Region, is a plain (elevation 50–70 m) with sandy knolls of fluvioglacial origin, swamps, and peat bogs. The climate is moderately continental, with fairly cold winters and warm summers. The temperature averages −12.7°C in January and 19.3°C in July. About 70 percent of the annual precipitation of 450–500 mm falls during the warm period. The growing season lasts 180 days.

All the republic's rivers drain into the Volga, which flows through Chuvashia for 127 km and whose principal tributaries are the Sura, Tsivil', and Anish. The south is drained by tributaries of the Sura (Bezdna, Kiria, Menia) and of the Sviiaga (Kubnia, Bula). There are lakes on the river floodplains, as well as karst lakes. Among the larger lakes are the Shikhazanskoe and Siutkul'.

About 70 percent of the republic's territory is covered by soddy

podzolic and gray forest soils, commonly found in the north and on the watersheds. Leached chernozems, occupying 20 percent of the republic's area, are found in the Trans-Sura Region and in the southeast. With the exception of the Trans-Volga Region, which belongs to the southern taiga subzone, the republic lies in the forest-steppe zone. Forests, found chiefly in the Sura and Trans-Volga region, cover 32 percent of the territory. The most common trees are pine, spruce, birch, oak, and linden. Wildlife includes the brown bear, wolf, fox, lynx, marten, raccoon dog, muskrat, squirrel, marmot, and elk.

Population. The Chuvash constitute the bulk of the population. The 1979 census showed that the republic was inhabited by 887,700 Chuvash, 338,100 Russians, 37,600 Tatars, 20,300 Mordovians, Ukrainians, and Mari.

Over the years the population of Chuvashia has increased from 891,000 in 1926 to 1,078,000 in 1939, 1,098,000 in 1959, and 1,224,000 in 1970. The average population density is 70 persons per sq km. The proportion of urban dwellers increased from 5 percent in 1926 to 45 percent in early 1977. The main cities are Cheboksary, Alatyr', Mariinskii Posad, Tsivil'sk, and Iadrin. The cities of Novocheboksarsk, Kanash, Shumerlia, and Kozlovka were founded in the Soviet period.

Historical survey. Relics of the middle Paleolithic, Mesolithic, and Neolithic have been discovered in Chuvashia. Finno-Ugric tribes arrived in the area at the end of the Neolithic. At the beginning of the Bronze Age (end of the third millennium B.C.) tribes of the Fat'ianovo culture migrated into Chuvashia from the southwest. They practiced livestock raising and hoe farming and made copper and bronze tools. In the early Iron Age (first millennium B.C.) the primitive communal system began to disintegrate among the tribes living in the area.

The tenth century A.D. saw the rise of the first state in the Middle Volga Region, Bulgaria on the Volga. Conquered by the Mongol Tatars in the 1230's, the state was included in the Golden Horde in 1241. The Chuvash nationality evolved in the 15th century through the mingling of Bulgars, who had moved into northern Chuvashia, and Finno-Ugric tribes. The Chuvash engaged in farming, apiculture, and, to a lesser extent, livestock raising, hunting, and fishing. After the Golden Horde broke up in the early 15th century, the Kazan Khanate emerged to rule over the Chuvash and other nationalities, all of whom had to pay tribute to the Tatar feudal lords. A considerable part of the Chuvash feudal nobility—centurion (*serbiu*) and decurion (*vonbiu*) princes and *tarkhans*—entered the service of the Tatars.

In 1551 the Chuvash voluntarily joined Russia, and the next year they helped Russian troops conquer Kazan. The fortified cities that were built, notably Cheboksary (first mentioned in chronicles in 1469 and founded as a fortified city in 1555), Alatyr', Tsivil'sk, and Iadrin, soon became trade and artisan centers. The incorporation of Chuvashia into Russia was a progressive event inasmuch as it freed the Chuvash working masses from the oppression of the Kazan feudal lords and put an end to devastating wars and raids by nomadic tribes. In the second half of the 16th and in the 17th centuries, as the Chuvash moved into the southern regions of the present-day republic, the area under cultivation expanded. Moreover, farming methods improved under the influence of the Russian peasantry. The Chuvash began to excel in woodworking and the processing of hides, wool, and fiber. Leather, tallow-making, and distilling enterprises were established in the cities of Chuvashia in the latter half of the 17th century; from the late 18th century they employed hired laborers.

The Chuvash peasants, who paid the *iasak* tax in money and kind and performed labor services, were gradually enserfed. In the 1720's the *iasak*-paying Chuvash were assigned to the category of state peasants, and the *iasak* was replaced by a poll tax and quitrent. The Chuvash were forcibly Christianized in the middle of the 18th century. The Chuvash peasants were exploited by moneylending tradesmen, Russian and Tatar merchants, and the Chuvash patriarchal feudal nobility. In the 16th and 17th centuries Chuvashia was administered by the Prikaz Kazanskogo Dvortsa; in the early 18th century it was divided between Kazan and Nizhny Novgorod provinces; and by the administrative reform of 1775 it became part of Kazan and Simbirsk provinces. The Chuvash working masses resisted feudal serfdom and national oppression and fought in the peasant wars led by S. T. Razin (1670–71) and E. I. Pugachev (1773–75).

The general crisis and decline of feudal serfdom in the first half of the 19th century also affected Chuvashia. In the early 19th century one-fourth of the Chuvash peasants were placed under the jurisdiction of the Office of Appanages, which administered the landed property belonging to the imperial family. The reforms introduced by P. D. Kiselev from 1837 to 1841 only intensified feudal oppression and increased the burden of requisitions for maintaining the bureaucracy. Peasant discontent, initially manifested in sporadic disturbances in 1841, escalated the next year into a full-scale armed uprising, sometimes called the Akramovo War. The uprising, which involved some 10,000 Chuvash and Mari, was suppressed.

Throughout much of the first half of the 19th century industry was limited to 15 *votchina* manufacturing establishments (*see* VOTCHINA INDUSTRY) producing leather, cloth, and other goods, as well as a glass and cloth factory. By about 1850 there were some 150 spinning, brick-making, copper-smelting, and other small enterprises. After the abolition of serfdom, capitalism developed more slowly in Chuvashia than in central European Russia, and the region became a source of agricultural raw material for the Central Industrial Zone. The post-Reform period saw the stratification and impoverishment of the peasantry. By the 1890's kulaks constituted more than 10 percent of the peasants; middle peasants, about 35 percent; and poor peasants, 55 percent. About 2 percent of the peasants owned no land. The kulaks opened small handicraft enterprises or became tradesmen, while the poor peasants hired themselves out as seasonal laborers in the local logging industry or migrated in search of seasonal employment. Capitalist factory production expanded somewhat in the late 19th and early 20th centuries. In 1913 there were 29 large and more than 400 small industrial enterprises. Together, industry and transport employed 6,000 workers.

The first Marxist circles were organized between 1902 and 1904 in Alatyr', Tsivil'sk, Cheboksary, and Iadrin. During the Revolution of 1905–07 in Russia, Bolshevik groups operated in several places in Chuvashia, and a united Social Democratic organization, calling itself Kurmysh-Iadrin-Vasil'sursk, was founded. There were large workers' strikes at the locomotive repair shops and railroad depot in Alatyr', at the Efremov Sawmill in Cheboksary, and at other mills. Armed peasant uprisings broke out in the Russian village of Ivanovo (1905) and in the Chuvash villages of Abashevo, Pervoe Semenovo (1906), and Chemeevo (1907). T. S. Krivov, who was of Chuvash peasant descent, took an active part in the revolution, joining the RSDLP in 1905. In 1913, 23 peasant villages in Iadrin District rebelled against Stolypin's agrarian reform aimed at resettling peasants on farmsteads.

The development of capitalism and expanding contacts between the Chuvash and the Russians and other nationalities contributed to a rise in the material and spiritual culture of the Chuvash people. Primary schools for the Chuvash were established by the Ministry of Education, the *zemstvos* (district and provincial governing bodies), and church parishes. In 1870 the tsarist government reluctantly allowed Chuvash to become the language of instruction in primary schools. Major credit for the spread of learning among the Chuvash belongs to I. N. Ul'ianov, the inspector of public schools of Simbirsk Province, and I. Ia. Iakovlev, the inspector of Chuvash schools of the Kazan School District. In 1868 Iakovlev founded the Simbirsk Chuvash School, which graduated more than 1,000 teachers before the October Revolution of 1917. He also developed an alphabet and a written language and published books in Chuvash (711 such books were published before 1917).

After the February Revolution of 1917, soviets were organized almost immediately in Cheboksary and Alatyr' and in June in Iadrin. Several soviets of peasants' deputies were also formed. The Cheboksary soviet, headed by K. Ia. Grasis and dominated by Bolsheviks, published the newspaper *Cheboksarskaia Pravda*. The Great October Socialist Revolution opened a new era in the history of the Chuvash people, permitting free political, economic, and cultural development. Soviet rule was established in Cheboksary on Oct. 30 (Nov. 12), 1917, in Iadrin in November, in Alatyr' and Tsivil'sk in January 1918, and in *volost* (small rural district) centers and villages by March. The Commissariat for Chuvash Affairs was established under the Kazan Provincial Soviet on Mar. 7, 1918, and the Chuvash Department of the Peo-

ple's Commissariat of Nationalities of the RSFSR was formed in May.

The struggle for the establishment of Soviet power was headed by groups of Bolsheviks who formed party organizations in late 1917 and in the first half of 1918. Among the most dedicated fighters for the establishment and consolidation of Soviet power were I. G. Kadykov (killed by the counterrevolutionaries in July 1918), A. S. Kosyrev, I. G. Filippov, and I. K. Skripkin. In 1918 district committees of the RCP(B) were established in Cheboksary, Iadrin, Tsivil'sk, and Alatyr'. By this time Bolshevik cells were active in many *volosts* and villages. Chuvash sections of the Kazan and Simbirsk provincial committees of the RCP(B) were formed in November 1918. In the Civil War of 1918–20, Chuvash working people fought at the front against the White Guards and interventionists and supplied the Red Army with food, uniforms, and wood for the railroads. V. I. Chapaev, the legendary division commander, and P. P. Lebedev, the chief of the Field Staff of the Red Army, were born in Chuvashia, and the army commander S. D. Pavlov was of Chuvash origin.

The First All-Russian Congress of Chuvash Communists, held in February 1920, discussed the question of Chuvash autonomy within the Soviet state. On June 24, 1920, V. I. Lenin and M. I. Kalinin signed the decree of the All-Russian Central Executive Committee and the Council of People's Commissars of the RSFSR establishing the Chuvash Autonomous Oblast. Cheboksary was designated the administrative center of the oblast, which was formed out of seven districts in Kazan and Simbirsk provinces. Soon thereafter, the Revolutionary Committee of the Chuvash AO was formed under the chairmanship of D. S. El'men'. By a resolution of the Organizational Bureau of the Central Committee of the RCP(B), a provisional oblast committee of the RCP(B) was established for the Chuvash AO on July 1, 1920.

The First Oblast Party Conference, held on Oct. 6–9, 1920, completed the establishment of the oblast party organization. The First Oblast Congress of Trade Unions (Sept. 6–7, 1920) and the First Oblast Conference of the Russian Communist League of Youth (October 1920) formed oblast trade union and Komsomol organizations. At the First Congress of Soviets of the Chuvash AO, held on Nov. 7–11, 1920, the administrative organization of the oblast was completed and an oblast executive committee was elected. The Soviet government and the working people of Moscow and Moscow Province extended massive aid to the Chuvash population during the famine of 1921–23. On Apr. 21, 1925, the Chuvash AO was transformed into the Chuvash ASSR. In June 1925 part of Alatyr' District, including the city of Alatyr', was detached from Ul'ianovsk Province and added to the republic. In 1927 the republic was subdivided into regions. From 1929 to 1936 it was part of Nizhny Novgorod (Gorky) Krai.

During the prewar five-year plans the de facto inequality of the Chuvash people was overcome, and the Chuvash socialist nation was formed through the implementation of the Leninist nationality policy, the support of the Russian and other fraternal peoples of the USSR, socialist industrialization, the collectivization of agriculture, and a cultural revolution. Woodworking, chemical, and food enterprises were built, and by 1940 the gross output of large industry was 9.5 times that of 1913. The Kanash-Cheboksary Railroad was built in 1939. In 1940 the republic's kolkhozes included 85.5 percent of the peasant households and 97.5 percent of the sown area. The living standard of the working people improved, and illiteracy was eradicated. A Chuvash working class and intelligentsia evolved. In 1935 the republic was awarded the Order of Lenin for outstanding achievements in economic and cultural development.

In the Great Patriotic War the Chuvash people acquitted themselves honorably in fulfilling their duty to their homeland. The title of Hero of the Soviet Union was conferred on 75 soldiers from Chuvashia, and some 54,000 persons were awarded orders and medals. More than 20 industrial enterprises were relocated here from the western and central regions of the country. New successes were achieved during the postwar five-year plans, when many workers in industry and agriculture were awarded orders and medals of the USSR. The title of Hero of Socialist Labor was conferred on 58 persons, including S. K. Korotkov on two occasions. In 1970, in honor of the 50th anniversary of its autonomy, Chuvashia was awarded the Order of the October Revolution for its achievements in communist construction. In 1972 the republic received the Order of Friendship of Peoples on the occasion of the 50th anniversary of the formation of the USSR.

V. D. DIMITRIEV

Economy. Socialist construction has transformed Chuvashia into a republic with a diversified industry and a well-developed agriculture.

INDUSTRY. Between 1941 and 1976 the republic's industrial output increased by a factor of 42, compared to a factor of 18 for the USSR as a whole. The republic has more than 200 industrial enterprises. Table 1 shows the output of selected industrial goods.

The heat and power plants in Cheboksary, Novocheboksarsk, Alatyr', Kanash, and Shumerlia are part of the Unified Power Grid of the European USSR. In 1978 construction was under way on a second large heat and power plant in Cheboksary and on the Cheboksary Hydroelectric Power Plant on the Volga.

The machine-building industry, predominantly labor-intensive, produces relays, contactors, magnetic exchanges, and other low-voltage apparatus, instruments for controlling and regulating technological processes, electric meters, electric actuating devices, cables, tools, and technological equipment. Also produced are shuttleless looms, specialized motor vehicles and vans, spare parts for tractors and motor vehicles, and power loaders. Most of the machine-building enterprises are located at Cheboksary, Kanash, Alatyr', and Shumerlia. Experimental models of the T-330 tractor have been assembled at the industrial tractor plant under construction at Cheboksary.

The chemical industry specializes in the manufacture of toxic chemicals, dyes, paints and varnishes, polymer products, and household chemicals. Light industry is represented by a cotton combine, a hosiery and knitwear factory, the Rassvet Clothing Production Association (Cheboksary), hemp plants, two footwear factories, and the Pakha Tĕrĕ National Embroidery Factory (Al'geshevo). The food industry, which processes mainly local raw materials, includes the meat-packing combines of the Chuvashmiasoprom Association in Cheboksary, Alatyr', and Ka-

Table 1. Output of selected industrial products

	1940	*1950*	*1960*	*1970*	*1976*
Electricity (million kW-hrs)	35.2	88.1	292.7	1,157	1,275
High-voltage electric equipment (million rubles)	—	—	—	—	10.1
Low-voltage electric equipment (million rubles)	—	—	—	60	76.6
Instruments, means of automation, and spare parts (million rubles)	—	—	3.2	20.8	33.2
Shuttleless looms (units)	—	—	—	—	4,000
Spare parts for tractors and motor vehicles (million rubles)	—	—	—	59	85.9
Washing machines (thousand units)	—	—	56	434	265
Lumber (thousand cu m)	369	536	855	731	590
Construction bricks (million units)	21.7	25.9	192.3	305.1	317.2
Cotton fabrics (million m)	0.04	8.6	90.1	117.3	111.7
Hosiery (million pairs)	0.2	4.4	7.1	35.3	35.9
Kitted underwear (million units)	0.05	0.09	0.6	17.6	18.2
Leather footwear (thousand pairs)	184	329	1,280	1,866	2,168
Butter (thousand tons)	0.6	1.3	2.6	4.9	6.9

nash, a powdered milk plant in Vurnary, a flour-milling combine and macaroni factory in Cheboksary, and breweries, distilleries, and enterprises of the Chuvashkrakhmalob"edinenie in Ial'chiki, Pervomaiskoe, and Kovali. The lumber and wood-products industry is concentrated in the Sura Region and along the Volga. The woodworking enterprises produce furniture, wood chips, skis and other sports equipment, and musical instruments. The construction industry, based in Novocheboksarsk, produces precast reinforced concrete, bricks, *keramzit*, ceramic blocks, and other structural members and construction materials.

AGRICULTURE. Both crop farming and animal husbandry are well developed. Of the 1,052,700 hectares (ha) of agricultural land in 1976, arable land covered 847,100 ha, hayfields 50,600 ha, and pastures 138,400 ha. That year there were 41,700 ha of irrigated lands, of which 29,200 ha were plowland, and 16,100 ha were drained land. The republic's 210 kolkhozes and 96 sovkhozes (Jan. 1, 1977) had at their disposal more than 10,000 tractors, about 3,000 grain-harvesting combines, and 7,600 trucks. See Table 2 for the distribution of the sown area.

Table 2. Sown acres
(hectares)

	1913	1940	1976
Total sown area	582,500	663,500	831,000
Grain	564,800	525,200	473,700
Potatoes	4,400	52,100	80,800
Industrial crops	7,600	11,800	3,300
Vegetables	100	4,600	4,700
Fodder	600	69,800	267,500

The main grain crops are spring wheat, barley, and rye, although buckwheat and peas are also grown. Industrial crops include hops, grown in the northeast, hemp, and makhorka (Indian tobacco). Between 1971 and 1975 the annual grain harvest averaged 839,300 tons, representing an 8 percent increase over the 1966–70 harvests. Concurrently, the yield of hops increased by 65 percent, averaging 19,800 centners between 1971 and 1975. In 1976 the grain harvest totaled 1.12 million tons, and orchards and berry plantings covered 17,200 ha.

Table 3. Livestock[1]

	1916	1941	1961	1977
Cattle	174,000	160,000	273,000	495,000
cows	117,000	102,000	154,000	216,000
Pigs	136,000	95,000	281,000	457,000
Sheep and goats	590,000	510,000	621,000	459,000

[1]At the beginning of each year

Agriculture is increasingly tending toward animal husbandry. (See Table 3 for data on the increase in the number of livestock.) Between 1940 and 1976 the output of meat rose from 15,000 tons to 68,300 tons (dressed weight), milk from 116,000 tons to 420,800 tons, eggs from 46 million to 213.1 million, and wool from 659 tons to 1,236 tons. In accordance with the resolution On Measures for the Further Development of Agriculture in the Nonchernozem Zone of the RSFSR, adopted by the Central Committee of the CPSU and the Council of Ministers of the USSR in 1974, livestock raising complexes and state and interkolkhoz mixed feed plants are being built in Chuvashia.

In 1976 state purchases amounted to 194,900 tons of grain, 158,000 tons of potatoes, 30,300 tons of vegetables, 1,952 tons of hops, 684 tons of makhorka, 83,200 tons of livestock and fowl (liveweight), 218,000 tons of milk, 107.3 million eggs, and 958 tons of wool.

TRANSPORTATION. The operational length of the railroads was 429 km in 1976. The main railroad lines cross in Kanash, forming a major railroad junction. The lines connect Kanash with Alatyr', Arzamas, Kazan, and Cheboksary. In 1976 there were 9,100 km of highways, of which 2,100 km were paved. The Volga and Suva are used for shipping; Cheboksary is the largest port on the Volga. The republic is crossed by several oil and gas pipelines that run from Western Siberia and the Middle Volga Region to the Central and Northwestern economic regions.

Chuvashia exports to other regions of the USSR machinery, chemical products, fabrics, clothing, and hops, and it imports chiefly industrial equipment, agricultural machinery, metals, and fuel.

REGIONAL DIFFERENCES. The Northern Region, the industrial heartland of Chuvashia, has machine-building, metalworking, chemical, textile, woodworking, and food industries. The northern industrial construction enterprises serve the entire republic. Grain, potatoes, and hemp are grown, and the production of hops, vegetables and fruit is highly mechanized. The region's livestock farms raise beef and dairy cattle, hogs (specialized complexes), and poultry. The main cities are Cheboksary, Novocheboksarsk, Kanash, Shumerlia, Kozlovka, Mariinskii Posad, Tsivil'sk, and Iadrin.

The Southeastern Region is predominantly a crop farming area producing large quantities of grain for the market. Beef and dairy cattle and hogs are also raised. Industry is limited to textile manufacture, food processing, and the repair of agricultural machinery.

The Southwest, which includes the Sura Region, has machine-building, food, forestry, and woodworking industries, many of them located in Alatyr'. The region is divided by the Sura River into the grain-growing steppe Trans-Sura region and the forested Sura Region. Other crops include Indian tobacco, hemp, and potatoes.

STANDARD OF LIVING. The republic's inhabitants are enjoying a steadily rising living standard. Between 1965 and 1976 the average monthly wage of workers increased by a factor of 1.6 and the remuneration of kolkhoz members doubled. The retail commodity turnover of state and cooperative trade, including food services, increased by a factor of 2.6 between 1966 and 1976, reaching 872 million rubles. From 1965 to 1976 the volume of consumer services increased by a factor of 5 in urban areas and a factor of 8.5 in rural areas. About 600,000 sq m of new housing are built each year by the state, the kolkhozes, or private individuals.

P. A. SIDOROV

Public health. In 1913 medical care in the area now included in the republic was provided by 40 doctors, 74 intermediate medical personnel, and 19 hospitals with 486 beds (0.6 per 10,000 population). In the years of socialist construction the incidence of infectious diseases has been greatly reduced, and trachoma and smallpox, formerly widespread, have been eradicated. In 1977 there were 118 hospitals with 14,000 beds, or 10.9 beds per 1,000 population, compared to 3,000 beds, or 2.8 per 1,000 population, in 1940. The republic had 2,901 doctors in 1977, or one for 442 inhabitants, compared to 351 doctors, or one for 3,100 inhabitants, in 1940. The number of intermediate medical personnel increased from 2,400 in 1940 to 11,744 in 1977. Doctors are trained at the medical department of Chuvash University, and intermediate medical personnel are graduated from medical schools in Cheboksary and Kanash. There are six sanatoriums for children and adults.

The main tourist routes follow the Volga and Sura rivers. There is a tourist hotel in Cheboksary and a tourist center on the Sura River.

Education and cultural-educational institutions. In the 1914–15 school year the 463 general-education schools on the territory of the present-day republic had an enrollment of 29,900 students and the area's two specialized secondary schools were attended by 140 students. By the 1977–78 school year there were 783 general-education schools of all types with 67,700 students, 27 vocational-technical schools with more than 13,600 students, and 23 specialized secondary schools with 23,300 students. Some 15,700 students attended higher educational institutions, namely Chuvash University, an agricultural and a pedagogical institute, and a correspondence department of the Moscow Cooperative Institute, all in Cheboksary. In 1976 the republic's 346 preschool institutions were caring for 48,300 children.

As of Jan. 1, 1977, there were five theaters and 722 public libraries with 8.4 million book and magazine holdings. The principal museums, located in Cheboksary, are the Chuvash Republic Art Gallery and the Chuvash Republic Museum of Local Lore with its affiliates, the V. I. Chapaev Museum and a literary muse-

um. Kanash also has a museum of local lore. There are 1,100 clubs, about 1,200 stationary motion-picture projection units, and 60 extracurricular institutions. (*See below*: Music and Theater.)

Scientific institutions. The republic's research institutions, all founded in the Soviet period, include the Scientific Research Institute of Language, Literature, History, and Economics (founded 1928), the All-Union Scientific Research and Design Technological Institute of Relay Construction (1961), the Chuvash Laboratory of the Scientific Research Institute of National Schools under the Ministry of Education of the RSFSR (1972), and the Chuvash State Agricultural Experiment Station (1925). Research is also conducted at the I. N. Ul'ianov Chuvash State University, the I. Ia. Iakovlev Chuvash State Pedagogical Institute, and the Chuvash Agricultural Institute.

Press, radio, and television. In 1979 the Chuvash Publishing House published 207 titles of books and pamphlets totaling 2.1 million copies. The republic newspapers are *Kommunizm yălavĕ* (The Banner of Communism), issued in Chuvash since 1918; the Russian-language *Sovetskaia Chuvashia* (Soviet Chuvashia, since 1917) and *Molodoi kommunist* (The Young Communist, since 1925); and *Pioner sassi* (The Call of the Pioneer), published in Chuvash since 1931. Seven magazines are published, among them the miscellany *Druzhba* (Friendship), founded in 1941.

In addition to the three programs of All-Union Radio, transmitted 60 hours daily, there are local radio broadcasts in Chuvash and Russian (2½ hours daily). Central Television broadcasts are relayed for 22.6 hours daily, and local television broadcasts, in Chuvash and Russian, are on the air three hours daily.

Literature. Chuvash oral folk poetry includes epics, historical and everyday-life songs and narratives, fairy tales, and legends. The earliest efforts to collect Chuvash folklore date from the 18th century. The first literary works were produced in the mid-19th century by the historian, folklorist, and ethnographer S. M. Mikhailov (1821–61). A distinctive national literature emerged in the 1870's on the basis of the written language developed by the educator I. Ia. Iakovlev (1848–1930). Its founders, I. I. Ivanov (1848–85) and I. N. Iurkin (1863–1943), were essentially portrayers of mores. The poet M. F. Fedorov (1848–1904), who helped shape the literary language, advocated critical realism.

Revolutionary democratic poetry appeared in the early 20th century. Among the contributors to the first Chuvash newspaper, *Khipar* (News), published from January 1906 to July 1907, were the satirist and playwright M. F. Akimov (1884–1914), the revolutionary poet Tair Timki (T. S. Semenov, 1889–1916), N. I. Polorussov-Shelebi (1881–1945), and G. A. Korenkov (1884–1958). The highest achievement of prerevolutionary national poetry, the narrative poem *Narspi* (1908) by the Chuvash classic author K. V. Ivanov (1890–1915), criticized patriarchal and feudal social values. The poem was staged, and an opera was based on its plot. N. Shubossinni (N. V. Vasil'ev, 1884–1942) drew on folk motifs in creating his realist narrative poem *Tale of Iantrak* (1908).

Chuvash literature was able to develop freely only afer the victory of the October Revolution of 1917. Verse reforms were introduced by the founder of Soviet Chuvash poetry and the communist poet M. Sespel' (M. K. Kuz'min, 1899–1922), who wrote about the October victory and the regeneration of the Chuvash people. The lyrics of I. E. Akhakh (1898–1920) and G. V. Tal-Mrza (1895–1921) extolled the revolutionary fighter and the Civil War soldier. Satirical motifs appeared in the epics of I. E. Tkhti (1889–1938) and the short stories of I. I. Muchi (1895–1946). A national dramaturgy was founded by F. P. Pavlov (1892–1931), M. F. Akimov-Arui (1895–1972), and N. S. Efremov (born 1895), whose traditions were developed in the plays of I. S. Maksimov-Koshkinskii (1893–1975) and P. N. Osipov (born 1900).

Prose came into its own in the mid-1920's. The short stories and novellas of D. V. Isaev (1905–30), M. D. Trubina (1888–1956), S. F. Fomin (1903–36), and M. N. Danilov-Chaldun (1894–1944) dealt with the revolutionary renewal of the countryside, the emergence of new mores and a new morality, and the development of the public-spirited woman.

The literary, artistic, and sociopolitical monthly *Suntal* (The Anvil), founded in 1924 and renamed *Yălav* (The Banner) in 1946, published such important works as the narrative poems *Under the Yoke* (1931) by S. V. El'ger (1894–1966) and *Twenty-six* (1930) by P. P. Khuzangai (1907–70), the novella *Village in Flames* (1929) by Isaev, the plays of manners by Osipov, the short stories of Fomin and Danilov-Chaldun, and the poems of N. T. Vasianka (born 1903), I. S. Tuktash (1907–57), and V. E. Mitta (1908–57).

In the 1930's, as Chuvash literature moved toward socialist realism, the socialist changes in the country were analyzed in greater depth. Among the gifted young writers who began their careers in the 1930's were Ia. G. Ukhsai (born 1911), L. Ia. Agakov (1910–77), A. F. Talvir (1909–1979), A. D. Kalgan (born 1911), I. N. Ivnik (1914–42), A. A. Eskhel' (born 1914), M. Uip (M. D. Shumilov, 1911–70), and A. E. Alga (1913–77). The industrialization of the country was the subject of the poem-essay *Magnetic Mountain* (1933) by Khuzangai and the plays *Noise* (1931) by N. S. Aizman (1905–67) and *Might* (1932) by Agakov. The collectivization of the Chuvash countryside was depicted in the novel *Uphill* (1929–64) by V. I. Krasnov-Asli (born 1900), the novella *Bull's Ravine* (1931) by Tuktash, and the plays *New Wave* (1933) by Osipov and *On the March* (1930) by Trubina. Themes from history and revolutionary history were treated in El'ger's novella *At Dawn* (1940), Krasnov-Asli's novella *The Struggle With the Whites* (1929), and the plays *Sadur and Ilem* (1933) by Maksimov-Koshkinskii, *Aidar* (1937) by Osipov, and *Tudimer* (1940) by Ukhsai. Children's literature flourished.

During the Great Patriotic War several fine patriotic lyrical epic works were produced: the narrative poems *Tania* (1942) by Khuzangai, *The Soldier's Mother* (1943) by Uip, *The Pioneer From Kiev* (1944) by S. Shavla (1910–76), and *The Eagle* (1944) by Eskhel'. Other outstanding wartime works were the novella *Partisan Murat* (1943) by Agakov and the plays of Aizman and Maksimov-Koshkinskii.

Since the war Chuvash writers have celebrated the combat and labor feats of the Soviet people in poetry and prose. The theme is sensitively rendered in such narrative poems as Ukhsai's *Old Man Kel'buk* (1951), *The Pass* (1952), and *Star of My Childhood* (1973), Khuzangai's *Aptraman's Family* (1957), and Alga's *My Countrymen* (1959). Outstanding novels and novellas devoted to this theme include *Village Among White Willows* (1951) by K. S. Turkhan (born 1915), *The Pilots* (books 1–2, 1952–57) by V. L. Sadai (born 1926), *The Golden Bee* (1964) by V. S. Alendei (born 1919), *Heroes Never Just Disappear* (1968) by D. A. Kibek (born 1913), *Salambi* (1954) by A. S. Artem'ev (born 1924), Agakov's *Soldiers' Children* (1961) and *Hope* (1971), and *The People of the Village of Shurgely* (1957) by V. V. Ukhli (born 1914).

A number of fine historical novels and novellas have been produced, notably *On the Buinsk Road* (1954) by Talvir, *Black Bread* (1962) by N. F. Il'bekov (born 1915), *The Sviiaga Flows Into the Volga* (1960–67) by Turkhan, *The Snare* (1952) by F. E. Uiar (born 1914), *The Bridge* (1964–66) by V. Paimen (1907–73), and *Living a Lifetime Is Not Like Crossing a Field* (parts 1–4, 1959–71) by N. F. Mran'ka (1901–73). Historical plays include *Entip* (1958) by V. T. Rzhanov (born 1915) and *October Wave* (1957) by Kalgan.

Lenin and the friendship of peoples have inspired Khuzangai's narrative poems *House in Gorki* (1952) and *Generous Heart* (1960) and lyrics by Ukhsai, Alga, A. A. Vorob'ev (1922–76), G. A. Efimov (born 1928), V. I. Davydov-Anatri (born 1917), and A. A. Galkin (born 1928). These themes are also developed in the play *The Waves Pound the Shore* (1969) by N. T. Terent'ev (born 1925). The life of the contemporary working class and rural workers is portrayed in the novels *Flooding of the Tsivil'* (1966) by A. V. Emel'ianov (born 1932), *Foundation* (1964) by Talvir, and *We Are Young Only Once* (1972) by G. V. Krasnov (born 1936), as well as in short stories by A. N. Lazareva (born 1917), I. G. Grigor'ev (born 1924), and M. N. Iukhma (born 1936).

Prominent literary critics and scholars include M. Ia. Sirotkin (1908–70), I. D. Kuznetsov (born 1906), V. A. Dolgov (born 1906), V. Ia. Kaniukov (born 1926), E. V. Vladimirov (born 1922), G. Ia. Khlebnikov (born 1932), and N. S. Dedushkin (born 1915). Many Chuvash works have been translated into other languages of the USSR and into foreign languages. The Writers' Union of Chuvashia was founded in 1934.

N. S. DEDUSHKIN and V. IA. KANIUKOV

Architecture, fine art, and decorative applied art. Archaeological

sites dating from the Paleolithic have been discovered in Chuvashia. The tribes of the Fat'ianovo, Timber-frame, and Abashevo cultures left behind fortified and unfortified settlements (pit houses, dwellings of logs or pisé) and burial grounds and kurgans. Remains of Volga Bulgar settlements, built between the tenth and 12th centuries, include a castle in the village of Tigashevo, unfortified settlements in the Bula, Tsivil', and Sura river basins, and a small town near the village of Bol'shaia Taiaba.

After Chuvashia's voluntary union with Russia in the middle of the 16th century, the Russian strongholds of Alatyr', Cheboksary, Tsivil'sk, and Iadrin gradually developed into urban centers modeled on Russian cities. Cheboksary acquired the five-domed Vvedenskii Cathedral (1657) and imposing mansions such as the Zeleishchikov House (17th century) and the Solovtsov House (mid-18th century). The influence of Russian folk architecture spread to the countryside in the second half of the 19th century. Chuvash peasant dwellings typically had a storeroom with a separate entrance and a *las'*, or summer house, that later became the kitchen. Window casings and shutters, gate and wicket posts, and cornices were decorated with planar, relief, applied, or openwork carving, employing geometric or floral designs.

Large public buildings have been erected in the Soviet period. Noteworthy examples in Cheboksary include the House of Soviets (1940, architect M. M. Bazilevich), the Agricultural Institute (1957, architect E. E. Kalashnikova), the Chuvash Theater of Music and Drama (1961, architect A. P. Maksimov), and the Elektrik Palace of Culture (1964, architect A. P. Korol'kov), which incorporates decorative motifs from Chuvash folk art. Large residential districts of multistory, large-panel apartment houses have been built in Cheboksary and Novocheboksarsk. Modern houses, farm structures, and public buildings are changing the appearance of Chuvash villages.

The most highly developed Chuvash folk applied arts are patterned weaving, embroidery, beadwork, and wood carving. In weaving, the traditional color scheme consisted of red rhomboid designs on a white ground or multicolored designs on a red ground. Embroidery was used to adorn clothing and ritual objects. A dense stitch (*nabor*) was employed in embroidering headbands (*masmak*), towels (*surban*), belt pendants (*sar, iarkach*), shawls (*khul'chi*), bridal veils, and kerchiefs. Shirts were embroidered with slanting (*kosaia stezhka*) and outline stitches (*rospis'*). The main colors were black (outline) and red with touches of yellow, green, and blue. Headdresses, belt tassels, and purses were embroidered with bands, which were also used to make necklaces. Furniture and such domestic articles as ladles, shaft-bows, and distaffs were decorated with carving, including fluted and sculptural carving. Fine art did not appear until the Soviet period, when the first works were produced by the painters M. S. Spiridonov, N. K. Sverchkov, and Iu. A. Zaitsev, the sculptor G. S. Spiridonov, and the stage designer K. M. Vasil'ev.

Chuvash art has been developing intensively since the 1960's. Especially noteworthy are the thematic canvases of N. P. Karacharskov, N. V. Ovchinnikov, and R. F. Fedorov, the portraits of P. G. Grigor'ev, the landscapes of E. A. Vdovicheva and V. S. Gurin, and the still lifes of R. M. Ermolaeva and V. L. Nemtsev. The leading graphic artists and book illustrators are V. I. Ageev, I. T. Grigor'ev, V. E. Emel'ianov, and A. A. Ereikina. Poster art is represented by O. I. Filippov. Fine work is also being done in sculpture (Iu. I. Ksenofontov), monumental decorative art, and stage design. The traditions of folk embroidery are carried on by E. I. Efremova at the artistic embroidery factory in the village of Al'geshevo near Cheboksary.

Music. Chuvash folk songs are monophonic and encompass a great variety of genres. Among the oldest are daily life songs (cradle, children's, lyric, drinking, humorous, dance, and round-dance songs), ritual songs, work songs, and songs about social evils or historical events. The most popular songs of the Soviet period are songs about the new mores and kolkhoz life, as well as lyric young people's songs. Chuvash music is generally based on the pentatonic scale, although diatonic scales with semitones are also encountered. A free variable meter is characteristic. Folk instruments include the *shakhlich* (pipe), the *shapar* (bagpipe made of bull's bladder), the *sarnai* (goatskin bagpipe), the *kesle* (gusli), the *varkhan* and *palnai* (reed instruments), the *parappan* (drum), and the *khankarma* (tambourine). The fiddle and the accordion have become popular in modern times.

The first published collection of Chuvash folk music was V. A. Moshkov's *The Music of Chuvash Songs*, issued in Kazan in 1893. It was followed by two collections entitled *Examples of Chuvash Folk Tunes With Texts*, published in Simbirsk in 1908 and 1912. The finest Soviet collections are S. M. Maksimov's *Songs of the Upstream Chuvash* (1932) and *Chuvash Folk Songs* (1964). Many songs are collected by V. P. Vorob'ev, G. G. Liskov, T. P. Paramonov, and Iu. A. Iliukhin. The best-known folk singers are G. F. Fedorov and I. G. Vdovina, whose repertoires include between 800 and 900 songs. The collection *Chuvash Folk Songs: 620 Songs and Melodies Recorded From Gavril Fedorov's Performances* was published in 1969.

Professional music appeared after the October Revolution of 1917, when the first Chuvash works were composed by F. P. Pavlov, Maksimov, V. P. Vorob'ev, and Liskov. In the 1930's G. V. Vorob'ev wrote a symphony (1939, completed by N. I. Peiko) and several suites for piano. A major contribution to the development of Chuvash music was made by the Russian musicians I. V. Liublin, S. I. Gaber, and especially V. M. Krivonosov, who composed the first Chuvash musical comedy, *Joy* (1935), as well as cantatas and orchestral and chamber works. The Leningrad composer V. G. Ivanishin wrote the first Chuvash symphony (1936) and the opera *Narspi* (1940).

Some of the best Chuvash vocal music—songs, choral works, and arrangements—has been written by F. M. Lukin, G. Ia. Khirbiu, G. S. Lebedev, A. G. Orlov-Shuz'm, and A. N. Togaev. Outstanding works for chorus and orchestra include F. S. Vasil'ev's oratorios *Samana* (The October Epoch, 1965) and *Lenin on the Volga* (1970) and his suite *Frontline Sketches* (1975), A. V. Aslamas' oratorio *Lenin* (1952) and the poem *In Memory of the Poet* (1957), Khirbiu's *Patriotic Oratorio* (to M. Sespel's verses; 1970), and the cantatas *Song of Glory* by V. A. Khodiashev (1950), *Song of Chuvashia* by A. A. Petrov (1971), and *Ivan Iakovlev* by T. I. Fandeev (1968).

Postwar symphonic music is best represented by A. M. Tokarev's three symphonies (1967, 1970, and 1974), Fandeev's symphony (1954), M. A. Alekseev's three symphonies (1961, 1964, and 1971) and his *Chuvash Capriccio* (1962), F. S. Vasil'ev's *War Symphony* (1975), his symphonette (1953), and his tone poem *Aidar* (1970), A. A. Petrov's symphony (1962), Aslamas' *Cosmic Symphony* (1974), and works by Khirbiu, Khodiashev, and A. G. Vasil'ev. These composers also produced instrumental pieces, concerti for solo instruments and orchestra, and chamber compositions.

In 1959 the republic's drama theater was reorganized as the Chuvash Theater of Music and Drama, and in 1969 the company was divided into a music and a drama group. Over the years the theater's opera company has given outstanding performances of F. S. Vasil'ev's *Shyvarman'* (The Water Mill, 1960) and *Khamar''ial* (Countrymen, 1962), Aslamas' *The Interrupted Waltz* (1963), *Sespel'* (1971), and *The Sacred Oak Grove* (1976), Khirbiu's *Narspi* (1967), and Orlov-Shuz'm's *Stellar Path* (1969). The theater has also staged Vasil'ev's ballets *Sarpige* (1970) and *Arziuri* (The Ghost, 1975) and musical comedies and operettas, notably Orlov-Shuz'm's *When the Bird Cherry Blossoms* (1949) and Fandeev's *Three Weddings* (1953) and *Happiness* (1963). Other noteworthy works include the operas *The Singer* (1971) and *Salambi* (1974) by Aslamas, *Chakka* by A. G. Vasil'ev (1972), and *Narspi* by I. Ia. Pustyl'nik (1952) and the ballets *Uline* by Alekseev (1960), *Zora* by Tokarev (1960), and *The Wonderful Embroideress* by Khodiashev (1971).

The leading singers are I. V. Vasil'ev, Honored Artists of the Chuvash ASSR A. I. Toksina and A. G. Kazakova, and Honored Artists of the RSFSR and People's Artists of the Chuvash ASSR T. I. Chumakova and M. I. Denisov. Prominent choral conductors include F. P. Pavlov, Honored Art Worker of the Chuvash ASSR V. P. Vorob'ev, People's Artist of the RSFSR F. M. Lukin, Honored Art Worker of the RSFSR G. S. Lebedev, and Honored Artist of the RSFSR and People's Artist of the Chuvash ASSR A. G. Orlov-Shuz'm. Musical performances are given regularly by the Chuvash Music Theater, the philharmonic

society (founded 1936), the State Song and Dance Ensemble of the Chuvash ASSR (1924), the chorus of Chuvash Radio and Television (1943), and the House of People's Creativity (1936). The Composers' Union of the Chuvash ASSR was founded in 1940. Musical training is offered by the Cheboksary Music School (1929) and 40 secondary music schools. IU. A. ILIUKHIN

Theater. Before the October Revolution dramatic elements were to be found in oral folklore and in games and rituals. A professional theater emerged in the first years of Soviet rule. In 1918 a group of students, Red Army soldiers, and employees staged A. N. Ostrovsky's *You Can't Always Live as You Like* in Kazan. Subsequently known as the Chuvash Soviet Traveling Theater, the group included the future playwright and prominent man of the theater I. S. Maksimov-Koshkinskii, P. N. Osipov, O. I. Yrzem, and K. M. Vasil'ev. The founding of the theater promoted the rise of a national dramaturgy; among the first Chuvash plays to be produced were M. F. Akimov-Arui's *Untimely Death* (1918) and F. P. Pavlov's *On Trial* (1919). The development of a national theater owed much to the concurrent mastery of the realist traditions of the Russian theater and dramaturgy. The Kazan company's repertoire included plays by A. N. Ostrovsky, N. V. Gogol, L. N. Tolstoy, Molière, Schiller, and V. Hugo. During the struggle with the interventionists in 1919, Chuvash drama groups performed in Simbirsk, Ufa, and Kazan.

After the formation of the Chuvash Autonomous Oblast in 1920, the theater was transferred from Kazan to Cheboksary, where it staged Pavlov's *In the Village* (1922), *Narspi* (based on K. V. Ivanov's narrative poem, 1923), and P. N. Osipov's *Kuzhar* (1926). A number of fine productions from the second half of the 1920's and early 1930's developed the character of the contemporary man fighting for a new life: Osipov's *Cursed Tribe* (1927), M. D. Trubina's *On the March* (1931), Maksimov-Koshkinskii's *Sadur and Ilem* (1933), N. F. Pogodin's *The Aristocrats* (1934), V. M. Kirshon's *The Miraculous Alloy* (1935), and A. E. Korneichuk's *Platon Krechet* (1935). The theater company was joined by graduates of the Chuvash music and theater technicum, notably I. O. Molodov, L. F. Semenov, B. A. Alekseev, and E. V. Shornikova. In 1933 the theater was designated an academic theater.

Among the theater's outstanding productions of the 1930's and 1940's were Osipov's *Aidar* (1935), a stage adaptation of N. A. Ostrovskii's novel *How the Steel Was Tempered* (1937), M. Gorky's *Lower Depths* (1938), Shakespeare's *Othello* (1943), and N. S. Aizman's *Liza Korotkova* (1943). V. I. Lenin was portrayed on the Chuvash stage for the first time in 1947 in Pogodin's *Man With a Gun*, with B. A. Alekseev playing the leading role. The directors E. A. Tokmakov, G. V. Parne, and K. I. Ivanov did much to build up the theater at that time. The theater was periodically augmented by graduates of the Chuvash Studio of the State Institute of Theatrical Art and the Ostrovskii Leningrad Theatrical Institute.

In 1959 the theater was reorganized as the Chuvash Theater of Music and Drama and named in honor of the poet K. V. Ivanov. In 1969 the company was divided into the Music Theater and the K. V. Ivanov Academic Drama Theater. Among the most successful productions of the postwar years were V. T. Rzhanov's *Entip* (1950), N. T. Terent'ev's *What Is Happiness?* (1957), *The Cuckoo Cuckoos* (1960), and *The Waves Pound the Shore* (1971), a stage adaptation of Ch. Aitmatov's *My Little Poplar in the Red Scarf* (1965), Gorky's *The Old Man* (1968), Shakespeare's *Twelfth Night* (1970), N. P. Ankilov's *The Soldier's Widow* (1972), F. García Lorca's *Blood Wedding* (1974), and I. A. Petrova's *Telei and Ilem* (1977). The theater performed in Moscow in 1974.

In addition to the K. V. Ivanov Academic Drama Theater, the republic has a Russian drama theater (founded 1922), a Chuvash young people's theater (1933), and a puppet theater (1943). In 1977 the leading performers of the Chuvash drama theater were People's Artist of the USSR A. K. Urgalkin, People's Artist of the RSFSR V. K. Kuz'mina, Honored art Worker of the RSFSR V. N. Iakovlev, and Honored Artists of the RSFSR O. I. Irzem, E. N. Nikitin, and V. I. Rodionov. In 1969, L. N. Rodionov (People's Artist of the Chuvash ASSR) was appointed the theater's principal director, a post he had previously held from 1941 to 1947. F. A. ROMANOVA

CHUVASH UNIVERSITY (full name, I. N. Ul'ianov Chuvash University), a university founded in Cheboksary in 1967. Its nucleus was the Volga branch of the Moscow Power Engineering Institute, established in 1930. The university was named in honor of I. N. Ul'ianov at the time of its founding.

In 1978 the university comprised eight departments: machine building, electrical engineering, industrial electrification, physics and mathematics, chemistry, economics, history and philology, and medicine. It also had evening, correspondence, and preparatory divisions, a graduate school, 60 subdepartments, and a scientific research center. The research center's staff of 350 scientists, engineers, and technicians contracts to do research on topics related to the specializations of the various departments. There is also a publishing department and a library with 700,000 volumes.

In the 1977–78 academic year the university had an enrollment of about 9,000 students and a teaching staff of 600, including 32 professors and doctors of sciences and 257 docents and candidates of sciences. The university publishes collections of articles on selected topics. From 1968 to 1977 it trained some 8,700 specialists. S. F. SAIKIN [29–721–1]

CHUVIAKI, soft leather slippers without heels, worn by various Caucasian peoples. [29–728–3]

CHU YÜAN-CHANG (reign title, Hung-wu). Born 1328 in Anhwei Province; died 1398 in Nanking. Chinese emperor from 1368; founder of the Ming Dynasty.

Chu Yüan-chang was the son of a landless tenant farmer. As a boy he became a Buddhist monk. In 1352 he joined the insurgent detachment of the wealthy townsman Kuo Tsu-hsing, who had raised a rebellion in Central China against the Mongol Yüan Dynasty. In 1355, Chu Yüan-chang became the main leader of a patriotic uprising in that region (*see* RED TURBANS REBELLION OF 1351–68). He united most of Central, East, and South China under his authority by annexing territories under the control of other rebel leaders, and in January 1368, Chu Yüan-chang proclaimed himself emperor. In the same year his forces took control of Tatu (Peking), which was the capital of the Yüan Empire, and overthrew the Mongol dynasty.

During the reign of Chu Yüan-chang, a number of measures were adopted in order to restore the economy of the country, especially agriculture, and to correct the widespread abuses of the civil service apparatus. Massive repression was directed against all who expressed dissatisfaction with the new dynasty.

CHUZHAK, NIKOLAI FEDOROVICH (real surname Nasimovich). Born 1876 in Nizhny Novgorod (now Gorky); died Sept. 3, 1937, in Leningrad. Figure in the revolutionary movement; journalist; literary critic. Member of the CPSU from 1904.

The son of a craftsman, Chuzhak joined the revolutionary movement in 1896. He emigrated in 1904 and worked in Geneva on the editorial staff of the newspaper *Proletarii.* He joined the military organization of the St. Petersburg committee of the RSDLP in late 1905 and edited the newspaper *Kazarma.* In 1906, Chuzhak was a delegate to the first conference of military and combat organizations of the RSDLP in Tammerfors.

Chuzhak was arrested in 1906 and was sent to a settlement in Irkutsk Province in 1908. After the February Revolution of 1917 he became a member of the Irkutsk unified committee of the RSDLP and editor of the journal *Rabochaia Sibir'.* Between 1918 and 1922 he was editor of such newspapers as *Krasnoe znamia* in Vladivostok, *Dal'nevostochnyi put'* in Chita, and *Vlast' truda* in Irkutsk; head of the press department in the Far East Bureau of the Central Committee of the RCP(B); and, during the Kolchak regime, a member of the Bolshevik underground.

Beginning in late 1922, Chuzhak worked in Moscow and belonged to LEF. He was one of the architects of the association's basic tenets, which held that "art is life construction" and which were oriented toward what was called the "literature of fact." Between 1926 and 1932 he was editor of publications of the All-Russian Society of Former Political Prisoners and Exiles. The author of a number of works on the history of the revolution, Chuzhak also researched Siberian literature and wrote *Siberian Poets and Their Works* (1916) and *The Siberian Theme in Poetry* (1922).

CHUZIK, a river in Tomsk Oblast, RSFSR; left headstream of the Parabel' River in the Ob' basin. The Chuzik River is 382 km long and drains an area of 9,000 sq km. It flows through the Vasiugan Plain. The river is fed by various sources but predominantly by snow. The mean flow rate 73 km from the mouth is 30.5 cu m per sec. The Chuzik freezes in late October or November, and the ice breaks up in late April or early May. It is used for floating timber. The river is navigable for 210 km from the mouth. [29–740–1]

CIAMICIAN, GIACOMO. Born Aug. 25, 1857, in Trieste; died Jan. 1, 1922, in Bologna. Italian organic chemist.

Ciamician became a professor at the University of Padua in 1887 and at the University of Bologna in 1889. His main research was devoted to the chemistry of pyrrole. In 1898, Ciamician began investigating photochemical reactions in organic chemistry; for example, he studied the splitting of acetone and the conversion of *o*-nitrobenzaldehyde into *o*-nitrobenzoic acid by the action of light. He also dealt with problems of the biochemistry of plants, such as alkaloid conversions and the formation of glucosides.

Ciamician was a member of the Académie des Sciences, and he became a foreign member of the St. Petersburg Academy of Sciences in 1912.

CIANO, COUNT GALEAZZO. Born Mar. 18, 1903, in Livorno (Leghorn); died Jan. 11, 1944, in Verona. State and political figure in fascist Italy, diplomat. Son-in-law of the fascist dictator B. Mussolini.

Ciano entered diplomatic service in 1925, and from 1936 to 1943 he was foreign minister. During World War II—as a result of the disastrous military situation for Italy and the onset of crisis for the fascist regime—Ciano in late 1942 joined the faction of the Italian ruling circle that favored a separate peace treaty. In February 1943, Ciano was removed from his ministerial post. He joined a conspiracy against Mussolini, and on July 25, 1943, he voted in the Grand Council of Fascism to remove Mussolini from power. After the occupation of Italy by fascist German troops (September 1943), Ciano was interned in Germany and handed over to the fascist authorities of the puppet Italian Socialist Republic that had been formed in northern Italy. Ciano was sentenced by a fascist military tribunal and executed by firing squad. [29–544–3]

CICERUACCHIO (nickname of Angelo Brunetti). Born 1800 in Rome; died Aug. 10, 1849, in Ca' Tiepolo, Rovigo. Italian revolutionary.

Ciceruacchio worked as a drayman in Rome. In 1846 and 1847 he helped organize mass protests in Rome that forced Pope Pius IX to implement certain liberal reforms. During the Revolution of 1848–49, Ciceruacchio took part in the defense of the Roman Republic. After the fall of the republic in July 1849, he and G. Garibaldi set out to aid revolutionary Venice, which was under siege by Austrian troops. On the way there, Ciceruacchio and his companions, including his sons Luigi and 13-year-old Lorenzo, were captured by the Austrians and shot. [29–666–1]

ÇIFTLIK, in the Ottoman Empire:

(1) A tract of land held by a peasant that could be worked with one team of oxen. In the late 16th century peasant holders of *çiftliks* became sharecropping tenants.

(2) A feudal holding, originally a grant, that was given to feudal lords on condition that they pay a tithe to the treasury or provide one soldier for the sultan's army. In the late 16th century it became a hereditary holding. In the first half of the 19th century the *çiftlik* was a large estate of a member of the gentry. [29–660–6]

ÇILDIR, a lake in northeastern Turkey. Lake Çıldır occupies an area of 120 sq km and has depths to 42 m. It is located on the Kars Plateau of the Armenian Highland, in an intermontane depression with an elevation of 1,959 m; it is ringed by lava flows. The lake is drained by the Kars River (Araks River basin). It freezes over in winter. [29–565–5]

CILLI, ALESSANDRO. Dates of birth and death unknown. Native of Pistoia, Italy.

From 1594 to 1615, Cilli was a singer in the choir of the king of Poland and a secret political agent of the duke of Tuscany at the Polish court. He wrote a work that described the events of the early 17th century in the Polish-Lithuanian Commonwealth (Rzeczpospolita) and Russia. The second part of Cilli's work dealt with the First False Dmitrii, with whom he was acquainted. [29–594–4]

CIMA, GIOVANNI BATTISTA (also Cima da Conegliano). Born circa 1459 in Conegliano, Treviso Province; died there 1517 or 1518. Italian Renaissance painter of the Venetian school.

Cima's early career was influenced by Bellini and Antonello da Messina. Later influences were Giorgione and Titian. Cima's paintings were characterized by a rich golden palette, majestic simplicity of human forms, and subtle expression of the poetic bond between nature and man. Examples are *The Baptism* (1494, Church of San Giovanni in Bragora, Venice), *The Entry Into the Temple* (Picture Gallery, Dresden), and *Annunciation* (1495, Hermitage, Leningrad).

CIMABUE, GIOVANNI (real name, Cenni di Peno). Born circa 1240; died circa 1302. Italian painter, representative of the Florentine school of the late 13th century.

Cimabue worked in Assisi, Pisa, and Florence. Despite a number of innovations reminiscent of the work of Cavallini, Cimabue's art as a whole developed within the framework of Byzantine tradition. Examples of his work are a cycle of frescoes in the Upper Church of St. Francis (c. 1290, Assisi), *Crucifix* (c. 1285, Uffizi Gallery, Florence), *Crucifix and Madonna* (1295, Santa Croce Museum, Florence), and the large altarpiece *Madonna Enthroned* (c. 1285, Uffizi Gallery). Cimabue's paintings are distinguished by monumentality, compositional symmetry, precision of line, and refinement and decorativeness of palette. There is gold striation on the garments, and two-dimensional and three-dimensional renderings of figures and faces are combined.

CIMAROSA, DOMENICO. Born Dec. 17, 1749, in Aversa, near Naples; died Jan. 11, 1801, in Venice. Italian composer; a leading representative of the *opera buffa*.

The son of a stonemason, Cimarosa was orphaned at an early age. He studied at the conservatory of Santa Maria di Loreto in Naples. From 1787 to 1791 he was court composer at St. Petersburg, where his operas *Le vergine del sole* and *Cleopatra* and his ballet *La felicità inaspettata* were staged. Cimarosa became *Kapellmeister* in Vienna in 1792 and *maestro di capella* in Naples in 1793. In 1799 he took part in an uprising of Neapolitan patriots and wrote the anthem of the Parthenopean Republic. Among his numerous *opere buffe*, *Il matrimonio segreto* (1792) is universally renowned. Cimarosa also composed *opere serie*, including *Gli orazi e curiazi* (1796).

CIMPOI, a Moldavian folk instrument. A mouth-blown bagpipe, the *cimpoi* consists of a reservoir in the form of a sheepskin bag and three wooden pipes: a blowpipe, a melody pipe, and a drone pipe. The conical melody pipe is in one piece and has seven finger holes. The drone pipe, which sounds a continuous bass tone, is made in three joints and is tuned to the interval of a fourth or an octave of the melody pipe. The *cimpoi* is used to play melodies embellished by melismata, trills, and appoggiaturas (*see* ORNAMENTATION). The instrument produces a powerful, shrill tone of an unvarying timbre.

CIOMPI, wool carders and other hired workers in cloth-making shops in Florence and various other Italian cities in the 14th century. The *ciompi* constituted approximately 25 percent of the population of Florence. They worked 14–16 hours a day; their extremely low wages were in reality reduced further by a harsh system of fines and did not amount to a living wage. Shop owners had the right to discharge *ciompi* from their jobs without warning. The *ciompi* were not guild members and therefore had no political rights. Their ranks were replenished by impoverished peasants and artisans.

In 1345 a spontaneous strike of the *ciompi* took place in Florence, and in 1371 there were disturbances in Perugia and Siena.

In 1378 the *ciompi* of Florence mounted a revolt, which was joined by small-scale artisans; the revolt lasted from June 22 to August 31. The most important demands of the *ciompi* were for a 50-percent increase in wages and the granting of political rights—the securing of one-fourth of the seats in the government and the post of gonfalonier of justice, the formation of a *ciompi* guild (which would have granted the *ciompi* full citizenship), the formation of a people's militia, and the establishment of equality of all inhabitants of the city. The rebels seized the palace of the podesta, drove the government from its residence, and formed a new government composed of three *ciompi*, three small-scale artisans, and three members of the *popolo grasso* (rich urban upper class). The *ciompi* formed a people's militia and a *ciompi* guild. The *popolo grasso* managed to have Michele di Lando, who had been a wool carder and overseer of hired workers prior to the revolt, made head of the government. With Michele di Lando in power, they were able to organize a starvation blockade of the city; the owners of the cloth-making shops, which had been closed since the first days of the revolt, refused to open their shops, and the *ciompi* were thus left wihtout any means of earning a living.

In August 1378, having ascertained that Michele di Lando had betrayed them, the *ciompi* formed a new revolutionary government (called the Eight Saints of the People of God), headed by the wool carder Bartolo di Jacopo. They tried to seize power, demanding that the old government submit to the new. Michele di Lando helped the *popolo grasso* bring troops up to the city. At this stage of the revolt the small-scale artisans, frightened by the radical nature of the *ciompi* program, deserted the *ciompi*. The revolt was suppressed, and its leaders were executed.

The *ciompi* revolt demonstrated the relatively high (for the 14th century) level of political consciousness of the Italian preproletariat, which was the first in European history to demand political rights and thus paved the way for the concept of universal equality.

ĆIPIKO, IVO. Born Jan. 13, 1869, in Kaštel Novi, Dalmatia; died there Sept. 23, 1923. Serbian writer.

Ćipiko graduated from a forestry school in 1890 and worked as a forestry officer until 1909. During the Balkan Wars of 1912–13 he was a military correspondent. In his short-story collections, such as *Seaside Souls* (1899) and *By the Sea* (1911), the novel *For Bread* (1904), and the drama *On the Border* (1910), Ćipiko depicted the life of Dalmatian peasants and their struggles with moneylenders, landowners, and Austrian bureaucrats. He introduced the figure of the peasant rebel into Serbian literature in the novel *Spiders* (1909; Russian translation, 1958). His search for moral ideals was expressed in his poetization of the "natural man," who resists the hypocrisy of bourgeois society. Ćipiko's notes and diaries from the front, *Impressions of the War of 1912* (1914) and *From the Days of War* (1917), are marked by a spirit of antimilitarism.

CIPRIANI, AMILCARE. Born Oct. 18, 1844, in Anzio; died May 2, 1918, in Paris. Italian revolutionary and socialist.

Cipriani took part in the Revolution of 1859–60 in Italy, the campaigns of Garibaldi in the 1860's, and the anti-Turkish uprising of 1866–69 on Crete. He was a colonel in the army of the Paris Commune of 1871. Cipriani was sentenced to death after the Commune was crushed, but the sentence was commuted to life imprisonment at hard labor in New Caledonia. He was freed by the amnesty of 1881.

In the 1880's Cipriani served a prison term in Italy. He took part in the congress of the Second International in Zürich in 1893 and the congress in London in 1896. In 1897 he served as a volunteer on the Greek side in the war between Greece and Turkey. Cipriani was a contributor to *L'Humanité*, a newspaper founded by J. Jaurès. [29–613–3]

CIREBON (also Tjirebon, Cherebon), a city and port in Indonesia, on the northern coast of the island of Java. Population, 179,000 (1971). Cirebon is an important transportation junction. The city produces cigars and cigarettes, textiles, leather, building materials, and concentrated phosphorites. [29–220–1]

CIUCURENCU, ALEXANDRU. Born Sept. 27, 1903, in Tulcea; died Dec. 27, 1977, in Bucharest. Rumanian painter. Corresponding member of the Rumanian Academy; People's Artist of the Socialist Republic of Rumania.

Ciucurencu studied in Bucharest with C. Ressu at the School of Fine Arts from 1921 to 1928. He also studied in Paris with A. Lhote in 1931–32. Ciucurencu painted cheerful light-filled landscapes and still lifes. He also produced dramatic paintings on heroic themes from national history (*Ana Ipătescu*, 1949; *Olga Bancic on a Scaffold*, 1959—both in the Art Museum of the Socialist Republic of Rumania, Bucharest), portraits, and genre scenes (*The Laundress*, Art Museum of the Socialist Republic of Rumania). Ciucurencu was awarded the State Prize of Rumania.

CIULEI, LIVIU. Born July 7, 1923, in Bucharest. Rumanian stage director, artist, and actor. Honored Artist of the Socialist Republic of Rumania (1958).

Ciulei graduated from the Architectural Institute and the Drama Conservatory in Bucharest in 1946. He began his stage career as a designer. He joined the Municipal Theater in Bucharest (since 1961, the L. Sturdza-Bulandra Theater) in 1948 as a designer and actor; he later became a stage director, and he headed the theater from 1962 to 1972. Ciulei has designed and played the leading roles in a number of his own productions. In 1958 he played V. I. Lenin in Pogodin's *Man With a Gun*. His other roles have included Treplev in Chekhov's *The Seagull* and Protasov in Gorky's *Children of the Sun*. He has staged Nash's *The Rainmaker* (1957), Gorky's *Children of the Sun* (1960) and *The Lower Depths* (1975), and Brecht's *The Threepenny Opera* (1964).

Ciulei began working in motion pictures in 1951. His films, which have proved highly significant for the development of Rumanian cinematography, include *Eruption* (1959), *Waves of the Danube* (1959; in Soviet release, *The Turbulent River*), and *The Forest of the Hanged* (based on the novel by L. Rebreanu; 1964). [29–756–3]

ČIURLIONIS, MIKALOJUS KONSTANTINAS. Born Sept. 10, (22), 1875, in Varėna, now in the Lithuanian SSR; died Mar. 28 (Apr. 10), 1911, in Pustelnik Mińsk, now in Poland. Lithuanian painter and composer.

Čiurlionis studied painting at the drawing school of J. Kauzik from 1902 to 1905 and at the Warsaw School of Fine Arts with K. Stabrauski in 1905. He studied music at the Warsaw Institute of Music and the Leipzig Conservatory. He joined the association World of Art in 1911. A proponent of symbolism, Čiurlionis based his aesthetics on the "national romance" of Lithuanian folklore, and his later works reflect his conception of music and the visual arts as being analogous.

Čiurlionis' paintings, in which the images are abstracted and symbolic, show a distinctive use of color and a subtle silvery palette. They transport the viewer into the world of fairy tales (the triptych *Fairy Tale* and the series *A Tale of Kings*, both 1907), fantastic visions and mysticism (the series *The Creation of the World*, 1904–06, and the series *Signs of the Zodiac*, 1907), and folk notions and superstitions (the three series *Spring*, 1907, *Winter*, 1907, and *Žemaite Crosses*, 1909). Čiurlionis' paintings show an affinity with his musical compositions, such as *Sun Sonata* (1907), *Spring Sonata* (1907), *Sea Sonata* (1908), and *Star Sonata* (1908). All the paintings mentioned are in the Čiurlionis Gallery in Kaunas.

Čiurlionis wrote the first Lithuanian symphonic poems, *In The Forest* (1900) and *The Sea* (1907), and chamber works, piano compositions, and adaptations of folk song.

CIVITAVECCHIA, a city in central Italy, in Lazio Region, on the Tyrrhenian Sea. Population, 44,200 (1971). A seaport for Rome, Civitavecchia handled 4.7 million tons of freight in 1973. It is linked by ferry with the island of Sardinia. Industries include petroleum refining and the production of building materials. [29–547–2]

CLASS RANKS, in the USSR, special ranks awarded to employees in the various bodies of the Procurator's Office. The statute on class ranks of employees in the Procurator's Office of the USSR was adopted by the Presidium of the Supreme Soviet of the USSR on Oct. 28, 1980 (*Vedomosti Verkhovnogo Soveta*

SSSR, 1980, no. 45, art. 950). The Presidium of the Supreme Soviet of the USSR confers the ranks of state councillor of justice and state councillor of justice classes I, II, and III. The other ranks—including councillor of justice and junior councillor of justice—are awarded by the procurator-general of the USSR. Members of the Procurator's Office who hold class ranks must wear uniforms with identifying insignia during the performance of their official duties. [29–612–6]

CLICHÉ, a means of expression whose repeated use in speech or literature (mainly in fiction) is perceived as a symptom of stereotyped thought or alleged (but not genuine) stylistic beauty.

Fashionable words, phrases, sentences, themes, plots, and stock images, as well as the very inertia of the devices of "ready-made artistry," influence everyone who uses language. Clichés are most often found in formulaic artistic speech, for example, the stock metaphor "black gold" (in reference to slaves, coal, and oil), and in some title formats, such as the use of "when" to begin a title or the use of a series of three nouns in the nominative case. The danger of cliché lurks in many of the "author's excursions" into childhood found in modern Soviet literature, in series of images of roses and nightingales in Turkic poetry, and in the use of rhymes of the type *moia—ne taia*. An uncritical acceptance of clichés hinders creative individuality, making the writer and any speaker the victim of an inertia of style.

In various spheres of communications—daily life, science, publicist writing, and literature—the relation among clichés, genuinely expressive language, and stylistically neutral elements of language (which may likewise be constantly repeated in speech) is not always the same. A sensitive artist always finds ways to transform clichés. In literature, for example, the fashionable word *okoem* (vista) is surrounded with subtle irony in a line by the poet A. Mezhirov: *Vladyki i tsari gliadiat za okoem* (Rulers and tsars gaze beyond the vista). The tendency of a cliché to gain currency and become a general "rule" is at odds with the writer's desire to create his personal "poetic rules" and to achieve "novelty of material and device" (V. V. Mayakovsky, *How Are Verses Made?*). The boundaries between formulaic units of artistic language and common linguistic phraseology free from banality of usage are fluid. Thus, the expression *nevooruzhennym glazom* (with the naked eye) can still be taken as a cliché, but dictionaries have already recorded the transformation into a stylistically neutral phrase.

CLINOMETER, a very simple geodetic instrument that is used to measure the slope angles of a terrain. A typical clinometer (see Figure 1) consists of a circular metal casing (1) and a sighting tube (2) that is fastened to the casing. The casing contains a graduated disk (3) on a spindle; attached to the disk is a weight that hangs

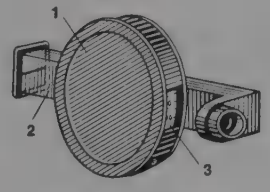

Figure 1. A clinometer

plumb, keeping the disk in a constant position. Other forms of clinometers are also available. The precision with which slope angles are determined by means of a clinometer does not exceed 0°2. [29–1768–1]

CLOCK, ASTRONOMICAL, a highly accurate clock used in astronomical observations. The accurate determination of time is essential to the solution of most problems of astrometry, as well as problems in other areas of astronomy.

From ancient times to the 15th century astronomical time was measured with sundials, sandglasses, or water clocks. Clocks with gear-wheel mechanisms were first used in astronomical observations in 1484. Owing to the primitive nature of the regulating devices, however, these clocks did not provide accurate readings. The pendulum clock, which was invented in 1657 by C. Huygens, came to be widely used by time services. The impracticability of using pendulum clocks on ships at sea provided the stimulus for the development of the chronometer, which, although not as accurate as the pendulum clock, was accurate enough for use on oceangoing expeditions.

The principal requirement made of an astronomical clock is that its regulating device—in a pendulum clock, the pendulum—maintain a period of oscillation that is extremely stable. If the acceleration of gravity is constant, the period of a pendulum is a function of the length of an equivalent simple pendulum, the amplitude of its motion, and the density of the medium in which it swings.

Variations in these quantities have a considerable effect on clock rate. A 1-micrometer change in the length of an equivalent simple pendulum—usually caused by temperature variations—will result in a change in clock rate of 0.04 sec over a 24-hour period. To minimize the influence of temperature, pendulum rods are made of materials with low expansion coefficients, various compensating devices are used, and the clocks are placed in isothermal chambers.

The amplitude of the pendulum of an astronomical clock does not usually exceed 120′. A change of 0′.1 alters the clock rate by 0.011 sec per day. To eliminate the influence of changes in ambient density, either the pendulum or the entire clock is placed in a partially evacuated vessel.

The Riefler clock, the first to employ a detached-lever escapement, was used in the late 19th and early 20th centuries; its variation in clock rate did not exceed ±0.01 sec/day. A Shortt pendulum clock with a variation in clock rate not exceeding ±0.01 sec/day was designed in 1910. The basic feature of this clock is its use of two pendulums. The master, or free, pendulum, which performs no mechanical work, is located in a glass cylinder in which the pressure is maintained at 20 mm Hg. The cylinder is installed in a room in which a constant temperature is maintained year round. All the mechanical work needed to trigger the clock's mechanism is supplied by the secondary, or slave, pendulum, the swing of which is synchronized with that of the master pendulum by a special electrical system. The secondary pendulum produces pulses that maintain the oscillation of both pendulums.

The most accurate pendulum clock is the Fedchenko clock, which has an isochronous pendulum suspension that assures a stable amplitude of swing. The accuracy of this clock is comparable to that of the best quartz clocks. Quartz clocks, which appeared in the 1940's and 1950's, are considerably more accurate than astronomical observations, but only for relatively brief periods of time. Because of the aging of the quartz plate, quartz clocks cannot determine a uniform time scale independently. Quartz clocks have revolutionized accurate time-measurement and timekeeping, which are accomplished by comparing the readings of several quartz clocks and those of astronomical observations.

As a result of advances in science and technology, the accuracy attained in astronomical clocks is no longer unique. The transmission of time signals by radio and television has enabled regular checks of the reference clocks at astronomical observatories against the best clocks of the official unified time service and thus has made possible a considerable increase in the reliability of the reference clocks. E. A. IUROV [29–103–2]

CLOCK AND WATCH INDUSTRY, a branch of instrumentation that includes production of timepieces for everyday use, such as wristwatches, pocket watches, alarm clocks, table clocks, wall clocks, floor clocks, and public clocks for buildings and enterprises, as well as technical and specialized timepieces for transportation, timing devices, timers, chronographs, time-delay relays, and various types of clock movements used as precision drives.

The production of clocks was initially a cottage industry. The first clockmaker's shop was established in Paris in 1453. The industrial production of pocket watches with a mainspring movement was begun in Germany in the 16th century. The clock and

watch industry was also established in Switzerland in the late 16th and early 17th centuries. The mechanized production of clocks and watches began in the second half of the 19th century in Switzerland, Germany, Japan, and the USA. In Russia, the cottage production of tower clocks was established by the 15th century, and the production of chronometers and deck clocks for the Russian Navy was organized in the late 19th century in St. Petersburg. In prerevolutionary Russia, clocks and watches for everyday use were assembled from imported parts at plants belonging primarily to the Swiss firms of P. Bouret, Moser, and Langendorf.

In the USSR, the production of very simple weight-driven pendulum clocks and the assembly of alarm clocks, partially from imported parts, were organized in the early 1920's at the Aviapribor factory in Moscow. The core of the clock and watch industry was created in 1929 and 1930 when the First and Second Moscow watch factories were established. The production of pocket watches totaled 42,000 units in 1931 and increased to 192,000 units in 1935. In 1940 the USSR had three watch factories, two factories for the production of jewels for movements, and one factory for the production of wooden clock cases.

During World War II the clock and watch industry converted to defense production, but the manufacture of clocks and watches for everyday use was restored as early as 1944. From 1944 to 1952, watch and clock factories were constructed in Serdobsk, Yerevan, Petrodvorets, and Uglich, a scientific research institute was established for the clock and watch industry, and a design bureau was organized for the machine tool industry. The production of mainsprings, elinvar alloy hairsprings, ruby movement jewels, and watch lubricants was initiated, which made it possible to produce several very popular lines of clocks and watches: Pobeda, Zvezda, Salyut, and Molniia. Subsequent expansion of the selection of clocks and watches available and the improvement of labor efficiency through mechanization, automation, and specialization have made the USSR better able to satisfy the country's demand for clocks and watches and to export its products.

In the mid-1970's, the USSR widely exported Chaika, Zaria, Slava, Raketa, and Poljot mechanical wristwatches and Slava and Sevani alarm clocks. In 1975 there were more than 15 specialized production enterprises for the manufacture of specific types of clocks and watches: the Penza Watch Factory produces women's wristwatches, the First Moscow Watch Factory produces men's wristwatches, the Orel Clock Factory produces table, wall, and alarm clocks, and the Yerevan Clock Factory produces alarm clocks.

Production has increased for clocks and watches equipped with additional devices, such as calendars and self-winding mechanisms, and for electric contactless and electronic watches, including wristwatches with digital and analogue displays. The production of specialized equipment and tools has been organized for the manufacture of time-measurement devices. The modern clock and watch industry, as a branch of precision industry, has several distinctive characteristics resulting from the small size of the parts manufactured and the industry's requirements for high precision. Special high-precision equipment is used, including automatic transfer machines that handle indexing for several production operations at one machining station or perform individual operations separately on multiposition automatic machines. The latter arrangement is characteristic of assembly operations, such as in the assembly of the gear wheel system of a clock or watch movement. The industry uses materials with special physical and chemical properties and extremely precise dimensions. The development of clock and watch production is shown in Table 1.

During the ninth five-year plan (1971–75), production quality was improved and the assortment of clocks and watches available was expanded. The output of class 1 clocks and watches has risen from 18 to 50 percent, and the production of watches with calendars, self-winding mechanisms, and other additional features reached 5.9 million items in 1975. The production of quartz-crystal watches with analogue and digital displays has been initiated; this required the production of integrated microcircuits, quartz-crystal oscillators, and miniature magnets and batteries, both within the clock and watch industry and in the electronics and electrical engineering industries. Labor productivity in the clock and watch industry during the period increased by a factor of more than 1.5.

Among the socialist countries, the clock and watch industry is most developed in the German Democratic Republic and Czechoslovakia, which produced 10 million and 2 million clocks and watches, respectively, in 1975. Clocks and watches are produced in small quantities in Hungary and Rumania.

The world production of wristwatches and pocket watches in 1974 totaled 230 million items, including 89 million in Switzerland, 32 million in Japan, 9 million in the Federal Republic of Germany, 24 million in the USA, and 17 million in France. Production is increasing for electronic wristwatches with analogue and digital displays (primarily in Japan) and digital quartz-crystal wristwatches (in the USA). The best-known firms are Seiko Time Corporation, Citizens Watch Company, Ltd., and Orient in Japan, Omega Watch Corporation, Longines-Wittnauer Watch Company, and Montres Rolex S.A. in Switzerland, Dill (Junghans) in the Federal Republic of Germany, Timex Corporation and Bulova Watch Company in the USA, and LIP in France.

K. M. BRITSKO [29–73–7]

CLOCK DRIVE, in astronomy, a mechanism of a telescope mounting designed to rotate the telescope at a constant speed about its polar axis—one turn for each sidereal day—to allow the telescope to track a celestial body being observed. [29–76–2]

CLOCKS AND WATCHES, devices for measuring the passage of time in seconds, minutes, and hours. Clocks and watches are classified as timepieces, which category also includes chronometers, timing devices, timers, time-delay relays, and combination devices, such as a watch combined with a stopwatch. Time can be measured by means of regular translatory motion, rotary motion, or periodic oscillations; the measure of time will be, respectively, the distance traveled, the angle of rotation, or the number of oscillations.

The first device used by man to measure time was the sundial. The gnomon was already used as a primitive clock in the middle of the third millennium B.C. Time was reckoned by sundials with horizontal and vertical faces in ancient Egypt and Greece. Ulug Beg constructed a sundial approximately 50 m high in Samarkand in the first half of the 15th century. Clocks with vertical faces became common in Europe in the Middle Ages; examples have been preserved in Moscow, for example, on the building of the Institute of Historical Archives and the old building of Moscow State University.

In the second and first millennia B.C., water clocks, as well as sundials, were built in India, Egypt, China, and Greece. The water clocks showed the time during the day and at night. Primitive water clocks consisted of a vessel with a scale graduated in units of time. Water fell drop by drop into the vessel from a tank filled to the top from an external source. The constant water pres-

Total	2,796	7,566	26,038	40,171	55,065

sure in the tank guaranteed a regular rate of filling of the vessel and an even rise in the water level, which was indicated by the scale. Circa 150 B.C., Ctesibius devised a water clock that became the prototype of timepieces used in many countries until the 18th century. Regular motion was the basis of operation of several other types of clocks, including the sand clock.

The first reference to a mechanical clock is contained in a Byzantine anthology of the late sixth century A.D. Some historians ascribe the invention of the mechanical clock to Pacificus of Verona (early ninth century); others give credit to the monk Gerbert (later Pope Sylvester II), who is alleged to have made a weight-driven tower clock for the city of Magdeburg, Germany, in 966. This was not a mechanical clock in the modern sense, but rather a water clock that used mechanisms to drive auxiliary devices, such as the striking mechanism, but not to measure time. It is known with certainty that a mechanical tower clock of simple design was built in Milan in 1335. Between 1348 and 1364, Giovanni Dondi in Italy built a clock that, in addition to counting time, reproduced the motion of the sun, the moon, and five planets. In 1354 the clock of the cathedral of Strasburg was installed; it played music and had a calendar and moving figures. The first tower clock in Russia was built in the Moscow Kremlin in 1404 by the monk Lazarus the Serb. It was driven by weights and featured a striking device and a planetary movement. Tower clocks were installed in many Russian cities from the 15th to 17th centuries.

The first mechanical clock with a verge escapement appeared in the 14th century. In comparison with water clocks, the new clocks were an advance, but their precision was still no better than 30 min/day, and until the 16th century they had only a single hand. Circa 1510, P. Henlein of Nuremberg first used a steel spring in place of weights and built a pocket watch with a verge escapement. Because of imperfections in the springs and in the verge mechanism, which did not have a natural period of oscillation, the readings of the clocks depended largely on the degree to which the spring was wound. In 1525, J. Zech of Prague proposed the fusee, a device designed to even out the force of the spring over time, thus making it possible to improve the precision of clocks with mainsprings. Even though their precision was not of a high order, clocks with verge escapements were highly reliable and continued in use until the end of the 19th century.

Galileo's discovery of the isochronism of the small oscillations of a pendulum—that is, that the period of oscillation does not depend on the amplitude—was enormously important for improving the precision of clocks. Circa 1640, Galileo proposed a new escapement, which resembled that of the modern chronometer, but his idea was not put into practice. C. Huygens is rightly considered the inventor of the modern mechanical clock; he first used a pendulum as a clock regulator in 1657. Pendulum clocks, even with an imperfect verge escapement, could reduce the daily error to 5–10 sec. In 1675 the English clockmaker W. Clement proposed replacing the verge escapement with a pallet mechanism that was a primitive variation of the anchor, or recoil, escapement. This mechanism has been kept to the present day in simple wall clocks with pendulums. A new advance in clockmaking was made by the Englishman G. Graham, who invented the deadbeat escapement, which had a considerably smaller energy loss than Clement's design.

In 1675, Huygens proposed a spiral spring and balance to regulate oscillations. The balance is a wheel with a solid metal (usually brass) rim, secured on a steel spindle; one end of the thin spiral spring (hairspring) is secured to the spindle of the balance wheel, and the other is attached to a fixed support. When set in motion, the system oscillates about its axis; the balance wheel's moment of inertia and the rigidity of the hairspring determine the system's period of oscillation. Such an oscillatory system has a natural period of oscillation; it is sufficiently reliable for operation when a watch is worn or a clock is moved.

The use of the balance regulator in spring-driven clocks demanded further improvements in escapements. Until the end of the 19th century, the cylinder escapement invented by Graham in the early 18th century was widely used in pocket watches. The detached lever escapement became widespread in the second half of the 19th century and has continued in use in all portable clocks, including wristwatches and pocket watches, to the present day. With the improved precision of clock mechanisms, minute hands were added to pocket watches in the late 17th century, and from circa 1760 second hands were added to clocks and watches.

Changes in the temperature of the environment have a significant effect on the accurate running of pendulum clocks, especially those with balance mechanisms. Over a 24-hour period in which the temperature changes by 1°C, the change in the length of a steel pendulum causes an error of 0.5 sec, and the change in a wooden pendulum induces an error of 0.2 sec; the corresponding error is about 11 seconds for a clock with a balance mechanism and steel hairspring, caused primarily by changes in the spring's rigidity.

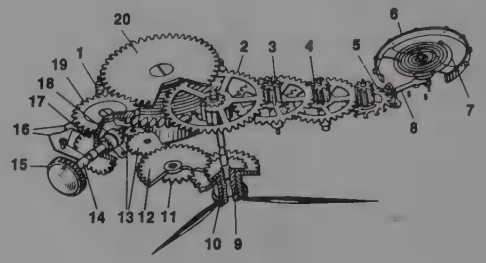

Figure 1. Diagram of the mechanism of a mechanical wristwatch: (1) barrel, (2), (3), and (4) main gear train, (5) escape wheel, (6) balance, (7) hairspring, (8) pallet, (9) minute hand pinion, (10) hour wheel, (11) minute wheel pinion, (12) minute wheel, (13) setting wheels, (14) winding shaft, (15) winding button, (16) setting and clutch levers, (17) winding pinion, (18) ratchet clutch, (19) winding wheel, (20) ratchet wheel

In the mid-18th century several types of pendulums were devised in which temperature error was compensated. The French clockmaker P. Leroy proposed the use of a bimetal to achieve temperature compensation of the balance regulator in 1761. Balances of this type with compensation weights on the rim are used in modern marine chronometers. In the late 18th century the Russian engineer I. P. Kulibin proposed an original design for a bimetallic balance. In the late 19th century and early 20th centuries, the Swiss physicist C. E. Guillaume invented Invar, an alloy with a coefficient of linear expansion close to zero (for pendulums), and elinvar, an alloy with a minimal coefficient of thermoelasticity (for hairsprings). The use of the new alloys in clocks and watches in conjunction with compensation devices virtually eliminated the effect of temperature on the running of mechanical clocks. For example, even without a compensation device, a clock with an Invar pendulum has a temperature error of less than 0.05 sec per 24 hours per 1°C, and the corresponding error for a wristwatch with an elinvar hairspring is less than 0.5 sec. Such accuracy is entirely satisfactory for clocks and watches designed for general use.

In 18th-century Russia the outstanding engineers Kulibin, T. I. Voloskov, and L. Sabakin worked on refinements of the clock, in particular, escapement design and methods of temperature compensation. Kulibin made a series of unique clocks. One example, preserved in the Hermitage, was in the form of an egg with figures that automatically performed intricate movements as the clock struck; another—a pocket planetary watch—had seven indicators showing the hour, minute, second, day of the week, month, phase of the moon, and sunrise and sunset. In 19th-century Russia the engineers D. I. Tolstoi and I. P. Nosov worked successfully on refinements of clocks and watches. The clockmaker brothers I. N. Butenop and N. N. Butenop completely modernized the musical clock of the Spasskaia Tower of the Moscow Kremlin in 1851 and 1852 (*see* KREMLIN CHIMES).

A somewhat arbitrary distinction is made between everyday and specialized clocks and watches, depending on the purpose of the timepiece. The former include wristwatches, pocket watches, table clocks, wall clocks, street clocks, and tower clocks, which differ in their conditions of use. Specialized clocks and watches include timepieces used underwater, traveling clocks, and antimagnetic clocks. There is a large group of specialized work clocks, including signal clocks, portal time clocks, medical clocks, and program clocks. Modern clocks and watches are classified by type of oscillatory system as pendulum, balance, tuning fork,

quartz-crystal, and quantum types. Because the oscillations in a clock may be maintained and readings given from different energy sources and by different methods, clocks and watches are also classified as mechanical, electric contact, electric contactless, and electronic (such as quartz-crystal watches with digital display by liquid crystals) types. AC clocks constitute a special category. They are classified as secondary timepieces; the role of the primary timepiece is played by the power plant generator. Conventional clocks may also serve as primary timepieces; they are usually highly accurate and transmit electric pulses to secondary clocks by wire every 30 or 60 sec.

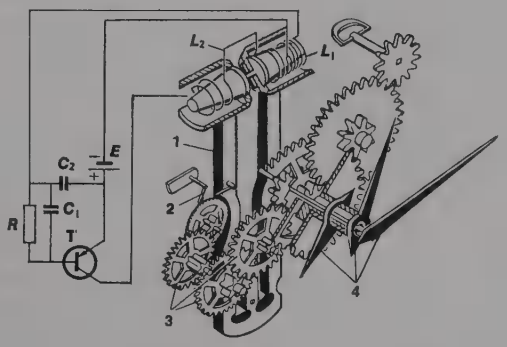

Figure 2. Diagram of the mechanism of a tuning fork clock: (*T*) transistor, (*R*) resistor, (C_1) and (C_2) capacitors, (L_1) release winding, (L_2) pulse winding, (*E*) power supply (galvanic cell), (1) tuning fork, (2) ratchet mechanism, (3) gear train, (4) hour, minute, and second hands

The most common clocks and watches are those driven mechanically by springs or weights. The principal units in a modern mechanical clock or watch (Figure 1) are a drive source, a system of gear wheels, an escapement, a regulator, the hand assembly, and a winding mechanism. A spring (the drive source) turns the barrel (1) in which it is located and through it a system of gear wheels (2, 3, 4, 5). The rate of rotation of the gear wheels depends on the period of oscillations in the balance-hairspring system (6, 7). The number of teeth on the gear wheels and the period of oscillation of the balance are so designed that one gear wheel (2) makes one rotation per hour and another gear wheel (4) makes one rotation per minute; the minute hand and second hand are connected, respectively, to the shafts of the two gear wheels. In practice, the minute hand is not directly connected to the shaft of the first gear wheel (2), but rather to a pinion (9), which makes it possible to shift the hand independently of the gear wheels (2, 3, 4, 5). The first gear wheel (2), through a gear train (9, 11, 12), moves the hour wheel (10), to which the hour hand is attached. During winding, rotation of the winding button (15) is imparted through a shaft (14), a clutch (18), and gears (17, 19, 20) to the shaft on which the spring is wound. When the hands are to be shifted, the winding button (15) is drawn out, and the clutch (18) is moved away from the winding pinion (17) by means of the setting and clutch levers (16) and engaged with the setting wheels (13) that turn the hands. Modern clocks and watches frequently have an additional mechanism that indicates the date and the day of the week; large timepieces may also indicate the month. Wristwatches often have antishock devices to protect them from damage.

Self-winding mechanical wristwatches are becoming more common. They have a free-swinging, unbalanced weight in the shape of a sector, which is mounted in the movement at the side of the case. While the watch is worn on the wrist, the weight oscillates and winds the spring through wheel gearing by means of a reversing device; in the course of 10–12 hours the spring is fully wound, which ensures that the watch will run for 20 hours or longer. The user is freed from the necessity of winding the watch, and, what is especially important, the watch is operated with a more constant force from the mainspring and consequently runs more accurately.

Electrical devices were first tried in clocks in the 1830's and 1840's. Initially electric contact pendulum and balance-wheel clocks were wound by an electromagnet, electric motor, or similar device. The work of the Swiss clockmaker M. Hipp and the French clockmaker L. Breguet, who designed clocks with an electric drive, was of great importance to the future development of electric contact clocks. In clocks operated by an electric drive, the power supply to the drive is switched on periodically through contacts controlled by a pendulum or balance wheel so that self-excited oscillations are established in the escapement. The oscillatory system fulfills the function of a motor, its motion being converted by a special mechanism into intermittent rotary motion of the hands.

Until the mid-1900's, electric contact clocks were mainly large pendulum types and, occasionally, balance-wheel types. The advent of miniature contacts and small current sources having a high energy density led to the perfection of small models, particularly wristwatches. In the early 1950's such watches were produced at the LIP factory in France and by the Hamilton Watch Company in the USA. Their electric circuit was completed through mechanical contacts when a pulse was fed to the balance wheel.

The replacement of mechanical contacts by electronic switches in the form of transistors, tunnel diodes, and integrated circuits improved the reliability of electric watches. Such modern balance-wheel wristwatches have an accuracy of ±15 sec per day and consume approximately 10 microamperes of current from a source having a voltage of 1.3–1.5 volts. Such timepieces may be called contactless types to distinguish them from their predecessors. They have a traditional oscillatory system—either a pendulum or a balance wheel and hairspring.

The high-speed response of electronic devices and the feasibility of controlling them at small oscillator amplitudes have motivated the development of tuning fork and quartz-crystal watches and clocks that are extremely accurate.

During the 1970's both wristwatches and table clocks that used tuning forks became popular. They operate on self-contained batteries that require replacement every one or two years, and they are accurate to ±2 sec per day. The first tuning fork regulator with a contact interrupter was devised in 1915 by H. Guye. In 1919, W. Eccles and F. W. Jordan of Great Britain and H. Abraham and E. Bloch of France proposed a vacuum-tube, tuning fork regulator circuit with an electromagnetic drive. Transistorized tuning fork regulators for wristwatches were first manufactured by the Bulova Watch Company of the USA in 1950; in the USSR tuning fork watches were first produced in 1962 at the Second Moscow Watch Factory. Such watches have a ratchet mechanism to convert vibrations from the tuning fork into rotary motion of the hands. One design for an electromagnetic, tuning fork clock is shown in Figure 2. When the tuning fork vibrates, an electromotive force is induced in the release winding that turns on the transistor, thereby causing current to flow from the power supply into the pulse winding. The vibration frequency of the tuning fork is 360 hertz.

In electric contactless clocks and watches that have relatively high-frequency (of the order of 32-kilohertz) quartz-crystal oscillators, the electric pulses of the regulator may control the operation of a stepper or synchronous electric motor, or they may synchronize the operation of a DC motor. The control circuit consists of an electronic frequency divider, a pulse-shaping circuit, and amplifiers. Most quartz-crystal clocks and watches have a stepper motor. The running rate is adjusted by means of a trimming capacitor in the oscillator circuit. W. A. Marrison of Great Britain was the first to propose a circuit for a quartz-crystal clock (1929); in the late 1970's such watches were produced by many firms, including Ebauches S. A. in Switzerland, Omega Watch Corporation and Hamilton Watch Company in the USA, and Seiko Time Corporation in Japan. The excellent temperature stability, high quality, and stable performance of quartz-crystal oscillators with respect to external dynamic influences ensures an accuracy of approximately 2 sec per day for small clocks designed for everyday use and of 0.001 sec per day for large high-precision types.

Quartz-crystal wristwatches are now common as a result of the capabilities of modern, semiconductor production technology and the development of integrated circuits. The watches that have electronic circuitry and digital readout by means of liquid crystals or light-emitting diodes are called electronic watches. In

addition to a quartz-crystal oscillator, the electronic portion of such watches includes a frequency divider (or counter) and decoders (Figure 3). In 1977 the USSR produced models with conventional hands and with digital displays.

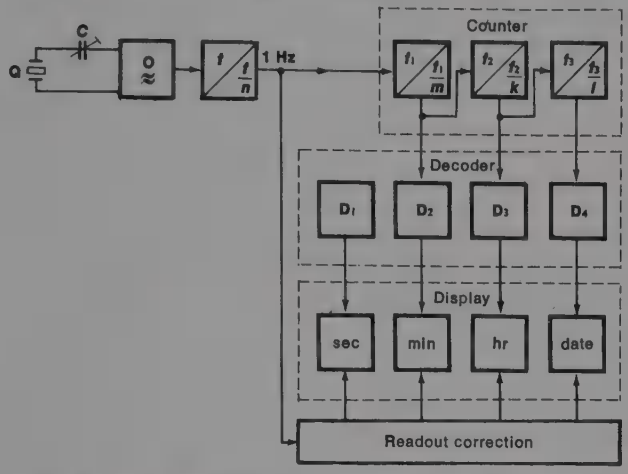

Figure 3. Block diagram of a quartz-crystal wristwatch with liquid-crystal readout: (Q) quartz crystal, (O) oscillator, (*C*) trimmer, (*f*) oscillation frequency, (D) decoder

A common timing system is used to match the readings of a group of clocks. The system consists of high-precision primary clocks and groups of secondary clocks, which are connected through communication channels with the primary clocks. The primary clocks control the operation of the secondary clocks, which may be ordinary electric contact clocks or electric pulse counters. In order to improve the accuracy and reliability of a common timing system, the secondary clocks are often made to operate independently, and their rate is either corrected periodically or synchronized by accurate time signals from the primary clocks.

Modern clocks and watches vary widely in accuracy, depending on the practical requirements of time measurement. For example, atomic clocks, used particularly for cosmic studies, have a relative error of approximately 10^{-13}; high-precision pendulum clocks have an error of the order of 10^{-11}; and quartz-crystal marine chronometers exhibit an error of approximately 10^{-8} (that is, the accuracy of their running is within several thousandths of a second per day). Quartz-crystal wristwatches have an accuracy of ±2 sec per day, and the tuning fork and balance-wheel electric contactless watches are accurate to within 15 sec per day. High-quality mechanical clocks designed for everyday use are accurate within 5 sec per day; those of average quality exhibit an error range between 30 and 60 sec per day. Mechanical alarm clocks exhibit an error ranging from 1 to 1.5 min per day.

CLOTHING INDUSTRY, the branch of light industry that produces clothing and other sewn goods for household and industrial purposes from woven and knitted fabrics; artificial and natural leather and fur; and double- and triple-layered materials of new design. It also produces various finishing materials and accessories and components. In the USSR the clothing industry is the largest industrial branch producing consumer goods, with an average annual output valued at more than 20 billion rubles.

In prerevolutionary Russia, the manufacture of clothing was a cottage industry, and there were no garment factories. In large cities craftsmen served the upper classes and the clergy, and commercial firms extensively employed home workers, including those who lived in rural areas. Most of the population wore homespun clothing. Only just before World War I were the first clothing shops established; they had only very simple equipment —hand-driven sewing machines, irons, and needles.

After the October Revolution of 1917, the Department of Ready-made Clothing and Underwear was established at the Central Textile Trust (Tsentrotekstil) in 1918; in April 1920 the Main Committee of the Clothing Industry was formed under the Supreme Council on the National Economy. The primary task of the committee was to industrialize the sector by centralized production planning. The clothing industry began developing rapidly as the result of new construction and the technical reequipping and organization of production-line manufacturing. The creation of domestic machine building for the clothing industry was a decisive step. By 1930, 32,000 general-purpose industrial machines and 6,500 specialized machines manufactured by the Podol'sk Machine Plant had been installed in the industry's enterprises. Between 1921 and 1930 the output of garments increased by a factor of 4.3. In 1930 the Scientific Research Institute of the Clothing Industry was founded in Moscow.

In 1940 the clothing industry had 210 large and medium-size enterprises whose operation was scientifically structured in the areas of technology, organization of labor and production, and planning and management. During World War II, one-third of the country's clothing factories were completely destroyed. The clothing industry regained its prewar level in 1950, and 30 percent of the industrial equipment was modernized.

Qualitative changes took place in the industry's technological equipment in the period 1951–55. The use of specialized and semiautomatic machines increased, and their number rose to 18,700 units; the number of presses in use totaled 3,800. Large-scale enterprises were built in Khabarovsk, Komsomol'sk-na-Amure, Angarsk, Ashkhabad, and Karaganda.

Technological reequipping of the industry has been particularly intensive in the 1960's and 1970's, primarily through extensive introduction of physicochemical methods of processing, high-efficiency semiautomatic equipment, specialized machinery, and presses for moisture and heat treatment of garments. The use of specialized and semiautomatic machines increased by a factor of more than 5 between 1955 and 1975, and the use of presses for moisture and heat treatment more than tripled.

New forms of production-line manufacturing developed in the 1960's: multifashion, sectional production lines, aggregate and group production lines, start-to-finish production lines, production line factories, and integrated mechanized production lines. The widespread introduction of integrated mechanized production lines in the clothing industry (806 such lines had been installed by July 1, 1977) made it possible to achieve a significant increase in the level of mechanization and to reduce the percentage of manual labor required. Labor productivity increased 40–50 percent.

The level of specialization and concentration in the clothing industry is rising. The proportion of specialized enterprises was 29.4 percent in 1966, 46.4 percent in 1968, 68.0 percent in 1970, and 74.0 percent in 1972. Enterprises with 300 or more employees today produce 87.7 percent of the total volume of output; those with less than 300 employees produce 12.3 percent.

High rates of development have been achieved in the clothing industry by implementing organizational and technical measures. Thus, the average annual growth rate of production was 12.2 percent in the period 1966–70 and 3.5 percent in the period 1971–75; the average annual growth rates for labor productivity for the same periods were 8.0 percent and 3.9 percent.

The volume of gross output rose 8 percent between 1960 and 1965; it had risen 90 percent in 1970 and 140 percent in 1975. Between 1965 and 1976, the production growth rates for most important garments have also been high: for coats and cloaks, 125 percent; suits, 127 percent; dresses, 205 percent; shirts, 126 percent; and trousers, 135 percent.

Table 1. Soviet production of garments in the highest quality category

million rubles[1]	—	69.3	77.0	275.5	432.3
million items	—	1.8	4.6	11	17.4
Number of models in highest quality category	349	509	1,184	2,121	3,026
Number of enterprises manufacturing garments in highest quality category	87	102	198	335	365

[1] In enterprise wholesale prices for July 1, 1967

Compared with 1960 figures, the number of employees in the clothing industry was 1.2 times higher in 1965, 1.5 times higher in 1970, and 1.6 times higher in 1975.

Efforts are being made in the industry to improve the quality and range of production (see Table 1).

In 1967 certain Moscow and Leningrad garment enterprises became the first to certify their products with the state seal of quality in the highest quality category. In 1976 the production volume of garments so certified had increased by a factor of 9.5 compared with 1972. In the period 1973–76, production totaled 77.4 million garments of improved quality and range (identified by the letter "N"), valued at 1.8 billion rubles.

Among the leading enterprises of the clothing industry are the Klara Zetkin Experimental-Technical Garment Factory of the Central Scientific Research Institute of the Clothing Industry and the 40th Anniversary of the All-Union Komsomol Tiraspol' Garment Factory. Leading production associations include Bol'shevichka, Saliut, Moskva, Smena, and Start in Moscow; Bol'shevichka, Pervomaiskaia zaria, Volodarskii Rassvet, and Vesna in Leningrad; and Rigas Apgerbs in Riga. The Znamia Industrializatsii Garment Factory in Vitebsk and the Chimkent Garment Factory are also major enterprises.

In the other socialist countries, the clothing industry is most highly developed in the German Democratic Republic and Czechoslovakia. Intensive development of the industry in Bulgaria, Hungary, Poland, and Rumania began only in the mid-1960's. The technological level of the clothing industry in these countries makes it possible to maintain high rates of development and steadily improve the quality of products. The largest enterprises are the garment associations in Prostějov and Trenčín (Czechoslovakia), the Fórtschritt (Berlin, German Democratic Republic), Vitosha (Sophia, Bulgaria), and the Red October and 1 May garment factories (Budapest, Hungary), the Cora Garment Factory (Warsaw, Poland), and the garment factory in the city of Focşani, Rumania.

Among the industrially developed capitalist countries, the most highly developed clothing industries are found in the USA, Italy, the Federal Republic of Germany, France, Great Britain, and Japan. A significant decline in the clothing industry can be observed in most of them. The most important garment manufacturers include the following: Levi Strauss and Company and Phillips–Van Heusen Corporation (USA), Lebole and Facis (Italy), B. und A. Becker GmbH and Nikolaus Boll Fabrik Modischer Anzüge GmbH, a factory that makes stylish suits (Federal Republic of Germany), Vestra-Union Manufacture de Vêtements and Vêtements Armand Thiéry Ainé (France), Arsa Trading Company Ltd. and Debretta Ltd. (Great Britain), and Teijin Ltd. and Wako Koeki Company Ltd. (Japan).

CODE, a set of arbitrary symbols used by members of the diplomatic service for secret correspondence with their government and by the armed forces for transmission of orders, directives, and messages. Encipherment is achieved by substituting in varying combinations numerals or letters of the alphabet for entire phrases or for words, syllables, or letters in accordance with a predetermined system, which, consequently, is the key for deciphering the text. Texts written in double codes must be deciphered twice and require two keys. Codes do not always guarantee secrecy of correspondence, since the key to even a very complex code can be derived from calculations, from computations involving the recurrence of individual symbols, and by other means. [29–1241–2]

COINING, the production of raised images on the surfaces of medals, coins, and the like (*see* COIN-MAKING AND MEDALLIC ART); it may be accomplished manually—by means of heavy blows—or in a coining press with steel dies bearing the desired images and inscriptions in intaglio.

REFERENCE
Flerov, A. V. *Khudozhestvennaia obrabotka metallov*. Moscow, 1976. [29–128–8]

COINING PRESS, a short-stroke, vertical knuckle-joint press designed for coining and other closed impression die forging operations. A distinguishing feature is the use of a crank-and-toggle mechanism to drive a slide, in which the upper link of the toggle is connected to the frame of the press and the lower link is connected to the slide block. Such a mechanism develops great force on the slide block at the end of the working stroke for a small torque at the driving crankshaft. Coining presses may develop pressures up to approximately 40 meganewtons (4,000 tons-force). [29–131–3]

COLEOPHORIDAE (casebearer moths), a family of small moths having a wingspread of 7 to 40 mm. The wings are narrow and lusterless, often with light linear patterns along the veins and framed by a long fringe. The caterpillars live in portable cases constructed from silk or small amounts of leaf epidermis. The shape of the case can be used to identify the species of the caterpillar. Some caterpillars live in the stems and fruits without a case or form galls. The caterpillars bore through and feed on the leaves of woody or herbaceous plants.

Casebearer moths are distributed throughout the world but are particularly diverse in the Mediterranean region and in the deserts of the Palaearctic region. The USSR has approximately 1,000 species. Some are agricultural and forest pests, including *C. laricella* and *C. dahurica*, which eat the coniferous needles of larches, and *C. prunifoliae* and *C. hemerobiella*, which gnaw passageways through the buds, young shoots, and leaves of seed and stone-fruit crops. [29–400–2]

COMMISSION FOR NATIONAL EDUCATION (Polish, Komisja Edukacji Narodowej), from 1773 to 1794, the governmental body in charge of education in Poland. Established after the dissolution of the Society of Jesus (the Jesuits), the commission was to use the Jesuits' property as the basis for establishing a new national school system. Such prominent representatives of the Polish Enlightenment as H. Kołłątaj, G. Piramowicz, and I. Potocki took part in its work. The commission reformed and secularized the system of secondary and higher education. It expanded in-

struction in the natural sciences and made Polish the language of instruction. The commission's achievements were of great importance for the development of Polish culture and education.

COMSTOCK MEALYBUG (*Pseudococcus comstocki*), an insect of the family Pseudococcidae of the suborder Coccoidea, a dangerous pest of many agricultural crops. The females are wingless; their elongate-oval bodies reach 5 mm in length and have a white waxy sheen. The males are often extremely small.

The Comstock mealybug is native mainly to tropical regions of East Asia but has been introduced accidentally to all continents. In the USSR the insect is an object of internal and external quarantine; it is found in Uzbekistan, Kirghizia, Tadzhikistan, southern Kazakhstan, and Transcaucasia. In Middle Asia three generations develop each year. The eggs (as many as 600) winter in fissures, under tree bark, or in the soil. The larvae hatch in April, damaging leaves, shoots, trunks, and—less commonly—roots and tubers. The plants are devitalized or killed. The pest is distributed in planting material and fruits, as well as by wind and water. Control measures include examining and decontaminating produce before its removal from regions where the pest is distributed, treatment of damaged plants with pesticides, and biological control (the use of *Opuntia vulgaris*, a parasite of the insect).

CONE DRYER-SHAKER, a device for drying cones of coniferous trees and removing the seeds. It may be manufactured as a stationary or mobile unit. The most common stationary model, designed by V. G. Kapper, is a two-level device occupying an area of about 30 sq m. Two double-drum drying chambers and an air heater are housed on the first level, and a drying box for preliminary drying of the cones is located on the upper level. A temperature of 25°C is maintained in the drying box, while a temperature of about 55°C is maintained in the drying chambers. The drums of the drying chambers are made of wire mesh and are divided into four sections. During the drying process, the drums are turned every 20–30 min so that the seeds fall out of the dried cones. The drying time is approximately one day, and the output of one cycle is 4.5 kg of seeds. Mobile cone driers are mounted in truck bodies. [29–1250–1]

CONNECTING ROD, a link in a plane mechanism that is connected to other moving links by means of rotating kinematic pairs and that describes a complex two-dimensional motion.

Connecting rods are an important component in widely used crank-slide mechanisms, which convert the reciprocal motion of a slide (the piston) into the rotary motion of a crank (the crankshaft), or vice versa. In piston engines, compressors, and pumps, the connecting rod generally has an H-shaped cross section; the end connected to the piston (the small, or piston end) is not detachable, and the big end, connected to the crankshaft, is demountable to allow assembly of the mechanism.

In forging and press equipment, the connecting rod end is sometimes of a special design that allows acceptance of high loads in a single direction; connecting rods of both constant and variable length are also used to control the position of a slide. The length of the connecting rod may be varied by means of a rod, the threaded end of which is screwed into the body of the connecting rod and the other (spherical) end of which forms a spherical kinematic pair with the slide. N. IA. NIBERG [29–882–2]

CONTINENTAL SHELF, the comparatively level part of the underwater margin of the continent adjacent to the coast and characterized by the same geological structure. The boundaries of the continental shelf are the shores of the sea or ocean and the shelf break (an abrupt increase of the declivity of the sea floor, the transition to the continental slope). The depth at the shelf break is close to 100–200 m, but in some cases reaches 500–1,500 m, for example, at the southern part of the Sea of Okhotsk and the shelf break of the New Zealand Shelf.

The continental shelf as a historical geological category has existed in all geological periods, prograding considerably in some, such as the Jurassic and Cretaceous periods, while retrograding in others, for example, the Permian and Devonian periods. The present geological epoch is characterized by a moderate development of the shelves.

The continental shelf is part of the underwater margin of the continent and has a continental crust. The coast and the shelf have similar geomorphological features. Various relict subaerial forms of relief and deposits are widespread, as are many traces of ancient shorelines, which indicate that the shelf formed primarily as a result of the inundation of the continental margins by the world ocean in postglacial times and as a result of recent tectonic subsidences of the earth's surface. Also widespread are shelves formed as a result of the retreat of shores through the action of abrasion or as a result of the underwater accumulation of thick deposits of sediments near the continental margins.

The total area of continental shelves is about 32 million sq km. The largest shelf areas are found along the northern margin of Eurasia, where it is 1,500 km wide, in the Bering Sea, Hudson Bay, the South China Sea, and along the northern coast of Australia.

The continental shelf has been used for fishing and hunting sea mammals since ancient times; 92 percent of all the fish caught commercially are caught in shelf waters. Prospecting for minerals, especially petroleum and gas, has developed extensively in the shelf area. In 1975 petroleum extracted from the shelf accounted for 20 percent of all the petroleum extracted in the world; placer deposits of minerals, such as cassiterite, titanomagnetite, diamonds, and gold, are also exploited.

The international legal status of the continental shelf is regulated by a special convention adopted in Geneva in 1958. In the Convention on the Continental Shelf, the term "continental shelf" refers to "(a) the seabed and subsoil of the submarine areas adjacent to the coast but outside the area of the territorial sea, to a depth of 200 m or, beyond that limit, to where the depth of superjacent waters admits of the exploitation of the natural resources of the set area; (b) the seabed and subsoil of similar submarine areas adjacent to the coasts of islands." The convention acknowledges the sovereign right of coastal states to explore and exploit the natural resources of the shelf, including mineral and other nonliving resources of the seabed and subsoil and living organisms attached to the seafloor or moving along it, such as corals, sponges, mussels, and crabs. Other states do not have the right to do this without the consent of the coastal state.

As a general principle, the boundary of the continental shelf is determined by agreement between interested states in conformity with the rules established by the convention. Such agreements have been concluded by the Soviet Union with Finland (May 20, 1965, and May 6, 1967) and with Poland (Aug. 28, 1969). In addition, the USSR, Poland, and the Democratic Republic of Germany signed a declaration on the continental shelf of the Baltic Sea on Oct. 23, 1968, which established the general principles for delineating the shelf in this region.

A special aspect of the legal status of the continental shelf is that it does not involve the legal status of the superjacent waters of the high seas and the air space above these waters. According to the convention, a coastal state has the right to build, maintain, and operate necessary structures and installations on the shelf and to create a 600-meter safety zone around such structures and installations, as well as to take any necessary steps to protect them. It is stipulated that these structures, installations, and safety zones must not be on important international sea-lanes.

CONTINUOUS COMPRESSION MOLDING OF PLASTICS, a method for the production of long items, such as pipes and rods, which consists in the pressing of a plastic through a heated compression mold with open entry and exit holes. The mold is set on a special horizontal press, the plunger of which performs a slow forward (compression) motion and then rapidly returns to the starting position. The entire batch of material is fed into the mold in one cycle; the heated plastic remaining from the previous load is mixed with a new portion, thus achieving a continuous process. The method is used primarily for working thermosetting plastics with a high volume fraction of filler, such as molding powders. It has been replaced almost entirely by extrusion in the production of items made from thermoplatics.

The processing cycle for thermosetting plastics includes softening of the material, consolidation to produce items with good mechanical properties (achieved by using compression molds in which the area of the plunger is several times greater than the area of the exit hole), and curing. The process is performed at pressures of 250–400 meganewtons per m^2 (2,500–4,000 kg-force per cm^2) and temperatures from 65°–80°C in the loading chamber of the compression mold to 150°–200°C at the exit of the item from the mold channel. Productivity ranges from 2 to 20 m per hour. [29–1488–2]

CONTRACT OF AFFREIGHTMENT, in international commercial navigation, a contract by which maritime cargoes are transported.

The contract of affreightment may include one or both of two documents: a charter party and a bill of lading. It places an entire ship, part of a ship, or a specified place on a ship at the disposal of the shipper. Standardized forms, such as the Jenkon or Soviet-wood charters, are used for different types of cargoes and routes; the signatory parties may introduce qualifications and additions by mutual consent. A charter party must name the parties to the contract and specify the freight charge, the vessel and its cargo, the port of loading, and the port of destination or the ship's route. A widely used charter party is the voyage charter, by which a ship is chartered for one or more voyages.

The charter party governs the relation between the shipper and the carrier and is signed by them or their agents. The charter party is often accompanied by a bill of lading, which must contain a clause stating that it has been issued on the basis of the charter party and that the conditions stated in the charter party hold good for tne bill of lading.

The demise charter is not considered a contract of affreightment but a type of property lease contract (*see* LEASE OF PROPERTY). In a demise charter, by which a ship is hired for a definite period, the shipowner, for a consideration (rent), places the capacity of the ship at the disposal of the charterer (lessee) for the transport of cargoes or passengers or for other purposes, such as towing or fishing. Standardization forms are used for the demise charter, as in contracts of affreightment. [29–66–2]

CONTROL PANEL, a complete operating board used for centralized monitoring and control of production processes in complexes such as industrial enterprises, electric power plants, and water-, gas-, and power-supply systems. Measuring and monitoring instruments, pilot lights, control switches, and graphic panels are arranged on the control panel so that they can be easily read and reached. In addition to panels for the process control of entire enterprises—usually known as master panels, or, in enterprises with supervisory control, as instrument panels—there are control panels for systems, shops, and units. [29–1607–1]

CONVERTER TUBE, a receiving tube that converts the frequency of electrical oscillations by mixing the oscillations with oscillations of another frequency; for example, in a superheterodyne receiver the signals received are mixed with oscillations from a local oscillator (*see also* FREQUENCY CHANGER and MIXER).

Converter tubes are usually multielectrode tubes, most often heptodes; combination tubes (triode-heptodes, triode-hexodes, and triode-pentodes) are also used. A typical feature is the presence of two control grids which permits dual control of the plate current in order to obtain combination oscillations. The mixer and the local oscillator are combined in a single envelope. If the local oscillator is a separate tube, the other tube is only used for mixing frequencies, in which case it is known as a mixer tube.

S. M. MOSHKOVICH [29–91–1]

ĆOPIĆ, BRANKO. Born Jan. 1, 1915, in Hašani, Bosnia. Serbian writer. Member of the Serbian Academy of Sciences and Arts (1967) and the Academy of Sciences of Bosnia and Hercegovina (1973). Participant in the National Liberation War in Yugoslavia of 1941–45.

Ćopić graduated from the philosophy faculty of the University of Belgrade. He began publishing in 1929. His mastery of the realistic short story was evident even in such early collections *At the Grmeč* (1938). The warm and sincere humor that characterizes this collection was also typical of Ćopić's later work.

Ćopić's poems and short stories from the war years, including the collection *The Fiery Birth of the Homeland* (1944), enjoyed wide popularity. He describes the antifascist struggle of the Yugoslav peoples in the novels *Breakthrough* (1952; Russian translation, 1959), *The Hidden Gunpowder* (1957), and *The Daredevils at Bihać* (1975) and in such short-story collections as *Events from the Life of Nikoletina Bursać* (1956; Russian translation, 1958) and *The Hollyhock Garden* (1970). In the novels *Do Not Grieve, Bronze Guard* (1958) and *The Eighth Attack* (1964), Ćopić deals with important problems of postwar Yugoslav life. He is also the author of many books for children.

In 1972, Ćopić was awarded the Antifascist National-liberation Council of Yugoslavia Prize and the Njegoš Prize.

A. D. ROMANENKO [29–684–3]

ČOPIĆ, VLADIMIR. Born Mar. 8, 1891, in Senj, Croatia; died 1938. Figure in the Yugoslav communist movement.

The son of a craftsman, Čopić graduated from a *Gymnasium* and studied law at the University of Zagreb until 1914. He was called into the army at the start of World War I and was captured by the Russians in April 1915. After joining the Yugoslav Communist group of the RCP(B) in May 1918 in Moscow, he was assigned in November of the same year to work in Yugoslavia.

Čopić was elected to the Central Committee in 1919 at the First (1919) and Second (1920) Congresses of the Communist Party of Yugoslavia (CPY). In 1920 he was chosen organizational secretary of the Central Committee and a CPY deputy to the Skupština. Čopić was sentenced in 1921 to two years in prison for revolutionary activities.

Čopić was elected a member of the Central Committee in January 1924 at the Third Conference of the CPY and was a CPY delegate to the Fifth Congress of the Comintern in the same year. He emigrated to the USSR in 1925 and served as a representative of the CPY in the Comintern. After commanding the 15th International A. Lincoln Brigade in Spain in 1937 and 1938, Čopić worked in the USSR. [29–685–1]

COPPERS, a group of closely related butterfly genera (*Lycaena, Heodes*, and *Thersamonia*) of the family Lycaenidae. In the past such insects were regarded as belonging to a single genus, *Chrysophanus*. The wings are red-gold or, less commonly, brown or light blue. The caterpillars, which resemble wood lice in

shape, feed on the leaves of herbaceous plants of the families Polygonaceae and Leguminosae. The insects are distributed mainly in Europe and Asia. Of the approximately 20 species occurring in the USSR, many are found only in the high meadows of Middle Asia and Transcaucasia. The two most common species are *Heodes virgaureae* and *Lycaena phlaeas*. The former has a wingspread of 30–35 mm and flies from June to August. The caterpillars feed on sorrel. The species is distributed in meadows in the forest zone of Europe and Asia. *L. phlaeas* has a wingspread of 25–30 mm. There are two generations: the first generation of butterflies flies in May and June, and the second in July and August. The caterpillars develop on sorrel and marjoram. The species is distributed in the northern hemisphere (except the far north). [29–182–9]

ÇORBACI, in the Ottoman Empire:

(1) An officer rank among the janissaries that corresponded to the commander of an *orta* (company).

(2) A member of the village elite, which comprised elders, leaders, and prosperous peasants. The Turkish authorities recruited *çorbacis* to work in judicial and administrative agencies and usually appointed tax collectors from their ranks. In the 19th century the term came to refer mainly to merchants and wealthy Christians. In modern Turkey the term is used colloquially by sailors to mean shipowner. [29–685–3]

CORDED WARE CULTURE, a group of archaeological cultures of the late Aeneolithic period and the Bronze Age in Central and Eastern Europe and of the Neolithic period in Northern Europe. Among the common features shared by the cultures are the pottery, decorated with cord impressions or with hatching resembling cords, as well as polished perforated stone battle axes, (hence the alternate name of the Corded Ware culture—the Battle-ax culture). The cultures also have many differences, and therefore the question of whether they belong to a single ethnic group has yet to be resolved, although it is believed that their bearers were Indo-European tribes, ancestors of the Slavs, Germans, and Balts.

[29–1329–3]

CORRESPONDING MEMBER, an academic title in the USSR and in a number of foreign countries, including the German Democratic Republic, Poland, and Czechoslovakia. (A similar title—correspondent—is used in France.) In the USSR, corresponding members are elected for outstanding achievements in science or scholarship to the Academy of Sciences of the USSR, the academies of sciences of the Union republics, the Academy of Medical Sciences of the USSR, the V. I. Lenin All-Union Academy of Agricultural Sciences, the Academy of Pedagogical Sciences of the USSR, and the Academy of Arts of the USSR. Candidates are nominated by scientific institutions, public organizations, or individuals. The names of the candidates are published in the press prior to the elections. Corresponding members are elected by secret ballot within the appropriate division of an academy and are approved by the academy's general assembly. [29–671–1]

ÇORUH (Russian, Chorokh), a river in Turkey and the USSR (in the Adzhar ASSR of the Georgian SSR). The Çoruh has a length of 438 km; of this total, 26 km of the lower course are in the USSR. The river drains an area of 22,000 sq km. It flows mainly in a tectonic valley between the Lazistan Ridge and the Çoruh Mountains before emptying into the Black Sea, near Batumi. The mean flow rate is 285 cu m per sec; high water occurs in spring and summer. The Çoruh is used for floating timber and for irrigation. The Turkish city of Bayburt is situated on the river. [29–686–1]

ÇORUM, a city in Turkey, in central Anatolia. Capital of Çorum Vilayet. Population, 65,000 (1975). Çorum is a highway junction and the commercial center of an agricultural region that produces grains, fruits, and livestock. Industry is represented by food processing and the production of cement. [29–686–3]

CORYMB, a type of racemose inflorescence in angiospermous plants. The lower flower stalks (in a simple corymb) or branches (in double and compound corymbs) are longer than the upper ones. The flowers are arranged in a single plane, with the outer ones opening first. The corymb originated as a type of raceme. The corymbose polychasium and the corymbose panicle are often confused with the corymb. [29–1613–1]

ĆOSIĆ, BRANIMIR. Born Nov. 13, 1903, in Štitar; died Jan. 29, 1934, in Belgrade. Serbian writer.

Ćosić studied law, literary history, and art history in Belgrade, Lausanne, and Paris. He was the author of the well known collections *Stories of Bošković* (1924), *The Egyptian Woman and Other Stories* (1927), and *Like the Waters That Flowed* (1933). In his early short stories and in his early novels *Sabbath* (1925) and *The Two Kingdoms* (1928), Ćosić wrote in the tradition of Serbian realism while dealing with moral questions from the viewpoint of idealist ethics. In the early 1930's, under the influence of the progressive literary movement called social literature, he adopted a sharply critical attitude toward bourgeois society. This attitude is evident in Ćosić's novel *The Mowed Field* (1934; Russian translation, 1957), which is one of the best works of Serbian prose written in the period between the two world wars.

[29–687–1]

COSMIC NOISE, the electrical fluctuations in a receiving antenna that are due to the radio radiation of the sun, the stars, the planets, interstellar media, and other matter.

Regardless of its origin, cosmic noise manifests itself in radio reception in the same manner as thermal noise. Its intensity is defined in terms of the brightness temperature of the sky, which is the equivalent temperature of the hypothetical celestial sphere that envelops the antenna and that has the properties of a black body. The heat-radiation levels of the hypothetical sphere and of the real sources of cosmic noise must be equal in all directions to satisfy the criterion of equivalence. Sky temperature decreases rapidly with the decrease of wavelength λ. Specifically, when detected by an antenna with a broad directivity diagram, mean cosmic noise levels—the noise background of the sky—decrease with λ as $\lambda^{-2.4}$. When $\lambda \approx 5$ cm, for example, cosmic-noise temperature is approximately 15°K. I. M. AINBINDER [29–1547–3]

COTTER PIN, a wire strip semicircular in cross section and bent approximately in half. Cotter pins are used to fasten lightly stressed, coupled parts or to prevent nuts from loosening. After a cotter pin is inserted through a hole, its ends are separated. Half of the pin is longer than the other for convenient separation. Cotter pins are made of carbon steel. [29–1403–1]

COUPLING LOOP, in microwave engineering, a section of transmission line of specified length that is used as the coupling link in loop-type directional couplers. A coupling loop is regarded as a type of four-terminal network with specified parameters. In the designing of loop-type directional couplers, the lengths and the characteristic impedance of coupling loops are calculated, together with certain other parameters that provide the required operating characteristics of such couplers—namely, the required directivity and isolation—in the frequency band used.

See references under STUB. R. I. PERETS [29–1282–2]

CRANIAL INDEX, the ratio of the maximum breadth of the skull (transverse diameter) to its maximum length (longitudinal diameter) expressed as a percent. The cranial index is used in anthropology to characterize the shape of the skull in the horizontal plane. Low values reflect a relatively long and narrow skull. An index not greater than 74.9 is indicative of dolichocrany, whereas indexes of 75–79.9 and 80 or greater reflect mesocrany and brachycrany, respectively. The cranial index of humans does not reflect intellectual capacity. The index is used as a means of distinguishing anthropological racial types from skeletons. [29–215–2]

CRANIAL NERVES, the 12 pairs of nerves that branch off from the anterior (lower) surface of the brain stem in succession from front to back through special openings in the skull. The cranial nerves innervate the organs and tissues of the head and neck, with the exception of the vagus nerve, which descends into the thoracic and abdominal cavities. Cyclostomes, fish, and amphibians normally have only the first ten pairs of cranial nerves.

The first and second pairs of the cranial nerves are the olfactory and optic nerves, which, unlike the other cranial nerves, originate in the brain and serve as conducting pathways for the olfactory and visual analyzers. The third, fourth, and sixth pairs are the oculomotor, trochlear, and abducens nerves; they develop in association with cephalic myotomes and innervate the muscles of the eye. The fifth pair, the trigeminal nerves, is associated with the region of the mandibular arch; the nerves are the chief sensory nerves of the face and serve as the motor nerves of the muscles of mastication. The seventh pair, the facial nerves, innervates the organs of the lateral line and the musculature of the hyoid arch in fish, the superficial musculature of the neck and the muscle that lowers the lower jaw in terrestrial vertebrates, and the facial muscles in humans and simians. The facial nerves also contain secretory fibers to the lacrimal and salivary glands and sensory fibers to the mucous membrane of the tongue. The eighth pair, the vestibulocochlear nerves, evolved from the facial nerves. These nerves are purely sensory: They are responsible for linking the organs of hearing and equilibrium with the brain. The related ninth, tenth, and 11th pairs—the glossopharyngeal, vagus, and accessory nerves—are unequal in fiber composition and extent of spread. The ninth and tenth pairs have motor, sensory, and autonomic components. In mammals the 11th pair arises from the vagus nerve. The accessory nerve is motor to the sternocleidomastoid and trapezius muscles. The 12th pair, the hypoglossal nerves, is unusual in that it arose in amniotes as a result of fusion of the muscular branches of the spinal nerves.

The cranial nerves, unlike the spinal nerves, are not segmented and are highly specialized. Every muscle or group of functionally combined muscles (for example, the masseter muscle) and every organ is supplied only by a single source. Hence, disturbance of nerve conduction, as in paralysis of the facial nerve, cannot be compensated by adjacent nerves. The cranial nerves are nerves of highly specialized sense organs and are regulators of respiration, blood circulation, and digestion.

V. V. KUPRIIANOV [29–216–1]

CRATER (the Cup), a constellation of the southern hemisphere; its brightest star has a visual stellar magnitude of 3.6. The constellation is most easily viewed in March; it is visible from the central and southern regions of the USSR. (*See* STELLAR SKY.) [29–111–2]

CRNOJEVIĆ, a feudal house in Zeta (now Montenegro). The first mention of the Crnojevići dates from 1331. In the late 14th and early 15th centuries they fought the Balšić brothers for control of Zeta. The Crnojevići came to power in the second third of the 15th century and ruled until 1528.

The most notable rulers from the Crnojević family were Ivan (Ivan the Black; ruled 1465–90) and Djuradj (ruled 1490–96). During the reign of Stefan Crnojević (ruled 1496–98), the state was subordinated to the Ottoman Empire; it was officially incorporated into the empire in 1499. [29–283–1]

CROCUS, a genus of perennial cormous stemless plants of the family Iridaceae. The flowers are solitary or, less commonly, in groups of two or three. Glumaceous scales that seem to arise directly from the bulb surround the variously colored flowers. The numerous radical and linear leaves usually develop during or after the flowering period.

There are about 80 species in Europe and Asia. The USSR has 19 species, found mainly in Transcaucasia, in the Crimea, and in the mountainous meadows of the Tien-Shan and the Dzhungar Alatau. Crocuses are cultivated in many countries, including the USSR. They are used as a coloring and flavoring agent by the food and candy industries. Many species have especially beautiful flowers.

The most common species raised as ornamentals are *C. tomasinianus*, whose light violet flowers bloom in the beginning or middle of April; the common crocus (*C. vernus*), whose lilac, white, or purple-striped flowers bloom in April; *C. chrysanthus*, whose yellow flowers bloom in February and March; and *C. speciosus*, whose lilac flowers bloom in September. Crocuses are propagated by bulbs, corms, or seeds. The soil must be light in texture and fertilized with humus. The corms are planted at a depth of 5–6 cm. Autumn-blooming species are planted in the spring, and spring-blooming species are planted in the fall and covered with leaves and spruce branches. The corms of plants that have blossomed are dug out, dried, and cleaned of earth, roots, and old scales; they are stored at a temperature of 17°C until planting. Plants grown from seed bloom in the second or third season. Garden and wild crocuses are planted in groups on lawns or in rock gardens. Garden forms are often forced during the winter.

Stigmata from the saffron crocus (*C. sativus*) were formerly used medicinally in a compound tincture of aloe and in infusions of opium and saffron. [29–888–4]

CSOKONAI VITÉZ, MIHÁLY. Born Nov. 17, 1773, in Debrecen; died there Jan. 28, 1805. Hungarian poet and dramatist.

Csokonai Vitéz' poems, representative of the Enlightenment, reflect the influence of J.-J. Rousseau and Voltaire; they include "Evening" and "Constantinople." In the satirical play *Tempefői* (published 1844; staged 1938), he denounced the stagnation and ignorance of the nobility. The poem cycle *Songs of Lilla* creates an atmosphere of amorous languor, bitter solitude, and disappointment while protesting against social inequality. Csokonai Vitéz' poems combine traditional mythological elements and a refined style with the form and language of Hungarian folk poetry.

During his lifetime, Csokonai Vitéz published only a small amount of poetry, the collection of translations *Spring* (1802), and the comic epic poem *Dorottya* (1804).

CSONGRÁD, a *megye* (county) in southern Hungary, in the basin of the middle course of the Tisza River. Area, 4,100 sq km. Population, 455,000 (1975). The administrative center is the city of Szeged.

Csongrád is an agricultural and industrial region. The main crops are wheat, corn, sugar beets, hemp, alfalfa, sunflowers, rye, potatoes, and fruits, including grapes. Rice is grown on irrigated land in the Tisza River valley. Red peppers used for paprika are cultivated near Szeged, and onions are grown around Makó. Cattle, swine, and poultry are raised, and fish are bred in ponds. Crude oil and natural gas are extracted near Szeged and Illos. Industrial enterprises manufacture textiles and food products. A plant for the production of agricultural machinery is located in Makó, and ceramics are produced at Hódmezövásárhely. [29–682–6]

CSONGRÁD, a city in Hungary; situated on the Tisza River, in the *megye* (county) of Csongrád. Population, 20,000 (1976). Food products, furniture, and bricks are manufactured in the city. [29–682–7]

ĆUBRILOVIĆ, VASO. Born Jan. 13, 1897, in Bosanska Gradiška. Yugoslav historian. Academician of the Serbian Academy of Sciences and Arts (1961).

Ćubrilović took part in the assassination of Archduke Francis Ferdinand, the heir to the Austro-Hungarian throne, on June 28, 1914. For his participation in the plot, Ćubrilović was sentenced to 16 years in prison, but he was freed in 1918. In 1922 he graduated from the faculty of philosophy of the University of Belgrade, and in 1939 he became a professor there. During World War II he was in a concentration camp in Banica. From 1946 to 1967, Ćubrilović headed the department of modern national history at the University of Belgrade. In 1967 he became the director of the Institute of Balkan Studies of the Serbian Academy of Sciences and Arts.

Ćubrilović is the author of works on the medieval and modern history of Bosnia, Hercegovina, Serbia, and Croatia. He was named a foreign member of the Academy of Sciences of the USSR in 1976.

ÇUKUROVA, a lowland plain in southern Turkey, situated between the Central Taurus and the Mediterranean Sea. The Çukurova extends along the coast for 150 km, reaching widths of as much as 70 km. The Ceyhan and Seyhan rivers flow across the plain. Insular mountain massifs rise above the Çukurova, the highest being the Misis Mountains, with a maximum elevation of 789 m.

The Çukurova has a Mediterranean climate and is the hottest region of Turkey. The country's main cotton-producing region, it also produces grain crops and citrus fruits and has plantations for the cultivation of olives and sugarcane. The cities of Adana, Ceyhan, and Mersin are situated on the Çukurova. [29–755–3]

ČULINOVIĆ, FERDO. Born May 17, 1897, in Karlovac; died Sept. 15, 1971, in Zagreb. Yugoslav historian. Academician of the Yugoslav Academy of Sciences and Arts (1962).

Čulinović was a lawyer by education. During the National Liberation War in Yugoslavia of 1941–45, he was a member of the Antifascist National-Liberation Council of Croatia and served as secretary of the council's legislative commission. In 1945 he became a professor of national history in the law faculty of the University of Zagreb. Čulinović was the author of many works on the history of Yugoslavia.

CUTTING, a part of a plant used for vegetative propagation. Cuttings are obtained from high-quality plants. Plants grown from cuttings retain the properties and characteristics of the maternal plant. There are root, stem, and leaf cuttings. Under certain growing conditions, roots form on stem cuttings, buds on root cuttings, and both buds and roots on leaf cuttings. The ability of plants to propagate by cuttings depends on the species and varietal characteristics of the maternal plants as well as on external conditions, for example, temperature, humidity, and aeration. [29–203–1]

CUTTINGS, PROPAGATION BY, a method of plant propagation by which a part of a plant is cut off and planted. Propagation by cuttings is used in fruit raising, ornamental horticulture, forestry, and the cultivation of certain industrial and medicinal plants. Root cuttings and stem cuttings (lignified stems without leaves or green stems with leaves) are most often used. Root cuttings are used to propagate raspberry, dewberry, young apple seedlings, and white poplar. Lignified stem cuttings are used to propagate currant, grape, quince, and fig. Green stem cuttings with two or three leaves are used to propagate currant, plum, cherry, grape, and certain varieties of gooseberry. Leaf cuttings are used to propagate begonia, violet, and some other plants. [29–201–1]

CYNOGLOSSUM (hound's-tongue), a genus of plants of the family Boraginaceae. The plants are biennial, perennial, or—less commonly—annual herbs. The leaves are entire and alternate. The flowers, which are mostly purple, red, dark blue, or violet, are in cymose inflorescences known as bostryxes. The calyx is five-partite to the base; it enlarges when fruits are present. The corolla is funnelform or rotate. The fruit consists of four nutlike lobes with hooked prickles.

There are about 60 species, distributed in temperate and subtropical zones and in tropical mountains, mainly in dry regions. The USSR has nine species. The common hound's-tongue (*C. officinale*) grows on dry slopes, along river bluffs, and in gravelly areas; it also is encountered as a weed along roads and in wastelands and fields. The plant is poisonous, as are other *Cynoglossum* species. Its roots and seeds contain alkaloids (cynoglossin, cynoglosseine) and glycoalkaloids. The roots and leaves are used in folk medicine as analgesics, as an agent to treat coughs and convulsions, and as an emollient in the form of a fomentation to treat furunculosis, burns, and snakebites. The juice and the roots are used to control insects and rodents. The species *C. amabile* is cultivated as an ornamental. [29–290–2]

CZARDAS, a Hungarian folk dance performed by couples to 2/4 time. The czardas, which appeared in the mid-19th century, consists of one slow section and one fast, impetuous section. It has syncopated rhythms, and many steps are improvised. The czardas served as the basis of ballroom dance that became popular in Russia in the early 20th century as the *vengerka.* Musical reworkings of the czardas are found in Liszt's *Hungarian Rhapsodies*, Brahms' *Hungarian Dances*, Delibes's *Coppélia*, and Tchaikovsky's *Swan Lake.* [29–59–2]

CZARTORYSKI, a Lithuanian-Byelorussian, later polonized, princely family, that claimed to trace its origins back to Gedymin. Its most prominent members were Adam Jerzy Czartoryski and Władysław Czartoryski.

Adam Jerzy Czartoryski. Born Jan. 14, 1770, in Warsaw; died July 15, 1861, in Montfermeil, France. Polish and Russian state and political figure.

A. J. Czartoryski was one of Alexander I's closest friends and a member of the Unofficial Committee. He became deputy foreign minister in 1802 and served as foreign minister from 1804 to 1806. He put forth a program by which all the Polish lands would be united under the rule of Alexander I. In 1816 he became a senator of the Kingdom of Poland. During the Polish Uprising of 1830–31, as head of the National Government, he obstructed the implementation of social and political reforms. After the defeat of the uprising he emigrated to Paris, where his residence, the Hôtel Lambert, became a center for conservative monarchist émigrés. In 1834 his adherents proclaimed him de facto king. Czartoryski developed a program for the restoration of Polish independence that relied on the support of the Western powers.

Władysław Czartoryski. Born July 3, 1828, in Warsaw; died June 23, 1894, in Boulogne-sur-Seine, France. Polish political figure. Son of A. J. Czartoryski.

W. Czartoryski succeeded his father as head of the Hôtel Lambert group. On May 15, 1863, during the Polish Uprising of 1863–64, the "white" Rząd Narodowy appointed Czartoryski its chief diplomatic agent. Czartoryski opposed the alliance of the Polish people with the revolutionary forces of other peoples and recommended that the insurgents limit themselves to armed demonstrations that would bring about the military intervention of the Western powers.

I. S. MILLER [29–71–2]

CZECH, the language of the Czechs, one of the official languages of the Czechoslovak Socialist Republic (the other is Slovak).

Czech is spoken in Czechoslovakia (in Bohemia, Moravia, and part of Silesia) and abroad (in the USA, Austria, Canada, and other countries) by approximately 10 million people (1974, estimate). Czech, which belongs to the West Slavic group of languages, has four groups of dialects: (1) the Bohemian dialects—central (with Prague as the center), southwestern, and northeastern; (2) the Haná (central Moravian) dialects; (3) the Lach dialects (in northeastern Moravia and in Silesia); and (4) the Moravian Slovak dialects (in eastern Moravia to the borders with Slovakia).

The Czech sound system is characterized by the presence of short and long vowels, which, like the diphthong *ou*, are phonemically distinctive, and by the presence of syllabic *r* and *l*. There are only three pairs of hard and soft consonants (*n*/*n'*, *t*/*t'*, and *d*/*d'*). Most consonants are paired as voiced-voiceless. Typical of Czech is the alternation of short and long vowels and consonant alternation. Stress is dynamic and always falls on the first syllable of a word; a secondary stress occurs in polysyllabic words. The morphological system is distinguished by a diversity of declensional and conjugational types. The noun is marked for the categories of gender, number, and case (six cases and a vocative form); masculine nouns are also marked for animateness. All relative, and some qualitative, adjectives are used only in the long form. The verb is marked for the categories of aspect, voice, mood, tense, person, and number; participles and adverbial participles are marked for gender.

The Czech literary language was formed on the basis of the central Bohemian dialect. The earliest written records date from the late 13th century. The written language of the first half of the 19th century was purely a bookish, literary form. The colloquial form of the modern literary language arose in the mid-19th century and existed side by side with everyday speech forms. The writing system is based on the Latin alphabet; diacritical marks are used to indicate sounds specific to the Czech language.

A. G. SHIROKOVA [29–525–3]

CZECHOSLOVAK ACADEMY OF SCIENCES (Československá Akademie Věd), the highest scientific institution in the Czechoslovak Socialist Republic and the Czech Socialist Republic. Founded in Prague in 1952, the academy includes the Slovak Academy of Sciences. Its predecessors were the Royal Bohemian Society of Sciences (1790) and the Czech Academy of Arts and Sciences (1890). The academy carries on the progressive traditions of Czech and Slovak science.

In 1976 the academy, with more than 150 members, included 19 scientific boards responsible for the development of their respective disciplines and 135 research institutes, of which 60 were institutes of the Slovak Academy of Sciences. Twenty-three of these institutes are conducting research in mathematics, physics, geology, and geography; 15 in the technical sciences; 11 in chemistry; 33 in biology, medicine, and agriculture; and 34 in the social sciences. The academy also serves as an advisory body to the government of Czechoslovakia on scientific matters. The first president of the academy was Z. Nejedlý; since 1970 the post has been held by Academician J. Kožešník, a foreign member of the Academy of Sciences of the USSR since 1971.

The academy plans the development of Czechoslovak science, prepares government plans for basic research, coordinates and directs the execution of such plans, trains scientific workers, and represents Czechoslovak science abroad. As of 1974, more than 13,000 workers were employed by the academy's institutions, including some 5,500 workers with higher education. [29–501–1]

CZECHOSLOVAK CORPS MUTINY OF 1918, an armed counterrevolutionary revolt of Czechoslovak troops in Soviet Russia instigated by agents of the Entente. Czechoslovak units were formed in Russia during World War I from among Austro-Hungarian prisoners of war and Russian subjects of Czech nationality. In June 1917 two rifle divisions were united to form the Czechoslovak Corps, which was deployed in the Ukraine. After the October Revolution of 1917 the commanders of the corps, abetted by agents of the Entente, conducted anti-Soviet propaganda among the soldiers, declared the corps to be part of the French Army, and demanded that the Soviet government send the corps to Western Europe. In the second half of March 1918 most of the corps left the Ukraine; only Czechoslovak internationalists joined the Red Army to fight the Austro-German aggressors.

On Mar. 26, 1918, the Soviet government agreed to evacuate the Czechoslovak troops via Vladivostok on condition that they surrender most of their weapons to local soviets. Nevertheless, the corps commanders, meeting with agents of the Entente and Right Socialist Revolutionaries (SR's) in Cheliabinsk on May 14, decided to stage a revolt. The soldiers were told that the Soviet government had ordered the trains stopped and the soldiers disarmed and confined in prison camps. The corps commanders exhorted the soldiers to make their way to Vladivostok by force of arms. By late May, trains carrying up to 45,000 Czechoslovak soldiers were stretched all along the Siberian Railroad from Rtishchevo station (near Penza) to Vladivostok, a distance of about 7,000 km. The revolt began in Mariinsk on May 25 and in Cheliabinsk a day later; thereafter Czechoslovak troops and SR-White Guard detachments captured Novonikolaevsk on May 26, Penza on May 29, Syzran' on May 30, Tomsk on May 31, Omsk on June 7, Samara on June 8, and Krasnoiarsk on June 18. Passing to the offensive, the Czechoslovak troops and White Guard detachments proceeded to seize Ufa on July 5, Simbirsk on July 22, Ekaterinburg on July 25, and Kazan on August 7, where the gold reserves of the republic fell into their hands.

The mutiny of the Czechoslovak Corps opened a new phase in the Civil War by greatly expanding the theater of operations and strengthening the counterrevolutionary forces. The mutiny was accompanied by mass arrests and executions of soviet and party functionaries and revolutionary workers and peasants. In the captured areas the Czechs abolished the Soviet governing bodies and assisted in the formation of such counterrevolutionary governments as the Committee of Members of the Constituent Assembly (Komuch) in Samara, the Cadet-SR Urals Government in Ekaterinburg, and the Provisional Siberian Government in Omsk.

In July 1918 the Soviet forces in the Volga Region were united to form the Eastern Front. In August 1918 the Soviet forces halted the advance of the Czechoslovak and SR-White Guard troops, and passing to the offensive, they liberated Kazan and Simbirsk in September, Samara and Syzran' in October, and Ufa and Cheliabinsk in November. Military reverses and clandestine work by communists demoralized the Czechoslovak troops. In November and December 1918, after refusing to fight on the side of the White Guards, they were withdrawn from the front and put to guarding the railroad. From the second half of 1919, the Czechoslovak units retreated to the east along with Kolchak's army. Meeting at Kuitun station on Feb. 7, 1920, the command of the Red Army and of the Czechoslovak Corps signed an armistice agreement guaranteeing the corps passage to the Far East and evacuation. In the spring of 1920 the Czechoslovak troops as-

sembled in Vladivostok, from where they were gradually evacuated from Russia.

General information

The Czechoslovak Socialist Republic is a socialist state in Central Europe. Situated on the watershed of the Danube, Labe (Elbe), and Oder, the republic is bounded on the north by Poland, on the northwest by the German Democratic Republic, on the west by the Federal Republic of Germany, on the south by Austria and Hungary, and on the east by the USSR. Area, 127,900 sq km. Population, 15 million (1977). The capital is Prague. The Czechoslovak Socialist Republic (CSSR) includes the Czech Socialist Republic (CSR; capital, Prague) and the Slovak Socialist Republic (SSR; capital, Bratislava). Administratively, the country is divided into ten regions (*kraje*), with Prague and Bratislava having the status of regions (see Table 1). The regions are divided into districts (*okresy*), which in turn are subdivided into communes (*obce*).

Constitution and government

Czechoslovakia is a socialist state and a federal republic composed of two equal sovereign socialist republics, the Czech and Slovak socialist republics. The present constitution was adopted in 1960 and amended by the 1968 Constitutional Law on the Czechoslovak Federation. All power in the country belongs to the working people.

The supreme state authority and sole legislative body of the CSSR is the bicameral Federal Assembly, composed of the House of the People, whose 200 deputies are elected by the entire country, and the House of Nations, whose 150 deputies are elected on a parity basis by the CSR and the SSR. The Federal Assembly is empowered to amend the constitution of the CSSR and enact laws. It ratifies the medium-range state plans for the development of the national economy and the state budget of the federation, resolves fundamental questions of foreign and domestic policy, elects the president of the CSSR (five-year term) and the members of the Supreme Court of the CSSR, and establishes federal agencies. Between sessions of the Federal Assembly its functions (except emergency powers) are exercised by the 40-member Presidium of the Federal Assembly, which is elected by both houses from among their members.

The head of state is the president, who is accountable to the Federal Assembly. He represents the CSSR in international relations, concludes and ratifies international treaties, appoints and recalls the members of the federal government (cabinet), and serves as the supreme commander in chief of the armed forces.

The federal government of the CSSR—the supreme executive body of state power—consists of a prime minister, deputy prime ministers, and ministers. A member of the Presidium of the Federal Assembly or of the Constitutional Court may not hold a cabinet post.

The 200-member Czech National Council and the 150-member Slovak National Council are the supreme representative institutions and sole legislative bodies of the constituent republics. Each National Council enacts the constitutional and other laws of the republic, ratifies the medium-range state plans for the development of the republic's economy, and adopts the republic's budget. The National Council elects from among its members the Presidium, which exercises the council's functions (except emergency powers) in the interval between sessions of the council. The Presidium of the National Council appoints and recalls the members of the government (cabinet), the highest executive body of state power in each republic.

The local governing bodies in the regions, districts, cities, and communes—called national committees—direct economic, cultural, and social development in their respective areas. The national committees elect general executive bodies—councils—and establish commissions to initiate and expedite the work of the committees. All representative bodies of state power are elected for five-year terms by universal and equal suffrage and direct and secret ballot. All citizens who have attained the age of 18 years may vote. Deputies to any representative body are required to take an oath.

The judiciary includes the Supreme Court of the CSSR, the Supreme Courts of the CSR and SSR, and regional, district, and military courts. Supervision of the observance of laws rests with the Procurator's Office, headed by the procurator general of the CSSR. Each of the constituent republics also has a procurator general.

east and 150–200 km from north to south. It is a country of uplands and low mountains, its natural landscape dominated by forests and forest-steppes.

Topography. The western part of the country is occupied by the Bohemian Massif, whose interior is a vast basin lying at an elevation of 200–400 m. The interior basin is divided into a series of smaller basins separated by uplands and crystalline and volcanic massifs ranging from 700 m to 900 m in elevation. Along the edges of the basin rise medium-elevation, predominantly flat-crested ranges: the Bohemian Forest and the Šumava in the southwest, the Ore Mountains (Krušné Hory) in the northwest, and the Krkonošě in the northeast. The prevailing elevation of these encircling mountains varies from 800 m to 1,200 m; the highest peak is Mount Sněžka (1,602 m) in the Krkonoše. In the southeastern part of the Bohemian Massif lie the Bohemian-Moravian Uplands. The section of the uplands known as the Moravian Kras has numerous karst landforms, among them the spectacular Macocha Gorge.

The eastern part of the country is dominated by mountains of the Carpathian system. The highest peak in Czechoslovakia and in the Carpathians, Gerlachovský Štít (2,655 m), is in the Tatra Mountains, which have well-defined glacial landforms. After the Tatras, the greatest heights occur in the Vel'ká and Malá Fatra, the Low Tatra, and the Slovak Ore Mountains, all of them deeply dissected, predominantly middle-elevation mountains. The Slovak Kras is noted for its karst formations, such as the famous Domica Cave. In the southern Carpathians rise the volcanic massifs of the Kremnica and Štiavnica mountains. The Central Danubian Plain enters Czechoslovakia from the south in two prongs, forming the Danubian Lowland in the south and southwest and the Tisza Lowland in the southeast. The elevation of the lowlands rises from 100–200 m in the south to 200–400 m near the Carpathians.

Geological structure and minerals. The western part of Czechoslovakia, the Bohemian Massif, is the core of the ancient basement of Variscan folding in Central Europe. The eastern part of the country, coinciding with the Western Carpathians, belongs to the Alpide geosynclinal region. The basement of the Bohemian Massif is composed of Precambrian gneisses, migmatites, schists, and granulites and of Paleozoic slates, quartzites, and sandstones. The sedimentary cover is made up of Cretaceous and Cenozoic, mainly clastic, rocks. The basement of the Carpathians consists of Precambrian and Paleozoic metamorphic rocks intruded by Variscan granitoids. (Such intrusions also occur in the Bohemian Massif.) The folded Mesozoic and early Cenozoic complex of the Carpathians (limestone, sandstone, flysch) serves as the foundation of late Cenozoic molasse basins filled mainly with sand-clay sediments and extrusive rocks.

The country's principal mineral resource is coal—the hard coal of the Ostrava-Karviná Basin and the brown coal of the North Bohemian Basin. Petroleum and gas deposits occur in the northern part of the Viennese and Pannonian basins and in the Ciscarpathian Foredeep. In the Spišská-Hemerska Ore Region of Slovakia iron-ore deposits are worked at Rudňaný and Nižna-Slana and manganese ore deposits at Kišovce-Svabovce. There are numerous hydrothermal lead and zinc deposits in Bohemia (Příbram, Kutná Hora, Stříbro), North Moravia (Zlaté Hory, Horní Benešov, Horní Město), and the Spišská-Hemerska Ore Region (Banská Štiavnica). Hydrothermal copper deposits are found in Moravia (Staré Ransko) and Slovakia (Slovinky, Rudňaný, Rožňava). In the Ore Mountains deposits of tin and tungsten ore (Cinovec, Krupka) are associated with Variscan granitoids. The uranium deposits at Příbram and Mimoň and in the Bohemian-Moravian Uplands are associated with hydrothermal veins. The schists and granitoids of the Carpathians contain veins of antimony ore, mined at Pezinok Pernek, Magurka, Medzibrod, Čučma, and Zlata Idka. The Cenozoic volcanic rocks of the Slovak Ore Mountains contain mercury deposits. Other deposits include fluorite, graphite, baryte, pyrite, kaolin, magnesite, and construction materials.

Czechoslovakia is rich in therapeutic mineral springs, including thermal springs, many of them associated with the Precambrian and Paleozoic rocks of the Bohemian Massif and with tectonic dislocations in the Carpathians. The most famous are the alkaline springs of Karlovy Vary and Mariánské Lázně, the hydrocarbon springs of Teplice, the sodium sulfate springs of Františkovy Lázně, the hydrogen sulfide springs of Trenčianske Teplice, and the radioactive springs of Jáchymov and Teplice.

Climate. The country's temperate climate becomes more continental from west to east and in the intramontane basins. The mean January temperature ranges from −1° to −4°C in the plains, dropping to −7°C in the mountains of the Bohemian Massif and to −10°C in the Carpathians. In winter there are frequent temperature inversions in the intramontane basins. The mean July temperature, 19°–21°C in the plains, can fall to as low as 8°C in the mountains of the Bohemian Massif, and 4°C in the Carpathians. The annual precipitation varies from 450 mm to 700 mm in the plains; in the mountains it increases rapidly with elevation, reaching 1,600 mm in the Bohemian Massif and 2,100 mm in the Carpathians at a height of about 2,000 m. The maximum precipitation falls in the summer, although droughts may occur in the plains at this time of the year owing to the strong evaporation. In the plains the snow cover, often unstable and broken by thaws, lasts 1½ to two months. Its duration increases to 2½ or three months in the mountains and to six months on the crests of the Carpathians.

Rivers and lakes. The country has a dense network of relatively short rivers. Among its largest rivers are the Danube, whose middle course flows through the country, the Váh and the Morava, both tributaries of the Danube, the upper reaches of the Oder and Labe (Elbe), and the Vltava, a tributary of the Elbe. The Tisza River, another tributary of the Danube, flows along the eastern border of Czechoslovakia for a short distance and receives the waters of the Hornád and Ondava. Most of the rivers have spring high water, resulting from the melting of snow in the mountains and foothills; heavy summer rains may cause flooding. The rivers are frozen for one or two months in the winter. The Danube and the Labe and the lower reaches of the Vltava are navigable, and hydroelectric power plants have been built on the Váh and Vltava. The country's lakes, mainly of glacial or tectonic origin, are small. Its numerous ponds, covering a total area of 50,000 ha, chiefly in South Bohemia, are used for fish raising and water supply.

Soils. The most common soils are the brown and mountain-brown forest soils typical of deciduous and mixed forests. Mountain podzolic soils are found in the upper part of the mountain forest belt, and mountain meadow soils occur under alpine meadows. In unforested areas, soddy brown-earth soils have developed under secondary meadows, and soddy calcareous soils (rendzinas) have formed on calcareous rocks. The plains of Central Bohemia and South Moravia are covered with chernozem-like soils, generally leached and podzolized but sometimes calcareous, and the valleys of the Danube, Labe, Morava, and other major rivers have alluvial soils. The soils of the plains and gentle mountain slopes are for the most part plowed up.

Flora. Cultivated steppes with small planted groves of oak and pine predominate to an elevation of 300 m. Forest-steppes, which in earlier times made up most of the vegetative cover of the plains, have survived only on unproductive lands and in preserves. At elevations of up to 600–700 m plowlands alternate with forests of oak or oak and beech. Between 600–700 m and 1,100–1,200 m the landscape is dominated by beech and fir-and-beech forests, above which spruce and fir forests grow to elevations of up to 1,400–1,500 m. About one-third of the country is forested, with conifers covering 71 percent of the area. The most common coniferous species is spruce, accounting for 48 percent of the forested area. Most of the forests are in the Carpathians and in the mountains of the Bohemian Massif. Between 1,400–1,500 m and 1,600–1,700 m the forests give way to *Krummholz* and then to scrub and subalpine and alpine meadows.

Fauna. Among the more common mammals are the brown bear, wolf, lynx, fox, marten, ermine, deer, wild boar, roe deer, hare, squirrel, and hedgehog. Birds include capercaillies, partridges, storks, goatsuckers (*Caprimulgus europaeus*), hoopoes (*Upupa epops*), kingfishers, and eagles. The rivers and ponds abound in trout, carp, salmon, grayling, pickerel, perch, burbot, and lamprey.

Preserves. Some 170,000 hectares (1976), mostly forests, have been set aside as protected areas. In addition to the famous Tatra

People's Park and the Krkonoše and Pěniny national parks, there is a network of sanctuaries and natural landmarks, notably the Karlstein and Bohemian Paradise.

Natural regions. There are four distinct natural regions: the Bohemian Massif, the Western Carpathians, and the Danubian and Tisza lowlands. On the Bohemian Massif rolling plowed-up plains alternate with low and middle-elevation mountains covered with beech, oak, and mixed forests. The Western Carpathians consist of middle-elevation and high mountain ranges whose landscapes change with elevation: mixed and coniferous forests are succeeded by *Krummholz*, which gives way to subalpine and alpine meadows. The Danubian Lowland is an undulating plain, mostly plowed up, with tracts of oak forests. The Tisza Lowland encompasses a rolling plowed-up plain and low mountains clothed with oak and beech forests.

Population

The basic population of Czechoslovakia consists of two nations, the Czechs and the Slovaks, each having its own republic. In 1977 the population was estimated to include 9,612,000 Czechs, 4,526,000 Slovaks, 598,000 Hungarians, most of them living in southern Slovakia, 76,000 Germans, 78,000 Poles, and 60,000 Ukrainians and Russians. About two-thirds of the believers are Roman Catholics, and the remainder are Protestants (Bohemian Brethren, Evangelicals, or Calvinists), Uniates, or Greek Orthodox. The official calendar is the Gregorian.

The population has been steadily growing; the censuses of 1960 and 1970 showed that the population had increased from 13,698,000 to 14,350,000. The rate of natural increase, per 1,000 population, was 6.7 in 1960, 6.4 in 1965, 4.3 in 1970, and 8.0 in 1975. In view of the diminishing rate of natural increase in the 1960's, the government adopted a vigorous demographic policy aimed at ensuring a higher birthrate. As for social composition, statistics from the end of 1976 indicate that workers made up 61 percent of the total population; office employees, 28 percent; peasants and artisans belonging to cooperatives, 10 percent; and independent peasants and artisans and members of the liberal professions, about 1 percent. In 1976 the labor force totaled 7,476,000 persons, of whom 80.6 percent (83.3 percent in 1960) were engaged in material production and 19.4 percent in the nonproduction sphere. A breakdown of the production sphere showed that industry accounted for 38.6 percent of the work force, construction for 9.6 percent, agriculture and forestry for 15.3 percent, transportation and communications for 6.7 percent, and other sectors for 10.4 percent. The nonproduction sphere included those employed in public health and social insurance (4.4 percent) and in the field of education, culture, or sports (6.3 percent).

The population density averages about 117 persons per sq km for the country as a whole and about 129 persons per sq km in the CSR. The most densely populated regions are the Ostrava-Karviná and Prague-Central Bohemia industrial conurbations, with about 650 and 500 persons per sq km, respectively.

A land with a very old urban culture, Czechoslovakia has many nationally distinctive cities that date from the early Middle Ages. Today, urban dwellers, classified as those living in cities or urban-type communities, account for 66.3 percent of the country's population. Apart from the three major historical urban centers—Prague in Bohemia, Brno in Moravia, and Bratislava in Slovakia—only Ostrava, Plzeň, and Košice have more than 100,000 inhabitants. Most Czechoslovak cities have a population of less than 50,000.

Historical survey

The territory of Czechoslovakia has been inhabited since the Paleolithic. Archaeological excavations have uncovered the remains of Upper Paleolithic permanent dwellings built by mammoth hunters at Dolní Věstonice, Pavlov, and other sites. In the Neolithic farming spread among the tribes of the Linear Pottery culture. During the Bronze Age, best represented by the Únětice culture, the area was a focal point of Central European metalworking. The Iron Age Hallstatt culture flourished here in the first half of the first millennium B.C. Around the fourth century B.C. the area was settled by Celts, who founded numerous urban artisan and trade centers, *oppida*, of which the best known are Hrazani, Stradonice, Závist, and Staré Hradisko. At the beginning of the Common Era, the power of the Celts was broken by the Germanic Marcomanni and Quadi tribes, who advanced as far as the Váh River. In the first and second centuries A.D. the Germanic tribes fought against the Romans, who occupied part of Slovakia. The arrival of Slavic tribes in the middle of the first millennium coincided with the decline of the primitive communal system among the tribes.

Early feudal period (sixth to mid-11th century). In the second half of the first millennium plow farming developed among the Slavs, mainly in connection with expanding land settlement, an irregular three-field system was adopted (tenth century), and handicrafts were gradually becoming separated from agriculture. The most famous of the fortified settlements, or *hrady*, founded by the Slavs was Pražský Hrad, built at the turn of the ninth century. The development of the city as a handicraft and commercial center surrounded by trade and artisan settlements (Staré Město on the Morava River)—accompanied by the social stratification of Slavic society and the rise of an elite—signaled the transition to an early feudal class state. The earliest rudimentary states were tribal principalities encompassing a network of *hrady*. The territory of modern Czechoslovakia formed part of Samo's state in the seventh century and was included in the Great Moravian State in the ninth and early tenth centuries.

The development of early feudalism in Great Moravia was facilitated by the spread of Christianity in the ninth century, introduced by the Slavic educators Cyril and Methodius, who devised the Slavic writing system. Feudal fragmentation (late ninth century) and the loss of its Bohemian (895) and Lusatian (897) lands weakened the Great Moravian State in its struggle against the expansion of the German feudal lords and enabled the nomadic Magyars to conquer some of its territory in the early tenth century. The Magyar conquest interrupted the amalgamation of the Bohemian-Moravian and Slovak tribes into one nationality, a process that had begun in the eighth century.

In Bohemia, the unification of tribal principalities ended in the early tenth century with the formation of a Bohemian state under the Přemyslid princes. Moravia was incorporated into Bohemia in 1029 (1019 according to some sources). In the first quarter of the 11th century Slovakia was absorbed into the Kingdom of Hungary, remaining under Hungarian rule until the formation of a unified Czechoslovak state in 1918. Over the centuries two nationalities would emerge on the territory of modern Czechoslovakia: the Czech people, who included the Moravians, although the latter preserved their ethnic distinctiveness, and the Slovaks.

Mature feudalism (mid-11th to the 15th century). Feudal fragmentation, affecting the Czech lands by the mid-11th century and Slovakia by the 13th century, was an important factor in the consolidation of the feudal seigniory and the establishment of fully developed conditional land tenure. The growth of productive forces from the 11th to the 14th century was accompanied in some regions, from the early 13th century, by the influx of large numbers of Germans into the cities and the countryside, first in the Czech lands and then in Slovakia as well. This period saw the evolution of the basic groups making up the feudal class: ecclesiastical feudal lords, secular feudal lords (*pán*), and lesser nobles (*vladyka*). Foreign trade linked the Czech lands and Slovakia with all of Central Europe and parts of Western and Eastern Europe. In the countryside the expansion of commodity production led to the introduction of monetary feudal rent. In Slovakia, which as part of the Kingdom of Hungary was subjected to the tyranny of Hungarian magnates and magyarization, the rate of economic development was slower than in the Czech lands. In the early 1240's southwestern and southeastern Slovakia and Moravia were invaded by the Mongol Tatars.

Bohemia became a powerful feudal estate monarchy under Emperor Charles IV of the Luxembourg dynasty (Charles I of Bohemia), who ruled from 1346 to 1378. Nevertheless, the political consolidation of the Czech lands was not destined to be completed in the 14th and early 15th centuries, partly owing to German feudal expansion, albeit in such a covert form as the settlement of German colonists, disrupting the ethnic homogeneity of the country. In Slovakia the strengthening of royal authority took place in the 14th century under the Anjou dynasty.

Intensified feudal exploitation of the Bohemian and Moravian peasantry by the ecclesiastical and secular feudal lords, corruption within the Catholic Church, and growing German domination in both the countryside and the cities, where the patriciate was predominantly German, gave rise to an opposition movement in the Czech lands in the late 14th and early 15th centuries. The movement took the form of popular heresies and the teachings of such preachers as Jan Milíč of Kroměříž and Matthew of Janov. The religious reforms advocated by these preachers, and especially the ideas of Jan Hus and his followers, notably Jerome of Prague, paved the way for the development of the Hussite revolutionary movement, a powerful and broadly based social-revolutionary, national liberation, and anti-Catholic movement. From the very outset the Hussites were divided into the moderate Calixtines and the radical Taborites.

The German Emperor Sigismund I and Pope Martin V failed in their attempts to suppress the Hussites by launching crusades against them (1420, twice in 1422, 1427, and 1431). Led by such gifted generals as J. Žižka and Prokop the Great, the Hussites repulsed the invasions of the crusaders. The treachery of the Calixtines and the dissension among the Taborites weakened the revolutionary forces, however, and in 1434 the Taborites were routed at the battle of Lipany. Despite its defeat, the Hussite revolutionary movement, as the wellspring of the revolutionary and national traditions of the Czech people, was a crucial period in the history of the Czech lands. In Slovakia, the dissemination of Hussite ideas fanned the Slovak burghers' struggle against the domination of the German patriciate, a struggle that had begun in the previous century. Taborite troops marched through Slovakia during their campaign against Hungary from 1428 to 1433. The large numbers of Taborites who escaped to Slovakia after the suppression of the Hussite movement formed the backbone of the anti-feudal Brethren movement, which lasted from 1445 to 1471. The Hussite revolutionary movement strengthened the linguistic and cultural ties between the Czechs and the Slovaks.

Late feudalism (16th to 18th centuries). A gradual shift to "second serfdom" took place in the Czech lands and Slovakia from the late 15th century. Seeking to expand their deliveries of agricultural products to markets, the feudal lords increased the peasants' obligations and began to rely more heavily on labor services, especially after 1550. The growing feudal exploitation exacerbated the class struggle and precipitated peasant uprisings. After the suppression of the Dózsa Rebellion in 1514, in which the Slovak peasantry took part, the Hungarian feudal lords legalized the enserfment of the Hungarian and Slovak peasantry. A decade later there were reverberations of the German Peasant War of 1524–26 among the peasants and miners of Bohemia.

Another sign of feudal reaction was the political domination of the magnates, whose influence increased as royal power declined under the Jagiellonian kings Vladislav II and Louis II, who ruled Bohemia from 1471 to 1516 and from 1516 to 1526, respectively. Inasmuch as the king of Bohemia also occupied the Hungarian throne from 1490 to 1526, the Czech lands and Slovakia were temporarily unified under one monarch. The decline of royal authority weakened the Czech lands and Slovakia in their struggle against Ottoman aggression. King Louis perished at the battle of Mohács (1526), in which the Turks inflicted a crushing defeat on the small Hungarian-Czech Army.

In 1526 the Czech feudal lords elected a Hapsburg to the throne; the Austrian archduke Ferdinand, who ruled from 1526 to 1564. The Czech lands were to remain an integral part of the Hapsburg monarchy until 1918. As a result of the Austro-Turkish wars of 1532–33 and 1540–47, most of Slovakia also came under Hapsburg rule in 1547 as part of the Kingdom of Hungary. The Slovaks in the Hapsburg monarchy were thus subjected to double national oppression, by both Hungarian and German-Austrian feudal lords. Southern Slovakia fell under the control of Ottoman feudal lords. In the Czech lands and the part of Slovakia that was under the Hapsburgs, German-Austrian ascendancy in the bureaucracy, urban life, and commerce and increasingly heavy taxation provoked the opposition of some of the nobility and burghers and stimulated the spread of the Reformation. The first open revolt against the Hapsburgs in the Czech lands, the Czech uprising of 1547, was suppressed. The next major anti-Hapsburg insurrection, the Czech uprising of 1618–20, precipitated the Thirty Years' War (1618–48).

After the defeat of the Czech troops by the Hapsburg forces and their allies in the battle of the White Mountain (Bílá Hora, 1620), the Czech lands lost their political autonomy and became hereditary possessions of the Hapsburgs. The privileges of the estate Diets were reduced to a minimum. In the ensuing period of feudal Catholic reaction and religious persecution, the land belonging to the Czech nobility and the cities was confiscated and turned over to foreigners, mainly Germans. Large numbers of Czechs emigrated. Meanwhile, the population of Slovakia, which was fully incorporated into the Hapsburg Empire under a peace treaty concluded at the Karlowitz Congress of 1698–99, also suffered great hardships. In Slovakia, the almost ceaseless warfare between Turkish and Hapsburg troops and the anti-Hapsburg revolts of the Hungarian nobility hindered the development of the area's productive forces and accelerated the decline of urban life, handicrafts, and agriculture.

The second half of the 17th century saw the culmination of "second serfdom" in the Czech lands and Slovakia, a situation made all the more intolerable by the Counter-Reformation. The growing feudal exploitation provoked numerous antifeudal peasant uprisings in the 17th and 18th centuries, of which the largest were the *kurucok* uprisings in Slovakia in 1672 and 1697 and the Czech uprisings of 1680 and 1775. The Austrian government was obliged to regulate the peasants' obligatory services through legislation, promulgating *corvée* patents in 1680, 1717, 1738, and 1775. Centralized manufacture arose in the Czech lands in the middle of the 18th century and somewhat later in Slovakia. Capitalist elements developed in the economy under conditions of absolutist Hapsburg rule and the germanization of the Czechs and the magyarization of the Slovaks.

Decline of feudal serfdom and development of capitalist economy; the national revival (late 18th and first half of the 19th centuries). A rapid growth of productive forces, beginning in the Czech lands in the late 18th century and in Slovakia in the early 19th century, hastened the decline of the feudal system and created conditions more favorable to capitalist enterprise. Another contributing factor was the abolition of the personal dependence of the peasants, which took place in the Czech lands in 1781 and in Slovakia in 1785. The industrial revolution, reaching the Czech lands in the early 19th century and Slovakia in the 1840's, gave impetus to the formation of new classes: an industrial bourgeoisie, predominantly German in the Czech lands and German and Hungarian in Slovakia, and a factory and agricultural proletariat.

The shift from feudalism to capitalism was accompanied by the emergence of the Czech and Slovak nations against the background of national oppression, an upsurge in the national movement, resistance to forcible germanization and magyarization, and efforts to develop the native language, literature, science, and art. In Czechoslovak historiography the period of the late 18th and first half of the 19th centuries is known as the National Renaissance, and the Czech and Slovak intellectuals who played a decisive role in fostering national consciousness and creating a national culture are called the awakeners. The idea of Slavic brotherhood expounded by J. Kollár played an important role in the Czech and Slovak national movement.

In the 1830's and 1840's the national movement began assuming a political character and attracting the popular masses. Learned and educational societies were founded, among them the Matice Česká (1831). The Czech national movement split into the radical democrats, whose spokesman was K. Sabina, and the national liberals, headed by F. L. Rieger and F. Palacký, whose national political program rested on the concept of Austro-Slavism. The ideology of the nascent Slovak bourgeoisie was essentially formulated by L. Štúr and J. Král, who headed the national movement in the 1830's and 1840's. Radical democratic

and revolutionary sentiments became stronger in the Slovak national movement in the 1840's.

Premonopoly capitalism (until the end of the 19th century). The intensity and complexity of the class and national antagonisms in the Czech lands and Slovakia made them an arena of revolutionary events in 1848–49, which were an integral part of the Revolution of 1848–49 in the Austrian Empire. The revolutionary democratic movement in the Czech lands culminated in the Prague uprising of 1848. The leaders of the Czech liberal bourgeoisie, which was frightened by the sweep of the democratic movement, leaned increasingly toward cooperation with the Hapsburgs. Concurrently, the radicals' attempt to incite an anti-Hapsburg uprising in May 1849 failed. In Slovakia, the revolutionary movement was closely tied to the Revolution of 1848–49 in Hungary. On May 10, 1848, the programmatic Demands of the Slovak People were adopted in Liptovský Mikuláš. Rejecting these demands, the noble-dominated government of revolutionary Hungary gave the Hapsburgs an opportunity to use the Slovaks in the struggle against the revolutionary forces in Hungary.

After quelling the revolutionary movement in 1849, the Hapsburgs nullified most of the gains won during the revolution in the Czech lands and Slovakia. They did not, however, rescind the Patent of Sept. 7, 1848, liberating the Czech peasants from feudal dependence and abolishing the *corvée* in return for redemption payments, and by the Patent of Mar. 2, 1853, they confirmed the abolition of personal dependence and the *corvée* (for part of the peasantry) in Slovakia. These measures opened the way for a freer development of capitalist relations. By the end of the 1860's the industrial revolution had transformed most of the industries in the Czech lands, now the most highly industrialized part of the Hapsburg monarchy. Small-scale production continued to prevail in Slovakia, which owing to historical circumstances lagged far behind the Czech lands economically.

The development of capitalist industry in the Czech lands and Slovakia was at this time almost exclusively financed by German-Austrian and Hungarian capital. Czech and Slovak capital investments were confined to industries processing agricultural raw materials and, in the Czech lands, also to enterprises manufacturing food-processing or farm machinery. The Czech Živnostenská Bank, founded in 1869, played a major role in the consolidation of Czech national capital. The trend toward concentration of production and the centralization of capital intensified in the Czech lands shortly after the economic crisis of 1873; in Slovakia this process did not begin until the 1890's. The formation of the basic classes of capitalist society—a national bourgeoisie and a proletariat—was completed in the latter half of the 19th century.

The Czech bourgeois National Party, founded around 1860, called for the reorganization of the Hapsburg monarchy along federal lines and broad autonomy for the Czech lands. The Slovak national movement also gained momentum in the early 1860's. The Martin Declaration, drawn up at a national congress convened in Turčianský Sv. Martin in 1861, demanded autonomy for Slovakia, and the Matica Slovenská, a cultural and educational society, was founded in 1863.

When the Hapsburg Empire was transformed into the dual monarchy of Austria-Hungary by the Austro-Hungarian agreement of 1867, the Czech lands became part of Cisleithania, ruled by Austria, and Slovakia was included in Transleithania, governed by Hungary. The establishment of the dual monarchy wrecked the political plans of the Czech bourgeoisie, which had hoped to see the Austrian Empire transformed into a federal state. Dual rule meant that the dominant position of the Hungarian and German-Austrian nationalities would be strengthened at the expense of the Slavic peoples.

In the late 1860's and early 1870's the Czech national movement, headed by the Czech bourgeoisie, began attracting the masses and assumed a general democratic character. People's rallies (*tábory*) were held demanding political independence, national equality, and universal franchise. In 1874 the Czech National Party split into the conservative Old Czechs and the left-wing Young Czechs. A division into conservatives and liberals also took place in the national movement of Slovakia, where magyarization was stepped up after 1868.

Socialist ideas spread through the Czech lands from the late 1860's, largely through the efforts of J. B. Pecka, L. Zápotocký, and J. Hybeš. The development of class consciousness among the Czech and Slovak workers was influenced by the strike movement, notably the Sárov Strike of 1870 and the strikes of the early 1870's in Banská Štiavnica. The Czechoslovak Social Democratic Labor Party was founded in 1878 as a member of the Social Democratic Party of Austria, becoming a separate party in 1893. The workers of the Czech lands and Slovakia participated in the May Day celebrations of 1890, and in 1893 they joined the working class of the other peoples of Austria-Hungary in agitating for universal franchise. Trade union organizations were founded in the Czech lands and Slovakia in the 1890's.

Several Czech political parties emerged in the late 19th century to promote the interests of various groups of the national bourgeoisie; the most influential of them was the Czech Progressive Party, whose founder and ideologist was T. G. Masaryk. In the early 20th century the Slovak national movement also separated into several currents: conservative, liberal (V. Šrobár), clerical (A. Hlinka), and agrarian (M. Hodža). From the late 1880's the leaders of the Czech and Slovak national movements showed an increasing desire to join forces in the struggle for the democratization of the Austro-Hungarian monarchy and for the solution of the national problem. In advocating the national liberation of their people, Slovak liberals urged close Czech-Slovak cooperation.

Monopoly capitalism (until 1918). The economic crisis of 1900–03 intensified the concentration and centralization of industrial production and capital in the Czech lands and Slovakia, a trend that had begun in the late 19th century: by 1913 the Czech lands accounted for 60 percent of the industrial output of the empire. The importance of Czech national investment capital increased: from 1900 to 1913 the proportion of the empire's capital that was controlled by Czech banks rose from 7.9 percent to 13.3 percent. Czech capital was exported to the Balkans and to Russia. In both the Czech lands and Slovakia there were large farms organized on a capitalist basis. The exploitation of the working people, national oppression, and the denial of political rights caused a powerful upsurge in the labor and general democratic movement. Under the impact of the Revolution of 1905–07 in Russia a mass campaign for universal suffrage unfolded in the Czech lands and Slovakia. The government was obliged to carry out an electoral reform, instituted in the Czech lands in 1907 and in Slovakia in 1912. The Czech and Slovak labor movement was adversely affected by Austro-Marxism and lacked unity.

During World War I intensified exploitation and national oppression, political terror, and a rapidly deteriorating economic situation caused a spontaneous upwelling of indignation among the working people in the Czech lands and Slovakia. Antigovernment demonstrations assumed a mass character, and Czech and Slovak soldiers and officers deserted or surrendered in droves. (In late 1916 there were more than 250,000 Czech and Slovak prisoners in Russia alone.) The Austrian government had the support of most of the Czech political parties, which in the fall of 1916 united to form the Czech Federation, a coalition of Reichsrat deputies from nine Czech parties, including the Czechoslovak Social Democratic Labor Party. At the same time, the pro-Austrian National Committee was formed in Prague by representatives of seven political parties. The policy of the Hungarian government received the wholehearted support of the Slovak bourgeois parties, especially the clericalists.

Nevertheless, pro-Entente sentiments became stronger among Czech and Slovak political circles during the war, with some pro-Entente groups, notably the Young Czechs and National Socialists, leaning toward tsarist Russia and others, mainly the political groupings of the Czech liberal bourgeoisie and intelligentsia, gravitating toward Great Britain and France. Some political activists among the Slovak bourgeoisie, notably Šrobár and Hodža, also shared the views of the pro-Entente politicians. Meanwhile, the émigré leaders of the Czech (Masaryk, E. Beneš) and Slovak (M. Štefánik) bourgeoisie founded a political center in Paris called the Czechoslovak National Council, opened negotiations with the Entente powers aimed at winning recognition for an independent Czechoslovak state after the war, and began organizing Czechoslovak military units in Russia, France, and Italy to fight on the side of the Entente. The revolutionary, antiwar, and

national liberation movement in the Czech lands and Slovakia escalated under the impact of the February Bourgeois Democratic Revolution of 1917 in Russia. The liberation movement in the Czech lands and Slovakia assumed mass proportions in the summer and fall of 1917.

Formation of the bourgeois Czechoslovak republic (1918). The Great October Socialist Revolution gave a powerful stimulus to the liberation struggle of the Czech and Slovak peoples. In late 1917 and early 1918 all of Austria-Hungary was engulfed by a wave of rallies, demonstrations, and strikes expressing solidarity with the proletarian revolution in Russia. In January 1918 a general strike broke out in the Hapsburg Empire, including the Czech lands and Slovakia. The working people called for peace on the basis of the Soviet proposals, national self-determination, the democratization of public life, and improved food supplies. In February sailors stationed on the Gulf of Kotor rebelled. Mass desertions at the front and numerous spontaneous soldiers' revolts in the rear throughout the spring and summer of 1918 attested to the rapid disintegration of the Austro-Hungarian army.

In the face of a mounting revolutionary crisis, the National Committee in Prague was reorganized in July 1918. Headed by K. Kramář, the leader of the National Democrats, the committee now included representatives of all the Czech political parties, who announced their intention of working for the establishment of a sovereign Czechoslovak state. The escalation of the liberation movement in the country and the failure of the Entente powers to negotiate a separate peace with the Hapsburgs impelled these powers and the USA to recognize the Czechoslovak National Council in Paris as the basis of a future government. The diplomatic position of the bourgeois émigrés was strengthened by the outbreak, on May 25, 1918, of an anti-Soviet mutiny in the Czechoslovak army corps that had been formed in Russia during the war.

In September 1918 the Socialist Council was set up in Prague to coordinate the actions of the Czechoslovak Social Democratic Labor Party and the Czech Socialist Party. On the council's initiative a general strike was held on October 14; in a number of cities demonstrators called for the creation of an independent Czechoslovak republic. Confronted with the military defeat and imminent collapse of Austria-Hungary, the National Committee proclaimed the establishment of an independent Czechoslovak state on Oct. 28, 1918. Two days later the Slovak National Council, meeting in Turčiansky Sv. Martin, adopted a declaration demanding the creation of a unified state of Czechs and Slovaks.

From November 1918 to March 1939. On Nov. 14, 1918, the Provisional National Assembly confirmed the Hapsburg dynasty's loss of all rights to the Czech lands and proclaimed Czechoslovakia a republic. Masaryk was elected president, and Kramář headed the first coalition government. The borders of Czechoslovakia were established by the Versailles (1919), St. Germain (1919), and Trianon (1920) treaties between the victorious powers and Germany, Austria, and Hungary. The Transcarpathian Ukraine was included in Czechoslovakia despite the resolution on unification with the Soviet Ukraine that was adopted by the People's Congress in Khust in January 1919. The Těšín district, claimed by both Czechoslovakia and Poland, was divided between them by a decision of the Conference of Ambassadors of the great powers in the summer of 1920.

Czechoslovakia emerged as a multinational state, with Germans, Hungarians, Ukrainians, Poles, and other nationalities constituting about one-third of its population. It encompassed 22 percent of the territory, 26 percent of the population, and more than 70 percent of the industry of former Austria-Hungary. Its heavy reliance on foreign markets and raw materials was to make its economy unstable.

The first postwar years saw the rapid growth and strengthening of Czech finance capital. The large Czech banks that profited from the war—the Živnostenská, Prague Credit, and Agrarian banks—became the nuclei of powerful concerns that controlled dozens of joint-stock companies in industry, agriculture, trade, and money circulation. Relying on their representatives in the state apparatus and on the support of the Entente powers, the Czech monopolies gradually squeezed out Austrian, German, and Hungarian capital and strengthened their position in the economy of Slovakia and the Transcarpathian Ukraine, turning them into an agricultural raw-material appendage of the industrially developed Czech lands and a source of cheap labor. At the same time, large amounts of foreign capital, mainly French, British, and American, began flowing into the Czechoslovak economy. By the late 1920's foreign capital accounted for 20 percent of all the capital invested in the Czechoslovak national economy.

As many as 50 different parties and associations functioned in Czechoslovakia in the interwar years. The interests of big Czech industrial and banking capital were most openly championed by the Czechoslovak National Democratic Party. The largest bourgeois party in the country was the Agrarian Party, founded in 1899 and renamed the Republican Party of the Farming and Small Peasant Population in 1922. Initially representing the Czech rural bourgeoisie, which was able to influence a considerable part of the peasantry, the Agrarian Party became the chief party of Czechoslovak finance capital. The Czechoslovak Socialist Party, founded in 1897 as the Czech National Socialist Party, drew its support from the urban petite bourgeoisie, part of the intelligentsia, and some nationalistic workers. After merging with most of the Slovak Social Democrats in December 1918, the Czechoslovak Social Democratic Labor Party became the country's most broadly based political party.

The constitution adopted by the Provisional National Assembly in February 1920 gave legal form to the country's bourgeois-democratic republican system. Behind the rapid succession of coalition governments (20 cabinets were formed prior to March 1939), the affairs of state were directed by a group of leaders of the bourgeois and reformist parties, called the "five" until 1925 and the "eight" thereafter. From 1922 most of the Czechoslovak governments were headed by Agrarians.

In the first years of the bourgeois republic the ruling circles were obliged to carry out several social and political reforms. The nobility lost its political privileges, legislation was enacted providing for an eight-hour workday, state unemployment compensation was introduced, and medical insurance was made available to more people. In April 1919 a law was passed establishing the principles of agrarian reform, and in the first half of 1920 laws were enacted that determined the procedure for the expropriation, with compensation, and redistribution of landed property, belonging for the most part to German and Hungarian nobles. These limited reforms could not satisfy the working people. From early 1919 the country was gripped by a spreading mass movement protesting against high prices and speculation and demanding the nationalization of industry and a thorough democratic agrarian reform.

In April 1919 Czechoslovak troops took part in the Entente-organized armed intervention against the Hungarian Soviet Republic, established earlier that year. The Hungarian Red Army stopped the interventionists, passed to the offensive, and, supported by local working people, entered eastern Slovakia. On June 16, 1919, the Slovak Soviet Republic was proclaimed in Prešov. The republic lasted only until early July, when troops of the Czechoslovak bourgeois government occupied Slovakia.

The municipal elections of June 1919 and the parliamentary elections of April 1920 clearly demonstrated the radicalization of the working people and the general discontent with the policy of the ruling circles. The Social Democrats and Socialists received almost half of all the votes cast, and the right-wing Social Democrat V. Tusar was chosen to head the new coalition government. A left opposition crystallized within the Czechoslovak Social Democratic Labor Party (CSDLP) in the second half of 1919; it insisted that the party eschew coalitions with the bourgeoisie and pursue an independent policy serving the working class. In December 1919 the revolutionary wing of the CSDLP organized itself as the Marxist Left, headed by B. Šmeral, J. Hybeš, and A. Zápotocký. Elections of delegates to the next regular party congress, held in the summer of 1920, gave an absolute majority to the Marxist Left. The Thirteenth Party Congress, duly convened in September, endorsed the formation of the CSDLP (Left). The party's right-wing leaders refused to accept the decisions of the congress. On December 9 the police seized the building occupied by the Executive Committee of the Marxist Left and sealed off the printing plant of the newspaper *Rudé právo*, thereby sparking a political strike (*see* DECEMBER POLITICAL STRIKE OF 1920). The December events hastened the formation of a

Communist Party. A congress of the CSDLP (Left) held in Prague on May 14–16, 1921, voted to assume the name "Communist" and to join the Comintern. The Unification Congress (Oct. 30–Nov. 4, 1921) completed the formation of the united Communist Party of Czechoslovakia.

In their foreign policy in the 1920's the Czechoslovak ruling circles aimed at consolidating the country's position within the Versailles system and looked to France as the chief guarantor of this system. The Little Entente, a military and political alliance between Czechoslovakia, Rumania, and Yugoslavia, was formed under the aegis of France in 1920–21. A Franco-Czechoslovak military and political treaty was concluded in 1924. After the collapse of the anti-Soviet armed intervention in 1918–20 and the failure of the capitalist countries to impose their will on Soviet Russia at the Genoa Conference of 1922, Czechoslovakia signed the Provisional Treaty with the RSFSR (Prague, June 5, 1922) and another treaty with the Ukrainian SSR (June 6). These treaties provided for mutual de facto recognition and for the establishment of trade and economic relations. Continuing, however, to support the anti-Soviet policy of the Western powers, Czechoslovakia participated in the Locarno Conference in 1925 and signed the Locarno Treaties, which greatly complicated its foreign policy without guaranteeing the security of its borders.

With the exception of a few brief recessions, such as the industrial slowdown of 1926, industrial and agricultural production increased steadily between 1924 and 1929, when the general indexes exceeded prewar levels. With the partial stabilization of capitalism, opportunist elements became more aggressive in the labor movement. In February 1929 the Fifth Congress of the Communist Party removed from the leadership the right-opportunist group that had formed around V. Bolen and B. Jilek and elected a new Central Committee headed by K. Gottwald.

The first symptoms of a world economic crisis were felt in Czechoslovakia as early as 1929. By the time the crisis reached its height in the spring of 1933, industrial output had dropped by more than one-third from the 1929 level. According to official statistics, unemployment reached 920,000 in late February 1933. The Communist Party headed the working people's struggle against the attempts of the bourgeoisie to resolve the crisis at their expense. The Communists led strikes and mass protests of the unemployed. The 1932 Most Strike in the North Bohemian Coal Basin, a political event of European significance, forced the employers and the government to satisfy some of the miners' demands. The economic depression intensified the conflicts among and within the various groups of Czechoslovak finance capital and between the bourgeoisie of the country's different nationalities.

The fascist victory in Germany complicated Czechoslovakia's international and domestic political situation. Czech fascist organizations that had arisen in the mid-1920's stepped up their activity. Fascist separatist elements gained the upper hand in the Slovak People's Party, which had been founded in 1918. The Sudeten German Party, founded in October 1933 by K. Henlein, became Hitler's tool. The threat of aggression by fascist Germany, the growing international prestige of the USSR, and the pressure of the popular masses obliged the Czechoslovak government to extend de jure recognition to the USSR in June 1934, and after the signing of the Franco-Soviet mutual assistance treaty, to conclude a similar treaty with the USSR in May 1935. Guided by the decisions of the Seventh Congress of the Comintern, the Communist Party proposed the formation of a united popular front to combat the mounting reaction and threat to national independence. The profascist forces were defeated in the parliamentary elections of May 1935, although Henlein's followers managed to poll two-thirds of the German votes. Neither did the extreme reactionaries succeed in electing their candidate in the presidential elections of December 1935, won by E. Beneš.

Nevertheless, the sabotage of the reformists and Agrarians prevented the formation of a united antifascist front. The ruling circles of Czechoslovakia followed the French and British policy of appeasing the aggressor. At a congress held in Karlovy Vary in April 1938, Henlein's supporters demanded autonomy for the Sudetenland. The next month German and Polish troops began massing along Czechoslovakia's borders. The Czechoslovak government announced a partial mobilization, but under the pressure from Lord Runciman's "unofficial" British mission, which arrived in Prague in July, it yielded to almost all the Karlovy Vary demands. Despite the concessions, Henlein's followers, acting on direct orders from Berlin, demanded the immediate unification of the Sudetenland with Germany. On September 12 they staged an armed putsch.

On September 21 the government of the Agrarian Hodža accepted, with the consent of President Beneš, the Anglo-French ultimatum to cede the border regions of Czechoslovakia to Germany. The next day the Communist Party initiated a general political strike. When the Hodža government resigned in favor of a new cabinet formed by General J. Syrový, Beneš assured Great Britain and France that the change of government did not mean a refusal to accept their demands. The ruling circles of Czechoslovakia rejected the military assistance that the Soviet government was ready to give under the Soviet-Czechoslovak treaty of 1935 even if France should refuse to aid Czechoslovakia. On September 29 the governments of Great Britain and France concluded the Munich Pact with Germany and Italy on the dismemberment of Czechoslovakia (*see* MUNICH PACT OF 1938). In early October 1938 fascist Germany occupied the Sudentenland. On October 2 bourgeois-landlord Poland seized the Těšín district, and on November 2, in accordance with the Vienna Arbitration, Horthy's Hungary appropriated the southern regions of Slovakia and of the Transcarpathian Ukraine. As a result, Czechoslovakia lost one-third of its territory and population, more than 40 percent of its industry, and a considerable part of its raw-material resources.

Czechoslovakia found itself completely dependent on fascist Germany, both politically and economically. The Communist Party was outlawed, first in Slovakia, where an autonomous government was formed by J. Tiso, the leader of the separatists, and later in the Czech lands. On March 14, 1939, the Slovak separatists, acting in concert with Berlin, proclaimed the formation of an "independent Slovak state." The next day German troops occupied the Czech lands, which on Hitler's orders were transformed into the Protectorate of Bohemia and Moravia. The Transcarpathian Ukraine was seized by Horthy's Hungary. The Soviet government alone refused to recognize the destruction of Czechoslovakia, branding Germany's actions as a lawless act of aggression.

Fascist German rule; the struggle of the peoples of Czechoslovakia against Nazi oppression (from March 1939 to May 1945). A brutal occupation regime was established in the Protectorate. The economy was subordinated to German monopolies and placed at the service of the Nazis' militarist plans. After signing treaties with Germany in 1939–40 establishing a military and political alliance and pledging economic cooperation, the Slovak puppet government drew Slovakia into the war on the side of the fascist axis. The reactionary circles among the Czech bourgeoisie embarked on open collaboration with the occupation forces. Some of the bourgeois political leaders, headed by Beneš, emigrated to the West. In 1939 they formed in Paris the Czechoslovak National Committee, which became the basis of a provisional government formed in London the following year. The Communist Party headed the resistance to the aggressors and their confederates. The activity of the underground Communist organizations (the Communist Party of Slovakia was constituted as a separate entity in the spring of 1939) was directed by the Moscow-based united party center, headed by Gottwald. At first the resistance to the occupation forces generally took the form of strikes, demonstrations, and acts of sabotage.

After the USSR entered the war with fascist Germany, it was the first power in the anti-Hitler coalition to recognize the Czechoslovak government in London. On July 18, 1941, the USSR and the provisional government signed an agreement on military cooperation that provided for the restoration of Czechoslovakia within the pre-Munich borders. Meanwhile, in the USSR a Czechoslovak military unit was being formed under the command of L. Svoboda that would subsequently grow into the First Czechoslovak Army Corps. The first partisan detachments were organized in Czechoslovakia in the summer of 1942. A Soviet-Czechoslovak treaty on friendship, mutual assistance, and postwar cooperation was signed in Moscow on Dec. 12, 1943.

The Moscow treaty and the Soviet Army's advance toward the borders of Czechoslovakia gave impetus to the national libera-

tion movement. A national uprising broke out in Slovakia on Aug. 29, 1944 (*see* SLOVAK NATIONAL UPRISING OF 1944). In the liberated areas power passed to the Slovak National Council, which had been founded in 1943 on the initiative of the Communists and which included three members of the Central Committee of the Slovak Communist Party—K. Schmidke, G. Husák, and L. Novomeský. To aid the rebels, the Soviet command changed its original plans and launched an offensive near the passes across the Carpathians, capturing Dukla Pass on October 6 after heavy fighting. Nevertheless, the center of the uprising, the town of Banská Bystrica, fell on October 27 under the onslaught of superior Nazi forces. The rebels retreated into the mountains, where they continued the struggle.

The Slovak uprising marked the beginning of the national democratic revolution in Czechoslovakia. Meeting in Moscow in March 1945, representatives of the London exiles, the Slovak National Council, and the leadership of the Czechoslovak Communist Party agreed to form the National Front of Czechs and Slovaks and worked out its program. In early April a National Front government was formed in Košice and its program was announced to the country (*see* KOŠICE PROGRAM). Supported by partisans, armed insurrections against the occupation forces broke out in several Czech cities in May. Prague rebelled on May 5 (*see* PEOPLE'S UPRISING OF 1945). Soviet troops came to the aid of the insurgents, and, entering Prague on May 9, completed the liberation of Czechoslovakia.

Establishment of ■ people's democratic system; the national democratic revolution develops into ■ socialist revolution (from May 1945 to February 1948). After the liberation of Czechoslovakia from the fascist German aggressors, the independent state of Czechs and Slovaks was resurrected on a new, democratic basis. The national democratic revolution that unfolded in the country led to the establishment of a people's democratic system, based on the National Front, which derived its strength from the alliance of workers and peasants. The Communist Party of Czechoslovakia and the Communist Party of Slovakia held leading positions in the National Front. Although all the parties that joined the National Front pledged to fulfill the joint government program and to build a people's democratic republic, the National Socialists, the Czechoslovak People's Party, and the Slovak Democratic Party tried from the very beginning to slow down the revolutionary process and gradually to restore the regime that had existed in the pre-Munich bourgeois republic. The Communists alone consistently struggled for revolutionary changes in political and economic life.

Relying on the working class and the working peasantry and overcoming the resistance of the bourgeoisie, the Communist Party of Czechoslovakia launched a campaign to turn the national democratic revolution into a socialist revolution. The national committees (local governing bodies), working jointly with factory councils, began taking over the management of enterprises belonging to the occupation forces or to persons who had cooperated with them and set about purging the state machinery of traitors and collaborators. The presidential decree of June 21, 1945, opened the first phase in the implementation of the agrarian reform. The land and other property belonging to German and some Hungarian landlords or to traitors was confiscated.

On Oct. 24, 1945, decrees were issued nationalizing key industries and all banks and private insurance companies. By the end of 1946 the state had taken over about 3,000 major industrial enterprises, including all mines, almost all the metallurgical works and power plants, and three-fourths of the chemical and metalworking enterprises. The nationalization of key industries and the banks heralded the formation of a socialist sector in the national economy. The Eighth Congress of the CPC (March 1946) summed up the social changes and set forth the tasks of further strengthening the people's democratic system. The congress demonstrated that the Communist Party had become the strongest political party in the country.

In the May 1946 elections to the Constituent National Assembly and to the national committees, the Communist Party polled more votes than any other political party. For the first time in Czechoslovak history the government was headed by a Communist, the party chairman K. Gottwald. The program adopted by the new government provided for further democratic changes, the drafting of a new constitution, and the drawing up of a plan for the restoration and development of the national economy in 1947–48. In accordance with the program, the government initiated the second phase of the agrarian reform: arable land in excess of 150 hectares (ha) or total landed property exceeding 250 ha was expropriated. By the middle of 1947, some 2,946,000 ha of agricultural land and forests had been confiscated, most of it in the border regions. A large part of the agricultural land was given to farmhands, small peasants, and peasants with large families.

At the end of 1947 economic difficulties, aggravated by a drought, and the bourgeoisie's resistance to revolutionary changes exacerbated the class struggle in the country. The bourgeois parties opposed the measures proposed by the Communist Party for improving the food situation in the country, measures that included raising the wholesale prices of farm products and levying an emergency tax on millionaires.

In February 1948 the reactionary bourgeoisie, which was losing one position after another, tried, with the support of Western imperialist circles, to stage ■ counterrevolutionary coup and to restore the capitalist system in the country. The ministers representing the bourgeois parties resigned in the hope of provoking a government crisis and forming a new government without Communists. The Communist Party appealed to the popular masses to defend the people's democratic system and its revolutionary gains (*see* FEBRUARY EVENTS OF 1948). On Feb. 24, 1948, a one-hour general strike was held to protest the machinations of the reactionary forces. By this time power in the country was in fact already wielded by the working class. The antipopular plot of the Czechoslovak bourgeoisie and international imperialism was foiled. The next day, President E. Beneš was obliged to accept the resignation of the reactionary ministers and to replace them with people proposed by Gottwald. The crisis was resolved by peaceful means. The February victory of the working class concentrated all power in the hands of the working class. The national democratic revolution had indeed developed into a socialist revolution. With the victory of the socialist revolution, the people's democratic system assumed the functions of a dictatorship of the proletariat.

Building socialism. The establishment of a dictatorship of the proletariat and the activity of the new Gottwald government made it possible to continue implementing revolutionary reforms and to begin building socialism. In March 1948 the National Assembly enacted a new land reform law that limited private landholdings to 50 ha of farmland. More than 4 million ha of farmland and forests had been redistributed since 1945; of this area more than 2 million ha of farmland were transferred to small peasants, and about 800,000 ha of land went to state farms, laying the basis for a socialist sector in agriculture.

The second stage of the nationalization of industry was completed in April 1948, when the state took over all enterprises employing more than 50 workers and, in some industries, all the enterprises. Large commercial firms and stores were also nationalized, and a state monopoly on foreign trade was established. These reforms produced radical changes in the socioeconomic structure of society and eliminated the main exploiting classes—the big industrial, banking, trade, and rural bourgeoisie. The alliance of the working class and the peasantry was strengthened.

The new constitution adopted on May 9, 1948, proclaimed Czechoslovakia a people's democratic republic of Czechs and Slovaks and made socialism the goal of the country's development. In the May 30, 1948, elections to the National Assembly the National Front candidates polled 89.3 percent of the votes.

After the resignation of Beneš in June 1948, Gottwald was elected president of the republic, and A. Zápotocký was chosen to head the new government (cabinet). The non-Communist National Front parties—the Czechoslovak Socialist Party, the Czechoslovak People's Party, the Slovak Reconstruction Party, and the Slovak Freedom Party—purged their ranks of reactionary elements and accepted the Communist Party's policy of building socialism. The guiding role of the Communist Party was considerably bolstered. In June 1948 the Social Democratic Party merged with the Communist Party on a Marxist-Leninist basis. At the party's Ninth Congress, held in May 1949, the building of

socialism was adopted as the party's general line. The primary objective of the first five-year plan (1949–53) was to lay the foundation for a socialist economy. The plan emphasized the development of heavy industry, especially machine building, called for the gradual formation of agricultural cooperatives, and aimed at raising the living standard of the working people. Special attention was given to overcoming the economic backwardness of Slovakia through industrialization. The country's cities and villages embarked on a massive program of building socialism.

After Gottwald's death in March 1953, Zápotocký was elected president. A. Novotný, first secretary of the Central Committee of the Communist Party from September 1953, succeeded to the presidency after Zápotocký's death in November 1957. The office was held by L. Svoboda from March 1968 to May 1975.

The Tenth Congress of the Communist Party (1954) affirmed that the first five-year plan had laid a firm foundation for a socialist society. The socialist sector, which included the unified agricultural cooperatives, now dominated the country's economy, accounting for 92 percent of the national product. The gross industrial output increased by 93 percent during the five-year plan, reaching a level more than double the 1937 output. Machine building became the leading industry, its output increasing by a factor of 3.3 over the five years. Industrial growth was especially rapid in Slovakia. At the same time, there were disproportions in the development of individual branches of the national economy, and agriculture lagged behind the growing demands of industry and the population.

The second five-year economic development plan (1956–60), adopted in 1956, aimed to complete the building of the material production base of socialism, promote a more even development of the national economy, revive the lagging fuel, energy, and mining industries, and ensure the preponderance of the socialist sector in agriculture. The party's Eleventh Congress (June 1958), noting the successes in building the foundation of socialism, set the concrete tasks of the second five-year plan: the more rapid development of production, the improvement of socialist democracy, and the strengthening of the moral and political unity of the people on the basis of Marxist-Leninist principles.
